Contents

Preface

This guide describes how to configure OcNOS.

Audience

This guide is intended for network administrators and other engineering professionals who configure OcNOS.

Conventions

Table P-1 shows the conventions used in this guide.

Table P-1: Conventions

Convention	Description
Italics	Emphasized terms; titles of books
Note:	Special instructions, suggestions, or warnings
`monospaced type`	Code elements such as commands, parameters, files, and directories

Chapter Organization

The chapters in command references are organized as described in Command Description Format.

The chapters in configuration guides are organized into these major sections:

- An overview that explains a configuration in words
- Topology with a diagram that shows the devices and connections used in the configuration
- Configuration steps in a table for each device where the left-hand side shows the commands you enter and the right-hand side explains the actions that the commands perform
- Validation which shows commands and their output that verify the configuration

Related Documentation

For information about installing of OcNOS, see the *Installation Guide* for your platform.

Feature Availability

The features described in this document that are available depend upon the OcNOS SKU that you purchased. See the *Application Notes* for a description of the OcNOS SKUs.

Support

For support-related questions, contact support@ipinfusion.com.

Comments

If you have comments, or need to report a problem with the content, contact techpubs@ipinfusion.com.

SP 3.0 New Features

Control Plane policing (CoPP):

- Chapter 1, *Control Plane Policing Configuration*
- Chapter 1, *Control Plane Policing Commands*

ISIS IPv6:

- Chapter 7, *IS-IS IPv6 Configuration*
- Chapter 5, *ISIS IPv6 VRF Configuration*

Optical Line Termination (OLT):

- Optical Line Termination Configuration Guide
- Optical Line Termination Command Reference

Layer 2 subinterface:

- Chapter 14, *Layer 2 Subinterface Configuration*
- Chapter 9, *Layer 2 Subinterface Commands*

Layer 3 subinterface:

- Chapter 15, *Layer 3 Subinterface Configuration*
- Chapter 1, *Layer 3 Subinterface Commands*

Precision Time Protocol (PTP) G.8275.1 (T-GM) with GPS:

- Chapter 1, *Boundary Clock Configuration*
- Chapter 1, *PTP 8275.1 and PTP 8275.2 Commands*

Synchronous Ethernet:

- Chapter 1, *SyncE Commands*
- Chapter 2, *SyncE Show Commands*

Layer 2 Multicast Listener Discovery (MLD) Snooping:

- Chapter 4, *Layer 2 MLD Snooping Commands*

6PE Inter-AS option-B:

- BGP Labeled Unicast with Inter-AS

MPLS VPN Inter-AS Option-B:

- neighbor allow-ebgp-vpn

MPLS ping and trace route:

- ping
- traceroute

DHCP relay with option 82:

- DHCP Relay option 82
- ip dhcp relay information option
- ip dhcp relay information source-ip

ACL over Loopback

Passwordless SSH

- SSH Key-Based Authentication

SP 1.0 ED 2.4 New Features

Chapter 1, *Control Plane Policing Configuration*

Chapter 5, *VXLAN Tunnel Over SVI*

ACL over Virtual Terminal

EVPN VxLAN:

- Chapter 2, *VXLAN Quality of Service Commands*
- Chapter 3, *VxLAN Multi-Homing Configuration*

CFM Performance Monitoring for VPWS:

- Chapter 4, *Y.1731 Performance Monitoring Configurations*
- Chapter 3, *CFM and Y.1731 Commands*

Ethernet Ring Protection Switching (ERPS):

- Chapter 5, *G.8032 ERPS Version 2*
- Chapter 4, *G.8032 ERPS Version 2 Commands*

Two-way Active Measurement Protocol (TWAMP):

- Chapter 16, *Two-way Active Measurement Protocol*
- Chapter 1, *TWAMP Commands*

IP Fast Reroute/Loop Free Alternate for ISIS/OSPF:

- Loop-Free Alternate Fast Reroute (OSPFv2)
- Loop-Free Alternate (LFA) ECMP PATH (OSPFv2)
- IS-IS IPv4 Loop-Free Alternate Fast Reroute
- LFA Tie-Breaker (ISISv4)
- LFA Termination (ISISv4)
- LFA For ECMP Paths (ISISv4)

Chapter 18, *VLAN Service Queuing (VLAN Shaping)*

Command Line Interface

This chapter introduces the OcNOS Command Line Interface (CLI) and how to use its features.

Overview

You use the CLI to configure, monitor, and maintain OcNOS devices. The CLI is text-based and each command is usually associated with a specific task.

You can give the commands described in this manual locally from the console of a device running OcNOS or remotely from a terminal emulator such as `putty` or `xterm`. You can also use the commands in scripts to automate configuration tasks.

Command Line Interface Help

You access the CLI help by entering a full or partial command string and a question mark “?”. The CLI displays the command keywords or parameters along with a short description. For example, at the CLI command prompt, type:

```
> show ?
```

The CLI displays this keyword list with short descriptions for each keyword:

```
show ?
  application-priority            Application Priority
  arp                             Internet Protocol (IP)
  bfd                             Bidirectional Forwarding Detection (BFD)
  bgp                             Border Gateway Protocol (BGP)
  bi-lsp                          Bi-directional lsp status and configuration
  bridge                          Bridge group commands
  ce-vlan                         COS Preservation for Customer Edge VLAN
  class-map                       Class map entry
  cli                             Show CLI tree of current mode
  clns                            Connectionless-Mode Network Service (CLNS)
  control-adjacency               Control Adjacency status and configuration
  control-channel                 Control Channel status and configuration
  cspf                            CSPF Information
  customer                        Display Customer spanning-tree
  cvlan                           Display CVLAN information
  debugging                       Debugging functions (see also 'undebug')
  etherchannel                    LACP etherchannel
  ethernet                        Layer-2
...
```

If you type the ? in the middle of a keyword, the CLI displays help for that keyword only.

```
> show de?
debugging  Debugging functions (see also 'undebug')
```

If you type the ? in the middle of a keyword, but the incomplete keyword matches several other keywords, OcNOS displays help for all matching keywords.

```
> show i? (CLI does not display the question mark).
interface  Interface status and configuration
ip         IP information
isis       ISIS information
```

Command Completion

The CLI can complete the spelling of a command or a parameter. Begin typing the command or parameter and then press the tab key. For example, at the CLI command prompt type `sh`:

```
> sh
```

Press the tab key. The CLI displays:

```
> show
```

If the spelling of a command or parameter is ambiguous, the CLI displays the choices that match the abbreviation. Type `show i` and press the tab key. The CLI displays:

```
> show i
  interface  ip         ipv6       isis
> show i
```

The CLI displays the `interface` and `ip` keywords. Type n to select `interface` and press the tab key. The CLI displays:

```
> show in
> show interface
```

Type ? and the CLI displays the list of parameters for the `show interface` command.

```
> show interface
  IFNAME  Interface name
  |       Output modifiers
  >       Output redirection
  <cr>
```

The CLI displays the only parameter associated with this command, the `IFNAME` parameter.

Command Abbreviations

The CLI accepts abbreviations that uniquely identify a keyword in commands. For example:

```
> sh in xe0
```

is an abbreviation for:

```
> show interface xe0
```

Command Line Errors

Any unknown spelling causes the CLI to display the error `Unrecognized command` in response to the ?. The CLI displays the command again as last entered.

```
> show dd?
% Unrecognized command
> show dd
```

When you press the Enter key after typing an invalid command, the CLI displays:

```
(config)#router ospf here
                         ^
% Invalid input detected at '^' marker.
```

where the ^ points to the first character in error in the command.

If a command is incomplete, the CLI displays the following message:

```
> show
% Incomplete command.
```

Some commands are too long for the display line and can wrap mid-parameter or mid-keyword, as shown below. This does *not* cause an error and the command performs as expected:

```
area 10.10.0.18 virtual-link 10.10.0.19 authent
ication-key 57393
```

Command Negation

Many commands have a `no` form that resets a feature to its default value or disables the feature. For example:

- The `ip address` command assigns an IPv4 address to an interface
- The `no ip address` command removes an IPv4 address from an interface

Syntax Conventions

Table P-2 describes the conventions used to represent command syntax in this reference.

Table P-2: Syntax conventions

Convention	Description	Example
`monospaced font`	Command strings entered on a command line	`show ip ospf`
`lowercase`	Keywords that you enter exactly as shown in the command syntax.	`show ip ospf`
UPPERCASE	See Variable Placeholders	IFNAME
`()`	Optional parameters, from which you must select one. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>)`
`()`	Optional parameters, from which you select one or none. Vertical bars delimit the selections. Do not enter the parentheses or vertical bars as part of the command.	`(A.B.C.D|<0-4294967295>|)`
`()`	Optional parameter which you can specify or omit. Do not enter the parentheses or vertical bar as part of the command.	`(IFNAME|)`
`{}`	Optional parameters, from which you must select one or more. Vertical bars delimit the selections. Do not enter the braces or vertical bars as part of the command.	`{intra-area <1-255>|inter-area <1-255>|external <1-255>}`

Table P-2: Syntax conventions (Continued)

Convention	Description	Example
`[]`	Optional parameters, from which you select zero or more. Vertical bars delimit the selections. Do not enter the brackets or vertical bars as part of the command.	`[<1-65535>|AA:NN|internet|local-AS|no-advertise|no-export]`
`?`	Nonrepeatable parameter. The parameter that follows a question mark can only appear once in a command string. Do not enter the question mark as part of the command.	`?route-map WORD`
`.`	Repeatable parameter. The parameter that follows a period can be repeated more than once. Do not enter the period as part of the command.	`set as-path prepend .<1-65535>`

Variable Placeholders

Table P-3 shows the tokens used in command syntax use to represent variables for which you supply a value.

Table P-3: Variable placeholders

Token	Description
`WORD`	A contiguous text string (excluding spaces)
`LINE`	A text string, including spaces; no other parameters can follow this parameter
`IFNAME`	Interface name whose format varies depending on the platform; examples are: `eth0`, `Ethernet0`, `ethernet0`, `xe0`
`A.B.C.D`	IPv4 address
`A.B.C.D/M`	IPv4 address and mask/prefix
`X:X::X:X`	IPv6 address
`X:X::X:X/M`	IPv6 address and mask/prefix
`HH:MM:SS`	Time format
`AA:NN`	BGP community value
`XX:XX:XX:XX:XX:XX`	MAC address

`<1-5>`
`<1-65535>`
`<0-2147483647>`
`<0-4294967295>`
	Numeric range

Command Description Format

Table P-4 explains the sections used to describe each command in this reference.

Table P-4: Command descriptions

Section	Description
Command Name	The name of the command, followed by what the command does and when should it be used
Command Syntax	The syntax of the command
Parameters	Parameters and options for the command
Default	The state before the command is executed
Command Mode	The mode in which the command runs; see Command Modes
Example	An example of the command being executed

Keyboard Operations

Table P-5 lists the operations you can perform from the keyboard.

Table P-5: Keyboard operations

Key combination	Operation
Left arrow or Ctrl+b	Moves one character to the left. When a command extends beyond a single line, you can press left arrow or Ctrl+b repeatedly to scroll toward the beginning of the line, or you can press Ctrl+a to go directly to the beginning of the line.
Right arrow or Ctrl-f	Moves one character to the right. When a command extends beyond a single line, you can press right arrow or Ctrl+f repeatedly to scroll toward the end of the line, or you can press Ctrl+e to go directly to the end of the line.
Esc, b	Moves back one word
Esc, f	Moves forward one word
Ctrl+e	Moves to end of the line
Ctrl+a	Moves to the beginning of the line
Ctrl+u	Deletes the line
Ctrl+w	Deletes from the cursor to the previous whitespace
Alt+d	Deletes the current word
Ctrl+k	Deletes from the cursor to the end of line
Ctrl+y	Pastes text previously deleted with Ctrl+k, Alt+d, Ctrl+w, or Ctrl+u at the cursor

Table P-5: Keyboard operations (Continued)

Key combination	Operation
Ctrl+t	Transposes the current character with the previous character
Ctrl+c	Ignores the current line and redisplays the command prompt
Ctrl+z	Ends configuration mode and returns to exec mode
Ctrl+l	Clears the screen
Up Arrow or Ctrl+p	Scroll backward through command history
Down Arrow or Ctrl+n	Scroll forward through command history

Show Command Modifiers

You can use two tokens to modify the output of a `show` command. Enter a question mark to display these tokens:

```
# show users ?
  | Output modifiers
  > Output redirection
```

You can type the | (vertical bar character) to use output modifiers. For example:

```
> show rsvp | ?
  begin     Begin with the line that matches
  exclude   Exclude lines that match
  include   Include lines that match
  last      Last few lines
  redirect  Redirect output
```

Begin Modifier

The `begin` modifier displays the output beginning with the first line that contains the input string (everything typed after the `begin` keyword). For example:

```
# show running-config | begin xe1
...skipping
interface xe1
 ipv6 address fe80::204:75ff:fee6:5393/64
!
interface xe2
 ipv6 address fe80::20d:56ff:fe96:725a/64
!
line con 0
 login
!
end
```

You can specify a regular expression after the `begin` keyword, This example begins the output at a line with either “xe2” or “xe4”:

```
# show running-config | begin xe[3-4]

...skipping
```

```
interface xe3
 shutdown
!
interface xe4
 shutdown
!
interface svlan0.1
 no shutdown
!
route-map myroute permit 3
!
route-map mymap1 permit 10
!
route-map rmap1 permit 3
!
line con 0
 login
line vty 0 4
 login
!
end
```

Include Modifier

The `include` modifier includes only those lines of output that contain the input string. In the output below, all lines containing the word “input” are included:

```
# show interface xe1 | include input
    input packets 80434552, bytes 2147483647, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 1, missed 0
```

You can specify a regular expression after the `include` keyword. This examples includes all lines with “input” or “output”:

```
#show interface xe0 | include (in|out)put
    input packets 597058, bytes 338081476, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 613147, bytes 126055987, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
```

Exclude Modifier

The `exclude` modifier excludes all lines of output that contain the input string. In the following output example, all lines containing the word “input” are excluded:

```
# show interface xe1 | exclude input
Interface xe1
  Scope: both
  Hardware is Ethernet, address is 0004.75e6.5393
  index 3 metric 1 mtu 1500 <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet6 fe80::204:75ff:fee6:5393/64
    output packets 4438, bytes 394940, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
```

You can specify a regular expression after the `exclude` keyword. This example excludes lines with “output” or “input”:

```
# show interface xe0 | exclude (in|out)put
Interface xe0
  Scope: both
  Hardware is Ethernet  Current HW addr: 001b.2139.6c4a
  Physical:001b.2139.6c4a  Logical:(not set)
  index 2 metric 1 mtu 1500 duplex-full arp ageing timeout 3000
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Bandwidth 100m
  DHCP client is disabled.
  inet 10.1.2.173/24 broadcast 10.1.2.255
  VRRP Master of :  VRRP is not configured on this interface.
  inet6 fe80::21b:21ff:fe39:6c4a/64
    collisions 0
```

Redirect Modifier

The `redirect` modifier writes the output into a file. The output is not displayed.

```
# show cli history | redirect /var/frame.txt
```

The output redirection token (>) does the same thing:

```
# show cli history >/var/frame.txt
```

Last Modifier

The `last` modifier displays the output of last few number of lines (As per the user input). The last number ranges from 1 to 9999.

For example:

```
#show running-config | last 10
```

Command Modes

Commands are grouped into modes arranged in a hierarchy. Each mode has its own set of commands. Table P-6 lists the command modes common to all protocols.

Table P-6: Common command modes

Name	Description
Executive mode	Also called *view* mode, this is the first mode to appear after you start the CLI. It is a base mode from where you can perform basic commands such as `show`, `exit`, `quit`, `help`, `list`, and `enable`.
Privileged executive mode	Also called *enable* mode, in this mode you can run additional basic commands such as `debug`, `write`, and `show`.
Configure mode	Also called *configure terminal* mode, in this mode you can run configuration commands and go into other modes such as interface, router, route map, key chain, and address family.

Table P-6: Common command modes (Continued)

Name	Description
Interface mode	In this mode you can configure protocol-specific settings for a particular interface. Any setting you configure in this mode overrides a setting configured in router mode.
Router mode	This mode is used to configure router-specific settings for a protocol such as BGP or OSPF.

Command Mode Tree

The diagram below shows the common command mode hierarchy.

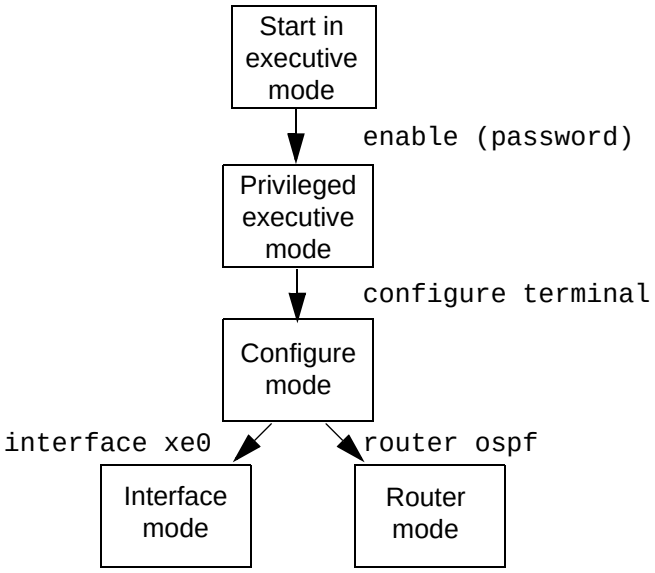

Figure P-1: Common command modes

To change modes:

1. Enter privileged executive mode by entering `enable` in Executive mode.
2. Enter configure mode by entering `configure terminal` in Privileged Executive mode.

The example below shows moving from executive mode to privileged executive mode to configure mode and finally to router mode:

```
> enable mypassword
# configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)# router ospf
(config-router)#
```

Note: Each protocol can have modes in addition to the common command modes. See the command reference for the respective protocol for details.

SECTION 1 Architecture

Architecture Guide

Contents

This document contains this chapter:

CHAPTER 1 Architecture Overview

This chapter introduces OcNOS and describes its high-level architecture.

OcNOS is an industry-standard network operating system with advanced networking features to meet the demands of data center, enterprise, and service provider networks.

The OcNOS networking protocol modules conform to leading IEEE, IETF, and other industry-specific standards:

- Layer 2 switching: VLANs, Spanning Tree
- Layer 3 routing: OSPFv2, OSPFv3, BGPv4, IS-IS
- MPLS: LDP, RSVP, L2VPN, L3VPN
- Carrier Ethernet
- Data center Ethernet

OcNOS provides configuration management through these layers:

- Command line interface
- SNMP

High-Level Architecture

Figure 1-1 shows the high-level architecture of OcNOS.

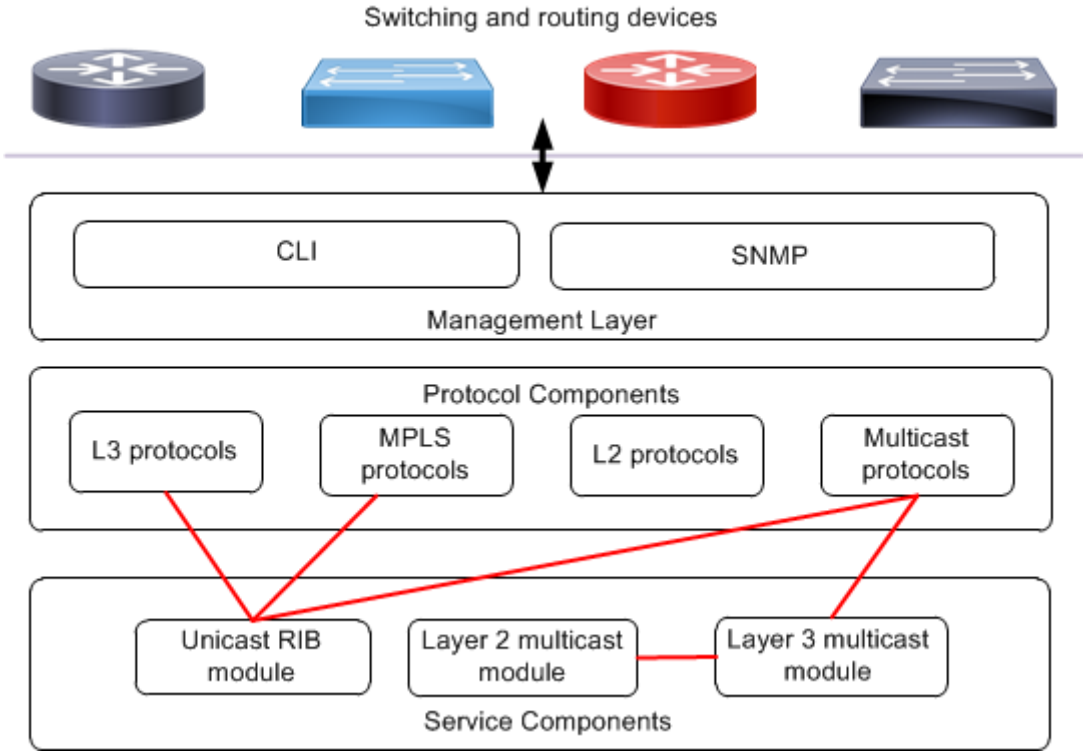

Figure 1-1: OcNOS high-level architecture

The major components of OcNOS are grouped into these categories:

- The Management Interface that is used to configure and operate the OcNOS routing and switching protocols.
- Protocol components, which include:
  - Layer 2 Protocols
  - Layer 3 Protocols
  - Multi Protocol Label Switching Protocols
  - Multicast Protocols
- Service components, which include:
  - Unicast Routing Information Base Module
  - Layer 2 Multicast Module
  - Layer 3 Multicast Module

Management Interface

OcNOS provides a comprehensive set of tools to manage, configure, and operate the routing and switching protocols.

The management interface includes:

- Command Line Interface
- Simple Network Management Protocol

Command Line Interface

The OcNOS command line interface (CLI) offers complete, unified management of OcNOS. Each command is usually associated with a specific task.

The IMI (Integrated Management Interface) shell is a interactive program for managing the OcNOS configuration. The IMI shell connects locally from the console of a device running OcNOS or remotely from a terminal emulator program such as `ssh` or `telnet`.

Through the IMI shell, a system administrator can configure and monitor all of the OcNOS protocols through one centralized connection. The IMI shell stores configuration data and offers extensive monitoring and logging capabilities.

The CLI can use the secure authentication methods of the operating system to manage and validate user names and passwords.

Note: The Linux `bash` shell can also be used to apply non-networking commands directly to the Linux system. However network-related commands such as `ifconfig`, `route`, `vconfig`, `iptunnel`, `brctl`, `ipmaddr`, or their iproute2 equivalents are not supported. The equivalent settings must be configured via the IMI shell in OcNOS.

Simple Network Management Protocol

The Simple Network Management Protocol (SNMP) provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework has three parts:

- SNMP manager: A system used to control and monitor the activities of network devices.
- SNMP agent: The component within a managed device that maintains the data for the device and reports data to SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables on the managed device which network management agents can extract from the OcNOS protocols for all standard defined MIBs.

OcNOS supports the AgentX (Agent Extensibility) protocol defined by RFC 2741 to communicate between the subagent and the master agent. As shown in Figure 1-2, an SNMP manager on the network sends query packets to gather status data. Each OcNOS protocol responds to these queries as defined by the corresponding MIB for the protocol.

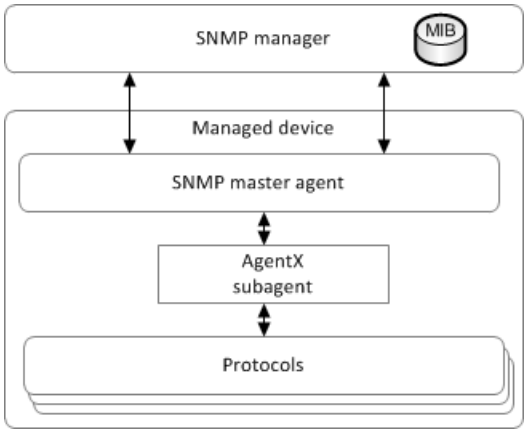

Figure 1-2: SNMP subagent

OcNOS can log both system events and errors.

For details about the MIBs that OcNOS supports, see the MIB compliance documents.

Layer 2 Protocols

OcNOS includes these Layer 2 features:

- Virtual Local Area Networks
- Spanning Tree
- Carrier Ethernet
- Link Aggregation (802.1AX)
- Multi-Chassis Link Aggregation

Virtual Local Area Networks

The VLAN modules offer consistent network-wide management tools to manage virtual LANs (Local Area Networks) and bridged VLANs:

- VLAN bridging divides a single physical LAN into two or more VLANs. Each VLAN is a collection of some of the LAN nodes grouped together to form individual broadcast domains.
- VLANs, in accordance with IEEE 802.1Q, enable multiple bridged LANs to transparently share the same physical network link without leaking information between LANs. Traffic between VLANs is restricted to bridges that forward unicast, multicast, or broadcast traffic only on the LAN segments that serve the VLAN to which the traffic belongs.

OcNOS VLAN modules make it easy to administer logical groups of stations that can communicate as if they were on the same LAN. They make it easier to manage a move, add, delete, or other updates to members of these groups.

The following highlights the features of the VLAN modules.

MAC Bridging (802.1d)

The OcNOS VLAN modules support all IEEE 802.1D LAN MAC (Media Access Control) protocols, shared media, and point-to-point LANs. MAC bridging allows multiple LANs to be connected together. MAC bridging filters data sent between LAN segments, reduces network congestion, and allows networks to be partitioned for administrative purposes.

Provider Bridging (802.1ad)

Provider Bridging (PB) enables a service provider to use the architecture and protocols of 802.1Q to offer the equivalent of separate Local Area Networks (LANs), bridged LANs, or virtual bridged LANs to multiple customers. Provider bridging requires no active cooperation between customers and requires minimal cooperation between an individual customers and the service provider.

When VLANs were originally defined in the 802.1Q, the number of unique VLAN identifiers was limited to 4096. In large provider networks, each subscriber needs a separate address, thus this limit could prevent a provider from having more than 4096 subscribers.

To overcome the 4096 VLAN identifier limit, the frame format for 802.1ad inserts an additional VLAN header into a single 802.1Q Ethernet frame. There are two types of VLAN headers:

- The C-VLAN or inner header which is closest to the payload portion of the frame identifies the customer VLAN
- The S-VLAN or outer header which is closest to the Ethernet header identifier the provider VLAN

The frame format for 802.1ad is also called “Q-in-Q” or “double tagged”.

With the two VLAN identifiers in combination for each provider-customer pair, it is possible to define up to 16,777,216 labels.

VLAN Prioritization (802.1p/Q)

OcNOS includes priority signaling for traffic at the data-link layer. IEEE 802.1Q specifies a priority value of between 0 and 7 inclusive that can be used by QoS (Quality of Service) disciplines to differentiate traffic. Although this technique is often called “802.1p”, there is no standard by that name published by the IEEE. Instead, the technique is now incorporated into 802.1Q standard.

Spanning Tree

The OcNOS Spanning Tree support are a combination of these modules:

- Spanning Tree Protocol (STP)
- Rapid Spanning Tree Protocol (RSTP)
- Multiple Spanning Tree Protocol (MSTP)

The following highlights the features of the Spanning Tree Protocol modules.

Note: All OcNOS spanning tree modules support 802.3x flow control, broadcast storm recovery, and port mirroring.

Spanning Tree Protocol (802.1d)

The OcNOS Spanning Tree Protocol (STP) module creates spanning trees within mesh networks of Layer 2 connected bridges, disabling any links that are not a part of the tree and leaving a single active connection between any two unique network nodes.

STP devices exchange BPDU (bridge protocol data unit) messages. The Spanning Tree Algorithm calculates the best path and prevents multiple paths between network segments. STP elects a root bridge, finds paths and determines the least cost path to the root bridge, then disables all other paths.

Network architects can design a topology that uses redundant links as automatic backup paths in the case of active link failure. Automatic backup takes place without the pitfalls of bridge loops, or the need to manually enable or disable backup links.

Rapid Spanning Tree Protocol (802.1w)

The Rapid Spanning Tree Protocol (RSTP) accelerates the re-configuration and restoration of a spanning tree after a link failure.

Multiple Spanning Tree Protocol (802.1s)

The Multiple Spanning Tree Protocol (MSTP) is a supplement to the IEEE 802.1ad standard. MSTP allows VLAN bridges to use multiple spanning trees, by providing the ability for traffic belonging to different VLANs to flow over potentially different paths within the virtual bridged LAN.

Carrier Ethernet

OcNOS offers a comprehensive set of Carrier Ethernet (CE) protocols from the IETF and IEEE.

Provider network operators can also benefit from Provider Bridging (802.1ad).

Link Level Discovery Protocol (802.1AB)

Link Layer Discovery Protocol (LLDP) is an agent running on an IEEE 802.1 bridge that provides a mechanism for all the bridges connected to the LAN to send and receive connectivity and management related information to each other.

Link Aggregation (802.1AX)

The link aggregation module allows one or more links to be aggregated together to form a Link Aggregation Group (LAG), such that a MAC client can treat the Link Aggregation Group as if it were a single link. The Link Aggregation Control Protocol (LACP) allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The system treats the aggregated interface as a single interface. When there is a failure in one physical interface, the remaining interfaces stay up, so there is no data traffic disruption. Link aggregation is defined in IEEE 802.1AX.

Multi-Chassis Link Aggregation

In data centers, spanning tree protocols like STP, RSTP, and MSTP create a loop-free topology that results in under-utilized physical links as well as redundant links between nodes that are in discarding state. As a result, more than 50% of the physical links are blocking. Link Aggregation (802.1AX) binds multiple physical links in a node into a single logical link, thereby increasing bandwidth and providing link-level redundancy. As a result, physical link utilization improves. However, a node failure in the network causes complete traffic loss as link aggregation does not provide any node-level redundancy.

The OcNOS implementation of multi-chassis link aggregation (MC-LAG) extends the link aggregation concept to ensure that connectivity between two networks can be maintained despite the failure of a node. MC-LAG provides node-level redundancy by allowing two or more nodes in the network to share a common LAG endpoint. MC-LAG emulates multiple nodes to represent a single logical node to the remote node running link aggregation. Even if one of the nodes is down, there exists a path to reach the destination via other nodes. MC-LAG allows you to use all interconnects in an active/active mode.

As shown in Figure 1-3, switch 2 and switch 3 share a common endpoint in switch 1. Switches 2 and 3 are a single logical node to switch 1. Even if switch 2 or switch 3 is down, there exists a path from switch 1 to reach other destinations. Switch 2 and switch 3 also share a common endpoint in switch 4.

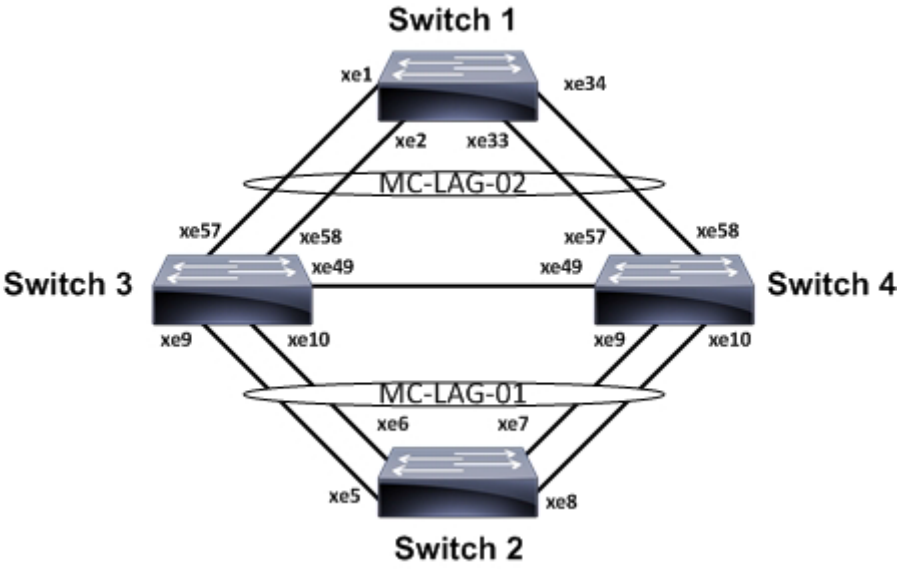

Figure 1-3: MC-LAG switching topology

With MC-LAG, at either one or both ends of a link aggregation group, a single aggregation system is replaced by a *portal* that is a collection of one to three portal systems. In Figure 1-3, switches 1, 2, and 3 are a portal system, each with physical links that together make up a link aggregation group. The portal's systems cooperate to emulate the presence of a single aggregation system to which the entire link aggregation group is attached. Switches 2, 3, and 4 are also a portal system.

MC-LAG is also called MLAG.

Layer 3 Protocols

OcNOS supports these IP protocols:

- Border Gateway Protocol
- Open Shortest Path First
- Intermediate System to Intermediate System
- Virtual Router Redundancy Protocol
- Bidirectional Forwarding Detection

In addition to the standard Layer 3 routing protocols, OcNOS offers:

- Virtual Routing and Forwarding (VRF) support
- Constrained Shortest Path First (CSPF) topology support for the Open Shortest Path First (OSPF) and Intermediate System-to-Intermediate System (IS-IS) protocols

Unicast Routing Information Base Module

OcNOS maintains a central unicast Routing Information Base (RIB). A RIB is a data structure stored in a network device that lists the routes to particular network destinations and metrics (distances) associated with those routes. A RIB contains information about the topology of the network immediately around it. Maintaining a RIB by discovering network topology is the primary purpose of dynamic routing protocols such as BGP and OSPF. Static fixed routes are added to a RIB by commands. (A RIB is also called a routing table.)

A Forwarding Information Base (FIB) is used to find the proper interface to which an input interface should forward a packet. In contrast to RIBs, FIBs are optimized for fast lookup of destination addresses. (A FIB is also called a forwarding table.)

Protocol modules create their own routes and communicate this protocol-specific information to the unicast RIB. The OcNOS unicast RIB contains all routing information received from routing peers, for example, destination prefix, nexthop information, and distance.

Figure 1-4 shows how the Layer 3 protocols and the unicast RIB communicate.

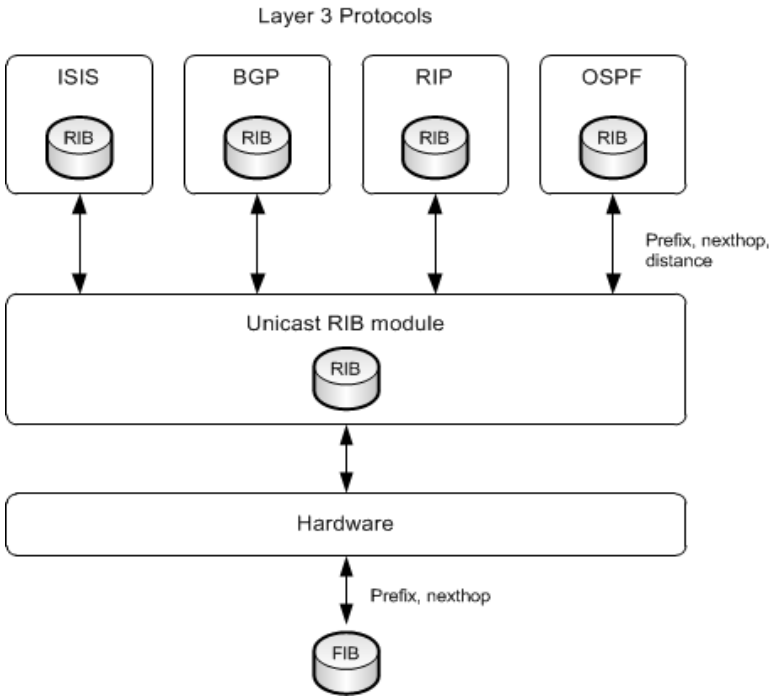

Figure 1-4: Protocol, unicast RIB, and kernel interaction

The unicast RIB performs these operations:

- Communicate with OcNOS routing and switching modules to get routing information updates
- Provide configuration for static routes
- Process the routing information and maintain all the received routes from clients as part of the RIB
- Maintain the FIB
- Process the routes and select the FIB route and program the kernel
- Redistribute routes
- Handle interface up and down events

For every known prefix, OcNOS maintains a route node entry in its RIB. OcNOS populates this table upon receiving routes from:

- Protocols such as BGP and OSPF
- Static routes configured using commands
- The kernel FIB
- Connected routes derived from interface information

Routing protocols use different metrics to calculate the best path for a destination.The best path is sent to the RIB.

Border Gateway Protocol

Border Gateway Protocol (BGP) is a core exterior gateway protocol (EGP) used on the Internet. BGP maintains a table of IP networks, or prefixes, which designate network reachability among Autonomous Systems (AS). BGP is a path-vector protocol that makes routing decisions based on path, network policies, and/or rule sets.

OcNOS supports BGP version 4 and offers VPN extensions for MPLS-VPN support. The VPN extensions work with MPLS-LDP and RSVP.

OcNOS BGP features include:

- IPv4 support
- Route Reflection
- Route Refresh
- Community Attributes
- Community Attributes in Multi-Home Routing
- Extended Communities
- Protection of BGP Session via the TCP MD5 Signature Option
- Capabilities Advertisement
- Route Flap Damping
- E-BGP Multi hop
- Stateful implementation
- Multi-protocol BGP (MP-BGP) extensions
- BGP/MPLS VPNs
- Graceful restart
- BGP Inter-Domain Routing (IDR):
    - Virtual Routing and Forwarding Support
    - Full MIB support

Open Shortest Path First

Open Shortest Path First (OSPF) is a link-state routing protocol that runs internally on a single autonomous IPv4 system. Each router designated to run OSPF maintains an identical database only within area. From this database, a routing table is calculated by constructing a shortest-path tree.

OcNOS OSPF features include:

- Opaque Link State Attributes (LSA)
- Link State Attributes (LSA) - Throttling
- Link Local Signaling
- Multiple Instance Support
- Intra- and inter-area routing
- Type 1/2 external routing
- Opaque link state availability (LSA) Option
- Manual and automatic virtual links
- Broadcast, point-to-point and point-to-multi-point models, NBMA network

- MD5 authentication
- Incremental SPF
- Traffic Engineering extensions
- Virtual Routing (VR) and Virtual Routing and Forwarding (VRF) support
- Graceful restart
- Virtual Private Network (VPN) support
- Constrained Shortest Path (CSPF) support
- Full MIB support

Intermediate System to Intermediate System

Intermediate System-to-Intermediate-System (IS-IS) is a link-state routing protocol that runs internally on a single autonomous system. IS-IS routers maintain identical databases that describe the autonomous system's topology. A routing table is calculated from the database by constructing a shortest-path tree.

OcNOS IS-IS features includes:

- Use of OSI IS-IS for Routing in TCP/IP
- Three-Way Handshake for Intermediate System to Intermediate System (IS-IS) Point-to-Point Adjacencies
- IS-IS Exponential Back-off of SPF
- IS-IS external routes redistribution
- BFD over IS-IS (v4)
- Full MIB support

Virtual Router Redundancy Protocol

The Virtual Router Redundancy Protocol (VRRP) allows a virtual router composed of two or more routers on the same subnet to prevent failure by providing at least one standby virtual router if the master virtual router fails. VRRP eliminates the single point of failure most common in a static default routed environment.

In OcNOS, the VRRP module functions are to:

- Bring up or down VRRP sessions in the respective VR mode
- Create and delete VRRP sessions dynamically
- Transmit and receive VRRP packets to and from the virtual-router peers based on the time-out value or the current state of the VRRP router

VRRP specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. The VRRP router controlling the IP addresses associated with a virtual router is called the master, and it forwards packets sent to these IP addresses. The election process manages dynamic fail-over in the forwarding responsibility should the master become unavailable. Any of the virtual router's IP addresses on a LAN can then be used as the default first-hop router by end-hosts. The advantage of using VRRP is a higher availability default path without requiring configuration of dynamic routing or router discovery protocols on every end-host.

OcNOS supports VRRP as specified in RFC 5798.

Bidirectional Forwarding Detection

Bidirectional Forwarding Detection (BFD) reduces the reliance upon the relatively slow Hello mechanism in routing protocols to detect failures where no hardware signaling is available to assist. BFD works with BGP, OSPFv2, and IS-

IS to enable them to configure BFD sessions, and for the sessions to receive the bidirectional forwarding failure notifications.

BFD provides the following features:

- A single mechanism to detect liveliness over any media and in any protocol layer
- Rapid detection of communication failures between adjacent systems to quickly establish alternative paths
- Passive, Active, Synchronous, Asynchronous, and Demand modes of operation
- Improved system performance when faster detection is required, because data-plane reachability detection is detached from control-plane functionality
- OcNOS protocol modules support BFD irrespective of where BFD packet-sending operations take place: in the interfaces, data links, or to some extent, in the forwarding engines themselves
- BFD is Graceful-Restart unaware: whenever BFD timers expire, a session-down event is triggered to the protocol module, and BFD maintains sessions for the protocol while it undergoes Graceful Restart
- A fast mechanism to detect liveliness of static next-hops

Multicast Protocols

OcNOS provides these multicast protocols:

- Layer 2 Multicast Module
- Layer 3 Multicast Module
- Protocol-Independent Multicast Module

Layer 2 Multicast Module

Multicast packets are transmitted to a specific multicast address that represents a group of receivers that want to receive the packets. Through the Internet Group Management Protocol (IGMP), a host receiver can join and leave a multicast group.

IGMP snooping is the ability to passively listen for IGMP packets to learn IPv4 multicast group membership information. With IGMP snooping, multicast traffic for a group is only forwarded to ports that have members in that group. OcNOS supports IGMP snooping functionality for IGMP versions 1, 2, and 3.

Layer 3 Multicast Module

The multicast protocols communicate with the Layer 3 multicast module which communicates with the multicast forwarder. A common multicast routing information base allows multiple multicast protocols to function simultaneously.

Figure 1-5 shows the Layer 3 multicast architecture of OcNOS. The Layer 3 multicast module holds the multicast RIB and consolidates the routes from multicast routing protocols such as Protocol-Independent Multicast Module and Multi Protocol Label Switching Protocols and installs them in the multicast FIB.

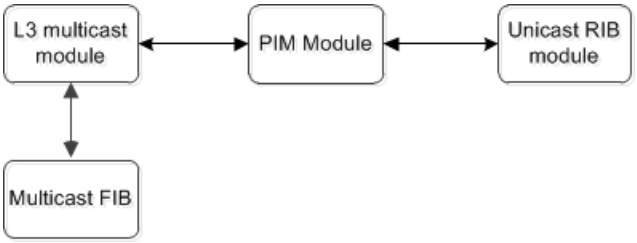

Figure 1-5: Layer 3 multicast architecture

Protocol-Independent Multicast Module

Protocol-Independent Multicast (PIM) is a family of multicast routing protocols for IP networks that provides one-to-many and many-to-many distribution of data over a network. PIM is termed *protocol-independent* because it does not have its own topology discovery mechanism, but instead uses routing information supplied by other routing protocols.

OcNOS support these variants of PIM:

- PIM Sparse Mode (PIM-SM: RFC 4601) efficiently establishes distribution trees across wide area networks (WANs) by routing packets to multicast groups. PIM-SM constructs a tree from each sender to the receivers in a multicast group and packets from the sender follow the tree to interested recipients. PIM-SM is for situations where multicast groups are thinly populated across a large region. Although it can operate in LAN environments, it is most efficient in WAN environments.
- PIM Source-Specific Multicast (PIM-SSM: RFC 3569) is a subset of PIM-SM that allows deployment of SSM in a network with hosts that do not support IGMP version 3. PIM-SSM builds trees that are rooted in just one source, offering a more secure and scalable model for a limited amount of applications (mostly broadcasting of content). In PIM-SSM, an IP datagram is transmitted by a source S to an PIM-SSM destination address G, and receivers can receive this datagram by subscribing to channel (S,G).

PIM features include:

- Any Cast RP
- Bootstrap router
- PIM border

Multi Protocol Label Switching Protocols

Multi-Protocol Label Switching (MPLS) operates at a layer operated between traditional definitions of Layer 2 (data link layer) and Layer 3 (network layer). The MPLS modules support enterprise, edge, and core applications.

The OcNOS MPLS module supports the following protocols and features:

- Resource Reservation Protocol-Traffic Engineering
- Label Distribution Protocol
- Layer 2 Virtual Private Network
- Layer 3 Virtual Private Network

Figure 1-6 shows the MPLS high-level architecture.

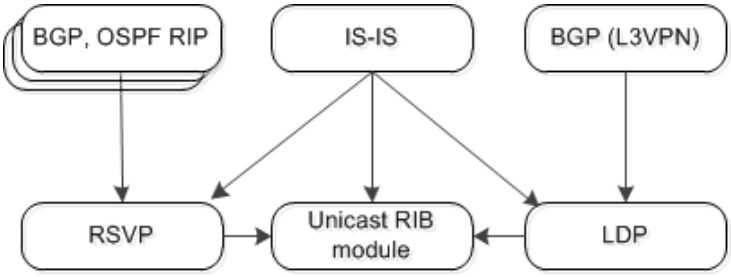

Figure 1-6: MPLS High Level Architecture

Resource Reservation Protocol-Traffic Engineering

Resource ReSerVation Protocol-Traffic Engineering (RSVP-TE) communicates with the QoS module to:

- Find if the requested bandwidth is available
- Reserve bandwidth for an LSP
- Release a reserved resource

Label Distribution Protocol

With the Label Distribution Protocol (LDP), two label-switched routers (LSR) exchange label mapping information. The two LSRs are called LDP peers and the exchange of information is bi-directional. LDP is used to build and maintain databases of LSRs that are used to forward traffic through MPLS networks.

LDP works with other routing protocols (such as OSPF and BGP) to create the LSPs used when forwarding packets. An LSP is the path taken by all packets that belong to the Forwarding Equivalence Class (FEC) corresponding to that LSP. In this way, LDP assigns labels to every destination address and destination prefix provided in the OcNOS RIB.

LDP also establishes sessions between non-directly connected peers (targeted LDP).

Layer 2 Virtual Private Network

OcNOS offers MPLS Layer 2 Virtual Private Network (VPN) and Virtual Private LAN Service (VPLS) protocol modules that enhance MPLS by providing transparent LAN access between VPN sites. The VPN infrastructure for the Provider Edge (PE) uses the IP routing, traffic engineering, and MPLS switching features of OcNOS.

Layer 2 VPN connectivity can be implemented by either VPWS (Virtual Private Wire Service) or Virtual Private LAN Service (VPLS):

- VPWS can be only used when interconnecting two sites
- VPLS provides multi-site connectivity and therefore is more flexible

VPLS provides an end-to-end connection over an MPLS tunnel, using a combination of LDP and/or BGP for peer discovery and signaling. Virtual Circuits (VC) create point-to-point VPN connections.

Layer 3 Virtual Private Network

The MPLS Layer 3 VPN is a Provider Edge (PE) technology for service provider VPN solutions. It uses BGP to advertise VPN routes and uses MPLS to forward VPN packets on service provider backbones. A Customer Edge (CE) device first establishes adjacency with a directly connected PE and advertises its VPN routes to the PE and learns remote VPN routes from that PE. A CE and a PE use BGP/IGP to exchange routing information

OcNOS supports BGP-MPLS VPNs for IPv4. Payload data packets are tunneled through the backbone, so that core routers are unaware of IPv4 VPN routes. BGP allocates the labels for these prefixes and then informs its peer about these labels. BGP then installs the labels in the data plane and maps the VPN prefix to the underlying MPLS tunnel. Data traffic is encapsulated with BGP labels and sent on the MPLS tunnel.

System Management

The system management module supports these host protocols:

- Authentication, Authorization, and Accounting
- Dynamic Host Configuration Protocol Client
- Dynamic Host Configuration Protocol Relay
- Domain Name System
- Network Time Protocol
- Remote Authentication Dial In User Service
- Secure Shell
- Simple Network Management Protocol
- Syslog
- Telnet
- User Roles

Authentication, Authorization, and Accounting

The authentication, authorization, and accounting (AAA) commands provide these functions:

- *Authentication* identifies users by asking them to provide a user name and password. This information can be encrypted if required, depending on the underlying protocol.
- *Authorization* provides a method of authorizing commands and services on a per user profile basis.
- *Accounting* collects detailed system and command information and stores it on a central server where it can be used for security and quality assurance purposes.

The AAA feature allows you to verify the identity of, grant access to, and track the actions of users managing devices. The AAA feature works with Remote Authentication Dial In User Service.

Dynamic Host Configuration Protocol Client

The Dynamic Host Configuration Protocol (DHCP) client is used to configure devices that are connected to a network so they can communicate on that network using the Internet Protocol (IP). DHCP is implemented in a client-server model where DHCP clients request configuration data, such as an IP address, a default route, or DNS server addresses from a DHCP server.

Dynamic Host Configuration Protocol Relay

DHCP relay allows DHCP clients to communicate directly with DHCP servers in small networks with only one IP subnet. To allow DHCP clients on subnets not directly served by DHCP servers to communicate with DHCP servers, DHCP relay agents can be installed on these subnets. The DHCP client broadcasts on the local link and the relay

agent receives the broadcast and transmits it to one or more DHCP servers using unicast. The DHCP server replies to the client and the relay agent then retransmits the response on the local network.

Domain Name System

The Domain Name System (DNS) translates easily-to-remember domain names into numeric IP addresses needed to locate computer services and devices. By providing a worldwide, distributed keyword-based redirection service, DNS is an essential component of the Internet.

Network Time Protocol

The Network Time Protocol (NTP) synchronizes computer clock times in a network of computers. NTP uses Coordinated Universal Time (UTC) to synchronize computer clock times to a millisecond, and sometimes to a fraction of a millisecond.

Remote Authentication Dial In User Service

Remote Authentication Dial In User Service (RADIUS) provides centralized Authentication, Authorization, and Accounting management for users that connect to and use a network service. RADIUS is specified in RFC 2865.

Secure Shell

Secure Shell (SSH) is a cryptographic protocol for secure data communication, remote login, remote command execution, and other secure network services between two networked computers.

Simple Network Management Protocol

In SNMP, administration groups are known as *communities*. SNMP communities consist of one agent and one or more SNMP managers. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated and /or encrypted.

SNMP is defined in RFCs 3411-3418.

Syslog

Linux applications use the `syslog` utility to collect, identify, time-stamp, filter, store, alert, and forward logging data. The `syslog` utility can track and log all manner of system messages from informational to extremely critical. Each system message sent to a `syslog` server has two descriptive labels associated with it:

- The function (facility) of the application that generated it. For example, applications such as `mail` and `cron` generate messages with facilities named mail and cron.
- Eight degrees of severity (numbered 0-7) of the message.

Telnet

Telnet is a client/server protocol that establishes a session between a user terminal and a remote host:

- The telnet client software takes input from the user and sends it to the server's operating system
- The telnet server takes output from the host and sends it to the client to display to the user

While telnet is most often used to implement remote login capability, the protocol is general enough to allow it to be used for a variety of functions.

User Roles

OcNOS provides four user roles:

- Network Administrator: all access permission to make permanent changes to the switch configuration. Changes are persistent across reset/reboot of switch.
- Network Engineer: all access permission to make permanent changes to the switch configuration. Changes are persistent across reset/reboot of switch. The `start-shell` and `hw-shell` commands are blocked for this role.
- Network Operator: all access permission to make permanent changes to the switch configuration. Changes are not persistent across reset/reboot of switch.
- Network User: access permission to display information, but cannot modify any existing configuration.

Virtual Extensible Local Area Network

Virtual extensible LAN (VxLAN) interconnects Layer 2 networks using VxLAN tunnel end points (VTEPs) and a Layer 3 tunnel (segment). A VTEP has an IP address and interacts with a local LAN segment and an IP transport network. A VTEP can be a hypervisor, top-of-rack (TOR) switch, or a gateway. VxLAN can run between VTEPs within a data center or can interconnect different data centers. VxLAN labels Layer 2 segments with a network identifier (VNID) which provides up to 16 million tunnels in the same administrative domain.

VxLAN creates LAN segments using MAC Address-in-User Datagram Protocol (MAC-in-UDP) encapsulation.

Figure 1-7 shows VLANs 32 and 47 connected by a VxLAN tunnel named VNID 82.VTEP-14 routes packets from VLAN 32 to the transport network based on the IP address of VTEP-37. VTEP-37 receives the packets, strips the outer headers, and forwards the packets to a host identified by the destination MAC address on VLAN 47.

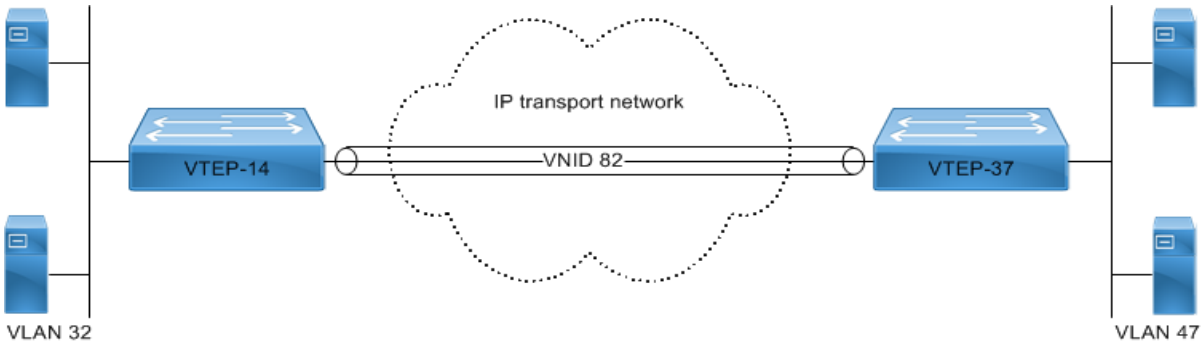

Figure 1-7: VxLAN High-level Architecture

VxLAN EVPN using MP-BGP

OcNOS supports VxLAN EVPN (Ethernet Virtual Private Network) using MP-BGP where the virtual machine MAC address learning happens in the control plane using MP-BGP and not in the data plane. This allows dynamic learning and provisioning of tunnels and hosts. BGP route reflectors can be deployed on the carrier backbone network. All provider edge devices maintain a peer relationship with the BGP route reflectors. The route reflectors distribute the EVPN routes.

SECTION 2 System Management

System Management Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 User Configuration

Overview

User management is an authentication feature that provides administrators with the ability to identify and control the users who log into the network.

OcNOS provides 4 different roles for users.

- Network Administrator: can make permanent changes to switch configuration. Changes are persistent across reset/reboot of switch.
- Network Engineer: can make permanent changes to switch configuration. Changes are persistent across reset/reboot of switch.
- Network Operator: can make permanent changes to switch configuration. Changes are not persistent across reset/reboot of switch.
- Network User: displays information; cannot modify configuration.

User Configuration

`#configure terminal`	Enter configure mode.
`(config)#username user1 password user12345`	Create Username “user1” with password user12345 which will have default role as network-user. Password should be <8-32> char, username <2-15>char.
`(config)#username user1 role network-operator password user12345`	Changing the role for user1 to network-operator. Password should be <8-32> char, username <2-15>char.
`(config)#username user2 role network-operator password user12345`	Create a user “user2” with role as network-operator. Password should be <8-32> char, username <2-15>char.
`(config)#username user3 role network-admin password user12345`	Create a user “user3” with role as network-admin. Password should be <8-32> char, username <2-15>char.
`(config)#username user4 role network-engineer password user12345`	Create a user “user4” with role as network-engineer. Password should be <8-32> char, username <2-15>char.
`(config)#exit`	Exit configure mode.

Validation

show user-account, show user-account <username>, show role

```
#show user-account
User:user1
                roles: network-operator
User:user2
                roles: network-operator
User:user3
                roles: network-admin
User:user4
                roles: network-engineer
```

```
#show role
Role Name                                Info
------------------------------------------------------------------------
network-admin          Network Administrator - Have all permissions
network-engineer       Network Engineer - Can save configuration
network-operator       Network Operator - Can not save configuration
network-user           Network User - Can not change configuration
rbac-customized-role   RBAC User - Can change only  permitted configuration

#show user-account user1
User:user1
                roles: network-operator
```

CHAPTER 2 Using the Management Interface

Overview

OcNOS provides support for different types of Management Interfaces. The management interface can be the standard out of band (OOB) port, or any in-band port.

To provide segregation between management traffic and data traffic, OcNOS provides a Management VRF. The Management VRF is created by default when OcNOS boots. This VRF cannot be deleted. All ports used as Management Interface needs to be in Management VRF. The management VRF is used for all types of Management applications listed below

- Remote access to router (SSH/Telnet)
- File transfer applications (SFTP/SCP)
- Login Authentication via Radius/Tacacs
- Network management protocols (SNMP, Netconf)

Apart from this, DHCP, DNS, NTP, Syslog, License/Software upgrade also uses ports mapped to management VRF for their operations. Also LLDP protocol can be run on any ports mapped to this Management VRF.

Note: If the management interface flaps, the device becomes unreachable.

Management Port

The Out of Band (OOB) Management Port in OcNOS is identified as “eth0.” This port is automatically mapped to the Management VRF when OcNOS boots, and will remain in same VRF throughout. It cannot be moved out of this VRF.

The IP address of the management port can be configured statically or via DHCP.

Static IP Configuration

A static IP can be configured on the management port during ONIE installation itself, or after installation using the OcNOS CLIs commands. To configure a static IP during ONIE installation, do the following

```
#onie-discovery-stop
#ifconfig eth0 <ip address> netmask <subnet mask> up
```

Please check the Install Guide for details.

The IP address configured during ONIE installation will be applied to the management port and the same will be retained when OcNOS boot up, and the port becomes part of Management VRF.

```
#show running-config interface eth0
!
interface eth0
 ip vrf forwarding management
 ip address 10.12.44.109/24
```

After getting the OcNOS prompt, this IP address can be changed from the CLI.

`#configure terminal`	Enter configure mode
`(config)#interface eth0`	Enter interface mode
`(config-if)#ip address 10.12.44.120/24`	Assign an IPv4 address to the interface
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit configure mode

If a static IP is not configured during ONIE installation the same can be configured via CLI by following the above steps. Using the OcNOS CLI, DHCP can also be enabled on the Management port.

`#configure terminal`	Enter configure mode
`(config)#interface eth0`	Enter interface mode
`(config-if)#ip address dhcp`	Enable DHCP on interface
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit configure mode

Obtaining IP Address via DHCP

During onie installation, the management port attempts to acquire IP address via DHCP automatically unless stopped explicitly using “onie-discovery-stop”. So, if management port is getting IP via DHCP, after OcNOS boots, the management port will continue to use DHCP, even when it is part of the Management VRF.

```
#show running-config interface eth0
!
interface eth0
 ip vrf forwarding management
 ip address dhcp
```

After OcNOS boots, the IP address can be changed to any static IP from the command line as shown earlier.

In-Band Ports

Any front-end ports of the device (in-band ports) can be made part of the management VRF. Once they are part of the management VRF they can also support all management applications such as SSH/Telnet and others as listed in Overview.

Once the ports are part of the management VRF, they should not be used for data traffic and routing or switching purposes. In-band ports can be added or removed from Management VRF as and when required.

`#configure terminal`	Enter configure mode
`(config)#interface xe1/1`	Enter interface mode
`(config-if)#ip vrf forwarding management`	Add in-band port to Management VRF
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit configure mode

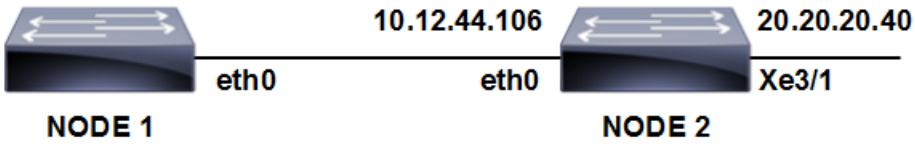
`#configure terminal`	Enter configure mode
`(config)#interface xe1/1`	Enter interface mode

`(config-if)# no ip vrf forwarding management`	Remove in-band port from Management VRF
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit configure mode

Using Ping in Management VRF

To check reachability to any node in the management network, you need to explicitly mention the VRF name as “management.”

In the following example, Node-1 has management interface eth0 and Node-2 has management interfaces eth0 and xe3/1. In order to reach the network 20.20.20.40/24 from Node-1 a static route needs to added.



`#configure terminal`	Enter configure mode
`(config)# ip route vrf management 20.20.20.0/24 10.12.44.106 eth0`	Add static route in management VRF to reach 20.20.20.0/24 network
`(config)#exit`	Exit configure mode

```
Node-1#show ip route vrf management
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "management"
C       10.12.44.0/24 is directly connected, eth0
S       20.20.20.0/24 [1/0] via 10.12.44.106, eth0

Gateway of last resort is not set

Node-1#ping 20.20.20.40 vrf management
PING 20.20.20.40 (20.20.20.40) 56(84) bytes of data.
64 bytes from 20.20.20.40: icmp_seq=1 ttl=64 time=0.494 ms
64 bytes from 20.20.20.40: icmp_seq=2 ttl=64 time=0.476 ms
```

CHAPTER 3 SSH Client Server Configuration

Overview

SSH is a network protocol that allows data to be exchanged using a secure channel between two networked devices. SSH was designed as a replacement for Telnet and other insecure remote shells, which send information, notably passwords, in plain text, rendering them susceptible to packet analysis.[2] The encryption used by SSH is intended to provide confidentiality and integrity of data over an unsecured network, such as the Internet. SSH uses public-key cryptography to authenticate the remote computer and allow the remote computer to authenticate the user.

SSH is typically used to log into a remote machine and execute commands, but it also supports tunneling, forwarding TCP ports and X11 connections; it can transfer files using the associated SFTP or SCP protocols. SSH uses the client-server model

TCP port 22 is assigned for contacting SSH servers. This document covers the SSH server configuration to enable SSH service and key generation and SSH client configuration for remote login to server.

In-band Management over Default VRF

OcNOS supports SSH over the default and management VRFs via the in-band management interface and out-of-band management interfaces, respectively.

SSH can run on the default and management VRFs simultaneously. By default, it runs on the management VRF.

Topology

Figure 3-8: SSH sample topology

Basic Configuration

`#configure terminal`	Enter configure mode
`(config)#ssh login-attempts 2 vrf management`	Set the number of login attempts to 2
`(config)#exit`	Exit configure mode

Validation

```
#show ssh server
ssh server enabled port: 22
authentication-retries 2

#show running-config ssh server
feature ssh vrf management
ssh login-attempts 2 vrf management
```

SSH Client Session

When the device acts as an SSH client, it supports both SSH IPv4 sessions to log into the remote machine.

`#ssh root@10.10.10.1 vrf management`	Log into remote machine using an IPv4 address

SSH Keys

Use the ssh key command to generate new RSA/DSA keys for the SSH server. By default, the system has RSA/DSA public/private key pair placed in `/etc/ssh/`. If you want to regenerate RSA keys, you must specify the `force` option.

Configuration

`#configure terminal`	Enter configure mode.
`(config)#ssh key rsa force vrf management`	Specify the `force` option to regenerate SSH RSA keys
`(config)#exit`	Exit configure mode

Validation

```
#sh ssh key
****************RSA KEY********************

************************************
```

Note: The newly created rsa/dsa key can be verified by logging into the device from a remote machine and checking whether the newly created key's fingerprint matches with the logging session fingerprint.

SSH Encryption Cipher

Specify an SSH cipher to encrypt an SSH session. By default, all the ciphers are supported for a new SSH client to connect to the SSH server.

SSH supports these encryption algorithms:

- Advanced Encryption Standard Counter:
  - aes128-ctr
  - aes192-ctr
  - aes256-ctr
  - aes128-cbc
- Advanced Encryption Standard Cipher Block Chaining:
  - aes192-cbc
  - aes256-cbc
- Triple Data Encryption Standard Cipher Block Chaining:
  - 3des-cbc

Configuration

`#configure terminal`	Enter configure mode
`(config)#ssh server algorithm encryption aes128-ctr vrf management`	Set the SSH server encryption algorithm to AES 128 bit counter
`(config)#ssh server algorithm encryption aes128-cbc vrf management`	Set the SSH server encryption algorithm to AES 128 cipher block chaining
`(config)#exit`	Exit configure mode

Validation

The new cipher encryption algorithm takes effect for a new incoming ssh client connection.

```
#show running-config ssh server
feature ssh vrf management
ssh server algorithm encryption aes128-ctr aes128-cbc vrf management
```

SSH Client Session

`#ssh cipher aes128-ctr root@1.1.1.1 vrf management`	Specify AES 128-bit counter encryption to establish an SSH connection to a remote machine using an IPv4 address

SSH Key-Based Authentication

Enable OcNOS device SSH server to perform public key based SSH authentication, to enable machine to machine communication possible without requiring password. Public key based authentication increases the trust between two Linux servers for easy file synchronization or transfer. Public-key authentication with SSH is more secure than password authentication, as it provides much stronger identity checking through keys.

Topology

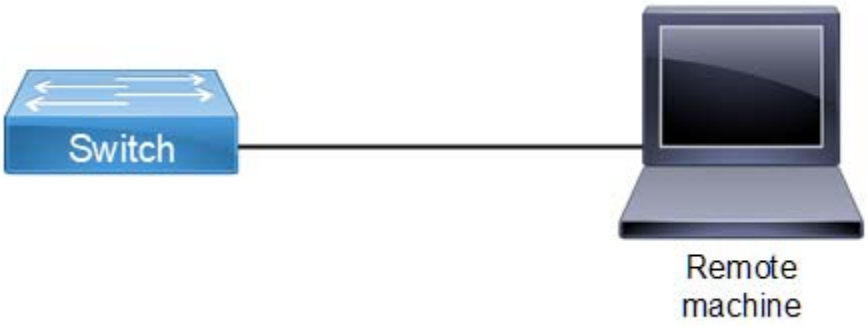

Figure 3-9: SSH Key-based authentication

Public Key Authentication Method

The server has the public key of the user stored; using this the server creates a random value, encrypts it with the public key and sends it to the user. If the user is who is supposed to be, he can decrypt the challenge using the private key and send it back to the server, server uses the public key again to decrypt received message to confirm the identity of the user. SSH is supported in-band (default VRF) and out of band (management VRF). Installed keys are stored in the `~/.ssh/authorized_keys` file.

SSH key based authentication steps:

1. Login to remote machine Linux desktop (ssh client) and generate the key pair using the `ssh-keygen` command.
2. Create the username in OcNOS device (ssh server).
3. Install the public key of remote Linux ssh client in the OcNOS device.
4. Display the installed key in the OcNOS device using the `show running-config` command.
5. Log in from the remote Linux ssh client to the OcNOS device without providing a password.

Useful Commands on Remote Desktop Client

`# ssh-keygen`	To generate key pair on remote Linux machine (ssh client)
`# cd /bob/.ssh/`	To go to the location of saved key pair
`# cat id_rsa.pub`	Command to display the generated public key in remote Linux client

Configuration commands in OcNOS

`#configure terminal`	Enter configure mode.
`#feature ssh vrf management`	Enable the SSH feature on vrf management. To enable in default vrf give the command "feature ssh"
`#username fred`	To create username with default role as network-user. To create user with different role specify role using command "username <username> role <role_name>
`#username fred sshkey AAAAB3NzaC1yc2EAAAADAQABAAABAQC8XhFiGlZP6yY6qIWUkew884NvqXqMPSOw3fQe5kgpXvX0SbcU15axI/VHVgU2Y0/ogAtRUlAk5soRrf5lZ2+rT0zNP37m+Tm5HIEFKZZut0FffGSuXtPKbE+GGlQYHEzC8RSnqQuHlxrlve3lGbB1UUxuWhMzJfgc2vZ78V2znd2zk4ygiN1jx1sE8UI98WyIcwuq44tzuIaUYAICIfrQJXriQml+QcJ9NER5O8rMS5D5NnTVh1nroqoozY8i/qMKfhCFMbysjiDMHU9GclNsNbIF/DQbvWEskFFEvf6fOrzXyvq26NpgaJnZ4pQVzgkOaVw16Cy3csoTncw0vyXV bob@localhost.localdomain`	Install the public key of remote Linux client in OcNOS device.
`#exit`	Exit configure mode.

Validation

The new cipher encryption algorithm takes effect for a new incoming ssh client connection.

```
#show running-config

<skipped other content>
feature ssh vrf management
username fred role network-user
username fred sshkey

```

SSH Key-based Client Session

`#ssh fred@10.10.26.186`	Specify user name and ip address to access the device. Supports IPv4 and IPv6.User should be able to access without password and through key based authentication

Restrictions

- Key generation or installation are not supported for "root" user account in OcNOS device.
- Third party SSH utilities cannot be used for key installation, rather OcNOS CLI is the only way to install public keys.

Sample Use Case

1. Login to remote machine linux desktop (ssh client) and generate the key pair using the `ssh-keygen` command.

```
[bob@localhost ~]# ssh-keygen
Generating public/private rsa key pair.
Enter file in which to save the key (/bob/.ssh/id_rsa):
/bob/.ssh/id_rsa already exists.
Overwrite (y/n)? y
Enter passphrase (empty for no passphrase):
Enter same passphrase again:
Your identification has been saved in /bob/.ssh/id_rsa.
Your public key has been saved in /bob/.ssh/id_rsa.pub.
The key fingerprint is:
b2:d0:cc:d2:dd:db:3d:05:c1:33:fc:4a:df:8e:85:af bob@localhost.localdomain
The key's randomart image is:
+--[ RSA 2048]----+
|             o.  |
|              =. |
|              .+ |
|     = . .    ...|
|    o * S .  . +o|
|     o o   o .o.+|
|      .   . . o= |

DQbvWEskFFEvf6fOrzXyvq26NpgaJnZ4pQVzgkOaVw16Cy3csoTncw0vyXV bob@localhost.localdomain
[bob@localhost .ssh]#
```

2. Create username in OcNOS switch device (ssh server)

```
(config)#username fred
```

Note: By default, the user role is `network-user`.

3. Install the public key of remote Linux ssh client in OcNOS device.

```
(config)#username fred sshkey
AAAAB3NzaC1yc2EAAAADAQABAAABAQC8XhFiGlZP6yY6qIWUkew884NvqXqMPSOw3fQe5kgpXvX0SbcU15axI/

DQbvWEskFFEvf6fOrzXyvq26NpgaJnZ4pQVzgkOaVw16Cy3csoTncw0vyXV bob@localhost.localdomain
<skipped other content>
```

5. Login from remote Linux ssh client to OcNOS device without providing password

```
[bob@localhost .ssh]# ssh fred@10.10.26.186
```

CHAPTER 4 Telnet Configuration

Overview

Telnet is a TCP/IP protocol used on the Internet and local area networks to provide a bidirectional interactive text-oriented communications facility using a virtual terminal connection. The Telnet program runs, connects it to a server on the network. A user can then enter commands through the Telnet program and they will be executed as if the user were entering them directly on the server console.Telnet enables users to control the server and communicate with other servers on the network. The default port number for Telnet protocol is 23.Telnet offers users the capability of running programs remotely and facilitates remote administration.

Support for In-band Management Over Default VRF

OcNOS supports Telnet over the default and management VRFs via in-band management interface and OOB management interface, respectively.

By default, Telnet runs on the management VRF.

Topology

Figure 4-10: Telnet topology

Enable and Disable the Telnet Server

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#exit`	Exit configure mode

Configure the Telnet Server Port

`#configure terminal`	Enter configure mode
`(config)#no feature telnet vrf management`	Disable Telnet feature
`(config)#telnet server port 6112 vrf management`	Set Telnet port to 61112
`(config)#feature telnet vrf management`	Enable Telnet feature
`(config)#exit`	Exit configure mode

Telnet Client Session

`#telnet 10.10.10.1 vrf management`	Log into remote machine using IPv4 address

Validation Commands

```
#show telnet server
telnet server enabled port: 6112

#show running-config telnet server
feature telnet
```

CHAPTER 5 Syslog Configuration

Syslog is a standard for logging program messages. It allows separation of the software that generates messages from the system that stores them and the software that reports and analyzes them. It also provides devices which would otherwise be unable to communicate, a means to notify administrators of problems or performance.

OcNOS supports logging messages to a syslog server in addition to logging to a file or the console (local or ssh/telnet console). OcNOS messages can be logged to a local syslog server (the machine on which OcNOS executes) as well as to one or more remote syslog servers. Remote syslog servers can either be configured with IPv4 addresses or host names.

Support for In-band management over default VRF

OcNOS supports syslog over the default and management VRFs via in-band management interface and OOB management interface, respectively.

By default, syslog runs on the management VRF.

Topology

Figure 5-11: Syslog sample topology

Enabling rsyslog

`#configure terminal`	Enter configure mode.
`config)#feature rsyslog [vrf management]`	Enable feature on default or management VRF. By default this feature runs on the management VRF.
`config)#exit`	Exit configure mode

Logging to a File

The below configurations shows how to enable debug logs for a particular protocol. In this case, OSPF is shown.

`#debug ospf all`	This enables the debugging on OSPF.
`#configure terminal`	Enter configure mode
`(config)#router ospf 1`	Enable OSPF process 1

(config-router)#exit	Exit router mode
(config)#feature rsyslog	Enable feature on default or management VRF. By default this feature runs on the management VRF.
(config)#logging level ospf 7	This enable debug messages for OSPF module. This is configurable either if default of management VRF.
(config)#logging logfile ospf1 7	This creates the log file where the logs will be saved. The path of the file will be in the directory /log/ospf1. Log File size 4096-4194304 bytes.
(config)#exit	Exit configure mode

To verify this, do some OSPF configuration and view the messages in the log file or with the `show logging logfile` command.

Validation Commands

```
    #show logging logfile

    pservd                  2                               2
```

Logging to Remote Server

`#configure terminal`	Enter configure mode.
`(config)#logging level bgp 7`	This enable debug messages for BGP module.
`(config)#logging server 10.16.2.1 vrf management`	Redirects the log messages to the server configured.
`(config)#debug bgp`	This enables the debugging on BGP configurations.
`(config)#router bgp 1`	Enabling BGP process 1.
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit configure mode.

Validation Commands

```
#show logging server
      Remote Servers:
                  10.16.2.1
                  severity: (debugging)
                  facility: local7
                  VRF: management

CHAPTER 6 DNS Configuration

Overview

The Domain Name System (DNS) is an Internet service that translates domain names into IP addresses. When a domain name is used, DNS service translates the name into the corresponding IP address. If one DNS server does not know how to translate a particular domain name, it gathers information from other Domain Name Systems to obtain the correct IP address.

Support for In-band Management over default VRF

OcNOS offers support for DNS over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can be enabled to run on default and management VRF simultaneously. By default, it runs on management VRF.

Topology

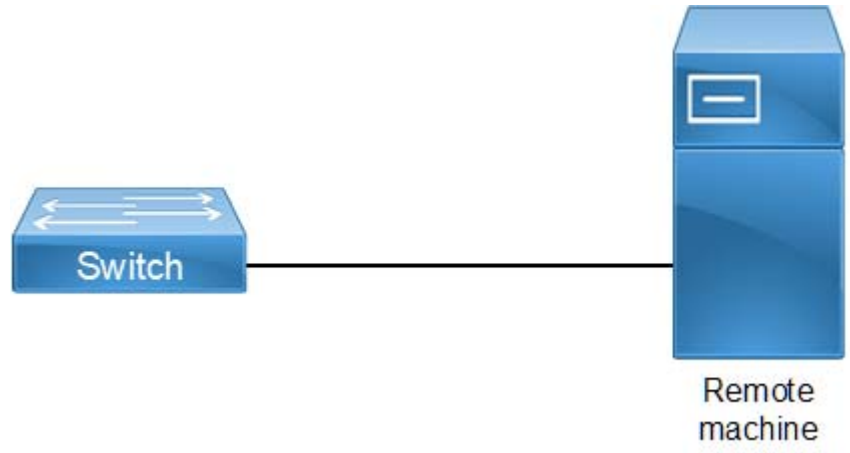

Figure 6-12: DNS sample topology

Configuration

`#configure terminal`	Enter Configure mode.
`(config)#ip name-server vrf management 10.12.17.11 10.1.1.2`	This add a IPv4 Name Server to the DNS.
`(config)#ip host BINGO vrf management 10.1.1.1`	This will add IPv4 host to the DNS
`(config)#exit`	Exit configure mode.

Validation Commands

```
#show hosts
```

```
         VRF: default

 DNS lookup is disabled
 Default domain is empty
 DNS domain list is empty

 Name Servers        : 10.12.17.11 10.1.1.2
Host                                                                Address

----                                                                -------

BINGO                                                               10.1.1.1

 * - Values assigned by DHCP Client.
```

CHAPTER 7 DHCP Client Configuration

Overview

Dynamic Host Configuration Protocol (DHCP) protocol is used for assigning dynamic IP addresses to systems on a network. Dynamic addressing allows a system to have an IP address each time it connects to the network. DHCP makes network administration easier by removing the need to manually assign a unique IP address every time a new system is added to the network. It is especially useful to manage mobile users. Once a system is configured to use DHCP, it can be automatically configured on any network that has a DHCP server.

DHCP uses a client-server model, in which the DHCP server centrally manages the IP addresses used in the network. DHCP clients obtain an IP address on lease from the DHCP server.

DHCP Client Configuration for IPv4

Before configuring the DHCP in client, make sure that DHCP server is ready and also dhcpd is running on the server machine.

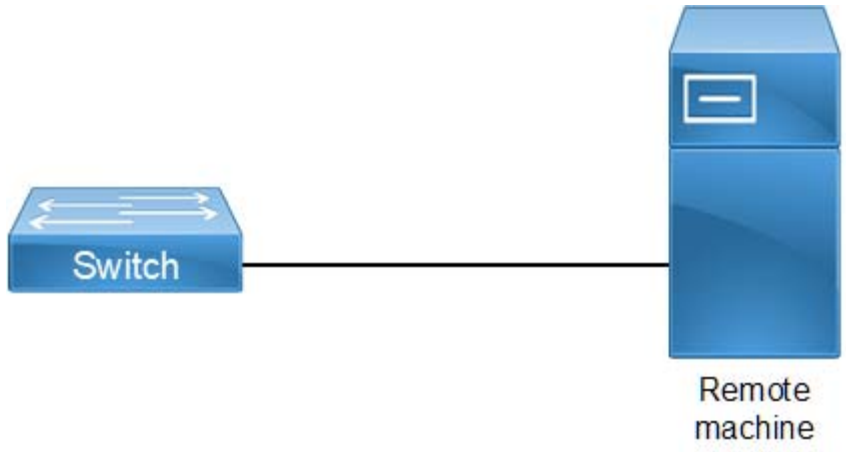

Figure 7-13: DHCP sample topology

`#configure terminal`	Enter Configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This will be enabled by default.
`(config)#interface xe1`	Specify the interface(xe1) to be configured and enter the interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the acknowledgment from the server, it assigns the IP address to the interface in which this command is enabled.
`(config if)#exit`	Exit interface mode.
`(config)#interface eth0`	Enter management interface mode.
`(config-if)#ip address dhcp`	The client requests for the IP address to the server, once it receives the Acknowledgement from the server, it assigns the IP address to the management interface.
`(config if)#exit`	Exit interface mode.

Validation Commands

```
#show running-config dhcp
    interface xe2
     ip address dhcp
    !
    ip dhcp relay information option

    #sh ip interface brief

    Interface           IP-Address     Admin-Status         Link-Status
    GMPLS Type
    eth0                10.12.44.20     up                  up
    -
    lo                  127.0.0.1       up                  up
    -
    lo.4                127.0.0.1       up                  up
    -
    vlan1.1             unassigned      up                  down
    -
    xe1/1               2.2.2.3         up                  up
    -
    xe1/2               unassigned      down                down
    -
    xe1/3               unassigned      down                down
    -
    xe1/4               unassigned      up                  down
    -
    xe2                *40.40.40.40     up                  down
    -
    xe3/1               20.20.30.1      up                  up
    -
```

CHAPTER 8 Software Monitoring and Reporting

Overview

OcNOS provides a mechanism (called “watchdogging”) to monitor all OcNOS modules and provides the following functions.

1. Periodic heart beat check.
2. Automatic restarts of a module upon a hung state or crash detection.
3. Upon hanging or crashing of a module, a crash report (including system states) is logged.
4. A proprietary SNMP trap is sent to the trap manager, if configured, after a fault is detected in a protocol module. Similarly a trap is sent when the module recovers.

By default, the software watchdog is enabled and the keep-alive time interval is 30 seconds. All OcNOS processes periodically send keep-alive messages to a monitoring module at the configured keep-alive time interval.

This functionality can be disabled for a particular module or all OcNOS modules by using CLI commands. In order to permanently disable software monitoring functionality, the user has to disable the watchdog feature. If, however, software watchdogging is disabled the monitoring module doesn’t take any action upon a hang or crash of any OcNOS module.

Software Monitoring

`#configure terminal`	Enter Configure mode.
`(config)#feature software-watchdog`	Enable software watchdog for all OcNOS modules — This is the default.
`(config)#no software-watchdog imi`	To disable software watchdog for only imi modules.
`(config)#software-watchdog keep-alive-time 100`	The keep-alive time interval in seconds. Default is 60 seconds and applies to all OcNOS modules.
`#show software-watchdog status`	Display the keep-alive time interval and list of OcNOS process names with watchdog status for each OcNOS modules.

Validation

```
#show software-watchdog status
Software Watchdog timeout in seconds : 100
Process name         Watchdog status
============         ===============

CHAPTER 9 TACACS Client Configuration

Overview

Terminal Access Controller Access Control System (TACACS) is a remote authentication protocol that is used to communicate with an authentication server. With TACACS, a network device communicates to an authentication server to determine whether a particular user should be allowed access to the device. TACACS+ listens at port 49.

TACACS Server Authentication

Figure 9-14: TACACS Server Host Configuration

Authenticating Device

`#configure terminal`	Enter configure mode.
`(config)#feature tacacs+ vrf management`	Enable the feature TACACS+ for management vrf
`(config)#feature tacacs+`	Enable the feature TACACS+. for default vrf
`(config)#tacacs-server login key testing101 vrf management`	Specify the global key for tacacs servers that are not configured with their respective keys for management vrf This key should match the one present in the config file of tacacs server
`(config)#tacacs-server login key testing101`	Specify the global key for tacacs servers that are not configured with their respective keys for default vrf This key should match the one present in the config file of tacacs server
`(config)#tacacs-server login host 10.16.19.2 vrf management key testing123`	Specify the tacacs server ipv4 address to be configured with shared key. The same key should be present on the server config file
`(config)#tacacs-server login host 10.16.19.2 key testing123`	Specify the tacacs server ipv4 address to be configured with shared local key for default vrf The same key should be present on the server config file.
`(config)#tacacs-server host 10.12.30.86 vrf management seq-num 2 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number.The tacacs server should be started with same port number
`config)#tacacs-server login host 10.12.30.86 seq-num 2 port 1045`	Specify the tacacs server ipv4 address to be configured with the sequence and port number for default vrf. The tacacs server should be started with same port number
`(config)#tacacs-server login host 10.12.17.11 vrf management seq-num 8 key 7 65535 port 65535`	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for management vrf. The tacacs server should be started with same port number.

`(config)#tacacs-server login host 10.12.17.11 seq-num 8 key 7 65535 port 65535`	Specify the tacacs server ipv4 address to be configured with the sequence, key and port number for default vrf. The tacacs server should be started with same port number.
`(config)#tacacs-server login host Tacacs-Server-1 vrf management seq-num 7 key 7 65535 port 65535`	Specify the tacacs server configured with host-name sequence number key and port number for management vrf. The tacacs server should be started with same port number
`(config)#tacacs-server login host Tacacs-Server-1 seq-num 7 key 7 65535 port 65535`	Specify the tacacs server configured with host-name sequence number key and port number for default vrf. The tacacs server should be started with same port number
`(config)#aaa authentication login default vrf management group tacacs+`	Enable authentication for TACACS+ server configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default group tacacs+`	Enable authentication for TACACS+ server configured for default vrf. Authorization is also enabled by default.
`(config)#aaa authentication login default vrf management group tacacs+ local`	Enable authentication for TACACS+ and fall-back to local configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group tacacs+ local none`	Enable authentication for TACACS+ fall-back to local followed by fall-back to none configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group tacacs+ none`	Enable authentication for TACACS+ fall-back to none configured for management vrf. Authorization is also enabled by default
`(config)#aaa authentication login default group tacacs+ none`	Enable authentication for TACACS+ fall-back to none , configured for default vrf. Authorization is also enabled by default
`(config)#aaa group server tacacs+ G1 vrf management`	Create aaa group G1 for management vrf
`(config-tacacs)#server 10.12.30.86 vrf management`	Make the tacacs-server 10.12.30.86 a part of this group G1 for default vrf
`(config-tacacs)#server Tacacs-Server-1`	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for management vrf
`(config-tacas)#exit`	Exit the tacacs-config
`(config)#aaa group server tacacs+ G1`	Create aaa group G1 for default vrf
`(config-tacacs)server 10.12.30.86`	Make the tacacs-server 10.12.30.86 a part of this group G1 for default vrf
`(config-tacacs)#server Tacacs-Server-1`	Make the tacacs-server Tacacs-Server-1 a part of this group G1 for management vrf
`(config-tacacs)#exit`	Exit the tacacs-config mode
`(config)#aaa authentication login default vrf management group G1`	Authenticate the tacacs+ group G1 with aaa authentication for management vrf
`(config)#aaa authentication login default group G1`	Authenticate the tacacs+ group G1 with aaa authentication for default vrf

Users are mapped as shown as shown in Table 9-1:

Table 9-1: Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14

Table 9-1: Role/privilege level mapping (Continued)

Role	Privilege level
Network operator	1 to 13
Network user	0 or any other values (>15 or negative values or any character)

TACACS Server Accounting

After authentication, the user can configure accounting to measure the resources that the user consumes during access.

Authenticating Device

`#configure terminal`	Enter configure mode.
`(config)#feature tacacs+ vrf management`	Enable the feature TACACS+ for vrf management
`(config)#feature tacacs+`	Enable the feature TACACS+ for default vrf
`(config)#tacacs-server host 10.16.19.2 vrf management key testing123`	Specify the TACACS server IPv4 address to be configured with shared key for vrf management. The same key should be present in the server configuration file.
`(config)#tacacs-server login host 10.16.19.2 key testing123`	Specify the TACACS server IPv4 address to be configured with shared key default vrf. The same key should be present in the server configuration file.
`(config)#aaa accounting default vrf management group tacacs+`	Enable accounting for TACACS server configured for vrf management.
`(config)#aaa accounting default group tacacs+`	Enable accounting for TACACS server configured for default vrf
`(config)#exit`	Exit configure mode
`#clear tacacs-server counters vrf management`	Clear tacacs server counters for management vrf
`#clear tacacs-server counters vrf all`	Clear tacacs server counters for management and default vrf
`#clear tacacs-server counters`	Clear tacacs server counters for default vrf

To verify the TACACS accounting process, connect using SSH or Telnet from the host to the client with the user created and provided TACACS server password, and check whether the client validates the user with corresponding username and password.

Validation Commands

show tacacs-server, show aaa accounting, show aaa accounting

```
#show aaa accounting vrf management
                     VRF: management
          default: group tacacs+
#

#show aaa accounting vrf all
                     VRF: management
          default: group tacacs+

                     VRF: default
          default: group tacacs+

#show aaa accounting
```

```
                    VRF: default
          default: group tacacs+
          #

#show running-config aaa
    aaa authentication login default vrf management group G1
    aaa accounting default vrf management group tacacs+
    aaa group server tacacs+ G1 vrf management
        server Tacacs-Server-1 vrf management
        server 10.12.17.11 vrf management

    aaa authentication login default group tacacs+
    aaa accounting default group tacacs+
    aaa group server tacacs+ G1
        server Tacacs-Server-1
        server 100.0.0.1
```

Sample TACACS Config File Contents

```
#tacacs configuration file
#set the key

    key = "testing123"
    accounting file = /var/log/tac_acc.log

    user = test1 {
            default service = permit
            login = cleartext "12345"
    }

    group = netadmin {
            service = ppp protocol = ip {
            priv-lvl = 1
            }
    }

    user = test2 {
            default service = permit
            login = cleartext "12345"
            member = netadmin
    }

    user = test3 {
            default service = permit
            login = cleartext "12345"
            service = ppp protocol = ip {
            priv-lvl = 15
    }
    }
```

TACACS Server Authorization

Authorization is realized by mapping the authenticated users to one of the existing predefined roles as shown in Table 9-1.

The privilege information from the TACACS+ server is retrieved for the authenticated users and is mapped onto one of the roles as shown in Table 9-1.

Each authenticated user is mapped to one of the pre-defined privilege level.

Users with priv-level <=0 and priv-level > 15 are treated as read-only user mapped onto the pre-defined network-user role.

There is no command to enable authorization. Authorization functionality is enabled by default when remote authentication is enabled with TACACS+.

Authorization is “auto-enabled”. After successful authentication, a user can enter into privilege exec mode, irrespective of its privilege level and such user is not prompted with enable mode password, if configured. However based on their role, commands are rejected if not allowed to perform certain operations.

Example

A network-user has read-only access and can only execute show commands. A network-user cannot enter configure mode. An error message is displayed upon executing any command which is not allowed.

```
#write
% Access restricted for user %
#configure terminal
% Access restricted for user %
```

The following attribute value pair in TACACS+ server is used to fetch user privilege information.

```
service = ppp protocol = ip {
        priv-lvl = <0…15>
}
```

Sample TACACS+ Configuration File

```
#tacacs configuration file from “tac_plus version F4.0.3.alpha “
#set the key

key = "testing123"
accounting file = /var/log/tac_acc.log

#Read only user “test1”, without any priv-lvl, mapped to role “network-user”
user = test1 {
default service = permit
login = cleartext "12345"
}

#We can create a group of users mapped to a privilege
group = netadmin {
service = ppp protocol = ip {
priv-lvl = 15
}
}

#User “test2” with highest priv-lvl=15, mapped to role “network-admin”
user = test2 {
default service = permit
login = cleartext "12345"
```

```
member = netadmin
}

#User “test3” with priv-lvl= 1…13, mapped to role “network-operator”
user = test3 {
default service = permit
login = cleartext "12345"
service = ppp protocol = ip {
priv-lvl = 10
}
}
#User “test4” with priv-lvl=14, mapped to role “network-engineer” user = test4 {
default service = permit
login = cleartext "12345"
service = ppp protocol = ip {
priv-lvl = 14
}
}
```

CHAPTER 10 RADIUS Client Configuration

Overview

Remote Authentication Dial In User Service (RADIUS) is a remote authentication protocol that is used to communicate with an authentication server.

A RADIUS server is responsible for receiving user connection requests, authenticating the user, and then returning all configuration information necessary for the client to deliver service to the user.

The key points for RADIUS authentication are:

- Transactions between client and server are authenticated through the use of a shared key and this key is never sent over the network.
- The password is encrypted before sending it over the network.

RADIUS Server Authentication

Figure 10-15: RADIUS Server Host Configuration

Host

`#configure terminal`	Enter configure mode.
`(config)# radius-server login key testing101 vrf management`	Specify the global key for radius servers that are not configured with their respective keys for management vrf. This key should match the one present in the config file of tacacs server.
`(config)# radius-server login key testing101`	Specify the global key for radius servers that are not configured with their respective keys for default vrf. This key should match the one present in the config file of tacacs server
`(config)# radius-server login host 10.12.17.13 vrf management key testing123`	Specify the radius server ipv4 address to be configured with shared local key for management vrf. The same key should be present on the server config file.
`(config)# radius-server login host 10.12.17.13 key testing123`	Specify the radius server ipv4 address to be configured with shared local key for default vrf. The same key should be present on the server config file.
`(config)# radius-server login host 10.12.17.11 vrf management auth-port 1045`	Specify the radius server ipv4 address to be configured with port number for management vrf. The radius server should be started with same port number.

`(config)# radius-server login host 10.12.17.11 auth-port 1045`	Specify the radius server ipv4 address to be configured with port number for default vrf.The radius server should be started with same port number
`(config)#radius-server login host 10.12.17.11 vrf management key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for default vrf. The radius server should be started with same port number. The radius server should be started with same port number
`(config)#radius-server login host Radius-Server-1 vrf management key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 2`	Specify the radius server configured with hostname, key authentication port number, accounting port number, for management VRF. The radius server should be started with same port number
`radius-server login host Radius-Server-1 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 2`	Specify the radius server configured with hostname sequence number, key and port number for default VRF. The radius server should be started with same port number.
`(config)#aaa authentication login default vrf management group radius`	Enable authentication for radius server configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius`	Enable authentication for radius server configured for default vrf. Authorization is also enabled by default.
`(config)#aaa authentication login default vrf management group radius local`	Enable authentication for radius server and fallback to local configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius local`	Enable authentication for radius server and fallback to local configured for default vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group radius local none`	Enable authentication for radius server, fallback to local followed by fallback to none, configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default radius local none`	Enable authentication for radius server, fallback to local followed by fallback to none, configured for default vrf. Authorization is also enabled by default
`(config)#aaa authentication login default vrf management group radius none`	Enable authentication for radius, fallback to none, configured for management VRF. Authorization is also enabled by default
`(config)#aaa authentication login default group radius none`	Enable authentication for radius, fallback to none, configured for default VRF. Authorization is also enabled by default
`(config)#aaa group server radius G1 vrf management`	Create aaa radius group G1 for management vrf
`(config)#aaa group server radius G1`	Create AAA radius group G1 for default VRF
`(config-radius)#server 10.12.30.86`	Make the radius server 10.12.30.86 a part of this group G1 for default VRF
`(config-radius)#server Radius-Server-1`	Make Radius-Server-1 a part of this group G1
`(config-radius)#exit`	Exit radius mode
`(config)#aaa group server radius G1`	Enter radius mode
`(config-radius)#server 10.12.30.86`	Make the radius server 10.12.30.86 a part of this group G1 for default vrf
`(config-radius)#server Radius-Server-1`	Make Radius-Server-1 a part of this group G1
`(config)#exit`	Exit radius mode.

`(config)#aaa authentication login default vrf management group G1`	Authenticate the tacacs+ group G1 with aaa authentication for management vrf
`(config)#aaa authentication login default group G1`	Authenticate the tacacs+ group G1 with aaa authentication for default vrf

Validation

To verify the RADIUS authentication process, use SSH or Telnet from the host machine to Host IP with the authenticating user created, and provide a RADIUS server password and check whether the client validates the user with the corresponding username and password.

RADIUS Server Accounting

You can configure accounting to measure the resources that another user consumes during access.

User

`#configure terminal`	Enter configure mode.
`(config)#radius-server login host 10.12.17.11 vrf management key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with authentication port number, accounting port number, shared key for management vrf. The radius server should be started with same port number.
`(config)#radius-server login host 10.12.17.11 key 7 wawyanb123 auth-port 60000 acct-port 60000 timeout 6`	Specify the radius server ipv4 address to be configured with port number for default vrf.The radius server should be started with same port number
`(config)#aaa accounting default vrf management group radius`	Enable accounting for radius server configured for vrf management
`(config)#aaa accounting default group radius`	Enable accounting for radius server configured for default vrf

Validation

```
#show aaa accounting vrf management
                VRF: management
  default: group radius

#show aaa accounting vrf all
                VRF: management
  default: group radius

                VRF: default
  default: group radius

#show aaa accounting
                VRF: default
  default: group radius
#
#show running-config aaa
aaa authentication login default vrf management group radius
aaa accounting default vrf management group radius
aaa group server radius rad1 vrf management
    server Radius-Server-1 vrf management
    server 100.0.0.1 vrf management
```

```
aaa authentication login default  group radius
aaa accounting default  group radius
aaa group server radius rad1
    server Radius-Server-1
    server 100.0.0.1
```

Sample Radius Clients.conf File

```
client 10.12.58.20 {
  secret    = testing123
  shortname = localhost
}
client 192.168.1.2 {
  secret    = testing123
  shortname = localhost
}
client 10.12.37.196 {
  secret    = testing123
}
client 100.0.0.2 {
  secret    = testing123
  shortname = localhost
}

# IPv6 Client
#client ::1 {
#       secret          = testing123
#       shortname       = localhost
#}
#
# All IPv6 Site-local clients
#client fe80::/16 {
#       secret          = testing123
#       shortname       = localhost
```

Sample Radius Users Configuration File

```
#
#DEFAULT
#       Service-Type = Login-User,
#       Login-Service = Rlogin,
#       Login-IP-Host = shellbox.ispdomain.com

# #
# # Last default: shell on the local terminal server.
# #
# DEFAULT
#       Service-Type = Administrative-User
```

```
# On no match, the user is denied access.

selftest Cleartext-Password := "password"
testuser1 Cleartext-Password := "user1@101"
testuser2 Cleartext-Password := "user2@202"
testuser3 Cleartext-Password := "user3@303"
```

CHAPTER 11 DHCP Relay Agent Configuration

Overview

The DHCP Relay feature was designed to forward DHCP broadcast requests as unicast packets to a configured DHCP server or servers for redundancy.

DHCP Relay for IPv4

Before configuring DHCP Relay, make sure DHCP server and client configurations are done.

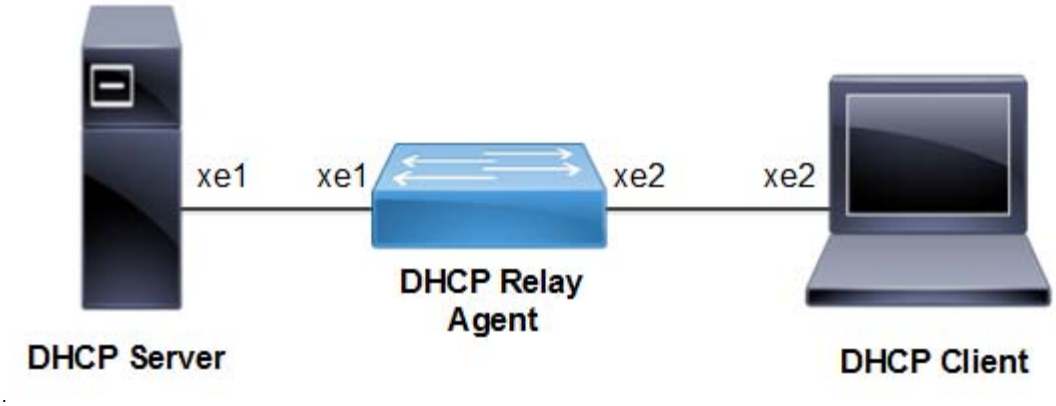

Figure 11-16: DHCP Relay Configuration

DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled by default.
`(config)#ip dhcp relay`	By default this will be enabled. It starts the ip dhcp relay service.
`(config)# ip dhcp relay address 10.10.10.2`	The relay address configured should be server interface address connected to DUT machine.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ip address 10.10.10.1/24`	Configure ipv4 address on the interface xe1.
`(config-if)#ip dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure ipv4 address on the interface xe2.
`(config-if)#ip dhcp relay`	Relay should be configured on the interface connecting to the client.
`(config if)#exit`	Exit interface mode.

Validation Commands

```
#show running-config dhcp

ip dhcp relay address 10.10.10.2
interface xe2
 ip dhcp relay
!
interface xe1
 ip dhcp relay uplink
!

#show ip dhcp relay
DHCP relay service is Enabled.
VRF Name: default
  Option 82: Disabled
  DHCP Servers configured: 10.10.10.2
  Interface                Uplink/Downlink
  ---------                -------------
  xe2                      Downlink
  xe1                      Uplink

#show ip dhcp relay address
 VRF Name: default
  DHCP Servers configured: 10.10.10.2
```

DHCP Relay for IPv6 Configuration

DHCP Agent

`#configure terminal`	Enter configure mode.
`(config)#feature dhcp`	Enable the feature dhcp. This is enabled in default.
`(config)#ipv6 dhcp relay`	By default this will be enabled. It starts the ipv6 dhcp relay service.
`(config)#ipv6 dhcp relay address 2001::2`	The relay address configured should be server interface address connected to DUT machine.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#ipv6 address 2001::1/64`	Configure ipv6 address on the interface xe1.
`(config-if)#ipv6 dhcp relay uplink`	Configure relay uplink on the device connecting the server.
`(config if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode.
`(config-if)#ipv6 address 2002::1/64`	Configure ipv6 address on the interface xe2.
`(config-if)#ipv6 dhcp relay`	Relay should be configured on the interface connecting to the client.
`(config if)#exit`	Exit interface mode.

Validation Commands

```
#sh ipv6 dhcp relay address

VRF Name: default
  DHCPv6 Servers configured: 2001::2

#show running-config dhcp

Ipv6 dhcp relay address 2001::2
 interface xe2
 ipv6 dhcp relay
!
interface xe1
 ipv6 dhcp relay uplink
!
```

DHCP Relay option 82

This section contains examples of DHCP Relay option-82 configuration. DHCP option 82 (Agent Information Option) provides additional security when DHCP is used to allocate network addresses. It enables the DHCP relay agent to prevent DHCP client requests from untrusted sources. Service Providers use remote identifier (option 82 sub option 2) for troubleshooting, authentication, and accounting. The DHCP Option 82 Remote ID Format feature adds support for the interpretation of **remote-IDs** that are inserted by end users. On the relay agent, you can configure information option to add option 82 information to DHCP requests from the clients before forwarding the requests to the DHCP server. When configured with option 82 and remote-id, the server will receive the DHCP request packet with Agent Circuit ID and remote-id.

The two examples below, show how to configure the DHCP Relay option 82:

- Configuration of DHCP Relay option 82 on a physical interface with Agent information and remote-id.
- Configuration of DHCP Relay option 82 on a VLAN interface with Agent information and remote-id.

Topology

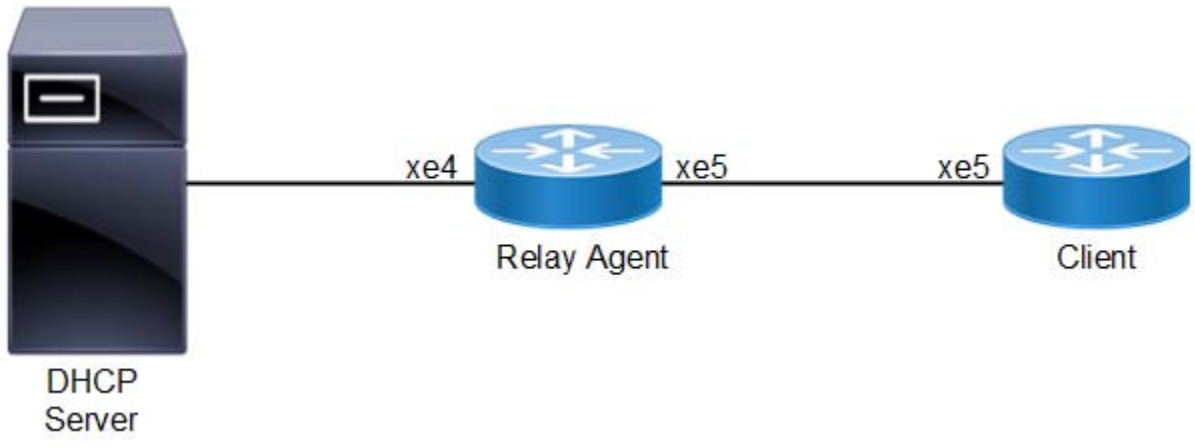

Figure 11-17: DHCP 82 interface topology

Physical Interface Configuration

Here, the DHCP Server is running with IP 192.168.1.2 with another pool of subnet 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for DHCP OFFER packets to reach the Relay Agent.

Relay agent

#configure terminal	Enter configure mode.
(config)#ip dhcp relay	Enable DHCP Relay
(config)#ip dhcp relay address 192.168.1.2	The relay address configured should be server interface address connected to DUT machine
(config)#ip dhcp relay information option remote-id hostname	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82. String support is also provided for remote-id.
(config)#interface xe5	Enter interface mode.
(config-if)#ip address 10.10.20.2/24	Add IP address
(config-if)#ip dhcp relay	Configure DHCP relay for the interface connecting to client.
(config-if)#exit	Exit from interface mode
(config)#interface xe4	Enter interface mode
(config-if)#ip address 192.168.1.1/24	Configure ipv4 address on the interface xe4
(config-if)#ip dhcp relay uplink	Configure DHCP relay uplink for the interface connecting to server.
(config-if)#exit	Exit interface mode.

Client

#configure terminal	Enter configure mode.
(config)#interface xe5	Enter interface mode.
(config-if)#ip address dhcp	Configure IP address DHCP
(config-if)#exit	Exit from interface mode

Validation

Relay Agent

```
#show running-config dhcp
!
ip dhcp relay information option remote-id hostname
ip dhcp relay address 192.168.1.2
interface xe5
 ip dhcp relay
!
interface xe4
 ip dhcp relay uplink
!

#show ip dhcp relay
```

```
DHCP relay service is Enabled.
VRF Name: default
  Option 82: Enabled
  Remote Id: OcNOS
  DHCP Servers configured: 192.168.1.2
  Interface                Uplink/Downlink
  ---------                -------------
  xe5                      Downlink
  xe4                      Uplink
```

Client

```
#show ip interface brief | include xe5
xe5            *10.10.20.10     up                    up

Physical Interface Configuration with non-default VRF

Here, the DHCP Server is running with IP 192.168.1.2 with another pool of subnet 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for DHCP OFFER packets to reach the Relay Agent.

Relay agent

#configure terminal	Enter configure mode.
(config)#ip dhcp relay	Enable DHCP Relay.
(config)#ip vrf vrf_dhcp	Configuring non default vrf vrf_dhcp
(config-vrf)#ip dhcp relay information option remote-id hostname	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82 on non default vrf.. String support is also provided for remote-id.
(config-vrf)#ip dhcp relay address 192.168.1.2	Configure DHCP relay address in non default vrf.
(config)#interface xe5	Enter interface mode.
(config-if)#ip vrf forwarding vrf_dhcp	Configure vrf forwarding for vrf_dhcp.
(config-if)#ip address 10.10.20.2/24	Add IP address.
(config-if)#ip dhcp relay	Configure DHCP relay for the interface connecting to client.
(config-if)#exit	Exit from interface mode
(config)#interface xe4	Enter interface mode
(config-if)#ip vrf forwarding vrf_dhcp	Configure vrf forwarding for vrf_dhcp
(config-if)#ip dhcp relay uplink	Configure DHCP relay uplink for the interface connecting to server.
(config-if)#ip address 192.168.1.4/24	Add IP address.
(config-if)#exit	Exit interface mode.

Client

#configure terminal	Enter configure mode.
(config)#interface xe5	Enter interface mode.
config-if)#ip vrf forwarding vrf_dhcp	Configure ip vrf forwarding for non default vrf.
(config-if)#ip address dhcp	Configure IP address DHCP.
(config-if)#exit	Exit from interface mode.

Validation

VLAN Interface Configuration

Topology

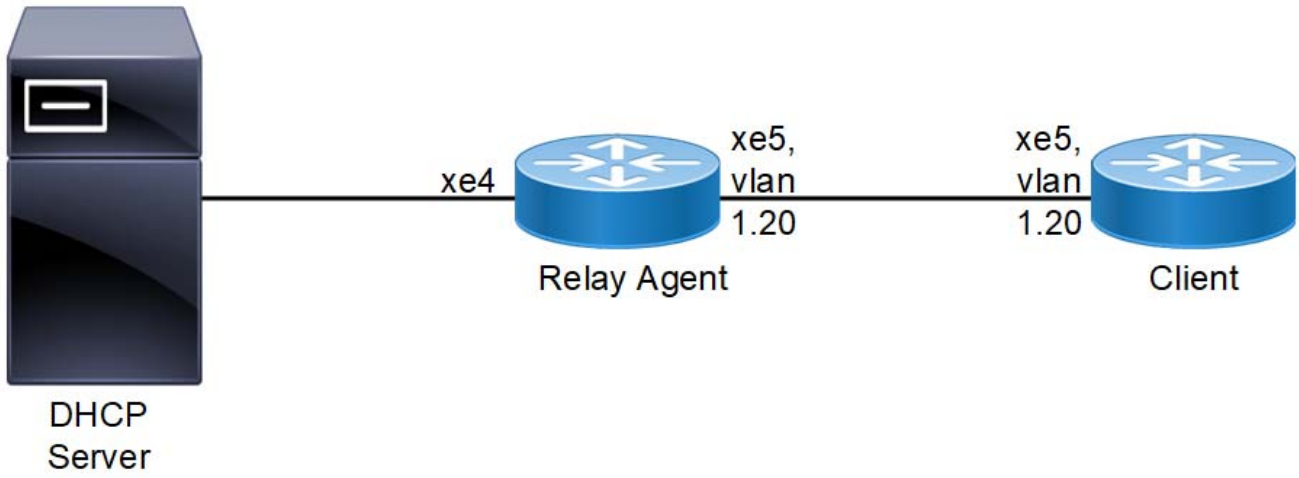

Figure 11-18: DHCP 82 vlan topology

Here, the DHCP Server is running with IP 192.168.1.2 with another pool of subnets 10.10.20.0 configured in the server. Configure a static route to 10.10.20.0 network for DHCP OFFER packets to reach the Relay Agent. In the above topology, vlan 20 is part of interface xe5 in relay Agent and xe5 in Client.

Relay Agent

t

`#configure terminal`	Enter configure mode.
`(config)#ip dhcp relay`	Enable DHCP Relay
`(config)#ip dhcp relay information option remote-id hostname`	Enable DHCP Relay information option with both agent circuit id which is sub option 1 of option 82 and remote-id which is sub option 2 of option 82. String support is also provided for remote-id.
`(config)#ip dhcp relay address 192.168.1.2`	Configure DHCP relay address
`(config)#bridge 1 protocol rstp vlan-bridge`	Configure bridge
`(config)#vlan 2-100 bridge 1 state enable`	Enable some VLANs
`(config)#interface xe5`	Enter interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Configure bridge-group
`(config-if)#switchport mode hybrid`	Configure switchport mode
`(config-if)#switchport hybrid allowed vlan all`	Enable vlan
`(config-if)#exit`	Exit from interface mode
`(config)#interface vlan1.20`	Enter interface mode for the vlan interface towards client.
`(config-if)#ip address 10.10.20.2/24`	Add IP address
`(config-if)#ip dhcp relay`	Configure DHCP relay on the vlan interface connecting to client.

(config-if)#exit	Exit from interface mode
(config)#interface xe4	Enter interface mode
(config-if)#ip dhcp relay uplink	Configure DHCP relay uplink for the interface connecting to server.
(config-if)#ip address 192.168.1.4/24	Add IP address
(config-if)#exit	Exit interface mode.

Client

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Configure bridge
(config)#vlan 2-100 bridge 1 state enable	Enable VLANs
(config)#interface xe5	Enter interface mode.
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Configure bridge-group
(config-if)#switchport mode hybrid	Configure switchport mode
(config-if)#switchport hybrid allowed vlan add 20 egress-tagged enable	Enable vlan
(config-if)#exit	Exit from interface mode
(config)#interface vlan1.20	Enter interface mode for the vlan interface which connects relay.
(config-if)#ip address dhcp	Configure IP address DHCP
(config-if)#exit	Exit from interface mode

Validation

Relay Agent

```
#show running-config dhcp
!
ip dhcp relay information option remote-id hostname
ip dhcp relay address 192.168.1.2
!

CHAPTER 12 NTP Client Configuration

Overview

NTP modes differ based on how NTP allows communication between systems. NTP communication consists of time requests and control queries. Time requests provide the standard client/server relationship in which a client requests time synchronization from an NTP server. Control queries provide ways for remote systems to get configuration information and reconfigure NTP servers.

SNTP is a simplified form of NTP that does not reach the level of accuracy compared to a full implementation of NTP. SNTP can be used for simple applications where the requirements for accuracy and reliability are not too demanding. OcNOS supports SNTP version 4, defined in RFC 2030.

Note: OcNOS uses “`ntp`” for the SNTP command names instead of “`sntp`.”

Support for Default VRF via In-band Management

OcNOS now offers support for NTP over default and management VRFs via in-band management interface & OOB management interface, respectively.

The feature can either be running on the default or management VRF. By default, it runs on the management VRF.

NTP Modes

The following describes the various NTP node types.

Client

An NTP client is configured to let its clock be set and synchronized by an external NTP timeserver. NTP clients can be configured to use multiple servers to set their local time and are able to give preference to the most accurate time sources. They do not, however, provide synchronization services to any other devices.

Server

An NTP server is configured to synchronize NTP clients. Servers can be configured to synchronize any client or only specific clients. NTP servers, however, will accept no synchronization information from their clients and therefore will not let clients update or affect the server's time settings.

Peer

With NTP peers, one NTP-enabled device does not have authority over the other. With the peering model, each device shares its time information with the others, and each device can also provide time synchronization to the others.

Authentication

For additional security, you can configure your NTP servers and clients to use authentication. Routers support MD5 authentication for NTP. To enable a router to do NTP authentication:

1. Enable NTP authentication with the `ntp authenticate` command.
2. Define an NTP authentication key with the ntp authentication-key vrf management command. A unique number identifies each NTP key. This number is the first argument to the ntp authentication-key vrf management command.
3. 3.Use the ntp trusted-key vrf management command to tell the router which keys are valid for authentication. If a key is trusted, the system will be ready to synchronize to a system that uses this key in its NTP packets. The trusted key should already be configured and authenticated.

NTP Configuration

NTP client, user can configure an association with a remote server. In this mode the client clock can synchronize to the remote server

After configuring the NTP servers, wait a few minutes before you verify that clock synchronization is successful. When the clock synchronization has actually happened, there will be an '*' symbol along with the interface while you give the "`show ntp peers`" command.

Topology

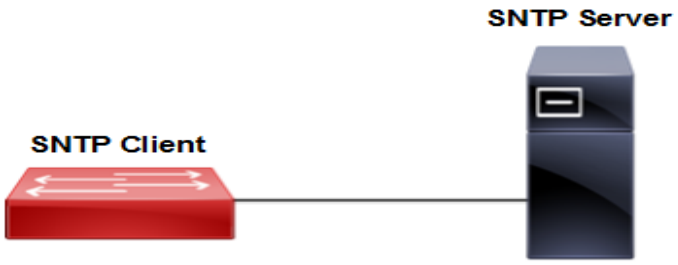

Figure 12-19: SNTP Client and Server

NTP Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)# ntp enable vrf management`	This feature enables ntp. This will be enabled in default.
`(config)#ntp server 10.1.1.1 vrf management`	Configure ntp server ip address.
`(config)#exit`	Exit from the Configure Mode.

Validation Commands

```
#show ntp peers
    ------------------------------------------------------------
    Peer IP Address Serv/Peer
    ------------------------------------------------------------
    10.1.1.1 Server (configured)

    #show ntp peer-status
```

```
    Total peers : 1
    * - selected for sync, + -  peer mode(active),
    - - peer mode(passive), = - polled in client mode
         remote           refid      st t when poll reach   delay   offset  jitter
    ==============================================================================
    *10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

Maxpoll and Minpoll Configuration

The maximum poll interval are specified in defaults to 6 (64 seconds), but can be increased by the `maxpoll` option to an upper limit of 16 (18.2 hours). The minimum poll interval defaults to 4 (16 seconds), and this is also the minimum value of the `minpoll` option.

The client will retry between `minpoll` and `maxpoll` range configured for synchronization with the server.

Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Configure feature on default or management VRF. By default this feature runs on management VRF.
`(config)#ntp server 10.1.1.1 maxpoll 7 minpoll 5 vrf management`	Configure `minpoll` and `maxpoll` range for ntp server.
`(config)#exit`	Exit from the Configure Mode.

Validation Commands

```
#show ntp peers
    ------------------------------------------------------------
    Peer IP Address Serv/Peer
    ------------------------------------------------------------
    10.1.1.1 Server (configured)

#show ntp peer-status
    Total peers : 1
    * - selected for sync, + -  peer mode(active),
    - - peer mode(passive), = - polled in client mode
         remote           refid      st t when poll reach   delay   offset  jitter
    ==============================================================================
    *10.1.1.1        LOCAL(0)         7 u   14   32   37    0.194   -4.870   3.314
```

NTP Authentication

When you enable NTP authentication, the device synchronizes to a time source only if the source carries the authentication keys specified with the source by key identifier. The device drops any packets that fail the authentication check, and prevents them from updating the local clock.

Client

`#configure terminal`	Enter Configure mode.
`(config)#feature ntp vrf management`	Enable feature on default or management VRF. By default this feature runs on management VRF..
`(config)#ntp server 10.1.1.1 vrf management`	Configure ntp server ip address.
`(config)#ntp authenticate vrf management`	Enable NTP Authenticate. NTP authentication is disabled by default.
`(config)#ntp authentication-key 1234 md5 text vrf management`	Configure ntp authentication key along with md5 value.
`(config)#ntp trusted-key 1234 vrf management`	Configure trusted key <1-65535>
`(config)#exit`	Exit from the Configure Mode.

Validation Commands

```
#show ntp authentication-status
    Authentication enabled

#show ntp authentication-keys
    --------------------------
     Auth Key       MD5 String
    --------------------------
    1234              SWWX

#show ntp trusted-keys
    Trusted Keys:
    1234
```

CHAPTER 13 Simple Network Management Protocol

Overview

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried (and sometimes set) by SNMP managers.

In SNMP, administration groups are known as communities. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption

SNMP is defined in RFCs 3411-3418.

Topology

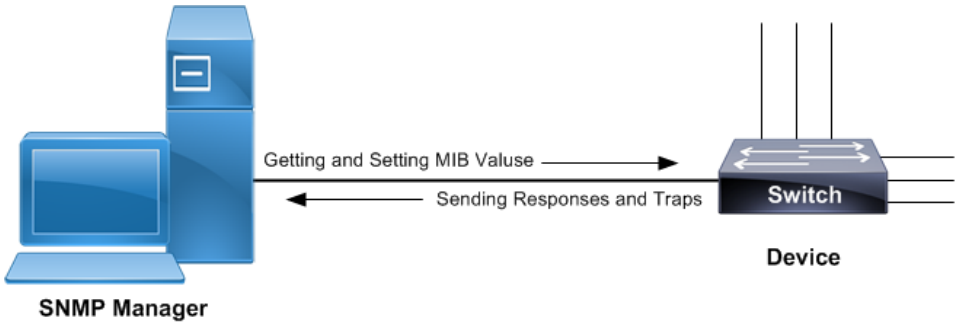

Figure 13-20: SNMP sample topology

Standard SNMP Configurations

`#configure terminal`	Enter configure mode.
`(config)#snmp-server view all .1 included vrf management`	Creates SNMP view labeled as “all” for OID-Tree as “.1” for vrf management.
`(config)#snmp-server community test group network-operator vrf management`	Set community string as “test” for group of users having “network-operator” privilege.
`(config)#snmp-server host 10.12.6.63 traps version 2c test udp-port 162 vrf management`	Specify host “10.12.6.63” to receive SNMP version 2 notifications at udp port number 162 with community string as “test”.
`(config)#snmp-server enable snmp vrf management`	Use this command to start the SNMP agent.
`(config)#exit`	Exit configure mode.

Validation

Use the below commands to verify the SNMP configuration:

```
#show running-config snmp
snmp-server view all .1 included vrf management
snmp-server community test group network-operator vrf management
snmp-server host 10.12.6.63 traps version 2c test udp-port 162 vrf management

#show snmp group
-------------------------------------------------------------------------------
community/user    group         version   Read-View   Write-view   Notify-view
-------------------------------------------------------------------------------
test          network-operator    2c/1       all        none           all

#show snmp host
-------------------------------------------------------------------------------
Host                Port   Version   Level          Type           SecName
-------------------------------------------------------------------------------
10.12.6.63          162    2c        noauth         trap           test
```

SNMP GET Command

```
# snmpget -v2c -c test 10.12.45.238
.1.3.6.1.2.1.6.13.1.2.10.12.45.238.22.10.12.6.63.52214

TCP-MIB::tcpConnLocalAddress.10.12.45.238.22.10.12.6.63.52214 = IpAddress:
10.12.45.238
```

SNMP WALK Command

SNMP WALK for particular OID

```
#snmpwalk -v2c -c test 10.12.45.238 .1.3.6.1.2.1.25.3.8.1.8
HOST-RESOURCES-MIB::hrFSLastFullBackupDate.1 = STRING: 0-1-1,0:0:0.0

Complete SNMP WALK

```
#snmpwalk -v2c -c test 10.12.45.238 .1
```

SNMP WALK Command

```
#snmpset -v2c -c test 10.12.45.102 1.3.6.1.2.1.10.246.1.2.1.30.1 u 123
iso.3.6.1.2.1.10.246.1.2.1.30.1 = Gauge32: 123
```

CHAPTER 14 Access Control Lists Configurations

This chapter contains a complete example of access control list (ACL) configuration.

Overview

An Access Control List is a list of Access Control Entries (ACE). Each ACE in ACL specifies the access rights allowed or denied.

Each packet that arrives at the device is compared to each ACE in each ACL in the order they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

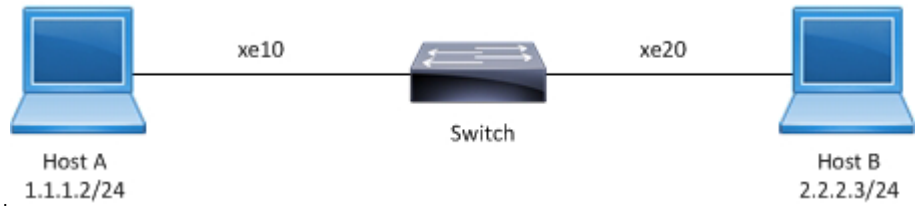

Figure 14-21: ACL sample topology

IPv4 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list T1`	Create an IP access list named T1.
`(config-ip-acl)#deny any host 1.1.1.1 any`	Create an access rule to deny IP packets with source address 1.1.1.1.
`(config-ip-acl)#permit any host 1.1.1.1/24 any`	Create an access rule to permit IP packets with source address 1.1.1.1.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group T1 in`	Apply access group T1 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.1, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists T1
IP access list T1
        10 deny any host 1.1.1.1 any [match=200]
        20 permit any 1.1.1.1/24 any
        default deny-all
```

When inbound IP packets reach interface xe10 with a source address in the range from 1.1.1.1 to 1.1.1.254, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists T1
IP access list T1
    10 deny any host 1.1.1.1 any
    20 permit any 1.1.1.1/24 any [match=2000]
    default deny-all
```

Note: Use the command `clear ip access-list counters` to clear the statistics of all ACLs or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

ICMP ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Create an IP access list named icmp-acl-01.
`(config-ip-acl)#10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 fragments`	Create an access rule with sequence number 10 to deny ICMP packets from a specific source towards a specific destination with a DSCP value of af11. Note: The sequence number is optional.
`(configip-acl)#20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash`	Create an access rule with sequence number 20 to permit ICMP packets from a specific source towards a specific destination with precedence as flash.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 1.1.1.3/24`	Assign an IP address.
`(config-if)#ip access-group icmp-acl-01 in`	Apply access group icmp-acl-01 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IP packets reach interface xe10 with source address 1.1.1.X, destination address 2.2.2.X, DSCP value af11, and are fragmented, then the count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 [match=200]
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
```

```
    default deny-all
```

When inbound IP packets reach interface xe10 with source address as 1.1.1.X, destination address 2.2.2.X, and precedence value flash, then the count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists icmp-acl-01
IP access-list icmp-acl-01
    10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11
    20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash [match=200]
    default deny-all
```

Note: Use the command `clear ip access-list counters` to clear statistics of all ACLs configured or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

Access List Entry Sequence Numbering

You can change the sequence numbers of rules in an access list.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

`#configure terminal`	Enter configure mode.
`(config)#ip access-list icmp-acl-01`	Enter access list mode for ACL icmp-acl-01.
`(config-ip-acl)#resequence 100 200`	Re-sequence the access list, starting with sequence number 100 and incrementing by 200.
`(config-ip-acl)#1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11`	Re-sequencing specific access rule 100 with sequence number 1000
`(config-ip-acl)#exit`	Exit access list mode.

Validation

Before re-sequencing:

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        10 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
        20 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
        default deny-all
```

After re-sequencing the access list, starting with sequence number 100 and incrementing by 200

```
#show access-lists icmp-acl-01
IP access list icmp-acl-01
        100 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
        300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
        default deny-all
```

After re-sequencing specific access rule 100 with sequence number 1000

```
 #show access-lists icmp-acl-01
IP access list icmp-acl-01
300 permit icmp 1.1.1.1/24 2.2.2.2/24 precedence flash
1000 deny icmp 1.1.1.2/24 2.2.2.2/24 dscp af11 log
default deny-all
```

IPv6 ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ipv6 access-list ipv6-acl-01`	Create an IPv6 access list named as icmp-acl-01.
`(config-ipv6-acl)#11 deny ip any any flow-label 100`	Create access rule sequence number 11 to deny IPv4 encapsulated packets in IPv6 with any source address to any destination address with flow label 100.
`(config-ipv6-acl)#default permit-all`	Update the default rule to permit all.
`(config-ipv6-acl)#exit`	Exit access list mode
`(config)#interface xe10`	Enter interface mode.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ipv6 address 1:1::1:3/64`	Assign an IPv6 address.
`(config-if)#ipv6 access-group ipv6-acl-01 in`	Apply access group ipv6-acl-01 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound IPv6 packets reach interface xe10 with IPv4 packets encapsulated with flow label 100, then count for access rule 11 increases equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
    11 deny ip any any flow-label 100 [match=1000]
    default permit all
```

For all other IPv6 packets, access rule 100 is invoked and the match counts increase equal to the number of packets sent.

```
#show ipv6 access-lists ipv6-acl-01
IPv6 access-list ipv6-acl-01
    11 deny ip any any flow-label 100
    default permit-all [match=2000]
```

Note: Use the command `clear ipv6 access-list counters` to clear statistics of all IPv6 ACLs configured or `clear ipv6 access-list <ipv6 access-list name> counters` to clear statistics of the particular IPv6 ACL.

MAC ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#mac access-list mac-acl-01`	Create a MAC access list named mac-acl-01.
`(config-mac-acl)#22 permit host 0000.0011.1212 host 0000.1100.2222 vlan 2`	Create an access rule with sequence number 22 to permit packets from a host with a specific MAC towards a host with a specific MAC with VLAN 2.
`(config-mac-acl)#exit`	Exit access list mode.

`(config)#bridge 1 protocol rstp vlan-bridge`	Create a VLAN-aware RSTP bridge.
`(config)#vlan 2 bridge 1 state enable`	Create VLAN 2.
`(config)#interface xe10`	Enter interface mode.
`(config-if)#switchport`	Configure the interface as Layer 2.
`(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`(config-if)#switchport trunk allowed vlan all`	Enable all VLAN identifiers on this interface.
`(config-if)#mac access-group mac-acl-01 in`	Applies the MAC access list mac-acl-01 to ingress traffic.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When inbound packets reach interface xe10 with the specific source and destination MAC with the VLAN as 2, then the count for access rule 22 increases equal to the number of packets sent.

```
#show mac access-lists
MAC access list mac-acl-01
    22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2 [match=3000]
    default deny-all
```

For all other packets, default rule is invoked and the match counts increases equal to the number of packets sent.

```
#show mac access-lists mac-acl-01
MAC access list mac-acl-01
    22 permit mac host 0000.0011.1212 host 0000.1100.2222 vlan 2
    default deny-all [match=2000]
```

Note: As per the present design, ARP/ND packets will be filtered based on the source MAC address only (host mac address).

Note: Use the command `clear mac access-list counters` to clear statistics of all MAC ACLs or `clear mac access-list <mac access-list name> counters` to clear statistics of a particular MAC ACL.

Management ACL Overview

Management Port ACL can be used to provide basic level of security for accessing the management network. ACLs can also be used to decide which types of management traffic to be forwarded or blocked at the management port.

When configuring access list on a router or a switch, each access list needs to be identified by a unique name or a number. Each access list entry can have permit or deny actions. Each entry will be associated with a sequence number in the range of <1-268435453>. Lower the sequence number, higher the priority.

User should be able to configure the system to allow certain IP address for a protocol and don't allow any other IP address matching for that protocol.

Note: If there is no match, the packet is dropped (implicit deny). Therefore, an ACL intended to deny a few selected packets should have at least one permit filter of lower priority; otherwise, all traffic is dropped because of the default implicit deny filter.

Topology

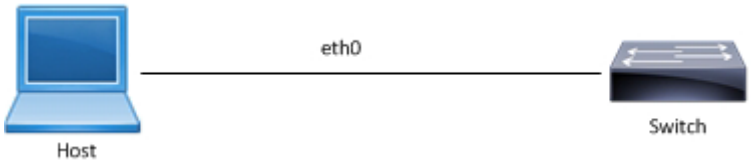

Figure 14-22: Management ACL Sample Topology

Management ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#ip access-list mgmt`	Create an IP access list named mgmt
`(config-ip-acl)#permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh`	Create an access rule to permit TCP connection with source address 10.12.45.57 with destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)#permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet`	Create an access rule to permit TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq snmp`	Create an access rule to permit UDP packet with any source address with Destination address 10.12.29.49 on destination port equal to SNMP.
`(config-ip-acl)#permit udp any host 10.12.29.49 eq ntp`	Create an access rule to permit UDP packet with any source address with Destination address 10.12.29.49 on destination port equal to NTP.
`(config-ip-acl)#permit udp host 10.12.29.49 any eq snmptrap`	Create an access rule to permit UDP packet with source address 10.12.29.49 with any Destination address on destination port equal to SNMPTrap.
`(config-ip-acl)#permit tcp host 10.12.29.49 eq ssh host 10.12.45.57`	Create an access rule to permit TCP connection with source address 10.12.29.49 on source port equal to ssh with Destination address 10.12.45.57 .
`(config-ip-acl)#deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh`	Create an access rule to deny TCP connection with source address 10.12.45.58 with Destination address 10.12.29.49 on destination port equal to SSH.
`(config-ip-acl)#deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet`	Create an access rule to deny TCP connection with source address 10.12.45.57 with Destination address 10.12.29.49 on destination port equal to Telnet.
`(config-ip-acl)#exit`	Exit access list mode.
`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#no switchport`	Configure the interface as Layer 3.
`(config-if)#ip address 10.12.29.49/24`	Assign an IP address.
`(config-if)#ip access-group mgmt in`	Apply access group mgmt for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to verify the match count. When a TCP connection for Destination Port SSH reach interface eth0 with source address 10.12.45.57, then the match count for access rule 10 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When a TCP connection for Destination Port Telnet reach interface eth0 with source address 10.12.45.58, then the match count for access rule 20 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet [match=10]
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When a UDP packet for Destination Port SNMP reach interface eth0 with any source address, then the match count for access rule 30 increases equal to the number of packets sent. Prior to this SNMP should be configured on Device (10.12.29.49).

```
    Example:
    snmp-server community SNMPTEST group network-admin vrf management
    snmp-server host 10.12.6.86 traps version 2c SNMPTEST udp-port 162 vrf
    management
    snmp-server enable snmp  vrf management

    #show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp [match=50]
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When a UDP packet for Destination Port NTP reach interface eth0 with any source address, then the match count for access rule 40 increases equal to the number of packets sent. Prior to this NTP should be configured on Device (10.12.29.49).

```
    Example:
    ntp enable vrf management
    ntp authenticate vrf management
    ntp authentication-key 123 md5 swwx 7 vrf management
    ntp trusted-key 123 vrf management
    ntp server 10.12.45.36 vrf management
    ntp server 10.12.16.16 prefer vrf management
```

```
    ntp server 10.12.16.16 key 123 vrf management

#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp [match=1]
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When a TCP connection request for Destination Port SSH reach interface eth0 with source address 10.12.45.58, this should deny the connection and the match count for access rule 70 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh [match=1]
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When a TCP connection request for Destination Port Telnet reach interface eth0 with source address 10.12.45.57, this should deny the connection and the match count for access rule 80 increases equal to the number of packets sent.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet[match=1]
            default deny-all
```

To enable SNMPTRAPS, apply the ACL outbound to the Management interface.

`#configure terminal`	Exit access list mode.
`(config)#interface eth0`	Enter interface mode of Management Interface.
`(config-if)#ip access-group mgmt out`	Apply access group mgmt for outbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

When a UDP packet for Destination Port SNMPTrap sends out of interface eth0 with any Destination address, then the match count for access rule 50 increases equal to the number of packets received. Prior to this SNMPTrap should be configured on Device (10.12.29.49) to listen to port 162.

```
    Example:
    snmp-server community SNMPTEST group network-admin vrf management
```

```
    snmp-server host 10.12.6.86 traps version 2c SNMPTEST udp-port 162 vrf
    management
    snmp-server enable snmp  vrf management

#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap [match=5]
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

When an ACL is applied on interface eth0 outbound and inbound together, then we must configure an ACL to establish a TCP connection between source 10.12.29.49 with source Port SSH to destination address 10.12.45.57. When a TCP connection is established on port SSH, then the match count for access rule 10 and 60 increases equal to the number of packets sent and received.

```
#show ip access-lists mgmt
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh [match=9]
            20 permit tcp host 10.12.45.58 host 10.12.29.49 eq telnet
            30 permit udp any host 10.12.29.49 eq snmp
            40 permit udp any host 10.12.29.49 eq ntp
            50 permit udp host 10.12.29.49 any eq snmptrap
            60 permit tcp host 10.12.29.49 eq ssh host 10.12.45.57[match=9]
            70 deny tcp host 10.12.45.58 host 10.12.29.49 eq ssh
            80 deny tcp host 10.12.45.57 host 10.12.29.49 eq telnet
            default deny-all
```

Note: Use the command `clear ip access-list counters` to clear the statistics of all ACLs or `clear ip access-list <access-list name> counters` to clear statistics of a particular ACL.

```
#show access-lists
    IP access list mgmt
            10 permit tcp host 10.12.45.57 host 10.12.29.49 eq ssh

```

ARP ACL Overview

ARP ACL can be used to permit or deny the ARP packets, based on the ARP request or response option configured.

Topology

Figure 14-23: ARP ACL Sample Topology

ARP ACL Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge4`	m
`(config-if)#ip address`	Assign IPv4 address.
`(config-if)#exit`	Exit access list mode.
`(config)#mac access-list mac1`	Enter mac access list mode.
`(config-mac-acl)#permit 0000.3ae0.456d 0000.0000.0000 any arp request`	Create an access rule to permit specific ARP request.
`(config-mac-acl)#permit 0000.3ae0.456d 0000.0000.0000 any arp response`	Create an access rule to permit specific ARP response.
`(config-mac-acl)#permit any any ipv4`	Create an access rule to permit any IPv4 packet.
`(config-mac-acl)#exit`	Exit access list mode.
`(config)#interface ge4`	Enter interface mode.
`(config-if)#mac access-group mac1 in`	Apply access group mac1 for inbound traffic to the interface.
`(config-if)#end`	Exit interface and configure mode.

Validation

Use the commands below to assign IP address on IXIA and ping from IXIA.

```
#show mac access-lists
    MAC access list mac1
            10 permit host 0000.3AE0.456D any arp request [match=1]
            20 permit host 0000.3AE0.456D any arp response [match=1]
            30 permit any any ipv4 [match=1]
            default deny-all
```

ACL over Loopback

The loopback interface ACL feature provides basic security for management applications accessible through In-band interfaces.

Note: Refer to the command reference section for limitations, default behavior, and unsupported features.

Topology

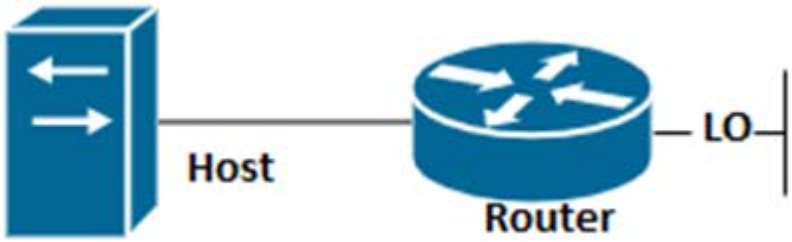

Figure 14-24: ACL Loopback Topology

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 4.4.4.4/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 5.5.5.5/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 6.6.6.6/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 7.7.7.7/32 secondary`	Assign the IPv4 secondary address.
`(config-if)# exit`	Exit interface mode.
`(config)#ip access-list loopback`	Create loopback access list
`(config-ip-acl)# 10 permit tcp any host 3.3.3.3 eq telnet`	Permit telnet session from any source with specific destination.
`(config-ip-acl)# 20 deny tcp any host 4.4.4.4 eq telnet`	Deny telnet session from any source with specific destination.
`(config-ip-acl)# 30 permit tcp any host 5.5.5.5 eq ssh`	Permit ssh session from any source with specific destination.
`(config-ip-acl)# 40 deny tcp any host 6.6.6.6 eq ssh`	Deny ssh session from any source with specific destination.
`(config-ip-acl)# 50 deny udp any host 6.6.6.6 eq snmp`	Deny udp from any source with specific destination.

`(config-ip-acl)# 60 deny udp any host 7.7.7.7 eq ntp`	Deny udp from any source with specific destination.
`(config-ip-acl)#exit`	Exit interface acl mode
`(config)#interface lo`	Enter interface lo mode
`(config-if)#ip access-group loopback in`	Associate loopback acl over lo interface
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit config mode

Validation

```
#sh access-lists
IP access list loopback
        10 permit tcp any host 3.3.3.3 eq telnet [match=12]
        20 deny tcp any host 4.4.4.4 eq telnet [match=12]
        30 permit tcp any host 5.5.5.5 eq ssh
        40 deny tcp any host 6.6.6.6 eq ssh
        50 deny udp any host 6.6.6.6 eq snmp  [match=6]
        60 deny udp any host 7.7.7.7 eq ntp

#sh ip access-lists summary
 IPV4 ACL loopback
       statistics enabled
       Total ACEs Configured: 6
       Configured on interfaces:
          lo - ingress (Router ACL)
       Active on interfaces:
          lo - ingress (Router ACL)
       Configured on line vty:

#sh running-config aclmgr
ip access-list loopback
 10 permit tcp any host 3.3.3.3 eq telnet
 20 deny tcp any host 4.4.4.4 eq telnet
 30 permit tcp any host 5.5.5.5 eq ssh
 40 deny tcp any host 6.6.6.6 eq ssh
 50 deny udp any host 6.6.6.6 eq snmp
 60 deny udp any host 7.7.7.7 eq ntp
!
interface lo
 ip access-group loopback in
!
```

ACL over Virtual Terminal

When a Telnet or SSH connection is made, OcNOS associates the connection with a virtual terminal (VTY) line. The ACL over VTY feature provides security for management features associated with VTY.

Standard ACLs are supported on VTY lines. Any standard ACL rule when applied on a VTY line permits/denies only management access ports such as SSH, Telnet, SNMP, and NTP.

Note: IPv6 and "out" filters for standard ACLs on VTY lines are not supported.

This is an example configuration:

```
#show run access-list
ip access-list standard abc
permit host 1.1.1.1
deny any
!

#show ip access-lists summary
 IPV4 STANDARD ACL abc
       Total ACEs Configured: 2
       Configured on interfaces:
       Active on interfaces:
       Configured on line vty:
          all vty lines - ingress
```

Topology

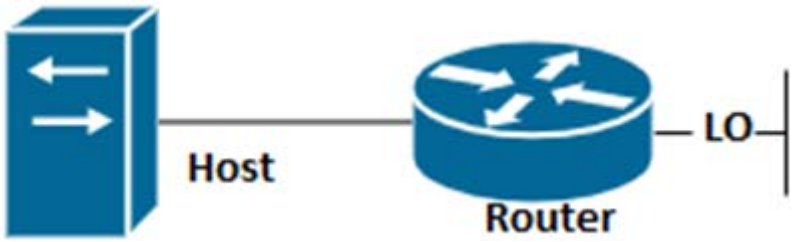

Figure 14-25: Line VTY ACL

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 3.3.3.3/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 4.4.4.4/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 5.5.5.5/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 6.6.6.6/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#ip address 7.7.7.7/32 secondary`	Assign the IPv4 secondary address.
`(config-if)#exit`	Exit interface mode.
`(config)#ip access-list vty`	Create loopback access list
`(config-ip-acl)#10 permit tcp any host 3.3.3.3 eq telnet`	Permit telnet session from any source with specific destination.
`(config-ip-acl)#20 deny tcp any host 4.4.4.4 eq telnet`	Deny telnet session from any source with specific destination.
`(config-ip-acl)#30 permit tcp any host 5.5.5.5 eq ssh`	Permit ssh session from any source with specific destination.
`(config-ip-acl)#40 deny tcp any host 6.6.6.6 eq ssh`	Deny ssh session from any source with specific destination.
`(config-ip-acl)#50 deny udp any host 6.6.6.6 eq snmp`	Deny udp from any source with specific destination.
`(config-ip-acl)#60 deny udp any host 7.7.7.7 eq ntp`	Deny udp from any source with specific destination.

(config-ip-acl)#exit	Exit interface acl mode
(config)#line vty	Enter Line vty mode
(config-all-line)#ip access-group vty in	Associate acl over VTY
(config-all-line)#end	Exit interface mode
(config)#exit	Exit config mode

Validation

```
#sh access-lists
IP access list vty
        10 permit tcp any host 3.3.3.3 eq telnet [match=53]
        20 deny tcp any host 4.4.4.4 eq telnet
        30 permit tcp any host 5.5.5.5 eq ssh
        40 deny tcp any host 6.6.6.6 eq ssh [match=4]
        50 deny udp any host 6.6.6.6 eq snmp
        60 deny udp any host 7.7.7.7 eq ntp

```

CHAPTER 15 Route-map Continue Configuration

This section contains Route-map continue configuration with BGP.

Overview

The continue clauses allow you to configure and organize more modular policy definitions to reduce the number of policy configurations that are repeated within the same route map.

Continue clause under a route-map provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses. The continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicates the order in which clauses are to be evaluated.

Using Continue with Match Clauses

When a `match` clause exists in a route-map with continue clause then `continue` clause is executed only when a successful match occurs. If a `match` clause does not exist in the route-map and if a `continue` clause exists, the `continue` clause will be evaluated and will go to the specified route-map entry. When a successful match occurs and we have a `continue` clause, the route-map executes the `set` clauses and then goes to the specified route-map entry. If a `continue` clause does not exist in the next route map, then the route-map will behave normally. If a `continue` clause exists in the next route-map but a match is not successful, the route-map will not continue and will “fall through” to the next sequence number if one exists

Using Continue with Set Actions

`Set` clauses are executed after the route-map evaluation is done. The `set` clauses are evaluated and executed in the order in which they were configured. `Set` clauses are only executed after a successful match occurs. The `continue` statement proceeds to the specified route-map entry only after configured `set` actions are performed. If a `set` action is configured in the first route-map and then the same `set` action occurs again but with a different value, in a subsequent route-map entry, then the last `set` action will override the previous `set` actions which were configured with the same set command.

Topology

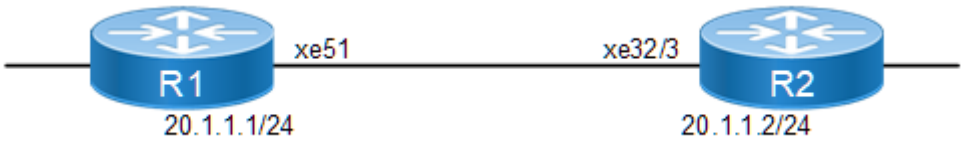

Figure 15-26: Route-map continue

Configure Route-map *continue* on R1

In the below example we will apply route-map `continue` on R1 under BGP 100, with redistributed connected routes from R2 on R1. Here, 10.1.0.0/16 is a superset, while 10.1.1.0/24, 10.1.2.0 /24, 10.1.3.0/24, 10.1.4.0/24, and 10.1.5.0/24 are subsets and will filter PF1, which is a superset and sets several prefixes.

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface xe51`	Enter interface mode.
`R1(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#ip prefix-list PF1 seq 5 permit 10.1.0.0/16 le 32`	Configure super set prefix PF1
`R1(config)#ip prefix-list P1 seq 5 permit 10.1.1.0/24 le 32`	Configure subset prefix P1
`R1(config)#ip prefix-list P2 seq 5 permit 10.1.2.0/24 le 32`	Configure subset prefix P2
`R1(config)#ip prefix-list P3 seq 5 permit 10.1.3.0/24 le 32`	Configure subset prefix P3
`R1(config)#router bgp 100`	Configure bgp process 100
`R1(config-router)#bgp router-id 1.1.1.1`	Configure bgp router id
`R1(config-router)#neighbor 20.1.1.2 remote-as 100`	Configure bgp remote-as 100 with neighbor IP
`R1(config-router)#neighbor 20.1.1.2 route-map myid1 in`	Configure bgp route-map myid1 as In bound policy with neighbor ip
`R1(config-routed)#exit`	Exit the router bgp mode
`R1(config)#route-map myid1 permit 1`	Configure route-map myid1 with sequence number 1
`R1(config-route-map)match ip address prefix-list PF1`	Match for prefix PF1
`R1(config-route-map)continue`	Configure continue command without sequence number
`R1(config-route-map)set metric 10`	Set metric as 10
`R1(config-route-map)set weight 3465789`	Set weight as 3465789
`R1(config-route-map)route-map myid1 permit 2`	Configure route-map myid1 with sequence number 2
`R1(config-route-map)match ip address prefix-list P1`	Match for IP prefix-list P1
`R1(config-route-map)continue 3`	Configure continue with sequence number 3
`R1(config-route-map)set metric 20`	Set metric as 20.
`R1(config-route-map)set origin igp`	Set origin as IGP protocol
`R1(config-route-map)route-map myid1 permit 3`	Configure route-map myid1 with sequence number 3
`R1(config-route-map)match ip address prefix-list P2`	Match for IP prefix-list P2
`R1(config-route-map)continue 4`	Configure continue with sequence number 4
`R1(config-route-map)set metric 30`	Set metric as 30.
`R1(config-route-map)set as-path prepend 600`	Set as-path prepend as 600
`R1(config-route-map)route-map myid1 permit 4`	Configure route-map myid1 with sequence number 4
`R1(config-route-map)match ip address prefix-list P3`	Match for IP prefix-list P3.
`R1(config-route-map)set local-preference 400`	Set local preference as 400
`R1(config-route-map)set weight 400`	Set weight as 400
`R1(config-route-map)end`	End the route-map

R2

R2#configure terminal	Enter configure mode.
R2(config)#interface xe32/1	Enter interface mode.
R2(config-if)#ip address 10.1.1.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/2	Enter interface mode.
R2(config-if)#ip address 10.1.2.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/4	Enter interface mode.
R2(config-if)#ip address 10.1.3.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe17/1	Enter interface mode.
R2(config-if)#ip address 10.1.4.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe21/1	Enter interface mode.
R2(config-if)#ip address 10.1.5.1/24	Configure the IP address of the interface on an interface which is up and running
R2(config-if)#interface xe32/3	Enter interface mode.
R2(config-if)#ip address 20.1.1.2/24	Configure the IP address on the connected interface.
R2(config-if)#exit	Exit interface mode.
R2(config)#router bgp 100	Configure BGP process 100
R2(config-router)#bgp router-id 2.2.2.2	Configure BGP router id
R2(config-router)#neighbor 20.1.1.1 remote-as 100	Configure BGP remote-as 100 with neighbor IP
R2(config-router)#redistribute connected	Redistribute the connected routes which are 10 networks here.

Validation

CHAPTER 16 Show Tech Support Configurations

Overview

OcNOS maintains a collection of consolidated information about system configurations and statistics. This information is for debugging and diagnosing system issues.

Note: Output is displayed on the terminal.

Tech Support Samples

`#show tech-support`	Collects system configurations and statistics for all modules.

CHAPTER 17 Debounce Timer

The debounce timer avoids frequent updates (churn) to higher layer protocols during flapping of an interface. If the status of a link changes quickly from up to down and then back to up, the port debounce timer suppresses the link status notification. If the link transitions from up to down, but does not come back up, the port debounce timer delays the link status notification.

Note: Keep the following in mind when using the debounce timer:

- Debounce timer is supported only for physical L2 and L3 interfaces.
- The debounce flap-count refers to the number of flaps OcNOS receives while the debounce timer is running:
  - The flap-count is only updated if the timer is still running and OcNOS receives a link status event for the interface.
  - The flap-count is reset at the subsequent start of the debounce timer.
- Protocol-specific timers such as BFD which depend on the link status should be configured to minimum of 1.5 times the value of the debounce time. Otherwise it could affect the protocol states if the debounce timer is still running.

Topology

Figure 17-27 is a simple deployment using the debounce timer

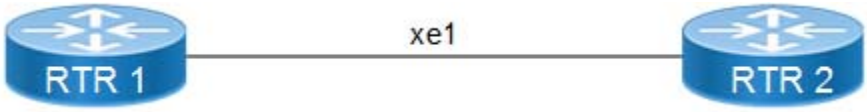

Figure 17-27: Debounce timer

RTR 1

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Enter into interface mode
`(config)#debounce-time 4000`	Configure debounce-time as 4000ms
`(config)#exit`	Exit configure mode

RTR 2

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Enter into interface mode
`(config)#debounce-time 4000`	Configure debounce-time as 4000ms
`(config)#exit`	Exit configure mode.

Validation

```
#show running-config
debounce-time 4000
#show interface xe1
Debounce timer: enabled
Debounce-time 4000 ms
Flap Count: 0
Debounce status : idle
```

RTR1 and RTR2 outputs after interface flap:

```
#show interface xe1
Debounce timer: enabled
Debounce-time 4000 ms
Flap Count: 1
Last Debounce Flap : 2019 Aug 14 17:24:33 (00:00:10 ago)
Debounce status : idle

#show interface xe1
Debounce timer: enabled
Debounce-time 4000 ms
Flap Count: 1
Last Debounce Flap : 2019 Aug 14 17:24:35 (00:00:16 ago)
Debounce status : idle
```

Log Messages

The following is a configuration example to log debounce timer activity:

`#configure terminal`	Enter Configure mode
`(config)#logging level nsm 7`	Enable operational log to display debounce start and end.

Example Log Messages

```
2019 Aug 14 17:24:32.532 : rtr1 : NSM : INFO : Start Debounce Timer on interface xe1, prev_state UP new_state DOWN
2019 Aug 14 17:24:33.810 : rtr1 : NSM : INFO : Interface xe1 Flapped, prev_state UP new_state UP,flap count 1
2019 Aug 14 17:24:36.532 : rtr1 : NSM : INFO : Debounce Timer Expired on interface xe1, prev_state UP, new_state UP
```

System Management Command Reference

Contents

This document contains these chapters and appendices:

CHAPTER 1 Dynamic Host Configuration Protocol Client

This chapter describes the Dynamic Host Configuration Protocol (DHCP) client commands.

DHCP is used to configure devices that are connected to a network so they can communicate on that network using the Internet Protocol (IP). DHCP is implemented in a client-server model where DHCP clients request configuration data, such as an IP address, a default route, or DNS server addresses from a DHCP server.

This chapter contains these commands:

feature dhcp

Use this command to enable the DHCP client and DHCP relay on the device.

Use the no form of this command to disable the DHCP client and DHCP relay and delete any DHCP-related configuration.

Command Syntax

```
feature dhcp
no feature dhcp
```

Parameters

None

Default

By default, feature dhcp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature dhcp
```

ip address dhcp

Use this command to get an IP address from a DHCP server for this interface.

Use the no form of this command to disable the DHCP client for this interface.

You can give the ip dhcp client request command before giving this command to request additional options.

Command Syntax

```
ip address dhcp
no ip address dhcp
```

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip address dhcp
(config-if)#
```

ip dhcp client request

Use this command to add an option to a DHCP request.

Use the no form of this command to remove an option from a DHCP request.

Command Syntax

```
ip dhcp client request dns-nameserver
ip dhcp client request host-name
ip dhcp client request log-server
ip dhcp client request ntp-server
no ip dhcp client request dns-nameserver
no ip dhcp client request host-name
no ip dhcp client request log-server
no ip dhcp client request ntp-server
```

Parameters

`dns-nameserver`	List of DNS name servers (DHCP option 6)
`host-name`	Name of the client (DHCP option 12)
`ntp-server`	List of NTP servers (DHCP option 42)
`log-server`	List of log servers (DHCP option 7)

Default

By default, ip dhcp client request is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip dhcp client request ntp-server
```

CHAPTER 2 Domain Name System

This chapter describes Domain Name System (DNS) commands. DNS translates easily-to-remember domain names into numeric IP addresses needed to locate computer services and devices. By providing a worldwide, distributed keyword-based redirection service, DNS is an essential component of the Internet.

The DNS database is hierarchical. When a client such as a Web browser gives a request that specifies a host name, the DNS resolver on the client first contacts a DNS server to determine the server's IP address. If the DNS server does not contain the needed mapping, it forwards the request to a different DNS server at the next higher level in the hierarchy. After potentially several forwarding and delegation messages are sent within the DNS hierarchy, the IP address for the given host eventually arrives at the resolver, that in turn completes the request over Internet Protocol (IP).

Note: The commands below are supported only on the “management” VRF.

The chapter contains these commands:

debug dns client

Use this command to display DNS debugging messages.

Use the no form of this command to stop displaying DNS debugging messages.

Command Syntax

```
debug dns client
no debug dns client
```

Parameters

None

Default

By default, disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug dns client
```

ip domain-list

Use this command to define a list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.

The `ip domain-list` command is similar to the ip domain-name command, except that with the `ip domain-list` command you can define a list of domains, each to be tried in turn.

If there is no domain list, the default domain name specified with the `ip domain-name` command is used. If there is a domain list, the default domain name is not used.

Use the `no` form of this command to remove a domain.

Command Syntax

```
ip domain-list (vrf management|) DOMAIN-NAME
no ip domain-list (vrf management|) DOMAIN-NAME
```

Parameters

`management`	Virtual Routing and Forwarding name
`DOMAIN-NAME`	Domain name, such as company.com

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip domain-list mySite.com
```

ip domain-lookup

Use this command to enable DNS host name-to-address translation.

Use the no form of this command to disable DNS.

Command Syntax

```
ip domain-lookup (vrf management|)
no ip domain-lookup (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip domain-lookup
```

ip domain-name

Use this command to set the default domain name used to complete unqualified host names (names without a dotted-decimal domain name).

The ip domain-list command is similar to the `ip domain-name` command, except that with the `ip domain-list` command you can define a list of domains, each to be tried in turn.

If a domain list has been created with ip domain-list, the default domain name is not used. If there is no domain list, the default domain name is used.

Use the `no` form of this command to disable DNS.

Command Syntax

```
ip domain-name (vrf management|) DOMAIN-NAME
no ip domain-name (vrf management|) DOMAIN-NAME
```

Parameters

`management`	Virtual Routing and Forwarding name
`DOMAIN-NAME`	Domain name, such as company.com

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip domain-name company.com
```

ip host

Use this command to define static hostname-to-address mappings in DNS. You can specify one or two mappings in a command.

Use the no form of this command remove a hostname-to-address mapping.

Command Syntax

```
ip host (vrf management|) WORD A.B.C.D
ip host (vrf management|) WORD A.B.C.D A.B.C.D
ip host (vrf management|) WORD (X:X::X:X | A.B.C.D)
ip host (vrf management|) WORD (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
no ip host (vrf management|) WORD A.B.C.D
no ip host (vrf management|) WORD A.B.C.D A.B.C.D
no ip host (vrf management|) WORD (X:X::X:X | A.B.C.D)
no ip host (vrf management|) WORD (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
```

Parameters

`management`	Virtual Routing and Forwarding name
`WORD`	Host name, such as company.com
`X:X::X:X`	IPv6 address of the host
`A.B.C.D`	IPv4 address of the host

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip host company.com 192.0.2.1
```

ip name-server

Use this command to add 1-3 DNS server addresses that are used to translate hostnames to IP addresses.

Use the no form of this command to remove 1-3 DNS server addresses.

Command Syntax

```
ip name-server (vrf management|) A.B.C.D
ip name-server (vrf management|)(A.B.C.D) (A.B.C.D)
ip name-server (vrf management|) (A.B.C.D) (A.B.C.D) (A.B.C.D)
ip name-server (vrf management|) (X:X::X:X | A.B.C.D)
ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
  (X:X::X:X | A.B.C.D)
no ip name-server (vrf management|) A.B.C.D
no ip name-server (vrf management|) A.B.C.D A.B.C.D
no ip name-server (vrf management|) A.B.C.D A.B.C.D A.B.C.D
no ip name-server (vrf management|) (X:X::X:X | A.B.C.D)
no ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
no ip name-server (vrf management|) (X:X::X:X | A.B.C.D) (X:X::X:X | A.B.C.D)
  (X:X::X:X | A.B.C.D)
```

Parameters

management	Virtual Routing and Forwarding name
A.B.C.D	IPv4 address of the host
X:X::X:X	IPv6 address of the host

Default

No default is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip name-server 123.70.0.23
```

show hosts

Use this command to display the DNS name servers and domain names.

Command Syntax

```
show hosts (vrf management|all)
```

Parameters

`vrf`	management or all VRFs

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command displaying two name servers: 10.10.0.2 and 10.10.0.88.

```
#show hosts
       VRF: management

DNS lookup is enabled
 Default domain      : .com
 Additional Domain   : .in .ac
 Name Servers        : 10.12.3.23
Host                                                                    Address
----                                                                    -------
test                                                                    10.12.12.67
test                                                                    10::23

 * - Values assigned by DHCP Client.
```

Table 2-2 explains the output fields.

Table 2-2: show hosts fields

Entry	Description
VRF: management	DNS configuration of specified VRF.
DNS lookup is enabled	DNS feature enabled or disabled.
Default domain	Default domain name used to complete unqualified host names (names without a dotted decimal domain name).
Additional Domain	A list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.
Name Servers	DNS server addresses that are used to translate hostnames to IP addresses.

Table 2-2: show hosts fields

Entry	Description
Host	Static hostname-to-address mappings in DNS.
Test	Static hostname-to-address mappings in DNS.
* - Values assigned by DHCP Client.	Name-server indicates it has been learned dynamically.

show running-config dns

Use this command to show the DNS settings of the running configuration.

Command Syntax

```
show running-config dns (vrf management|)
```

Parameters

vrf	management

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config dns
ip domain-lookup vrf management
ip domain-name vrf management .com
ip domain-list vrf management .in
ip domain-list vrf management .ac
ip name-server vrf management 10.12.3.23
ip host vrf management test 10.12.12.67 10::23
```

CHAPTER 3 Secure Shell

This chapter describes Secure Shell (SSH) commands.

SSH is a cryptographic protocol for secure data communication, remote login, remote command execution, and other secure network services between two networked computers.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

clear ssh hosts

Use this command to clear the `known_hosts` file.

This command clears all trusted relationships established with SSH servers during previous connections. When a client downloads a file from an external server the first time, the client stores the server keys in the `known_hosts` file. After that, other connections to the same server will use the server keys stored in the `known_hosts` file. In other words, a trusted relationship is created when a client accepts the server keys the first time.

An example of when you need to clear a trusted relationship is when SSH server keys are changed.

Command Syntax

```
clear ssh hosts
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ssh hosts
```

debug ssh server

Use this command to display SSH server debugging information.

Use the no form of this command to stop displaying SSH server debugging information.

Command Syntax

```
debug ssh server
no debug ssh server
```

Parameters

None

Default

By default, disabled.

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ssh server
```

feature ssh

Use this command to enable the SSH server.

Use the no form of this command to disable the SSH server.

Command Syntax

```
feature ssh (vrf management|)
no feature ssh (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature ssh
```

show debug ssh-server

Use this command to display whether SSH debugging is enabled.

Command Syntax

```
show debug ssh-server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug ssh-server
ssh server debugging is on
```

show running-config ssh server

Use this command to display SSH settings in the running configuration.

Command Syntax

```
show running-config ssh server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config ssh server
feature ssh vrf management
ssh server port 1024 vrf management
ssh login-attempts 2 vrf management
ssh server algorithm encryption 3des-cbc
```

show ssh key

Use this command to display the SSH server key.

By default, ssh feature is enabled in "management" vrf. Until and unless the same feature is explicitly enabled in "default" vrf, respective show command output will be empty.

Command Syntax

```
show ssh key vrf management
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ssh key
******************RSA KEY*********************
 ssh-rsa AAAAB3NzaC1yc2EAAAADAQABAAABAQDMuVc0jpNgMyNzaqzIELX6LlsaK/

```

show ssh server

Use this command to display the SSH server status.

Command Syntax

```
show ssh server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ssh server
ssh server enabled port: 22
authentication-retries 3
```

show username

Use this command to display the RSA or DSA key pair for a user.

Command Syntax

```
show username USERNAME keypair
```

Parameters

USERNAME	User identifier

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show username OcNOS keypair

ssh

Use this command to open an ssh session to a ipv4 address or host name resolved to an ipv4 address.

Command Syntax

```
ssh WORD (vrf (NAME | management))
ssh WORD <1-65535> (vrf (NAME | management))
ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc| aes256-cbc | 3des-cbc)) WORD  (vrf (NAME | management))
ssh (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc | aes256-cbc | 3des-cbc)) WORD <1-65535> (vrf (NAME | management))
```

Parameters

WORD	User and Destination Host name to resolve into IPV4 Address or IPv4 Address to open a ssh session as user@ipv4-address/Hostname
1-65535	Destination Port to open a ssh session. Default is 22
cipher	Specify algorithm to encrypt ssh session
aes128-ctr	Advanced Encryption Standard 128 bit Counter Mode
aes192-ctr	Advanced Encryption Standard 192 bit Counter Mode
aes256-ctr	Advanced Encryption Standard 256 bit Counter Mode
aes128-cbc	Advanced Encryption 128 bit Standard Cipher Block Chaining
aes192-cbc	Advanced Encryption Standard 192 bit Cipher Block Chaining
aes256-cbc	Advanced Encryption Standard 256 bit Cipher Block Chaining
3des-cbc	Triple Data Encryption Standard Cipher Block Chaining
vrf	Specify the VPN routing/forwarding instance.
NAME	Specify the name if the VPN routing/forwarding instance.
management	Management VPN routing/forwarding instance name.

Default

By default, ssh WORD option is 22

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#ssh cipher aes128-ctr 10.12.16.17 22 vrf management
The authenticity of host '10.12.16.17 (10.12.16.17)' can't be established.
RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
Are you sure you want to continue connecting (yes/no)?
```

ssh6

Use this command to open an ssh session to an ipv6 address or host name resolved to an ipv6 address.

Command Syntax

```
ssh6 (X:X::X:X | HOSTNAME) (vrf (NAME | management))
ssh6 (X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME | management))
ssh6 (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc |
  aes256-cbc | 3des-cbc)) (X:X::X:X | HOSTNAME) (vrf (NAME | management))
ssh6 (cipher (aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc |aes192-cbc |
  aes256-cbc | 3des-cbc))  (X:X::X:X | HOSTNAME) <1-65535> (vrf (NAME |
  management))
```

Parameters

X:XX::X:X	User and Destination IPv6 Address to open a ssh session as user@ipv6-address
HOSTNAME	User and Destination Host name to resolve into IPv6 Address to open an ssh session as user@ipv4-address/Hostname
1-65535	Destination Port to open a ssh session. Default is 22
cipher	Specify algorithm to encrypt ssh session
aes128-ctr	Advanced Encryption Standard 128 bit Counter Mode
aes192-ctr	Advanced Encryption Standard 192 bit Counter Mode
aes256-ctr	Advanced Encryption Standard 256 bit Counter Mode
aes128-cbc	Advanced Encryption 128 bit Standard Cipher Block Chaining
aes192-cbc	Advanced Encryption Standard 192 bit Cipher Block Chaining
aes256-cbc	Advanced Encryption Standard 256 bit Cipher Block Chaining
3des-cbc	Triple Data Encryption Standard Cipher Block Chaining
vrf	Specify the VPN routing/forwarding instance.
NAME	Specify the name if the VPN routing/forwarding instance.
management	Management VPN routing/forwarding instance name.

Default

No default value is specified.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#ssh6 cipher aes128-ctr 2:2::2:2 22 vrf management
The authenticity of host '2:2::2:2 (2:2::2:2)' can't be established.
RSA key fingerprint is 93:82:98:ce:b7:20:1a:85:a5:9a:2e:93:13:84:ea:9e.
```

```
        Are you sure you want to continue connecting (yes/no)?
```

ssh algorithm encryption

SSH server authorizes connection of only those algorithms that are configured from the list below. If a client tries establishing a connection to the server with the algorithm encryption that are not part of the list, the connection will not established.

SSH server supports the encryption algorithms Advanced Encryption Standard Counter Mode [AES-CTR], Advanced Encryption Standard Cipher Block Chaining [AES-CBC], and Triple Data Encryption Standard [3DES].

and they are as follows:

1. aes128-ctr
2. aes192-ctr
3. aes256-ctr
4. aes128-cbc
5. 3des-cbc
6. aes192-cbc
7. aes256-cbc

Use this command to set an algorithm encryption to establish ssh session.

Use the no form of this command to remove an algorithm encryption.

Command Syntax:

```
ssh server algorithm encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-cbc
  |aes192-cbc | aes256-cbc | 3des-cbc} (vrf management|)
no ssh server algorithm encryption {aes128-ctr | aes192-ctr | aes256-ctr | aes128-
  cbc |aes192-cbc | aes256-cbc | 3des-cbc} (vrf management|)
```

Parameters

aes18-ctr	AES 128 bit Counter Mode
aes192-ctr	AES 192 bit Counter Mode
aes256-ctr	AES 256 bit Counter Mode
aes128-cbc	AES 128 bit Cipher block chaining
aes192-cbc	AES 192 bit Cipher block chaining
aes256-cbc	AES 256 bit Cipher block chaining
3des-cbc	Triple DES Cipher block chaining
vrf	Virtual Routing and Forwarding
NAME	Virtual Routing and Forwarding name

Default

No default value is specified.

By default, all the ciphers are supported for a new ssh client to connect to the ssh server.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh server algorithm encryption aes128-ctr
```

Note: After configuring the ssh server algorithm encryption, if you disable the previous encryption algorithm, the command is rejected, and the following message is displayed:

```
"% There must be at least one session encryption alogirthm."
```

ssh key

Use this command to create a SSH server key.

Use the no form of this command remove a SSH server key. The `no ssh key` form (with no other parameters) deletes both RSA and DSA keys.

Command Syntax

```
ssh key dsa (vrf management|)
ssh key dsa force (vrf management|)
ssh key rsa (vrf management|)
ssh key rsa length <1024-4096> (vrf management|)
ssh key rsa length <1024-4096> force (vrf management|)
ssh key rsa force (vrf management|)
no ssh key (vrf management|)
no ssh key dsa (vrf management|)
no ssh key rsa (vrf management|)
```

Parameters

`dsa`	Digital System Algorithm (DSA) SSH key
`management`	Virtual Routing and Forwarding name
`force`	Forces the replacement of an SSH key
`rsa`	Rivest, Shamir, and Adelman (RSA) public-key cryptography SSH server key
`<1024-4096>`	Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024)

Default

DSA keys have a default value of 1024.

RSA keys have a minimum key length of 768 bits and the default length is 2048.

By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh key dsa vrf management
```

ssh login-attempts

Use this command to set the number of times that a user can try to log in to a SSH session.

Use the no form of this command to set the number of login attempts to its default (3).

Command Syntax

```
ssh login-attempts RETRIES (vrf management|)
no ssh login-attempts (vrf management|)
```

Parameters

RETRIES	Number of retries <1-3>
management	Virtual Routing and Forwarding name

Default

By default, the device attempts to negotiate a connection with the connecting host three times.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh login-attempts 3
```

ssh server port

Use this command to set the port number on which the SSH server listens for connections. The default port on which the SSH server listens is 22.

Use the no form of this command to set the default port number (22).

Command Syntax

```
ssh server port <1024-65535> (vrf management|)
no ssh server port (vrf management|)
```

Parameters

<1024-65535>	Port number
management	Virtual Routing and Forwarding name

Default

By default, SSH server port is 22.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ssh server port 1720
```

username sshkey

Use this command to add public key of the ssh clients to perform pasword-less login into the switch.

Command Syntax

```
username USERNAME sshkey LINE
```

Parameters

USERNAME	User identifier
LINE	Digital System Algorithm (DSA) key or Rivest, Shamir, and Adelman (RSA) key in OpenSSH format; this key is written to the `authorized_keys` file

Default

By default, SSHKEY is 1024.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#username fred
(config)#username fred sshkey

```

username keypair

Use this command to generate the key for users.

Command Syntax

```
username USERNAME keypair rsa
username USERNAME keypair dsa
username USERNAME keypair rsa length <1024-4096>
username USERNAME keypair rsa length <1024-4096> force
username USERNAME keypair rsa force
username USERNAME keypair dsa force
```

Parameters

`USERNAME`	User identifier
`rsa`	Rivest, Shamir, and Adelman (RSA) public-key cryptography SSH server key
`dsa`	Digital System Algorithm (DSA) SSH key
`<1024-4096>`	Number of bits to use when creating the SSH server key; this parameter is only valid for RSA keys (DSA keys have a default length of 1024)
`force`	Forces the replacement of an SSH key

Default

DSA keys have a default value of 1024.

RSA keys have a minimum key length of 1024 bits and the default length is 4096.

By default the system has RSA/DSA public/private key pair placed in /etc/ssh/. The force option is used if the user wants to regenerate the ssh rsa keys. The same thing applies for dsa also.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#username fred keypair rsa
```

CHAPTER 4 Simple Network Management Protocol

This chapter is a reference for Simple Network Management Protocol (SNMP) commands.

SNMP provides a standardized framework and a common language for monitoring and managing devices in a network. The SNMP framework consists of three parts:

- An SNMP manager: The system used to control and monitor the activities of network devices. This is sometimes called a Network Management System (NMS).
- An SNMP agent: The component within a managed device that maintains the data for the device and reports these data SNMP managers.
- Management Information Base (MIB): SNMP exposes management data in the form of variables which describe the system configuration. These variables can be queried (and sometimes set) by SNMP managers.

In SNMP, administration groups are known as *communities*. SNMP communities consist of one agent and one or more SNMP managers. You can assign groups of hosts to SNMP communities for limited security checking of agents and management systems or for administrative purposes. Defining communities provides security by allowing only management systems and agents within the same community to communicate.

A host can belong to multiple communities at the same time, but an agent does not accept a request from a management system outside its list of acceptable community names.

SNMP access rights are organized by groups. Each group is defined with three accesses: read access, write access, and notification access. Each access can be enabled or disabled within each group.

The SNMP v3 security level determines if an SNMP message needs to be protected from disclosure and if the message needs to be authenticated. The security levels are:

- noAuthNoPriv: No authentication or encryption
- authNoPriv: Authentication but no encryption
- authPriv: Both authentication and encryption.

SNMP is defined in RFCs 3411-3418.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

- snmp-server host
- snmp-server location
- snmp-server tcp-session
- snmp-server user
- snmp-server view

clear snmp hostconfig

Use this command to remove all SNMP trap hosts.

Command Syntax

```
clear snmp hostconfig
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear snmp hostconfig
```

debug snmp-server

Use this command to display SNMP debugging information.

Use the no form of this command to stop displaying SNMP debugging information.

Command Syntax

```
debug snmp-server
no debug snmp-server
```

Parameters

None

Default

By default, disabled.

Command Mode

Exec and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug snmp-server
```

show running-config snmp

Use this command to display the SNMP running configuration.

Command Syntax

```
show running-config snmp
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config snmp
snmp-server view all .1 included
snmp-server community abc group network-admin
snmp-server enable snmp
```

show snmp

Use this command to display the SNMP configuration, including session status, system contact, system location, statistics, communities, and users.

Command Syntax

```
show snmp
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp
SNMP Protocol:Enabled
sys Contact:
sys Location:

--------------------------------------------------------------------------------
Community Group/Access Context acl_filter
--------------------------------------------------------------------------------
public network-admin
_______________________________________________________________________________

                         SNMP USERS
_______________________________________________________________________________
User Auth Priv(enforce) Groups
_______________________________________________________________________________

SNMP Tcp-session :Disabled
```

show snmp community

Use this command to display SNMP communities.

Command Syntax

```
show snmp community
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp community

-------------------------------------------------------------------------------
-------------------------
Community                    Group/Access        view-name
version
-------------------------------------------------------------------------------
-------------------------
test                                  network-operator
testing                     network-operator          ipi
2c
```

Table 4-3 explains the output fields.

Table 4-3: show snmp community fields

Entry	Description
Community	SNMP Community string.
Group/Access	Community group name.
View-name	Community view name.
Version	Community version.

show snmp engine-id

Use this command to display the SNMP engine identifier.

The SNMP engine identifier is a unique string used to identify the device for administration purposes. You do not specify an engine identifier for a device; OcNOS generates a default string. For more about the SNMP engine identifier, see RFC 2571.

Command Syntax

```
show snmp engine-id
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp engine-id
SNMP ENGINE-ID : 80 00 8f 41 03 00 00 00 00 00 00
```

Table 4-4 explains the output fields.

Table 4-4: show snmp engine-ip fields

Entry	Description
SNMP ENGINE-ID : 80 00 8f 41 03 00 00 00 00 00 00	The SNMP engine identifier is a unique string used to identify the device for administration purposes.

show snmp group

Use this command to display SNMP server groups and associated views.

Command Syntax

```
show snmp group
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp group
--------------------------------------------------------------------------------
-------------------------------
community/user    group         version   Read-View   Write-view   Notify-view
--------------------------------------------------------------------------------
-------------------------------

test          network-operator    2c/1      all          all          all
kedar         network-operator    3         all          none         all
tamil         network-operator    3         all          none         all
```

Table 4-5 explains the output fields.

Table 4-5: show snmp group output

Entry	Description
Community/User	Displays the access type of the user for which the notification is generated.
Group	The name of the SNMP group, or collection of users that have a common access policy.
Version	SNMP version number.
Read-View	A string identifying the read view of the group. For further information on the SNMP views, use the show snmp view command.
Write-View	A string identifying the write view of the group.
Notify-View	A string identifying the notify view of the group. The notify view indicates the group for SNMP notifications, and corresponds to the setting of the snmp-server group group-name version notify notify-view command.

show snmp host

Use this command to display the SNMP trap hosts.

Command Syntax

```
show snmp host
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp host
-------------------------------------------------------------------------
Host           Port   Version   Level      Type     SecName
-------------------------------------------------------------------------

10.10.26.123   162    2c        noauth     trap     test
```

Table 4-6 explains the output fields.

Table 4-6: Show snmp host output

Entry	Description
Host	The IP address of the SNMP host server.
Port	The port being used for SNMP traffic.
Version	SNMP version number.
Level	The security level being used.
Type	The type of SNMP object being sent.
SecName	Secure Name for this SNMP session.

show snmp user

Use this command to display SNMP users and associated authentication, encryption, and group.

Command Syntax

```
show snmp user
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp user

SNMP USERS
_____________________________________________________________________
User            Auth    Priv(enforce)     Groups
_____________________________________________________________________
ntwadmin        MD5     AES               network-admin

#
```

Table 4-7 explains the output fields.

Table 4-7: Show snmp user output

Entry	Description
User	The person attempting to use the SMNMP agent.
Auth	The secure encryption scheme being used.
Priv(enforce)	What enforcement privilege is being used (in this case, it is the Advance Encryption Standard).
Group	The group to which the user belongs.

show snmp view

Use this command to display SNMP views.

Command Syntax

```
show snmp view
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show snmp view

View : all
  OID : .1
  View-type : included
```

snmp-server community

Use this command to create an SNMP community string and access privileges.

Use the no form of this command to remove an SNMP community string.

Command Syntax

```
snmp-server community WORD (| (view VIEW-NAME version (v1 | v2c ) ( ro | rw)) |
  (group WORD) |( ro | rw) | (use-acl WORD) ) (vrf management|)
no snmp-server community COMMUNITY-NAME (vrf management|)
```

Parameters

WORD	SNMP community string; maximum length 32 characters
VIEW-NAME	Defined view that defines the objects available to the SNMP community
v1	SNMP v1
v2c	SNMP v2c
ro	Read-only access
rw	Read-write access
group	Community group
WORD	Community group name; maximum length 32 characters
ro	Read-only access
rw	Read-write access
use-acl	Access control list (ACL) to filter SNMP requests
WORD	ACL name; maximum length 32 characters
management	Virtual Routing and Forwarding name

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server community MyComm view MyView1 version v2c rw vrf
management
```

snmp-server contact

Use this command to set the system contact information for the device (`sysContact` object).

Use the no form of this command to remove the system contact information.

Command Syntax

```
snmp-server contact (vrf management|) (TEXT|)
no snmp-server contact (vrf management|) (TEXT|)
```

Parameters

`management`	Virtual Routing and Forwarding name
`TEXT`	System contact information; maximum length 32 characters without spaces

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server contact vrf management Irving@555-0150
```

snmp-server enable snmp

Use this command to start the SNMP agent daemon over UDP.

Use the no form of this command to stop the SNMP agent daemon over UDP.

Command Syntax

```
snmp-server enable snmp  (vrf management|)
no snmp-server enable snmp  (vrf management|)
```

Parameters

management	Virtual Routing and Forwarding name

Default

No default value specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server enable snmp vrf management
```

snmp-server enable traps

Use this command to enable or disable SNMP traps and inform requests.

Command Syntax

```
snmp-server enable traps (link(linkDown|linkUp|)|snmp(authentication|)|) (vrf
  management|)
no snmp-server enable traps ((link(linkDown|linkUp|))|(snmp(authentication|))|)
  (vrf management|)
```

Parameters

`link`	Module notifications enable
`linkDown`	IETF Link state down notification
`linkUp`	IETF Link state up notification
`snmp`	Enable RFC 1157 notifications
`authentication`	Send SNMP authentication failure notifications
`management`	Virtual Routing and Forwarding name

Default

By default, SNMP server traps are enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server enable traps vrf management
```

snmp-server host

Use this command to configure an SNMP trap host. An SNMP trap host is usually a network management station (NMS) or an SNMP manager.

Use the no form of this command to remove an SNMP trap host.

Command Syntax

IPv4/SNMP v2:

```
snmp-server host (A.B.C.D|HOSTNAME) (traps | informs)
  version ((1 | v2c) WORD)  (|udp-port <1-65535>) (vrf management|)
```

IPv4/SNMP v3:

```
snmp-server host (A.B.C.D|HOSTNAME) (traps | informs)
  version(( (1 | 2c) WORD | (3 (noauth | auth | priv) WORD)) (|udp-port <1-65535>)
  (vrf management|)
```

Parameters

A.B.C.D	IPv4 address
HOSTNAME	DNS host name
traps	Send notifications as traps
informs	Send notifications as informs
version	Version
v1	SNMP v1
1	SNMP v1
v2c	SNMP v2c
2c	SNMP v2c
WORD	SNMP community string
<1-65535>	Host UDP port number; the default is 162
management	Virtual Routing and Forwarding name
3	SNMP v3 security level
noauth	No authentication and no privacy (noAuthNoPriv) security model: messages transmitted as clear text providing backwards compatibility with earlier versions of SNMP
auth	Authentication and no privacy (authNoPriv) security model: use message digest algorithm 5 (MD5) or Secure Hash Algorithm (SHA) for packet authentication; messages transmitted in clear text
priv	Authentication and privacy (authPriv) security model: use authNoPriv packet authentication with Data Encryption Standard (DES) Advanced Encryption Standard (AES) for packet encryption
WORD	SNMPv3 user name

Default

The default SNMP version is v2c and the default UDP port is 162.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server host 10.10.10.10 traps version 3 auth MyUser udp-port 512
vrf management
```

snmp-server location

Use this command to set the physical location information of the device (`sysLocation` object).

Use the `no` form of this command to remove the system location information.

Command Syntax

```
snmp-server location (vrf management|) (LINE|)
no snmp-server location (vrf management|) (LINE|)
```

Parameters

`management`	Virtual Routing and Forwarding name
`LINE`	Physical location information

Default

No system location string is set.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server location vrf management Bldg. 5, 3rd floor, northeast
```

snmp-server tcp-session

Use this command to start the SNMP agent daemon over TCP.

Use the no form of this command to close the SNMP agent daemon over TCP.

Command Syntax

```
snmp-server tcp-session (vrf management|)
no snmp-server tcp-session (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

By default, snmp server tcp session is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server tcp-session vrf management
```

snmp-server user

Use this command to create an SNMP server user.

Use the no form of this command to remove an SNMP server user.

Command Syntax

```
snmp-server user WORD (|WORD) ((auth (md5 | sha ) AUTH-PASSWORD) ((priv (des | aes)
  PRIV-PASSWORD) |) |) (vrf management|)
no snmp-server user USER-NAME (vrf management|)
```

Parameters

WORD	User name; length 5-32 characters
WORD	Name of the group to which the user belongs; maximum length 35 characters
auth	Packet authentication type
md5	Message Digest Algorithm 5 (MD5)
sha	Secure Hash Algorithm (SHA)
AUTH-PASSWORD	Authentication password; length 8-32 characters
priv	Packet encryption type (“privacy”)
des	Data Encryption Standard (DES)
aes	Advanced Encryption Standard (AES)
PRIV-PASSWORD	Encryption password; length 8-33 characters
management	Virtual Routing and Forwarding name

Default

By default, snmp server user word is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp-server user Fred auth md5 J@u-b;l2e`n,9p_ priv des
t41VVb99i8He{Jt vrf management
```

snmp-server view

Use this command to create or update a view entry

Use the no from of this command to remove a view entry.

Command Syntax

```
snmp-server view VIEW-NAME OID-TREE (included | excluded) (vrf management|)
no snmp-server view VIEW-NAME (vrf management|)
```

Parameters

`VIEW-NAME`	View name; maximum length 32 characters
`OID-TREE`	Object identifier of a subtree to include or exclude from the view; specify a text string consisting of numbers and periods, such as 1.3.6.2.4
`included`	Include `OID-TREE` in the SNMP view
`excluded`	Exclude `OID-TREE` from the SNMP view
`management`	Virtual Routing and Forwarding name

Default

By default, snmp-server view VIEW-NAME OID-TREE is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example creates a view named `myView3` that excludes the `snmpCommunityMIB` object (1.3.6.1.6.3.18).

```
#configure terminal
(config)#snmp-server view myView3 1.3.6.1.6.3.18 excluded vrf management
```

CHAPTER 5 Telnet

This chapter describes telnet commands.

Telnet is a client/server protocol that establishes a session between a user terminal and a remote host:

- The telnet client software takes input from the user and sends it to the server's operating system
- The telnet server takes output from the host and sends it to the client to display to the user

While telnet is most often used to implement remote login capability, the protocol is general enough to allow it to be used for a variety of functions.

Note: The commands below are supported only on the "management" VRF.

This chapter contains these commands:

debug telnet server

Use this command to display telnet debugging information.

Use the no form of this command to stop displaying telnet debugging information.

Command Syntax

```
debug telnet server
no debug telnet server
```

Parameters

None

Default

By default, disabled.

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug telnet-server

telnet server debugging is on
#
```

feature telnet

Use this command to enable the telnet server.

Use the no form of this command to disable the telnet server.

Note: Executing no form command closes the active telnet session.

Command Syntax

```
feature telnet (vrf management|)
no feature telnet (vrf management|)
```

Parameters

management	Virtual Routing and Forwarding name

Default

By default, feature telnet is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature telnet vrf management
```

show debug telnet-server

Use this command to display whether telnet debugging is enabled.

Command Syntax

```
show debug telnet-server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug telnet-server
telnet server debugging is on
```

show running-config telnet server

Use this command to display telnet settings in the running configuration.

Command Syntax

```
show running-config telnet server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config telnet server

telnet server port 1025 vrf management
feature telnet vrf management
```

show telnet-server

Use this command to display the telnet server status.

Command Syntax

```
show telnet server
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show telnet server
telnet server enabled port: 23
```

telnet

Use this command to open a telnet session to an ipv4 address or host name resolved to ipv4 address.

Command Syntax

```
telnet (A.B.C.D | HOSTNAME) (vrf (NAME|management))
telnet (A.B.C.D | HOSTNAME) (<1-65535>) (vrf (NAME|management))
```

Parameters

A.B.C.D	Destination IPv4 Address to open a telnet session.
HOSTNAME	Destination Hostname to resolve into IPv4 address to open a telnet session.
1-65535	Destination Port to open a telnet session. Default is 23.
vrf	Specify the VPN routing/forwarding instance.
NAME	Specify the name if the VPN routing/forwarding instance.
management	Management VPN routing/forwarding instance name.

Default

By default, telnet is 23

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#telnet 10.12.16.17 2543 vrf management
Trying 10.12.16.17...
```

telnet6

Use this command to open a telnet session to an ipv6 address or host name resolved to ipv6 address.

Command Syntax

```
telnet6 (X:X::X:X| HOSTNAME) (vrf (NAME|management))
telnet6 (X:X::X:X | HOSTNAME) (<1-65535>) (vrf (NAME|management))
```

Parameters

X:X::X:X	Destination IPv6 Address to open a telnet session.
HOSTNAME	Destination Host name to resolve into IPv6 address to open a telnet session.
1-65535	Destination Port to open a telnet session. Default is 23.
vrf	Specify the VPN routing/forwarding instance.
NAME	Specify the name if the VPN routing/forwarding instance.
management	Management VPN routing/forwarding instance name.

Default

By default, telnet is 23.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#telnet6 2:2::2:2 2543 vrf management
 Trying 2:2::2:2...
```

telnet server port

Use this command to set the port number on which the telnet server listens for connections. The default port on which the telnet server listens is 23.

You can only give this command when the telnet server is disabled. See the feature telnet command.

Use the no form of this command to set the default port number (23).

Command Syntax

```
telnet server (port <1024-65535>) (vrf management|)
no telnet server port (vrf management|)
```

Parameters

`<1024-65535>`	Port number
`management`	Virtual Routing and Forwarding name

Default

By default, telnet server port number is 23

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#telnet server port 1157 vrf management
```

CHAPTER 6 Syslog

This chapter is a reference for the `syslog` commands.

Linux applications use the `syslog` utility to collect, identify, time-stamp, filter, store, alert, and forward logging data. The `syslog` utility can track and log all manner of system messages from informational to extremely critical. Each system message sent to a `syslog` server has two descriptive labels associated with it:

- The function (facility) of the application that generated it. For example, an application such as `mail` and `cron` generates messages with a facility names “mail” and “cron”.
- Eight degrees of severity (numbered 0-7) of the message which are explained in Table 6-8.

This chapter contains these commands:

Syslog Severitie

Note: The prefixes of the example logs are all removed. i.e. Following full log "2020 Apr 12 11:20:27.612 : 17U-18U : PSERV : MERG : !!! hsl Module crashed, System reboot halted as it rebooted continuosly 2 times" is captured as "hsl Module crashed,System reboot halted as it rebooted continuosly 2 times".

Table 6-8: Syslog severities (Sheet 1 of 2)

Severity Level	Keyword	Description

0	emergency	The whole system is unusable and needs operator intervention to recover. If only a particular port or component is unusable, but the system as a whole is still usable it is not categorized at an emergency level.
		Examples of this type of message:
		`Output Power of PSU XX (psu_no) XX Watt] has exceeded Maximum Output Power Limit[XX Watt]`
		`OSPF Initialization failed.`

1	alert	The operator needs to act immediately or the system might go into emergency state. The system or one of its component's functionality might be critically affected.
		Examples of this type of message:
		`Temperature of sensor is (curr_temp)C. It is nearing Emergency Condition.`
		`OSPF has exceed lsdb limit`
		`OSPF Detected router with duplicate router ID [ID]`

2	critical	A critical system event happened which requires the operator's attention. The event might not require immediate action, but this event can affect functionality or behavior of a system component.
		Examples of this type of message:
		`OSPF Neighbor session went down.`
		`Interface %s changed state to down`

3	error	An error event happened which does not require immediate attention. This log message provides details about error conditions in the system or its components which you can use to troubleshoot problems.
		These events are not logged directly even if the logging level is set to include this level. You also need to enable the protocol debug filters (such as `debug ospf all`).
		Examples of this type of message:
		`Device i2c bus open error.!!!`
		`[DECODE] Attr ASPATH: Invalid AS Path value.`
		`OSPF MD5 authentication error`

4	notification	Notifications about important system and protocol events to assure the operator that the system is running properly. If a critical/alert condition has happened and has been corrected, that is also logged at this level.
		Examples of this type of message:
		`OSPF Received link up for interface: xe1`
		`OSPF neighbour [10.1.1.1] Status change Exstart -> Exchange`
		`Interface %s changed state to UP`

Table 6-8: Syslog severities (Sheet 2 of 2)

Severity Level	Keyword	Description

5	informational	Detailed informational events happening across the system and protocol modules. These events are not necessarily important and are useful only to find details about the functionality being executed in the system and its components. Some of these events might be periodic events like hello or keep alive messages along with packet dumps. Also, this level includes logs for control packets that are ignored and do not impact the protocol states.
		IP Infusion Inc. recommends to use proper debug filters to log only relevant events and switch off other events; otherwise the logs can get verbose. For example:
		`debug ospf all`
		`no debug ospf packet hello`
		The above enables all OSPF debugging, but disables the periodic hello messages.
		Examples of this type of message:
		`Successfully added dynamic neighbour`
		`[DECODE] KAlive: Received!`
		`[FSM] Ignoring Unsupported event <EVENT> in state <STATE>`
		`Unknown ICMP packet type"`
		`OSPF RECV[%s]: From %r via %s: Version number mismatch`
		`OSPF RECV[%s]: From %r via %s: Network address mismatch`

6	debug informational	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.
7	debug detailed	Developer notification events that might not be readable by an operator. However these logs are useful for debugging by a developer and if required, this level needs to be enabled and provided to technical support for analysis.

Log File Rotation

Log rotation is important to maintain the stability of the device, because the larger log files are difficult to manipulate and file system would run out of space. The solution to this common problem is Log File Rotation.

Log rotation is scheduled to happen for every 5 minutes, here the log file size is used as the condition to perform rotation.

Log rotate operation creates a backup of the current log file, and clears the current log file content. Also these rotated log files are compressed to save disk space. Excluding the current log file, four backup files are maintained in the system, and the older logs are removed as part of the rotation operation.

Default log file `/var/log/messages` rotated, if the size is greater than 100 MB. The following are the rotated log files generated in the path `/var/log`

```
root@OcNOS:/var/log# ls messages*
messages  messages.1  messages.2.gz  messages.3.gz  messages.4.gz
```

Manually configured log file `/log/LOG1` gets rotated, if its size is greater than configured size. Here `LOG1` is the manually configured using the command `logging logfile <filename>` and the log file size in bytes can be configured using the command `logging logfile LOG1 <severity> size <4096-419430400>`

```
OcNOS(config)#logging logfile LOG1 7 size 4096
```

Here configured logging file `/log/LOG1` is rotated if the size is greater than 4096 bytes. The following are the rotated log files generated in the path `/log`

```
root@OcNOS:/log# ls LOG*
LOG1  LOG1.1  LOG1.2.gz  LOG1.3.gz  LOG1.4.gz
```

clear logging logfile

Use this command to clear the existing contents of the configured logging logfile.

Note: If the name of the configured logging log file is “mylogfile”, this command clears only the log file mylogfile. But the other rotated or compressed log files are untouched.

Command Syntax

```
clear logging logfile
```

Parameters

None

Default

No default value is specified

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS-SP version 3.0.

Example

```
#clear logging logfile
```

feature rsyslog

Use this command to enable the rsyslog server.

Use the no form of this command to disable the rsyslog server.

Command Syntax

```
feature rsyslog vrf (management|)
no feauture rsyslog vrf (management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#feature rsyslog vrf management
```

debug logging

Use this command to display logging debugging information.

Use the no form of this command stop displaying logging debugging information.

Command Syntax

```
debug logging host
no debug logging host
```

Parameters

None

Command Mode

Exec and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug logging host
```

log syslog

Use this command to begin logging to the system log and set the level to debug.

Syslog enables centrally logging and analyzing of configuration events and system error messages. This helps monitor interface status, security alerts, and CPU process overloads. It also allows real-time capturing of client debug sessions. The command instructs the `VLOGD` daemon to forward all PVR debug output from all active `terminal monitor` sessions to the syslog file.

Use the `no` parameter to disable logging to the system log.

Command Syntax

```
log syslog
no log syslog
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#log syslog
```

logging console

Use this command to set the severity level that a message must reach before the messages is sent to the console. The severity levels are from 0 to 7 as shown in Table 6-8.

Use the no form of this command to disable logging console messages.

Note: Below message will be displayed if console severity is set to 6 or 7:

% Warning : If debug volume is huge it can degrade system performance and makes console to be non-responsive

Command Syntax

```
logging console (<0-7>|)
no logging console
```

Parameters

<0-7>	Maximum logging level for console messages as shown in Table 6-8.

Note: Setting the level above 5 might affect performance and is not recommended in a production network.

Default

If not specified, the default logging level is 2 (Critical).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#logging console 6

(config)#2015 Dec 23 03:13:26 OcNOS BGP-6: [RIB] Scanning BGP Network Route
s...
2015 Dec 23 03:13:41 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:13:56 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:00 OcNOS BGP-6: [RIB] Scanning BGP RIB...
2015 Dec 23 03:14:11 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:26 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:41 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:14:56 OcNOS BGP-6: [RIB] Scanning BGP Network Routes...
2015 Dec 23 03:15:00 OcNOS BGP-6: [RIB] Scanning BGP RIB...

(config)#no logging console
```

logging level

Use this command to set the severity level that a message for a specific process must reach before the messages is logged. The severity levels are from 0 to 7 as shown in Table 6-8. Logging happens for the messages less than or equal to the configured severity level.

Use the no form of this command to disable logging messages.

Note: Default log level is 2 to report Emergency-0, Alert-1 and Critical-2 level events.

Command Syntax

```
logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
  mstp|ndd|nsm|onm|oam|ospf|ospf6|pim|pon|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow
  |vrrp) <0-7>
no logging level (all|auth|bgp|dvmrp|hostp|hsl|isis|l2mrib|lacp|lagd|ldp|mrib|
  mstp|ndd|nsm|oam|onm|ospf|ospf6|pim|pon|pservd|ptp|rib|rip|ripng|rmon|rsvp|sflow
  |vrrp)
```

Parameters

`all`	All messages
`auth`	Auth messages
`bgp`	BGP messages
`dvmrp`	DVMRP messages
`hostp`	Hostp messages
`hsl`	HSL messages
`isis`	ISIS messages
`l2mrib`	L2MRIB messages
`lacp`	LACP messages
`lagd`	LAGD messages
`ldp`	LDP messages
`mrib`	MRIB messages
`mstp`	MSTP messages
`ndd`	NDD messages
`nsm`	NSM messages
`oam`	OAM messages
`onm`	ONM messages
`ospf`	OSPF messages
`ospf6`	OSPF6 messages
`pim`	PIM messages
`pon`	PON messages
`pservd`	PSERVD messages
`ptp`	PTP messages
`rib`	RIB messages

`rip`	RIP messages
`ripng`	RIPNG messages
`rmon`	RMON messages
`rsvp`	RSVP messages
`sflow`	Sflow messages
`vrrp`	VRRP messages
`<0-7>`	Severity level as shown in Table 6-8.

Default

By default, the logging level is 2 (critical).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#logging level all 5

#configure terminal
(config)#logging level bgp 6

(config)#no logging monitor
```

logging logfile

Use this command to specify the log file controls and where to save the logs in a configuration file. This command enables writing debug output and command history to the disk file in the directory `/log/`.

When logging logfile is enabled, OcNOS log information is stored in user configured logging file which is present in "/log" directory. The log is spread across four files total of these files size is the user configured size.

For example, if the name of the logging log file is “mylogFile” and logging file size configured is 4 MB then each file will be maximum size of 1MB. The logging file names will be "mylogFile", "mylogfile.0", "mylogfile.1" and "mylogfile.2".

"mylogFile" will have the latest log information. As soon as it’s size becomes 1 MB this file is renamed as mylogFile.0 and newlog information is written to new "mylogFile". As a result oldest log information stored in mylogfile.2 and is lost in order to accommodate new set of logs in mylogFile.

Use option no to cancel writing to a specific log file.

Note: Changing logfile paramenters (name/size/severity) will be taken into effect for the next OcNOS session.

Command Syntax

```
logging logfile LOGFILENAME <0-7> ((size <4096-4194304>)|)
no logging logfile
```

Parameter

`LOGFILENAME`	Name of the log file.
`<0-7>`	Severity level as shown in Table 6-8.
`<4096-4194304>`	Log file size in bytes.

Default

By default, log file size is 4194304 bytes.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This command is used to log the debug messages of a particular protocol daemon to the specified file.

```
#configure terminal
(config)#logging logfile test123 7
```

logging monitor

Use this command to set the severity level that a message must reach before a monitor message is logged. The severity levels are shown in Table 6-8.

Use the no parameter to disable logging monitor messages.

Command Syntax

```
logging monitor (<0-7>|)
no logging monitor
```

Parameters

<0-7>	Maximum logging level for monitor messages as shown in Table 6-8.

Note: Setting the level above 5 might affect performance and is not recommended in a production network.

Default

If not specified, the default logging level is 3 (error).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#logging monitor 6

(config)#no logging monitor
```

logging server

Use this command to set a syslog server.

OcNOS supports logging messages to a syslog server in addition to logging to a file or the console (local or ssh/telnet console). OcNOS messages can be logged to a local syslog server (the machine on which OcNOS executes) as well as to one or more remote syslog servers.

Use the `no` form of this command to remove a syslog server.

Note: Only one facility is supported for all protocol modules across all the configured logging servers.

Command Syntax

```
logging server (A.B.C.D|HOSTNAME) (|((<0-7>) (|facility (local0| local1 | local2 |
  local3| local4 |local5 | local6 | local7 |user)))) (vrf management|)
no logging server (A.B.C.D | HOSTNAME ) (vrf management|)
```

Parameters

`A.B.C.D`	IPv4 address
`HOSTNAME`	Host name; specify `localhost` to log locally
`<0-7>`	Severity at which messages are logged as shown in Table 6-8. If not specified, the default is 3.
`facility`	Entity logging the message (user defined); if not specified, the default is local7
`local0`	Local0 entity
`local1`	Local1 entity
`local2`	Local2 entity
`local3`	Local3 entity
`local4`	Local4 entity
`local5`	Local5 entity
`local6`	Local6 entity
`local7`	Local7 entity (default)
`user`	User entity
`management`	Virtual Routing and Forwarding name

Default

If not specified, the default severity at which messages are logged is 3 (error).

If not specified, the default `facility` is `local7`.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#logging server MyLogHost vrf management

(config)#no feature rsyslog vrf management
(config)#
(config)#feature rsyslog
(config)#logging server 10.10.10.10 7
```

Note: In the latter configuration, the default VRF does not need not to be specified in the command.

logging timestamp

Use this command to set the logging timestamp granularity.

Use the no form of this command to reset the logging timestamp granularity to its default (milliseconds).

Note: Any change in timestamp configurations will result in timestamp configured for event logged by protocol modules except for CLI history for the current and active sessions. The timestamp configuration is reflected in CLI history for new CLI sessions.

Changing logging timestamp will be taken into effect for the next OcNOS session.

Command Syntax

```
logging timestamp (microseconds|milliseconds|seconds|none)
no logging timestamp
```

Parameters

`microseconds`	Microseconds granularity
`milliseconds`	Milliseconds granularity
`seconds`	Seconds granularity
`none`	no timestamp in log message

Default

By default, logging time stamp granularity is milliseconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#logging timestamp milliseconds
```

show logging

Use this command to display the logging configuration.

Command Syntax

```
show logging (info|level|server|console|timestamp|monitor)
```

Parameters

`info`	Show server logging configuration
`level`	Show facility logging configuration
`server`	Syslog server configuration
`console`	Console configuration
`timestamp`	Timestamp configuration
`monitor`	Monitor configuration

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging console
Console logging     : enabled Severity: Operator (critical) Level : 2

#show logging monitor
Logging monitor     : enabled Severity: Operator (debugging) Level: 7

#show logging server
  Remote Servers:
               1.1.1.1
               severity: Operator (informational)

pservd                  2                       2
cmmd                    2                       2
```

show logging last

Use this command to display lines from the end of the log file.

Command Syntax

```
show logging last (<1-9999>)
```

Parameters

<1-9999>	Number of lines to display from end of the log file

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging last 100
2016 Mar 03 00:02:32 x86_64-debian NSM-3: AgentX: failed to send open message:

```

show logging logfile

Use this command to display whether logging is enabled, the log file name, and the logging severity.

Command Syntax

```
show logging logfile
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh logging logfile
File logging        : enabled  File Name   : /log/abc  Severity   : (7)
2017 Sep 25 17:18:14 : OcNOS : CMLSH : CLI_HIST : User root@/dev/ttyS1 : CLI : '

2017 Sep 25 17:29:02 : OcNOS : CMLSH : CLI_HIST : User root@/dev/ttyS1 : CLI : '
sh logging console
```

show logging logfile last-index

Use this command to display the number of line in the log file.

Command Syntax

```
show logging logfile last-index
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging logfile last-index
logfile last-index : 10
```

Table 6-9 explains the output fields.

Table 6-9: show logging logfile last-index fields

Entry	Description
logfile last-index	Number of line in the logfile.

show logging logfile start-seqn end-seqn

Use this command to display a range of lines in the log file.

Command Syntax

```
show logging logfile start-seqn (<0-2147483647>) (|(end-seqn <0-2147483647>))
```

Parameters

`start-seqn`	Starting line number
`end-seqn`	Ending line number

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show logging logfile start-seqn 2 end-seqn 7
2
3 2019 Jan 04 06:20:49.611 : NE4-router : CMLSH : CLI_HIST : User root@/dev/

4
5 2019 Jan 04 06:21:08.512 : NE4-router : CMLSH : CLI_HIST : User root@/dev/
ttyS0 : CLI : show logging logfile last-index
6
7 2019 Jan 04 06:21:16.246 : NE4-router : CMLSH : CLI_HIST : User root@/dev/
ttyS0 : CLI : show logging logfile last-index
NE4-router#
```

Table 6-10 explains the output fields.

Table 6-10: show logging logfile start-seqn end-seqn fields

Entry	Description
start-seqn	Starting line number
end-seqn	Ending line number

show logging logfile start-time end-time

Use this command to display lines from the log file within a given date-time range.

Command Syntax

```
show logging logfile start-time (<2000-2030> WORD <1-31> WORD) (|(end-time <2000-
  2030> WORD <1-31> WORD))
```

Parameters

start-time	Starting date and time:
<2000-2030>	Year in YYYY format
WORD	Month as jan, feb, mar,..., oct, nov, or dec (maximum length 3 characters)
<1-31>	Day of month in DD format
WORD	Hour, minutes, seconds in HH:MM:SS format (maximum length 8 characters); range <0-23>:<0-59>:<0-59>
end-time	Ending date and time:
<2000-2030>	Year in YYYY format
WORD	Month as jan, feb, mar,..., oct, nov, or dec (maximum length 3 characters)
<1-31>	Day of month in DD format
WORD	Hour, minutes, seconds in HH:MM:SS format (maximum length 8 characters); range <0-23>:<0-59>:<0-59>

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh logging logfile start-time 2019 Jan 04 06:20:49 end-time 2019 Jan 04
06:21:16
2019 Jan 04 06:20:49.611 : NE4-router : CMLSH : CLI_HIST : User root@/dev/
ttyS0 : CLI : sh logging logfile

2019 Jan 04 06:21:08.512 : NE4-router : CMLSH : CLI_HIST : User root@/dev/
ttyS0 : CLI : show logging logfile last-index

2019 Jan 04 06:21:16.246 : NE4-router : CMLSH : CLI_HIST : User root@/dev/
ttyS0 : CLI : show logging logfile last-index
#
```

show running-config logging

Use this command to display the logging configuration.

Command Syntax

```
show running-config logging
```

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config logging
no Logging console
no Logging monitor
logging timestamp milliseconds
```

CHAPTER 7 User Management

This chapter is a reference for user management commands.

This chapter includes these commands:

clear aaa local user lockout username

Use this command to unlock the locked user due to three times wrong password login attempt.

Command Syntax

```
clear aaa local user lockout username USERNAME
```

Parameters

USERNAME	User name; length 2-15 characters

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear aaa local user lockout username testuser
```

clear line

Use this command to clear or close the already opened vty line sessions.

Command Syntax

```
clear line WORD
```

Parameters

```
WORD Enter the Location name (Max Size 64)
```

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

          Line       User              Idle        Location/Session  PID
TYPE   Role
   (*) 130 vty 0    [C]ocnos              0d00h00m     pts/0
16725   Local  network-admin
#clear line pts/0
Connection closed by foreign host.
-bash-4.1#
```

clear user

Use this command to clear or close the already opened sessions based on the username.

Note: This command will close active telnet sessions if the account being cleared is already active, however the SSH sessions will continue to persist until disconnect.

Command Syntax

clear user WORD

Parameters

`WORD Enter the username (Max Size 28)`

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

          Line       User              Idle        Location/Session  PID
TYPE   Role
   (*) 130 vty 0    [C]ocnos              0d00h00m     pts/0
16725   Local  network-admin
#clear user ocnos
Connection closed by foreign host.
-bash-4.1#
```

debug user-mgmt

Use this command to display user management debugging information.

Use the no form of this command stop displaying user management debugging information.

Command Syntax

```
debug user-mgmt
no debug user-mgmt
```

Parameters

None

Default

By default, disabled.

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug user-mgmt

#config t
(config)#debug user-mgmt
```

show user-account

Use this command to display information about all users or a given user.

Command Syntax

```
show user-account (WORD|)
```

Parameters

WORD	User name

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show user-account
User:user1
                roles: network-operator
User:user2
                roles: network-operator
User:user3
                roles: network-operator
```

username

Use this command to add a user or to change a user password.

The `role` parameter maps to privilege levels in the TACACS+ server as shown in Table 7-11

Table 7-11: Role/privilege level mapping

Role	Privilege level
Network administrator	15
Network engineer	14
Network operator	1 to 13
Network user	0 or greater then 15

Note: You cannot change the `role` parameter for the currently active user.

Use the `no` form of this command to remove a user.

Command Syntax

```
username USERNAME
username USERNAME password (encrypted|) PASSWORD
username USERNAME role (network-admin|network-engineer|network-operator|network-user)
username USERNAME role (network-admin|network-engineer|network-operator|network-user) password (encrypted|) PASSWORD
no username USERNAME
```

Parameters

`USERNAME`	User name; length 2-15 characters
`encrypted`	Password is encrypted
`PASSWORD`	Password; length 5-32 characters
`network-admin`	Network administrator role with all access permissions that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch. Only network administrators can manage other users with the enable password, Authentication, Authorization and Accounting, RADIUS, and TACACS+ commands.
`network-engineer`	Network engineer role with all access permission that can make permanent changes to the configuration. Changes persist after a reset/reboot of the switch.
`network-operator`	Network operator role with all access permissions that can make temporary changes to the configuration. Changes do not persist after a reset/reboot of the switch.
`network-user`	Network user role with access permissions to display the configuration, but cannot change the configuration.

Default

By default, user name is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#username fred_smith password encrypted W3g7y&6yV}JH6&5EYIah?779IT9iV2
```

CHAPTER 8 Network Time Protocol

This chapter is a reference for Network Time Protocol (NTP) commands.

NTP synchronizes clocks between computer systems over packet-switched networks. NTP can synchronize all participating computers to within a few milliseconds of Coordinated Universal Time (UTC).

NTP uses a hierarchical, layered system of time sources. Each level of this hierarchy is called a “stratum” and is assigned a number starting with zero at the top. The number represents the distance from the reference clock and is used to prevent cyclical dependencies in the hierarchy.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

clear ntp statistics

Use this command to reset NTP statistics.

Command Syntax

```
clear ntp statistics (all-peers | io | local | memory)
```

Parameters

`all-peers`	Counters associated with all peers
`io`	Counters maintained in the input-output module
`local`	Counters maintained in the local protocol module
`memory`	Counters related to memory allocation

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ntp statistics all-peers
```

debug ntp

Use this command to display NTP debugging messages.

Use the no form of this command to stop displaying NTP debugging messages.

Command Syntax

```
debug ntp
no debug ntp
```

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug ntp

(config)#no debug ntp
```

feature ntp

Use this command to enable NTP.

Use the no form of this command to disable NTP.

Command Syntax

```
feature ntp (vrf management|)
no feature ntp (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

By default, feature ntp is enabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature ntp vrf management

(config)#no feature ntp vrf management
```

ntp authenticate

Use this command to enable NTP authentication.

Use the no form of this command to disable authentication.

Command Syntax

```
ntp authenticate (vrf management|)
no ntp authenticate (vrf management|)
```

Parameters

management	Virtual Routing and Forwarding name

Default

By default, ntp authenticate is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ntp authenticate vrf management
```

ntp authentication-key

Use this command to set an NTP Message Digest Algorithm 5 (MD5) authentication key.

Use the no form of this command to delete an authentication key.

Command Syntax

```
ntp authentication-key <1-65534> md5 WORD (vrf management|)
ntp authentication-key <1-65534> md5 WORD 7 (vrf management|)
no ntp authentication-key <1-65534> md5 WORD (vrf management|)
```

Parameters

`<1-65534>`	Authentication key number
`WORD`	MD5 string (maximum 8 characters)
`7`	Encrypt using weak algorithm
`management`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ntp authentication-key 535 md5 J@u-b;l2 vrf management
```

ntp enable

Use this command to enable NTP.

Use the no form of this command to disable NTP.

Command Syntax

```
ntp enable (vrf management|)
no ntp enable (vrf management|)
```

Parameters

management	Virtual Routing and Forwarding name

Default

By default, ntp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ntp enable vrf management
```

ntp logging

Use this command to log NTP events.

Use the no form of this command to disable NTP logging.

Command Syntax

```
ntp logging (vrf management|)
no ntp logging (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

By default, ntp logging message is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ntp logging vrf management
```

ntp peer

Use this command to configure a peer association. In a peer association, this system can synchronize with the other system or the other system can synchronize with this system.

Use the no command to remove a peer association.

Command Syntax

```
ntp peer (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp peer (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp peer (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
no ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp peer (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
```

Parameters

A.B.C.D	IPv4 address of peer
HOSTNAME	Host name of peer
X:X::X:X	IPv6 address of peer
prefer	Prefer this peer; preferred peer responses are discarded only if they vary dramatically from other time sources
key	Peer authentication key
<1-65534>	Peer authentication key value
minpoll	Minimum poll interval
<4-16>	Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)
maxpoll	Maximum poll interval
<4-16>	Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)
management	Virtual Routing and Forwarding name

Default

By default, value of minpoll is 4 and maxpoll is 6.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ntp peer 10.10.0.23 vrf management
(config)#ntp peer 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp peer 10.10.0.23 vrf management
```

ntp server

Use this command to configure an NTP server so that this system synchronizes with the server, but not vice versa.

Use the no option with this command to remove an NTP server.

Command Syntax

```
ntp server (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
no ntp server (A.B.C.D | X:X::X:X | HOSTNAME) ({prefer|key <1-65534>|minpoll <4-16>|maxpoll <4-16>}|) (vrf management|)
no ntp server (A.B.C.D | HOSTNAME) ({prefer|key|minpoll|maxpoll}|) (vrf management|)
```

Parameters

A.B.C.D	IPv4 address of the server
HOSTNAME	Host name of the server
X:X::X:X	IPv6 address of the server
prefer	Prefer this server; preferred server responses are discarded only if they vary dramatically from other time sources
key	Server authentication key
<1-65534>	Server authentication key
minpoll	Minimum poll interval
<4-16>	Minimum poll interval value in seconds raised to a power of 2 (default 4 = 16 seconds)
maxpoll	Maximum poll interval
<4-16>	Maximum poll interval value in seconds raised to a power of 2 (default 6 = 64 seconds)
management	Virtual Routing and Forwarding name

Default

By default, minpoll is 4 and maxpoll is 6.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ntp server 10.10.0.23 vrf management
(config)#ntp server 10.10.0.23 prefer key 12345 vrf management

(config)#no ntp server 10.10.0.23 vrf management
```

ntp source-interface

Use this command to configure an NTP source-interface. NTP sets the source IP address for all NTP packets based on the address of the interface through which the NTP packet are sent.

Use the `no` option with this command to remove an NTP server.

Command Syntax

```
ntp source-interface  IFNAME
```

Parameter

`IFNAME`	Interface name

Default

No default value is specified.

Command Mode

Configure mode

Applicability

This command was introduced in a version before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ntp source-interface xe7/1
(config)#no ntp source-interface xe7/1
```

ntp sync-retry

Use this command to retry NTP synchronization with configured servers.

Command Syntax

```
ntp sync-retry (vrf management|)
```

Parameters

`management`	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#ntp sync-retry vrf management
```

ntp trusted-key

Use this command to define a “trusted” authentication key. If a key is trusted, the device will synchronize with a system that specifies this key in its NTP packets.

Use the no option with this command to remove a trusted key.

Command Syntax

```
ntp trusted-key <1-65534> (vrf management|)
no ntp trusted-key <1-65534> (vrf management|)
```

Parameter

<1-65534>	Authentication key number
management	Virtual Routing and Forwarding name

Default

By default, ntp trusted key is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ntp trusted-key 234676 vrf management
```

show ntp authentication-keys

Use this command to display authentication keys.

Command Syntax

```
show ntp authentication-keys
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ntp authentication-keys
--------------------------
 Auth Key       MD5 String
--------------------------
123             0xa2cb891442844220
#
```

Table 8-12 explains the output fields.

Table 8-12: show ntp authentication-key fields

Entry	Description
Auth key	Authentication key (password). Use the password to verify the authenticity of packets sent from this interface or peer interface.
MD5 String	One or more MD5 key strings. The MD5 key values can be from 1 through 16 characters long. You can specify more than one key value within the list.

show ntp authentication-status

Use this command to display whether authentication is enabled or disabled.

Command Syntax

```
show ntp authentication-status
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp authentication-status
Authentication enabled
```

show ntp logging-status

Use this command to display the NTP logging status.

Command Syntax

```
show ntp logging-status
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp logging-status
NTP logging enabled
```

show ntp peer-status

Use this command to display the peers for which the server is maintaining state along with a summary of that state.

Command Syntax

```
show ntp peer-status
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ntp peer-status
Total peers : 1
* - selected for sync, + -  peer mode(active),
- - peer mode(passive), = - polled in client mode,
x - source false ticker
     remote           refid      st t when poll reach   delay   offset  jitter
==============================================================================
*216.239.35.4    .GOOG.           1 u   24   64  377   38.485    0.149   0.053
#
```

Table 8-13 explains the output fields.

Table 8-13: show ntp peer-status fields

Entry	Description
Total peers	Number of servers and peers configured.
* - selected for sync, + - peer mode (active), - - peer mode (passive), = - polled in client mode x - source false ticker	Fate of this peer in the clock selection process.
Remote	Address of the remote peer.
refid	Reference ID (0.0.0.0 for an unknown reference ID).
st	The stratum of the remote peer (a stratum of 16 indicated remote peer is unsynchronized).
t	Type of peer (local, unicast, multicast and broadcast).
when	Time the last packet was received.

Table 8-13: show ntp peer-status fields

Entry	Description
poll	The polling interval (seconds).
reach	The reachability register (octal).
delay	Current estimated delay in seconds.
offset	Current estimated offset in seconds.
jitter	Current dispersion of the peer in seconds.

show ntp peers

Use this command to display NTP peers.

Command Syntax

```
show ntp peers
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp peers
-------------------------------------------------------
Peer IP Address                          Serv/Peer
-------------------------------------------------------
216.239.35.4                             Server (configured)
```

Table 8-14 explains the output fields.

Table 8-14: show ntp peers fields

Entry	Description
Peer IP Address	Address of the neighbor protocol.
Serv/Peer	List of NTP peers and servers configured or dynamically learned.

show ntp statistics

Use this command to display NTP statistics.

Command Syntax

```
show ntp statistics (io | local | memory | peer ( ipaddr (A.B.C.D | X:X::X:X ) |
  name (HOSTNAME)) )
```

Parameters

`io`	Counters maintained in the input-output module
`local`	Counters maintained in the local protocol module
`memory`	Counters related to memory allocation
`peer`	Counters associated with the specified peer
`A.B.C.D`	Peer IPv4 address
`X:X::X:X`	Peer IPv6 address
`HOSTNAME`	Peer host name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp statistics local
time since restart:     1685
time since reset:       1685
packets received:       4
packets processed:      0
current version:        0
previous version:       0
declined:               0
access denied:          0
bad length or format:   0
bad authentication:     0
rate exceeded:          0
#show ntp statistics memory
time since reset:     1698
total peer memory:    15
free peer memory:     15
calls to findpeer:    0
new peer allocations: 0
peer demobilizations: 0
hash table counts:      0   0   0   0   0   0   0   0
                        0   0   0   0   0   0   0   0
                        0   0   0   0   0   0   0   0
                        0   0   0   0   0   0   0   0
                        0   0   0   0   0   0   0   0
                        0   0   0   0   0   0   0   0
```

Table 8-15 explains the output fields.

Table 8-15: show ntp statisticsfields

Entry	Description
Time since restart	Time when the ntp protocols were last started and how long they have been running.
Time since reset	Time when the ntp protocols were last reset and how long they have been running.
Packets received	Number of packets received from the peers.
Packets processed	Number of packets processed to the peers.
Current version	Current version of the protocol that is being used.
Previous version	Previous version of the protocol that has been used.
Declined	Access to the protocol declined
Access denied	Number of attempts denied to access protocol
Bad length or format	Number of messages received with length or format errors so severe that further classification could not occur.
Bad authentication	Number of messages received with incorrect authentication.
Rate exceeded	Exceed the configured rate if additional bandwidth is available from other queues
Total peer memory	Actual memory available to the peer system.
Free peer memory	Free memory available to the peer system.
Calls to find peer	Number of calls to find peer.
New peer allocations	Number of allocations from the free peer list.
Peer demobilizations	Number of structures freed to free peer list.
Hash table counts	Peer hash table’s each bucket count.

show ntp trusted-keys

Use this command to display keys that are valid for authentication.

Command Syntax

```
show ntp trusted-keys
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ntp trusted-keys

Trusted Keys:
333
#
```

Table 8-16 explains the output fields.

Table 8-16: show ntp trusted-keys fields

Entry	Description
Trusted Keys	Keys that are valid for authentication.

show running-config ntp

Use this command to display the NTP running configuration.

Command Syntax

```
show running-config ntp (|all)
```

Parameters

`all`	Reserved for future use

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh running-config ntp
feature ntp vrf management
ntp enable vrf management
ntp authenticate vrf management
ntp logging vrf management
ntp authentication-key 123 md5 0xa2cb891442844220 7 vrf management
ntp trusted-key 123 vrf management
ntp server 216.239.35.4 vrf management
```

CHAPTER 9 Dynamic Host Configuration Protocol Relay

This chapter describes the Dynamic Host Configuration Protocol (DHCP) relay commands.

In small networks with only one IP subnet, DHCP clients communicate directly with DHCP servers. When DHCP clients and associated servers do not reside on the same subnet, a DHCP relay agent can be used to forward DHCP client messages to DHCP server.

The DHCP client broadcasts on the local link, the relay agents receives the broadcast DHCP messages, and then generate a new DHCP message to send out on another interface.

The relay agent sets the gateway IP address (`giaddr` field of the DHCP packet) and, if configured, adds the relay agent information option (option 82) in the packet and forwards it to the DHCP server. The DHCP server replies to the client and the relay agent then retransmits the response on the local network.

This chapter contains these commands:

ip dhcp relay (configure mode)

Use this command to enable the DHCP relay agent. The DHCP relay starts forwarding packets to the DHCP server address once configured.

Use the no form of this command to disable the DHCP relay agent.

Command Syntax

```
ip dhcp relay
no ip dhcp relay
```

Parameters

None

Default

By default, this feature is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip dhcp relay

#configure terminal
(config)#no ip dhcp relay
```

ip dhcp relay (interface mode)

Use this command to configure an interface as a DHCP client-facing port.

Use the no form of this command to remove an interface as a DHCP client-facing port.

Command Syntax

```
ip dhcp relay
no ip dhcp relay
```

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ip dhcp relay
```

ip dhcp relay address

Use this command to set an IPv4 address of a DHCP server to which a DHCP relay agent forwards client requests.

Use the no form of this command to remove the IP address of a DHCP server.

User must enable the DHCP relay feature with the ip dhcp relay (configure mode) command to configure server address.

Command Syntax

```
ip dhcp relay address A.B.C.D
no ip dhcp relay address A.B.C.D
```

Parameters

A.B.C.D	IPv4 address of the DHCP server

Default

No default value is specified

Command Mode

Configure mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay address 198.51.100.127

#configure terminal
(config)#ip dhcp relay address 198.51.100.127
```

ip dhcp relay information option

Use this command to enable the device to insert and remove option 82 information in DHCP packets forwarded by the relay agent.

The option 82 suboption remote-id can be configured either as hostname or any string provided by the User.

Use the no form of this command to disable inserting and removing option-82 information.

Command Syntax

```
ip dhcp relay information option (|remote-id (hostname|WORD))
no ip dhcp relay information option (|remote-id)
```

Parameters

remote-id	Remote host Identifier, can either be the System's hostname or a user-specified string.

Default

No default value is specified

Command Mode

Configure mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay information option remote-id hostname

#configure terminal
(config)#ip dhcp relay information option

#configure terminal
(config)#no ip dhcp relay information option
```

ip dhcp relay information source-ip

Use this command to enable DHCP relay option 82 link selection.

Use the no form of this command to disable DHCP relay option 82 link selection.

Command Syntax

```
ip dhcp relay information source-ip A.B.C.D
no ip dhcp relay information source-ip
```

Parameters

A.B.C.D	IPv4 address

Default

No default value is specified.

Command Mode

Configure mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3.6.

Example

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ip dhcp relay information option source-ip 2.2.2.2

#configure terminal
(config)#ip dhcp relay information option source-ip 3.3.3.3
```

ip dhcp relay uplink

Use this command to configure an interface as a DHCP server-facing port.

Use the no form of this command to remove an interface as a DHCP server-facing port.

Command Syntax

```
ip dhcp relay uplink
no ip dhcp relay uplink
```

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ip dhcp relay uplink
```

ipv6 dhcp relay (configure mode)

Use this command to enable the DHCP IPv6 relay agent.

Use the no form of this command to disable the DHCP IPv6 relay agent.

Command Syntax

```
ipv6 dhcp relay
no ipv6 dhcp relay
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 dhcp relay

#configure terminal
(config)#no ipv6 dhcp relay
```

ipv6 dhcp relay (interface mode)

Use this command to configure an interface as a DHCPv6 client-facing port.

Use the no form of this command to remove an interface as a DHCPv6 client-facing port.

Command Syntax

```
ipv6 dhcp relay
no ipv6 dhcp relay
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 dhcp relay
```

ipv6 dhcp relay address

Use this command to set an IPv6 address of a DHCP server to which a DHCP relay agent forwards client requests.

Use the no form of this command to remove an IPv6 address of a DHCP server.

User must enable the IPv6 DHCP relay feature with the ipv6 dhcp relay (configure mode) command to configure server address.

Command Syntax

```
ipv6 dhcp relay address X:X::X:X
no ipv6 dhcp relay address X:X::X:X
```

Parameters

X:X::X:X	IPv6 address of the DHCP server

Default

No default value is specified

Command Mode

Configure mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3 and was changed in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#ip vrf vrf1
(config-vrf)#ipv6 dhcp relay address 2001:db8::7F

#configure terminal
(config)#ipv6 dhcp relay address 2001:db8::7F
```

ipv6 dhcp relay uplink

Use this command to configure an interface as a DHCP IPv6 server-facing port.

Use the no form of this command to remove an interface as a DHCP IPv6 server-facing port.

Command Syntax

```
ipv6 dhcp relay uplink
no ipv6 dhcp relay uplink
```

Parameters

None

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#configure terminal
(config)#interface eth2
(config-if)#ipv6 dhcp relay uplink
```

show ip dhcp relay

Use this command to display DHCP relay status including DHCP server addresses configured on interfaces.

Command Syntax

```
show ip dhcp relay
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ip dhcp relay
DHCP relay service is Enabled.
VRF Name: vrf1
  Option 82: Enabled
  Remote Id: ocnos-device
  Link selection Source-IP: 1.4.5.6
  DHCP Servers configured: 9.9.9.9 8.8.8.8
  Interface               Uplink/Downlink
  ---------               -------------
  ge10                    Uplink
  ge28                    Downlink
VRF Name: default
  Option 82: Enabled
  Remote Id: OcNOS
  Link selection Source-IP: 1.2.3.4
  DHCP Servers configured: 1.1.1.1 2.2.2.2
  Interface               Uplink/Downlink
  ---------               -------------
  ge11                    Uplink
  ge27                    Downlink
```

show ip dhcp relay address

Use this command to display DHCP relay addresses.

Command Syntax

```
show ip dhcp relay address
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ip dhcp relay address
VRF Name: vrf1
  DHCP Servers configured: 9.9.9.9 8.8.8.8
VRF Name: default
  DHCP Servers configured: 1.1.1.1 2.2.2.2
```

show ipv6 dhcp relay

Use this command to display DHCP IPv6 relay status including DHCP IPv6 server addresses configured on interfaces.

Command Syntax

```
show ipv6 dhcp relay
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ipv6 dhcp relay
IPv6 DHCP relay service is Enabled.
VRF Name: vrf1
  DHCPv6 Servers configured: 2001::1
  Interface                Uplink/Downlink
  ---------                -------------
  ge35                     Uplink
  xe50                     Downlink
VRF Name: default
  DHCPv6 Servers configured: 3001::1
  Interface                Uplink/Downlink
  ---------                -------------
  ge34                     Uplink
  xe49                     Downlink
```

show ipv6 dhcp relay address

Use this command to display DHCP IPv6 relay addresses.

Command Syntax

```
show ipv6 dhcp relay address
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show ipv6 dhcp relay address
VRF Name: vrf1
  DHCPv6 Servers configured: 2001::1
VRF Name: default
  DHCPv6 Servers configured: 3001::1
```

show running-config dhcp

Use this command to display DHCP settings in the running configuration.

Command Syntax

```
show running-config dhcp
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.8.

Examples

```
#show running-config dhcp
ip vrf vrf1
 ip dhcp relay information option remote-id hostname
 ip dhcp relay address 1.1.1.2

ip dhcp relay information option remote-id hostname
ip dhcp relay information source-ip 5.4.3.2
ip dhcp relay address 1.1.1.1
```

CHAPTER 10 Remote Management

This chapter is a reference for commands that copy these types of files:

- Start-up configuration and running configuration
- System files such as boot files, core dumps, and debug logs

You can use these commands to copy files locally or to copy between the local device and a remote system.

The commands in this chapter use the techniques in Table 10-17 to remotely transfer files:

Table 10-17: File transfer techniques

Trivial File Transfer Protocol (TFTP)	No authentication or encryption; dangerous to use over the Internet, but might be acceptable in a trusted environment Address format: `tftp:[//server[:port]][/path]`
File Transfer Protocol (FTP)	Authenticates, but does not encrypt Address format: `ftp:[//server][/path]`
Secure copy (SCP)	Authenticates and encrypts using Secure Shell (SSH1) Address format: `scp:[//server][/path]`
SSH File Transfer Protocol (SFTP)	Authenticates and encrypts using Secure Shell (SSH2); this is the most secure technique Address format: `sftp:[//server][/path]`
Hyper text Transfer Protocol (HTTP)	Address format: `http:[//server][/path]` For download of running and startup configurations

This chapter contains these commands.

copy running-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, a TFTP server or an HTTP server.

Command Syntax

```
copy running-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL|http HTTP-URL) (vrf (NAME|management)|)
```

Parameters

`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]`
`HTTP-URL`	Destination: `http:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy running-config sftp sftp://sftp.mysite.com/running_conf vrf management
```

copy running-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, a TFTP server or an HTTP server.

Command Syntax

```
copy running-config (ftp|tftp|scp|sftp|http) (vrf (NAME|management)|)
```

Parameters

`ftp`	Destination: FTP server
`tftp`	Destination: TFTP server
`scp`	Destination: SCP server
`sftp`	Destination: SFTP server
`http`	Destination: HTTP server
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy running-config sftp vrf management
```

copy startup-config

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, a TFTP server or an HTTP server.

Command Syntax

```
copy startup-config (tftp TFTP-URL|ftp FTP-URL|scp SCP-URL|sftp SFTP-URL|http
  HTTP_URL) (vrf (NAME|management)|)
```

Parameters

`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]`
`HTTP-URL`	Destination: `http:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy startup-config sftp sftp://sftp.mysite.com/start-up_conf vrf management
```

copy startup-config (interactive)

Use this command to copy the running configuration to an FTP server, an SCP server, an SFTP server, a TFTP server or an HTTP server.

Command Syntax

```
copy startup-config (ftp|tftp|scp|sftp|http) (vrf (NAME|management)|)
```

Parameters

`ftp`	Destination: FTP server
`tftp`	Destination: TFTP server
`scp`	Destination: SCP server
`sftp`	Destination: SFTP server
`http`	Destination: HTTP server
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy startup-config sftp vrf management
```

copy system file

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax

```
copy (core|debug|log|techsupport|filepath) FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-
  URL|sftp SFTP-URL)(vrf (NAME|management)|)
```

Parameters

`core`	Core file storage; on Linux this refers to `/var/log/crash/cores/`
`debug`	Debug file storage; on Linux this refers to `/log/`
`log`	Log file storage; on Linux this refers to `/var/log/`
`techsupport`	Copy techsupport log files to remote machine
`filepath`	Copy device file to remote machine
`FILE`	Source file name
`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy core myFile sftp sftp://sftp.mysite.com/dst_filename vrf management

#copy techsupport tech_support_23_Feb_2001_18_27_00.tar.gz scp scp://
10.12.16.17/home/satya/tech_support_23_Feb_2001_18_27_00.tar.gz vrf management
Enter Username:root
Enter Password:
% Total % Received % Xferd Average Speed Time Time Time Current
Dload Upload Total Spent Left Speed
100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
100 72368 0 0 0 72368 0 147k -::- -::- -::- 147k
Copy Success
```

copy system file (interactive)

Use this command to copy a system file to an FTP server, an SCP server, an SFTP server, or a TFTP server.

Note: The names of the options for the source in the first parameter refer to symbolic locations. The specific locations for Linux are noted below. The locations on a specific device can vary depending on the platform.

Command Syntax

```
copy (core|debug|log|techsupport|filepath) FILE (tftp TFTP-URL|ftp FTP-URL|scp SCP-
  URL|sftp SFTP-URL)(vrf (NAME|management)|)
```

Parameters

`core`	Core file storage; on Linux this refers to `/var/log/crash/cores/`
`debug`	Debug file storage; on Linux this refers to `/log/`
`log`	Log file storage; on Linux this refers to `/var/log/`
`techsupport`	Copy techsupport log files to remote machine
`filepath`	Copy device file to remote machine
`FILE`	Source file name
`TFTP-URL`	Destination: `tftp:[//server[:port]][/path]`
`FTP-URL`	Destination: `ftp:[//server][/path]`
`SCP-URL`	Destination: `scp:[//server][/path]`
`SFTP-URL`	Destination: `sftp:[//server][/path]`
`ftp`	Destination: FTP server
`tftp`	Destination: TFTP server
`scp`	Destination: SCP server
`sftp`	Destination: SFTP server
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy log myFile sftp sftp://sftp.mysite.com/dst_filename vrf management
```

copy ftp startup-config

Use this command to copy the start up configuration from an FTP server to the local device.

Command Syntax

```
copy ftp FTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

`FTP-URL`	Configuration source: `ftp:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy ftp ftp://ftp.mysite.com/scr filename startup-config vrf management
```

copy scp filepath

Use this command to copy the remote system file using SCP to the local device.

Note: OcNOS has a dedicated partition called `/cfg` for storing system level configurations, OcNOS configurations and license data. This is persistent across reboots and upgrades and consists of directories `/cfg/` and `/usr/local/etc`. Copying `user/general` files under `/cfg` partition is discouraged because the size of this partition is very small and impacts normal system operations like `bootup/upgrades` and important system files copy when it doesn't have enough space. Users are recommended to use `/home` to copy the general files. Please note that the contents placed in `/home` directory are deleted upon software upgrade.

Command Syntax

```
copy scp SCP-URL (filepath FILEPATH) (vrf (NAME|management)|)
```

Parameters

`SCP-URL`	Configuration source: `scp:[//server][/path]`
`FILEPATH`	Enter the local filesystem path with filename
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS-SP version 3.0.

Examples

```
#copy scp scp://10.12.65.89/root/cmlsh filepath /root/cmlsh vrf management
```

copy scp startup-config

Use this command to copy the start up configuration from a SCP server to the local device.

Command Syntax

```
copy scp SCP-URL startup-config (vrf (NAME|management)|)
```

Parameters

`SCP-URL`	Configuration source: `scp:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy scp scp://scp.mysite.com/scr filename startup-config vrf management
```

copy sftp startup-config

Use this command to copy the start up configuration from a SFTP server to the local device.

Command Syntax

```
copy sftp SFTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

SFTP-URL	Configuration source: sftp:[//server][/path]
NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy sftp sftp://sftp.mysite.com/scr filename startup-config vrf management
```

copy tftp startup-config

Use this command to copy the start up configuration from a TFTP server to the local device.

Command Syntax

```
copy tftp TFTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

`TFTP-URL`	Configuration source: `tftp:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy tftp tftp://tftp.mysite.com/scr filename startup-config vrf management
```

copy http startup-config

Use this command to copy the start up configuration from an HTTP server to the local device.

Command Syntax

```
copy http HTTP-URL startup-config (vrf (NAME|management)|)
```

Parameters

`HTTP-URL`	Configuration source: `http:[//server][/path]`
`NAME`	Virtual Routing and Forwarding name
`management`	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy http http://http.mysite.com/scr filename startup-config vrf management
```

copy ftp startup-config (interactive)

Use this command to copy the start up confguration from an FTP server to the local device.

Command Syntax

```
copy ftp startup-config (vrf (NAME|management)|)
```

Parameters

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy ftp startup-config vrf management
```

copy scp startup-config (interactive)

Use this command to copy the start up confguration from a SCP server to the local device.

Command Syntax

```
copy scp startup-config (vrf (NAME|management)|)
```

Parameters

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy scp startup-config vrf management
```

copy sftp startup-config (interactive)

Use this command to copy the start up confguration from an SFTP server to the local device.

Command Syntax

```
copy sftp startup-config (vrf (NAME|management)|)
```

Parameters

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy sftp startup-config vrf management
```

copy tftp startup-config (interactive)

Use this command to copy the start-up confguration from a TFTP server to the local device.

Command Syntax

```
copy tftp startup-config (vrf (NAME|management)|)
```

Parameters

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy tftp startup-config vrf management
```

copy http startup-config (interactive)

Use this command to copy the start-up confguration from an HTTP server to the local device.

Command Syntax

```
copy http startup-config (vrf (NAME|management)|)
```

Parameters

NAME	Virtual Routing and Forwarding name
management	Management Virtual Routing and Forwarding

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy http startup-config vrf management
```

copy file startup-config

Use this command to copy and store a local file into the startup configuration.

Command Syntax

```
copy file FILE startup-config
```

Parameters

FILE	File name

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#copy file myFile startup-config
```

CHAPTER 11 Software Monitoring and Reporting

This document describes software watchdog and reporting related commands.

show tech-support

Use this command to collect system data for technical support.

Command Syntax

```
show tech-support
({bgp|cef|hw-info|isis|lacp|mpls|mstp|ospf|page|pim|rip|rsvp|tacacs+}|)
```

Parameters:

daemon	Protocol/daemon name

Default

The default file path for show techsupport is /var/log/.

Command Mode

Privileged EXEC

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show tech-support
#show tech-support bgp
#show tech-support bgp isis
```

CHAPTER 12 Source Interface Commands

This chapter is a reference for source interface commands. The source Interface feature routes management traffic to a dedicated interface using `iptables` NAT rules.

The source interface feature is supported for the protocols shown in Table 12-18.

Table 12-18: Source interface protocols and port numbers

Protocol	Default port number
Tacacs+	49
Radius	1812 and 1813
Snmp	161 and 162
Ntp	123
Syslog	514

Note: Because management applications are allowed only on the default and management VRF, the commands in this chapter are supported on the "management" and "default" VRFs only.

This chapter contains these commands:

- ip source-interface
- ipv6 source-interface
- show ip source-interface detail
- show ipv6 source-interface detail
- show running-config ip source-interface
- show running-config ipv6 source-interface

ip source-interface

Use this command to configure the IPv4 source interface for a protocol.

Use the no form of this command to remove the IPv4 source interface for a protocol.

Command Syntax

```
ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port <1025-65535>|)
  (vrf management|)
no ip source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port <1025-65535>|)
  (vrf management|)
```

Parameters

IFNAME	Interface name (lo or physical interface)
tacacs+	Terminal Access Controller Access Control System
ntp	Network Time Protocol
snmp	Simple Network Management Protocol
syslog	Rsyslog
radius	Remote Authentication Dial-In User Service
<1025-65535>	Port number. Default value is as per the protocol.
management	Virtual Routing and Forwarding name

Default

NA

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)# ip source-interface lo tacacs+
(config)# ip source-interface lo.management radius vrf management
(config)# ip source-interface xe1 syslog port 1025
(config)# ip source-interface lo.management ntp port 1026 vrf management
```

ipv6 source-interface

Use this command to configure the IPv6 source interface for a protocol.

Use the no form of this command to remove the IPv6 source interface for a protocol.

Command Syntax

```
ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port <1025-65535>|)
  (vrf management|)
no ipv6 source-interface IFNAME (tacacs+|ntp|snmp|syslog|radius) (port <1025-
  65535>|) (vrf management|)
```

Parameters

IFNAME	Interface name (lo or physical interface)
tacacs+	Terminal Access Controller Access Control System protocol
ntp	Network Time Protocol
snmp	Simple Network Management Protocol
syslog	Rsyslog
radius	Remote Authentication Dial-In User Service
<1025-65535>	Port number. Default value is as per the protocol.
management	Virtual Routing and Forwarding name

Default

NA

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)# ipv6 source-interface lo tacacs+
(config)# ipv6 source-interface lo.management radius vrf management
(config)# ipv6 source-interface xe1 syslog port 1025
(config)# ipv6 source-interface lo.management ntp port 1026 vrf management
```

show ip source-interface detail

Use this command to display the IPv4 source interface status in detail.

Command Syntax

```
show ip source-interface detail
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ip source-interface detail
Source-Interface Detailed Information
=====================================
  Protocol : tacacs+
  Interface : lo
  Address : 1.1.1.1
  Status : Active
  VRF Name : Default

  Protocol : radius
  Interface : lo
  Address : 1.1.1.1
  Status : Active
  VRF Name : Default
```

Table 12-19 explains the output fields.

Table 12-19: Output fields

Field	Description
Protocol	tacacs+, ntp, snmp, syslog, or radius
Interface	Interface name (lo or physical interface)
Address	IP address
Status	Whether active or inactive
VRF Name	Virtual Routing and Forwarding name

show ipv6 source-interface detail

Use this command to display the IPv6 source interface status in detail.

Command Syntax

```
show ipv6 source-interface detail
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ipv6 source-interface detail
Source-Interface Detailed Information
=====================================
  Protocol : tacacs+
  Interface : lo
  Address : ::1
  Status : Active
  VRF Name : Default

  Protocol : radius
  Interface : lo
  Address : ::1
  Status : Active
  VRF Name : Default
```

Table 12-19 explains the output fields.

show running-config ip source-interface

Use this command to display the IPv4 source interface running configuration.

Command Syntax

```
show running-config ip source-interface
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0

Example

```
#show running-config ip source-interface
ip source-interface lo tacacs+ port 1025
ip source-interface lo radius
ip source-interface lo.management ntp vrf management
ip source-interface lo.management syslog port 1026 vrf management
ip source-interface ge3 snmp
```

show running-config ipv6 source-interface

Use this command to display the IPv6 source interface running configuration.

Command Syntax

```
show running-config ipv6 source-interface
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show running-config ipv6 source-interface
ip source-interface lo tacacs+ port 1025
ip source-interface lo radius
ip source-interface lo.management ntp vrf management
ip source-interface lo.management syslog port 1026 vrf management
ip source-interface ge3 snmp
```

Authentication Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Authentication, Authorization and Accounting

This chapter is a reference for the authentication:

- Authentication identifies users by challenging them to provide a user name and password. This information can be encrypted if required, depending on the underlying protocol.
- Authorization provides a method of authorizing commands and services on a per user profile basis.

Note: Authorization will be auto-enabled if user enables the Authentication.

- Accounting collects detailed system and command information and stores it on a central server where it can be used for security and quality assurance purposes.

The authentication feature allows you to verify the identity and, grant access to managing devices. The authentication feature works with the access control protocols as described in these chapters:

- Chapter 2, *RADIUS*
- Chapter 3, *TACACS+*

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF.

This chapter describes these commands:

- aaa authentication login default
- aaa accounting details
- aaa authentication login default
- aaa authentication login default fallback error
- aaa group server
- aaa local authentication attempts max-fail
- aaa local authentication unlock-timeout
- debug aaa
- server
- show aaa authentication
- show aaa authentication login
- show aaa groups
- show aaa accounting
- show running-config aaa

aaa authentication login

Use this command to set login authentication behavior.

Use the no form of this command to disable either authentication behavior.

Command Syntax

```
aaa authentication login error-enable (vrf management|)
no aaa authentication login error-enable (vrf management|)
```

Parameters

`error-enable`	Display login failure messages
`management`	Management VRF

Default

By default, aaa authentication login is local

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login error-enable vrf management
```

aaa accounting details

Use this command to set a list of server groups to which to redirect accounting logs.

Use the no form of this command to only log locally.

Command Syntax

```
aaa accounting default (vrf management|) ((group LINE)|local)
no aaa accounting default (vrf management|) ((group LINE)|local)
```

Parameters

group	Server group list for authentication
LINE	A space-separated list of up to 8 configured RADIUS or TACACS+ server group names
local	Use local authentication
management	Management VRF

Default

Default AAA method is local

Default groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa accounting default vrf management group radius
```

aaa authentication login default

Use this command to set the AAA authentication methods.

Use the no form of this command to set the default AAA authentication method (local).

Command Syntax

```
aaa authentication login default (vrf management|) ((group LINE) | (local (|none))
  | (none))
no aaa authentication login default (vrf management|) ((group LINE) | (local
  (|none)) | (none))
```

Parameters

`group`		Use a server group list for authentication
	`LINE`	A space-separated list of up to 8 configured RADIUS or TACACS+, server group names followed by `local` or `none` or both `local` and `none`. The list can also include:
		`radius` All configured RADIUS servers
		`tacacs+` All configured TACACS+ servers
`local`		Use local authentication
`none`		No authentication
`management`		Management VRF

Default

By default, AAA authentication method is local

By default, groups: RADIUS or TACACS+

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login default vrf management group radius
```

aaa authentication login default fallback error

Use this command to enable fallback to local authentication for the default login if remote authentication is configured and all AAA servers are unreachable.

Use the no form of this command to disable fallback to local authentication.

Command Syntax

```
aaa authentication login default fallback error local (vrf management|)
no aaa authentication login default fallback error local (vrf management|)
```

Parameters

management	Management VRF

Default

By default, AAA authentication is local.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa authentication login default fallback error local vrf management
```

aaa group server

Use this command to create a server group and enter server group configure mode.

Use the no form of this command to remove a server group.

Command Syntax

```
aaa group server (radius|tacacs+) WORD (vrf management|)
no aaa group server (radius|tacacs+) WORD (vrf management|)
```

Parameters

`radius`	RADIUS server group
`tacacs+`	TACACS+ server group
`WORD`	Server group name; maximum 127 characters
`management`	Management VRF

Default

By default, the AAA group server option is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa group server radius maxsmart
(config-radius)#
```

aaa local authentication attempts max-fail

Use this command to set the number of unsuccessful authentication attempts before a user is locked out.

Use the no form of this command to disable the lockout feature.

Command Syntax

```
aaa local authentication attempts max-fail <1-25>
no aaa local authentication attempts max-fail
```

Parameters

<1-25>	Number of unsuccessful authentication attempts

Default

By default, the maximum number of unsuccessful authentication attempts before a user is locked out is 3.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication attempts max-fail 2
```

aaa local authentication unlock-timeout

Use this command to set timeout value in seconds to unlock local user-account.

Use the no form of this command to set default timeout value in seconds.

Note: This command is applicable only to local user but not for user/s present at the server end to authenticate using TACACS+ or RADIUS.

Command Syntax

```
aaa local authentication unlock-timeout <1-3600>
no aaa local authentication unlock-timeout
```

Parameters

<1-3600>	Timeout in seconds to unlock local user-account. Default value is 1200.

Default

By default, the unlock timeout is 1200 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#aaa local authentication unlock-timeout 1800
```

debug aaa

Use this command to display AAA debugging information.

Use the no form of this command to stop displaying AAA debugging information.

Command Syntax

```
debug aaa
no debug aaa
```

Parameters

None

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug aaa
```

server

Use this command to add a server to a server group.

Use the no form of this command to remove from a server group.

Command Syntax

```
server (A.B.C.D | X:X::X:X | HOSTNAME)
no server (A.B.C.D | X:X::X:X | HOSTNAME)
```

Parameters

A.B.C.D	IPv4 address
X:X::X:X	IPv6 address

Default

None

Command Modes

RADIUS server group configure mode

TACACS+ server group configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature tacacs+
(config)#aaa group server tacacs+ TacacsGroup4
(config-tacacs)#server 203.0.113.127
```

show aaa authentication

Use this command to display AAA authentication configuration.

Command Syntax

```
show aaa authentication (|vrf(management|all))
```

Parameters

None

Command Modes

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show aaa authentication
                VRF: default
  default: local
  console: local
```

Table 1-20 explains the output fields.

Table 1-20: show aaa authentication fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Default	Displays the aaa authentication method list.
Console	Authentication setting for the console access.

show aaa authentication login

Use this command to display AAA authentication configuration for login default and login console.

Command Syntax

```
show aaa authentication login error-enable (|vrf management|all))
```

Parameters

`error-enable`	Display setting for login failure messages
`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show aaa authentication login error-enable
                VRF: default
disabled
```

Table 1-21 explains the output fields.

Table 1-21: show aaa authentication login error-enable fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

show aaa groups

Use this command to display AAA group configuration.

Command Syntax

```
show aaa groups (vrf (management|all)|)
```

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show aaa groups
VRF: default
radius
```

Table 1-22 explains the output fields.

Table 1-22: show aaa groups fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

show aaa accounting

Use this command to display AAA accounting configuration.

Command Syntax

```
show aaa accounting (vrf (management|all)|)
```

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show aaa accounting
                VRF: default
```

Table 1-23 explains the output fields.

Table 1-23: show aaa accounting fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.

show running-config aaa

Use this command to display AAA settings in the running configuration.

Command Syntax

```
show running-config aaa (vrf(management|all)|)
```

Parameters

`vrf`	Management VRF or all VRFs

Command Modes

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show aaa accounting
                VRF: default
  default: local
```

Table 1-24 explains the output fields.

Table 1-24: show aaa accounting fields

Field	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Default	Displays the aaa authentication method list.

CHAPTER 2 RADIUS

This chapter is a reference for Remote Authentication Dial In User Service (RADIUS) commands, RADIUS provides centralized Authentication, Authorization management for users that connect to and use a network service. RADIUS is specified in RFC 2865.

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF.

- clear radius-server
- debug radius
- radius-server login host
- radius-server login host acct-port
- radius-server login host auth-port
- radius-server login host key
- radius-server login key
- radius-server login timeout
- show debug radius
- show radius-server
- show running-config radius

clear radius-server

Use this command to clear Radius Server statistics.

Command Syntax

```
clear radius-server ((HOSTNAME | X:X::X:X | A.B.C.D)|) counters (vrf (management |
  all)|)
```

Parameters

A.B.C.D	IPv4 address of RADIUS server
X:X::X:X	IPv6 address of RADIUS server
HOSTNAME	DNS host name of RADIUS server
vrf	Virtual Routing and Forwarding
management	Management VRF
all	All VRF's

Default

No default value is specified

Command Mode

Executive mode

Applicability

This command was introduced in OcNOS version 1.3.

Example

```
#clear radius-server counters vrf management
```

debug radius

Use this command to display RADIUS debugging information.

Use the no form of this command stop displaying RADIUS debugging information.

Command Syntax

```
debug radius
no debug radius
```

Parameters

None

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug radius
```

radius-server login host

Use this command to configure a RADIUS server for both accounting and authentication.

Use the no form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) timeout <1-60>
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|)
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num (<1-8>)|) timeout
```

Parameters

`login`	Remote login
`A.B.C.D`	IPv4 address of RADIUS server
`X:X::X:X`	IPv6 address of RADIUS server
`HOSTNAME`	DNS host name of RADIUS server
`seq-num`	seq-num Sequence Number / Priority index for radius-servers
`<1-8>`	sequence number for servers
`timeout`	How long to wait for a response from the RADIUS server before declaring a timeout failure
`<1-60>`	Range of time out period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management
```

radius-server login host acct-port

Use this command to configure a RADIUS server and specify a UDP port to use for RADIUS accounting messages.

Use the no form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num
  (<1-8>)|) acct-port <0-65535> |) | timeout <1-60> |)
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-
  num (<1-8>)|) acct-port |) | timeout <1-60> |)
```

Parameters

login	Remote login
A.B.C.D	IPv4 address of RADIUS server
X:X::X:X	IPv6 address of RADIUS server
HOSTNAME	DNS host name of RADIUS server
seq-num	seq-num Sequence Number / Priority index for radius-servers
<1-8>	sequence number for servers
acct-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
timeout	How long to wait for a response from the RADIUS server before declaring a timeout failure
<1-60>	Range of timeout period in seconds
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

By default, Radius-server login host acct-port is 1813

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 192.168.2.3 vrf management acct-port 23255
```

radius-server login host auth-port

Use this command to configure a RADIUS server and specify a UDP port to use for RADIUS authentication messages.

Use the no form of this command to remove a RADIUS server.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num
  (<1-8>)|) (|(auth-port <0-65535> (|(acct-port <0-65535> (|(timeout <1-60>))))))
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-
  num (<1-8>)|) (auth-port (|(acct-port (|timeout))))
```

Parameters

`login`	Remote login
`A.B.C.D`	IPv4 address of RADIUS server
`X:X::X:X`	IPv6 address of RADIUS server
`HOSTNAME`	DNS host name of RADIUS server
`seq-num`	seq-num Sequence Number / Priority index for radius-servers
`<1-8>`	sequence number for servers
`auth-port`	UDP port to use for RADIUS accounting messages
`<0-65535>`	Range of UDP port numbers
`acct-port`	UDP port to use for RADIUS accounting messages
`<0-65535>`	Range of UDP port numbers
`timeout`	How long to wait for a response from the RADIUS server before declaring a timeout failure
`<1-60>`	Range of timeout period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

By default, Radius-server login host acct-port is 1812

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management auth-port 23255
```

radius-server login host key

Use this command to set per-server shared key (“shared secret”) which is a text string shared between the device and RADIUS servers.

Use the no form of this command to remove a server shared key.

Command Syntax

```
radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-num
  (<1-8>)|) (|(key ((0 WORD) | (7 WORD) | (WORD)) (|(auth-port <0-65535> (|(acct-
  port <0-65535> (|(timeout <1-60>))))))))
no radius-server login host (A.B.C.D | X:X::X:X | HOSTNAME) (vrf management|) (seq-
  num (<1-8>)|) (key ((0 WORD) | (7 WORD) | (WORD)) (|(auth-port <0-65535> (|(acct-
  port (|(timeout)))))))
```

Parameters

login	Remote login
A.B.C.D	IPv4 address of RADIUS server
X:X::X:X	IPv6 address of RADIUS server
HOSTNAME	DNS host name of RADIUS server
seq-num	seq-num Sequence Number / Priority index for radius-servers
<1-8>	sequence number for servers
0	Unencrypted (clear text) shared key
WORD	Unencrypted key value; maximum length 63 characters
7	Hidden shared key
WORD	Hidden key value; maximum length 63 characters
WORD	Unencrypted (clear text) shared key value; maximum length 63 characters
auth-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
acct-port	UDP port to use for RADIUS accounting messages
<0-65535>	Range of UDP port numbers
timeout	How long to wait for a response from the RADIUS server before declaring a timeout failure
<1-60>	Range of timeout period in seconds
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login host 203.0.113.15 vrf management key 0 testing
auth-port 23255
```

radius-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and RADIUS servers.

Use the no form of this command to remove a global preshared key.

Command Syntax

```
radius-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
no radius-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
```

Parameters

login	Remote login
0	Unencrypted (clear text) shared key
WORD	Unencrypted key value; maximum length 63 characters
7	Hidden shared key
WORD	Hidden key value; maximum length 63 characters
WORD	Unencrypted (clear text) shared key value; maximum length 63 characters
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login key 7 p2AcxlQA vrf management

#configure terminal
(config)#no radius-server login key 7 p2AcxlQA vrf management
```

radius-server login timeout

Use this command to set the global timeout which is how long the device waits for a response from a RADIUS server before declaring a timeout failure.

Use the no form of this command to set the global timeout to its default (1 second).

Note: TELNET client session's default timeout is 60 seconds, so configuring timeout of 60 seconds timeout impacts TELNET client applications, because it cannot be fallback to use the other configured server/group. Hence it is recommended to configure 57 seconds or lesser timeout while using TELNET. This timeout doesn't have an impact on SSH connections.

Command Syntax

```
radius-server login timeout <1-60> (vrf management|)
no radius-server login timeout (vrf management|)
```

Parameters

`login`	Remote login
`<1-60>`	Range of timeout period in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Note: The system takes minimum 3 secs to timeout even though the configured timeout value is less than 3 seconds. Hence do not configure timeout value less than 3 secs. The timeout range value is mentioned as 1-60 secs for backward compatibility.

Default

By default, radius-server login timeout is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server login timeout 15 vrf management

#configure terminal
(config)#no radius-server login timeout 15 vrf management
```

show debug radius

Use this command to display debugging information.

Command Syntax

```
show debug radius
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug radius
RADIUS client debugging is on
```

show radius-server

Use this command to display the RADIUS server configuration.

Command Syntax

```
show radius-server (|vrf(management|all))((WORD)|(groups (GROUP|)|)|sorted
```

Parameters

`WORD`	DNS host name or IP address
`groups`	RADIUS server group
`GROUP`	Group name; if this parameter is not specified, display all groups
`sorted`	Sort by RADIUS server name
`vrf`	management or all VRFs

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show radius-server vrf management
        VRF: management
timeout value: 5

Total number of servers:2

Following RADIUS servers are configured:
Radius Server                          : 10.12.12.39
   Sequence Number                     : 1
   available for authentication on port : 1812
   available for accounting on port     : 1813
   RADIUS shared secret                 : ********
   Failed Authentication count          : 0
   Successful Authentication count      : 0
   Failed Connection Request            : 0
   Last Successful authentication       :

Radius Server                          : 1.1.1.1
   Sequence Number                     : 2
   available for authentication on port : 1234
   available for accounting on port     : 1234
   timeout                             : 5
   Failed Authentication count          : 0
   Successful Authentication count      : 0
   Failed Connection Request            : 0
   Last Successful authentication       :
```

Table 2-25 explains the output fields.

Table 2-25: show radius-server fields

Entry	Description
VRF	Virtual Routing and Forwarding (VRF) default support.
Timeout Value	Period the local router waits to receive a response from a RADIUS accounting server before retransmitting the message
Total number of servers	Number of authentication requests received by the authentication server.

show running-config radius

Use this command to display RADIUS configuration settings in the running configuration.

Command Syntax

```
show running-config radius
```

Parameters

None

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show running-config radius
 10.12.12.39 vrf management seq-num 1 key 7 wawyanb123
 1.1.1.1 vrf management seq-num 2 auth-port 1234 acct-po
rt 1234
radius-server login key 7 wawyanb123
```

CHAPTER 3 TACACS+

Terminal Access Controller Access-Control System Plus (TACACS+, usually pronounced like tack-axe) is an access control network protocol for network devices.

The differences between RADIUS and TACACS+ can be summarized as follows:

- RADIUS combines authentication and authorization in a user profile, while TACACS+ provides separate authentication.
- RADIUS encrypts only the password in the access-request packet sent from the client to the server. The remainder of the packet is unencrypted. TACACS+ encrypts the entire body of the packet but leaves a standard TACACS+ header.
- RADIUS uses UDP, while TACACS+ uses TCP.
- RADIUS is based on an open standard (RFC 2865). TACACS+ is proprietary to Cisco, although it is an open, publicly documented protocol (there is no RFC protocol specification for TACACS+).

Note: Only network administrators can execute these commands. For more, see the username command.

Note: The commands below are supported only on the “management” VRF.

This chapter contains these commands:

clear tacacs-server counters

Use this command to clear the counter on a specified TACACS server.

Syntax

```
clear tacacs-server ((HOSTNAME | X:X::X:X | A.B.C.D)|) counters (vrf (management |
  all)|)
```

Parameters

HOSTNAME	The name of the server
X:X::X:X	IPv6 address of the server
A.B.C.D	IPv4 address of the server
vrf	VRF of the sever
management	The management VRF
all	All VRFs

Default

NA

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear tacacs-server 10.1.1.1 counters
```

debug tacacs+

Use this command to display TACACS+ debugging information.

Use the no form of this command stop displaying TACACS+ debugging information.

Command Syntax

```
debug tacacs+
no debug tacacs+
```

Parameters

None

Default

Disabled

Command Mode

Executive mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug tacacs+
```

feature tacacs+

Use this command to enable the TACACS+ feature.

Use the no form of this command to disable the TACACS+ feature.

Command Syntax

```
feature tacacs+ (vrf management|)
no feature tacacs+ (vrf management|)
```

Parameters

`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

By default, feature tacacs+ is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#feature tacacs+ vrf management
```

show debug tacacs+

Use this command to display whether TACACS+ debugging is enabled.

Command Syntax

```
show debug tacacs+
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debug tacacs+
TACACS client debugging is on
```

show running-config tacacs+

Use this command to display TACACS+ settings in the running configuration.

Command Syntax

```
show running-config tacacs+
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh running-config tacacs+
feature tacacs+ vrf management
tacacs-server login host 10.16.19.2 vrf management seq-num 1 key 7
0x9f4a8983e02
16052
```

Table 3-26 explains the output fields.

Table 3-26: show running-config fields

Entry	Description
TACAS server host	TACACS+ server Domain Name Server (DNS) name.
Seq-num	Sequence number of user authentication attempt with the TACACS+ server.
VRF Management	The management traffic using VPN Routing and Forwarding (VRFs).

show tacacs-server

Use this command to display the TACACS+ server configuration.

Command Syntax

```
show tacacs-server (|vrf (management|all))((WORD)|(groups (GROUP|)|)|(sorted)
```

Parameters

WORD	DNS host name or IP address
groups	TACACS+ server group
GROUP	Group name; if this parameter is not specified, display all groups
sorted	Sort by TACACS+ server name
vrf	management or all VRFs

Command Mode

Executive mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show tacacs-server
total number of servers:1

Tacacs+ Server                  : 192.168.10.215/49(*)
           Sequence Number      : 1
      Failed Auth Attempts      : 0
     Success Auth Attempts      : 14
   Failed Connect Attempts      : 0
 Last Successful authentication: 2017 December 18, 12:27:13

(*) indicates last active.
```

Table 3-27 explains the output fields.

Table 3-27: show tacacs-server output fields

Field	Description
Sequence Number	Sequence number of user authentication attempt with the TACACS+ server.
Failed Auth Attempts	Number of times user authentication failed with the TACACS+ server. Increments for server key mismatches and password mismatches or wrong password for the user.
Success Auth Attempts	Number of times user authenticated with TACACS+ server. Increments for each successful login.

Table 3-27: show tacacs-server output fields

Field	Description
Failed Connect Attempts	Number of failed TCP socket connections to the TACACS+ server. Increments for server connection failure cases such as server not-reachable, server port mismatches.
Last Successful authentication	Timestamp when user successfully authenticated with the TACACS+ server.

tacacs-server login host

Use this command to set the TACACS+ server host name or IP address.

Use the no form of this command to remove an TACACS+ server (if only a host name or IP address is specified as a parameter) or to remove all of a TACACS+ server's configuration settings (if any other parameters are also specified).

Command Syntax

```
tacacs-server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (seq-num
  <1-8> |) (key ((0 WORD) | (7 WORD) | (WORD))|) (port <1025-65535> |)
no tacacs-server login host (HOSTNAME | A.B.C.D | X:X::X:X) (vrf management|)
no tacacs-server login host (HOSTNAME | X:X::X:X | A.B.C.D) (vrf management|) (key
  ((0 WORD) | (7 WORD) | (WORD))|) (port <1025-65535> |)
```

Parameters

HOSTNAME	Host name
X:X::X:X	IPv6 address
A.B.C.D	IPv4 address
vrf	Virtual Routing and Forwarding
management	Management VRF
seq-num	Sequence Number / Priority index for tacacs-servers
key	Authentication and encryption key ("shared secret")
0	Unencrypted (clear text) shared key
WORD	Unencrypted key value; maximum length 63 characters
7	Hidden shared key
WORD	Hidden key value; maximum length 63 characters
WORD	Unencrypted (clear text) shared key value; maximum length 63 characters
port	TACACS+ server port
<1205-65535>	TACACS+ server port number; the default is 49

Default

Enable authentication for TACACS+ server configured. Authorization is also enabled by default. The default server port is 49.

There is no command to enable authorization. Authorization functionality is enabled by default when remote authentication is enabled with TACACS+.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#tacacs-server login host 203.0.113.31 vrf management
```

tacacs-server login key

Use this command to set a global preshared key (“shared secret”) which is a text string shared between the device and TACACS+ servers.

Use the no form of this command to remove a global preshared key.

Command Syntax

```
tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
no tacacs-server login key ((0 WORD) | (7 WORD) | (WORD)) (vrf management|)
```

Parameters

0	Unencrypted (clear text) shared key
WORD	Unencrypted key value; maximum length 63 characters
7	Hidden shared key
WORD	Hidden key value; maximum length 63 characters
WORD	Unencrypted (clear text) shared key value; maximum length 63 characters
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#tacacs-server login key 7 jvn05mlQH1 vrf management
```

tacacs-server login timeout

Use this command to set the period to wait for a response from the server before the client declares a timeout failure. The default timeout value is 5 seconds.

You can only give this command when the TACACS+ feature is enabled.

Use the `no` form of this command to set the timeout value to its default value (5 seconds).

Note: TELNET client session's default timeout is 60 seconds, so configuring timeout of 60 seconds timeout impacts TELNET client applications, because it cannot be fallback to use the other configured server/group. Hence it is recommended to configure 57 seconds or lesser timeout while using TELNET. This timeout doesn't have an impact on SSH connections.

Command Syntax

```
tacacs-server login timeout <1-60> (vrf management|)
no tacacs-server login timeout (vrf management|)
```

Parameters

`<1-60>`	Timeout value in seconds
`vrf`	Virtual Routing and Forwarding
`management`	Management VRF

Default

Disabled

Command Mode

Configure mode

Applicability

This command is introduced in OcNOS version 1.3.9

Examples

```
#configure terminal
(config)#tacacs-server login timeout 35 vrf management
```

SECTION 3

Security Features

Security Features Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 Proxy ARP and Local Proxy ARP

Overview

Proxy ARP (RFC 1027) is a technique by which a device on a given network answers the ARP queries for a network address that is not on that network. The Proxy ARP is aware of the location of the traffic's destination, and offers its own MAC address as destination. The captured traffic is then typically routed by the Proxy to the intended destination via another interface. Proxy ARP can help machines on a subnet reach remote subnets without the need to configure routing or a default gateway.

Use `no ip proxy-arp` to disable Proxy ARP, Proxy ARP is disabled by default.

Topology

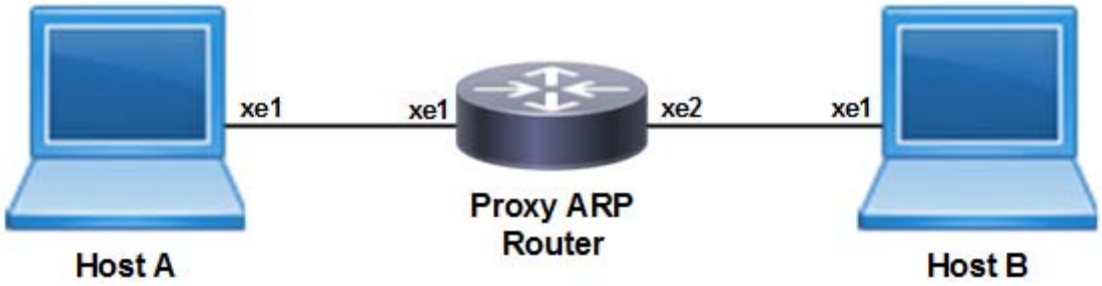

Figure 1-28: Sample topology

Host A

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.2/16`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Host B

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.1.2/24`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Enable Proxy ARP

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface connected to Host A
`(config-if)#ip address 20.20.0.1/24`	Configure the ip address on the interface
`(config-if)#interface xe2`	Specify the interface connected to Host B
`(config-if)#ip address 20.20.1.1/24`	Configure the ip address on the interface
`(config-if)#interface xe1`	Specify the interface to configure Proxy ARP
`(config-if)#ip proxy-arp`	Enable Proxy ARP
`(config)#end`	Exit interface and configure mode

Validation

```
#show running-config arp
!
interface xe1
ip proxy-arp
!
```

The `show arp` command on the hosts shows the arp table entries to reach different subnets. Ping Host B from Host A.Host A. The ARP table should have Router's xe1 interface MAC address to reach Host B. Execute the below command at Host A.

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State
20.20.0.3      00:02:39      ecf4.bbc0.3d71      xe1       STALE.
```

Local Proxy ARP Overview

Local Proxy ARP feature is used to enable local proxy support for ARP requests per interface level. Activation will make the router answer all ARP requests on configured subnet, even for clients that should not normally need routing. Local proxy ARP means that the traffic comes in and goes out the same interface.

The local proxy ARP feature allows responding to ARP requests for IP addresses within a subnet where normally no routing is required. With the local proxy ARP feature enabled, ARP responds to all ARP requests for IP addresses within the subnet and forwards all traffic between hosts in the subnet. Use this feature only on subnets where hosts are intentionally prevented from communicating directly.

Topology

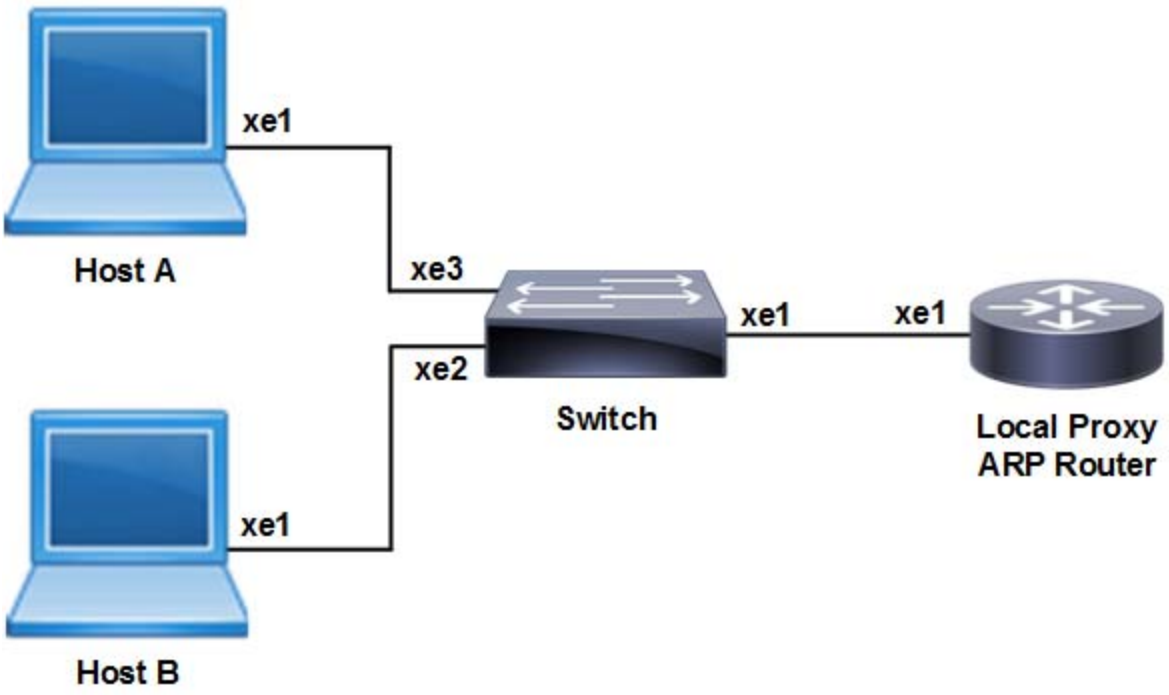

Figure 1-29: Sample topology

Host A

`#configure terminal`	Enter Configure mode.
`(config)#interface xe1`	Specify the interface to be configured on Host A
`(config-if)#ip address 20.20.0.2/16`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Host B

`#configure terminal`	Enter Configure mode
`(config)#interface xe1`	Specify the interface to be configured on Host B
`(config-if)#ip address 20.20.0.3/24`	Configure the ip address on the interface
`(config)#end`	Exit interface and configure mode

Private Vlan Configuration on Switch

`#configure terminal`	Enter Configure mode.
`(config)# bridge 1 protocol ieee vlan-bridge`	Create ieee vlan-bridge on switch for pvlan configuration
`(config)# vlan database`	Enter into the vlan database
`(config-vlan)# vlan 100-101 bridge 1 state enable`	Create vlans 100 and 101 as part of bridge 1
`(config-vlan)# private-vlan 100 primary bridge 1`	Configure vlan 100 as a primary vlan
`(config-vlan)# private-vlan 101 isolated bridge 1`	Configure vlan 101 as a isolated vlan
`(config-vlan)# private-vlan 100 association add 101 bridge 1`	Associate secondary vlan 101 to primary vlan 100
`(config-vlan)#exit`	Exit from the vlan database
`(config)#interface xe1`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe1 as a layer2 interface.
`(config-if)#bridge-group 1`	Associate the interface to the bridge
`(config-if)#switchport access vlan 100`	Associate primary vlan to the interface
`(config-if)#switchport mode private-vlan promiscuous`	Configure xe1 interface as a promiscuous port
`(config-if)# switchport private-vlan mapping 100 add 101`	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
`(config-if)# exit`	Exit interface mode
`(config)#interface xe2`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe2 as a layer2 interface.
`(config-if)#bridge-group 1`	Associate the interface to the bridge
`(config-if)#switchport access vlan 100`	Associate primary vlan to the interface
`(config-if)#switchport mode private-vlan promiscuous`	Configure xe2 interface as a promiscuous port
`(config-if)# switchport private-vlan mapping 100 add 101`	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
`(config-if)# exit`	Exit interface mode
`(config)#interface xe3`	Specify the interface to be configured
`(config-if)#switchport`	Configure xe3 as a layer2 interface.

(config-if)#bridge-group 1	Associate the interface to the bridge
(config-if)#switchport access vlan 100	Associate primary VLAN to the interface
(config-if)#switchport mode private-vlan promiscuous	Configure xe2 interface as a promiscuous port
(config-if)# switchport private-vlan mapping 100 add 101	Associate primary vlan 100 and secondary vlan 101 to a promiscuous port
(config-if)# exit	Exit interface mode

Enable Local Proxy ARP on Router

#configure terminal	Enter Configure mode
(config)#interface xe1	Specify the interface to be configured on Host B
(config-if)#ip address 20.20.0.3/24	Configure the ip address on the interface
(config-if)#ip local-proxy-arp	Enable Local Proxy ARP
(config)#end	Exit interface and configure mode

Validation

ARP cache on Host A and Host B

The show arp command on hosts shows the arp table entries to reach different subnets. Ping Host B from Host A.Host A ARP table should have Router's xe1 interface MAC address to reach Host B. Execute the below command at Host A.

```
#show arp

Flags: D - Static Adjacencies attached to down interface

IP ARP Table for context default
Total number of entries: 2
Address          Age          MAC Address     Interface    State
20.20.0.3      00:02:39      ecf4.bbc0.3d71      xe1       STALE.
```

SECTION 4

System Configuration

Control Plane Policing Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 Control Plane Policing Configuration

Control plane policing (CoPP) manages the traffic flow destined to the host router CPU for control plane processing. CoPP limits the traffic forwarded to the host CPU and avoids impact on system performance.

1. CoPP has organized handling of control packets by providing per-protocol hardware CPU queues. So, control packets are queued in different CPU queues based on protocol.
2. Per-protocol CPU queue rate limits and buffer allocations are programmed during router initialization, thus every CPU queue is rate-limited to a default stable and balanced behavior across protocols.
3. When control packets received at higher rate than the programmed rate, the excess traffic is dropped at queue level in the packet processor hardware itself.
4. OcNOS does not support per-queue rate modification and usage monitoring.
5. All CPU queues are pre-programmed with default rate limits and buffer allocations to ensure a default stable and balanced behavior across protocols.
6. Rate limits are in terms of kbps. Hardware does not support PPS (packets per second).
7. Qumran (MX, AX, and UX) supports per-queue rate shaping configuration within a range of 469 kbps to 483 gbps. The granularity is 469 kbps for low range and 1.56% for higher range.

.

Table 1-28: Default CPU queues

Default queues	Default rate In kbps	Maximum configurable rate in kbps	Default queue length In kbytes	Description
CPU0.q0	900	900	1024	Unclassified protocols and unknown or destination lookup failure packets are redirected to default CPU queues 0-7 based on packet's cos/dscp values. SSH, TELNET and SNMP traffic destined to host router CPU is remarked to CPU0.q6. SSH: TCP Source/Destination port 22 TELNET: TCP Source/Destination port 23 SNMP: UDP Source/Destination port 161/162
CPU0.q1	900	900	1024	
CPU0.q2	900	900	1024	
CPU0.q3	900	900	1024	
CPU0.q4	900	900	1024	
CPU0.q5	900	900	1024	
CPU0.q6	900	900	1024	
CPU0.q7	900	900	1024	
CPU1.q0	900	900	1024	
CPU1.q1	900	900	1024	
CPU1.q2	900	900	1024	
CPU1.q3	900	900	1024	
CPU1.q4	900	900	1024	
CPU1.q5	900	900	1024	
CPU1.q6	900	900	1024	
CPU1.q7	900	900	1024	
*cpu1 is valid only for QMX				

Table 1-29: Per protocol CPU queues

Protocol queues	Default rate In kbps	Maximum configurable Rate in kbps	Default queue length In kbytes	Description
IGMP	1000	1000	2048	Internet Group Management Protocol packets (IP protocol 2)
ISIS/ESIS	8000	8000	1024	ISIS (DMAC 0180:C200:0014/0015) ESIS (DMAC 0900:2B00:0004/0005) Note: ESIS = End System-to-Intermediate System (ISIS point-to-point case)
Reserved Mcast	8000	8000	2048	Reserved IPv4 and IPv6 Multicast packets IPv4: Local Network Control Block (224.0.0.0 - 224.0.0.255 (224.0.0/24)) IPv6: Link-Local Scope Multicast Addresses (FF02::/8)
IPv6 Link Local	1000	1000	1024	IPv6 link local packets DIPv6: FE80::/8

icmp-redirect	1000	1000	256	Data packets to CPU for ICMP redirect packet generation.

Hybrid Switch Router Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 Hybrid Switching Overview

An OcNOS Hybrid Switch Router offers Layer 3 forwarding found in routers with the high-speed performance associated with traditional Layer 2 switches. The following are some advantages of Hybrid Switch Routers:

- Reduced system cost and infrastructure. Traditionally you would require a separate box for switching and one for routing.
- Off-loading IP traffic from backbone routers, thus making them more efficient for firewalls and WAN connectivity.
- Simplified network design and maintenance.

Routing and Switching

Layer 2 and Layer 3 switches are similar at a high-level, both look at the packet headers, and steer the packets toward their destination port. Therefore, after being passed through a switch or router, the packet is closer to its destination.

Layer 2 Switching

Layer 2 switches are typically used to provide connectivity within high bandwidth local area networks (LANs). A Layer 2 switch makes forwarding decisions based on the MAC or the Layer 2 header. It extracts the Layer 2 header from the packet, finds a matching destination address in the forwarding table, and transmits the packet out to the port associated with the specific destination address in the forwarding table. The forwarding table is populated through a self-learning process, whereby each arriving packet is used to update the entries in the table. Typically, the Layer 2 switch implements the switching function in the hardware, as that requires stripping of the packet only in two layers (the physical and data link layer) to get to the useful part of the packet header. This allows switches to steer packets at wire-speed rates without slowing down arriving streams of packets to process them.

Layer 3 Routing

Layer 3 (L3) routers are typically used to provide connectivity between different LANs. A Layer 3 router discards MAC headers, and indexes further into the packet–making decisions based on the IP or Layer 3 header. It extracts the Layer-3 header from the packet, finds a matching destination address in a routing table, identifies a new MAC address for the packet from an ARP cache, wraps the IP packet in a new MAC header, and then transmits the packet out to the port associated with that destination address in the routing table.

The routing table is populated through statically configured command line interface entries or through routing protocol messages from neighboring routers. A Layer 3 router must strip through 3 layers (physical, data link, and network) which is more complicated than a Layer 2 switch. Layer 3 routers historically implement the routing function in software. This often results in limited packet-forwarding rates. However, improvements in VLSI circuit technology have allowed Layer 3 routing functions to be implemented rapidly in hardware, enabling wire-speed performance similar to the performance of Layer 2 switches. As a result, along with the complexity of next-generation Layer 3 routers, the throughput of these routers has also been increasing.

An architecture is required that is flexible enough to accommodate the demands of different customers, and accommodate the changing demands of a single customer whose requirements may change over time. Typical Layer 2 switches and Layer 3 routers fail to provide this flexibility.

An optimal configuration can be an integrated solution, a Layer 3 router with Layer 2 bridge groups around it. The OcNOS Hybrid Switch Router implementation allows easy configuration of different combinations of routers and switches. OcNOS can be configured as an absolute Layer 3 router, absolute Layer 2 switch (Figure 1-30) or a hybrid Layer 2/Layer 3 switch router, (Figure 1-31) that can easily change modes with the use of a single command.

System Configuration

- OcNOS stack will bring up all the ports of the board as routed ports by default.
- However OcNOS provides flexibility to create a Layer 2 bridge, and ports can be converted to switch ports and added to the bridge.
- OcNOS also supports VLAN interfaces and routing between VLANs.

Thus it can work as a router, a switch, or as a hybrid switch.

Hybrid Switch Router Possibilities

With only Layer 2 protocols configured, the OcNOS Hybrid Switch Router can become an absolute Layer 2 switch.

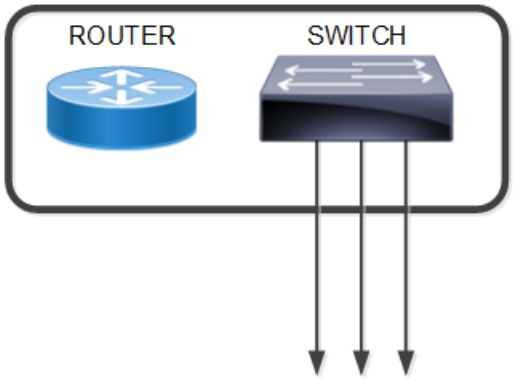

Figure 1-30: Layer 2 Switch

With Layer 2 and Layer 3 protocols configured, the OcNOS Hybrid Switch Router can become a Switch and/or a Router.

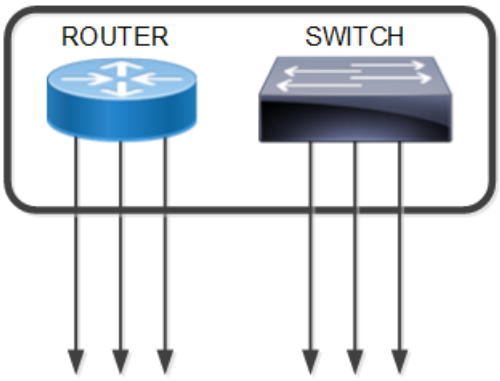

Figure 1-31: Working as a Router or a Switch

With only Layer 3 protocols enabled, the OcNOS Hybrid Switch Router can become an absolute router.

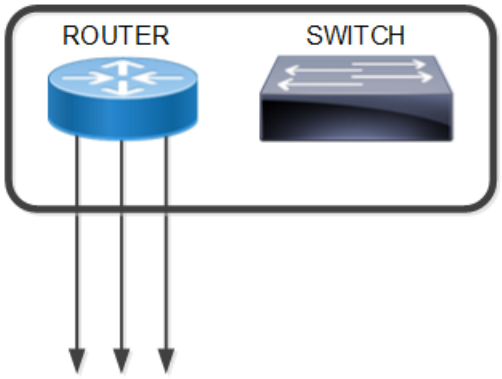

Figure 1-32: Working as Layer 3 Router

On switch ports, VLANs can be created for different broadcast domains.

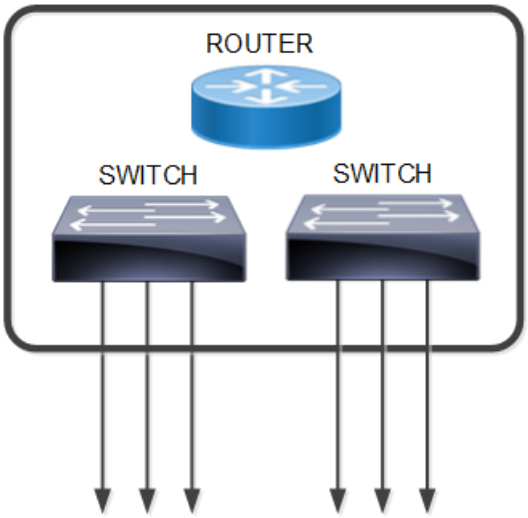

Figure 1-33: Port- or Policy-based VLANs

For routing between VLANs, the OcNOS routing protocols or static routing via NSM can be utilized.

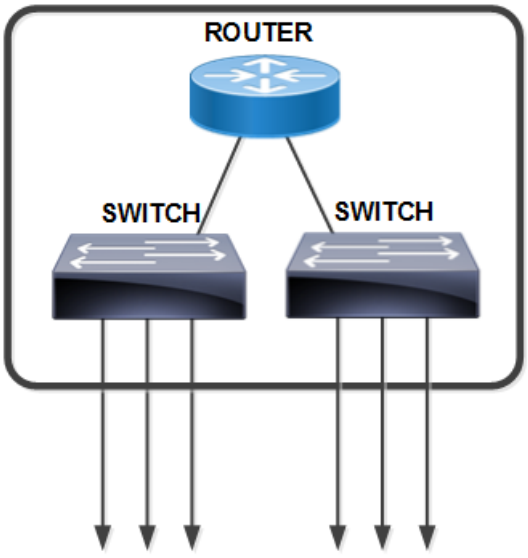

Figure 1-34: Routing between VLANs

For routing between VLANs and other routing ports, OcNOS routing protocols or static routing via NSM can be utilized.

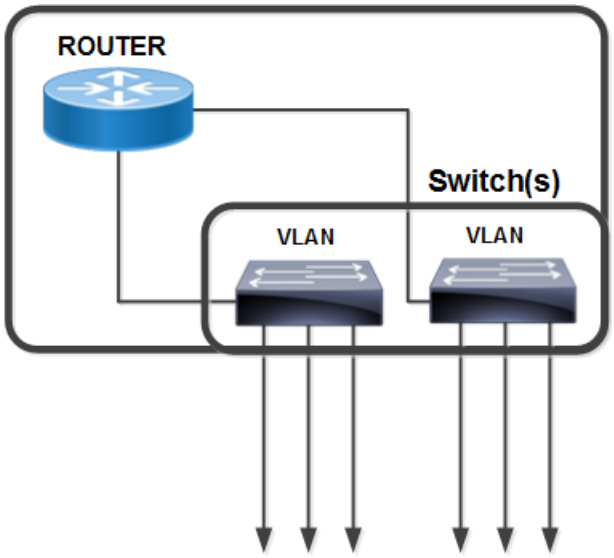

Figure 1-35: Routing between VLANs and Routing Ports

CHAPTER 2 Hybrid Switch Router Configuration

This chapter describes various configurations that can be done with the Hybrid Switch Router solution. OcNOS can be configured as a Layer 2 switch, a Layer 3 router or a Hybrid Switch Router.

Configuring Layer 2 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces are configured as routed interfaces. To configure a Layer 2 interface (switched interface), you must explicitly configure this using the `switchport` command in the interface mode. For example:

`#configure terminal`	Enter the Configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.
`(config)#interface eth2`	Specify an interface to configure and enter the Interface mode.
`(config-if)#switchport`	Configure eth2 as a Layer 2 port.
`(config-if)#bridge-group 1`	Associate interface to bridge 1.
`(config-if)#no shutdown`	Start interface.eth2

Configuring Layer 3 Interfaces

For the Hybrid Switch Router, it is important to understand that by default, all interfaces in OcNOS are L3 ports. If a port has been configured as L2, then use the `no switchport` command to make it a L3 port.

For example:

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth3`	Specify an interface to configure and enter the Interface mode.
`(config-if)#no switchport`	Configure eth3 as a Layer 3 port.

In the Hybrid Switch Router mode, if a VLAN is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols. For example:

`#configure terminal`	Enter the Configure mode.
`(config)#bridge 1 protocol mstp`	Creating bridge.
`(config)#vlan database`	Enter the VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1`	Enable VLAN 2 on bridge 1.

The last step in the example above show an interface given a name with the following format:

```
vlanXX.YYYY
```

Where XX is the bridge ID, and YYYY is the VLAN ID,

For example, the name, `vlan1.3` indicates that VLAN IP's interface is in VLAN 3, and bridge-group 1.

Integrated Management Interface Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Common IMI Commands

This chapter describes common Integration Management Interface (IMI) commands.

- show users
- terminal width
- terminal length
- terminal monitor
- write

banner motd

Use this command to set the message of the day (motd) at login.

After giving this command, you must write to memory using the terminal monitor command. If you do not write to memory, the new message of the day is not available after the device reboots.

Use the no parameter to not display a banner message at login.

Command Syntax

```
banner motd LINE
banner motd default
no banner motd
```

Parameters

LINE	Custom message of the day.
default	Default message of the day.

Default

By default, the following banner is displayed after logging in:

```
OcNOS version 1.3.4.268-DC-MPLS-ZEBM 09/27/2018 13:44:22
```

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#banner motd default

#configure terminal
(config)#no banner motd
```

configure terminal

Use this command to enter configure mode.

Command Syntax

```
configure terminal
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering configure mode (note the change in the command prompt).

```
#configure terminal
(config)#
```

configure terminal force

Use the configure terminal force command to kick out the configure command mode to privileged EXEC mode, iff there is any session already in configure command mode.

Note: Configure terminal force with option 0 or without any option indicates immediate kick out the session which is locked to configure command mode. similarly, configure terminal force with option of any value indicates session locked to configure command mode will be exited to privileged Exec mode after the specified number of seconds completed.

Command Syntax

```
configure terminal force <0-600|>
```

Parameters

<0-600>	Timeout value in seconds for the session in config mode to exit to Privileged

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal force 0
#
```

copy running-config startup-config

Use this command to a write the configuration to the file used at startup. This is the same as the terminal monitor command.

Command Syntax

```
copy running-config startup-config
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy running-config startup-config
Building configuration...
[OK]
#
```

disable

Use this command from to exit privileged exec mode and return to exec mode. This is the only command that allows you to go back to exec mode. The exit or quit commands in privileged exec mode end the session without returning to exec mode.

Command Syntax

```
disable
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#disable
>
```

enable

Use this command to enter privileged exec command mode.

Command Syntax

```
enable
```

Parameters

None

Default

No default value is specified

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering the Privileged Exec mode (note the change in the command prompt).

```
>enable
#
```

enable password

Use this command to change or create a password to use when entering enable mode.

Note: Only network administrators can execute this command. For more, see the username command.

There are three methods to enable a password:

Plain Password

The plain password is a clear text string that appears in the configuration file as configured.

Encrypted Password

An encrypted password encrypts a password. First, use this command to create a password. Then, use the service password-encryption command to encrypt the password. An encrypted password does not display in the configuration file; instead, it displays the encrypted string.

Hidden Password

A hidden password also encrypts a password; however, you do not need the service password-encryption command for this method. Use this method if you know the encrypted string of the plain text string that you want to use as a password. The output in the configuration file displays only the encrypted string and not the text string.

Use the no parameter to disable the password.

Command Syntax

```
enable password (8|) LINE
no enable password
no enable password LINE
```

Parameters

8	Hidden password.
line	Password string, up to 80-characters, including spaces. The string cannot begin with a number.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#enable password mypasswd
```

end

Use this command to return to privileged exec command mode from any other advanced command mode.

Command Syntax

```
end
```

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows returning to privileged exec mode directly from interface mode.

```
#configure terminal
(config)#interface eth0
(config-if)#end
#
```

exec-timeout

Use this command to set the interval the command interpreter waits for user input detected. That is, this sets the time a telnet session waits for an idle VTY session before it times out. A value of zero minutes and zero seconds (0 and 0) causes the session to wait indefinitely.

Use the no parameter to disable the wait interval.

Command Syntax

```
exec-timeout <0-35791> (<0-2147483>|)
no exec-timeout
```

Parameters

<0-35791>	Timeout value in minutes.
<0-2147483>	Timeout value in seconds.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, the telnet session will timeout after 2 minutes, 30 seconds if there is no response from the user.

```
Router#configure terminal
Router(config)#line vty 23 66
Router(config-line)#exec-timeout 2 30
```

exit

Use this command to exit the current mode and return to the previous mode. When used in exec mode or privileged exec mode, this command terminates the session.

Command Syntax

```
exit
```

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows exiting interface mode and returning to configure mode.

```
#configure terminal
(config)#interface eth0
(config-if)#exit
(config)#
```

help

Use this command to display help for the OcNOS command line interface.

Command Syntax

```
help
```

Parameters

None

Default

No default value is specified

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#help
CLI provides advanced help feature. When you need help,
anytime at the command line please press '?'.

If nothing matches, the help list will be empty and you must backup
until entering a '?' shows the available options.
Two styles of help are provided:
1. Full help is available when you are ready to enter a
   command argument (e.g. 'show ?') and describes each possible
   argument.
2. Partial help is provided when an abbreviated argument is entered
   and you want to know what arguments match the input
   (e.g. 'show ve?'.)
```

history

Use this command to set the maximum number of commands stored in the command history.

Use the no parameter to remove the configuration.

Command Syntax

```
history max <0-2147483647>
no history max
```

Parameters

`<0-2147483647>` Number of commands.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#line vty 12 77
(config-line)#history max 123

(config-line)#no history max
```

hostname

Use this command to set the network name for the device. OcNOS uses this name in system prompts and default configuration filenames.

Setting a host name using this command also sets the host name in the kernel.

Note: After giving the `hostname` command, you must write to memory using the terminal monitor command. If you do not write to memory, the change made by this command (the new host name) is not set after the device reboots.

Use the `no` parameter to disable this function.

Command Syntax

```
hostname WORD
no hostname (WORD|)
```

Parameter

`WORD`	Network name for a system. Per RFC 952 and RFC 1123, a host name string can contain only the special characters period (“.”) and hyphen (“-”). These special characters cannot be at the start or end of a host name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#hostname ABC
(config)#

(config)#no hostname
(config)#exit
```

line console

Use the this command to move or change to the line console mode.

Command Syntax

```
line console <0-0>
```

Parameters

<0-0>	First line number.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example enters line mode (note the change in the prompt).

```
#configure terminal
(config)#line console 0
(config-line)#
```

line vty (all line mode)

Use this command to move or change to all line VTY mode.

Note: line vty is just a mode changing command, and it can't exist without sub attributes being configured. i.e exec-timeout.

Command Syntax

```
line vty
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

The following example shows entering all line mode (note the change in the prompt).

```
#configure terminal
(config)#line vty
(config-all-line)#exit
(config)#
```

line vty (line mode)

Use this command to move or change to VTY mode. This command is used to connect to a protocol daemon. This configuration is necessary for any session. This configuration should be in the daemon's config file before starting the daemon.

Use the no parameter to disable this command.

Note: line vty is just a mode changing command, and it can't exist without sub attributes being configured. i.e exec-timeout.

Command Syntax

```
line vty <0-871> <0-871>
no line vty <0-871> (<0-871>|)
```

Parameters

<0-871>	Specify the first line number.
<0-871>	Specify the last line number.

Note: Configurations (exec-timeout) performed under this mode, affects only the current VTY session.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows entering line mode (note the change in the prompt).

```
#configure terminal
(config)#line vty 9
(config-line)#exit
(config)no line vty 9
```

logging cli

Use this command to enable logging commands entered by all users.

Use the no parameter to disable logging commands entered by all users.

Command Syntax

```
logging cli
no logging cli
```

Parameter

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#logging cli
(config)#no logging cli
```

logout

Use this command to exit from the shell from any exec mode.

Command Syntax

```
logout
```

Parameters

None

Default

No default value is specified

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following examples show the use of `logout` command.

```
>logout
OcNOS login:

>enable
en#logout
>
```

quit

Use this command to exit the current mode and return to the previous mode. When this command is executed in one of the exec modes, it closes the shell and logs you out.

Command Syntax

```
quit
```

Parameters

None

Default

No default value is specified

Command Mode

All modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#quit
(config)#

>enable
#quit
[root@TSUP-123 sbin]#
```

service advanced-vty

Use this command to set multiple options to list when the tab key is pressed while entering a command. This feature applies to commands with more than one option.

Use the no parameter to not list options when the tab key is pressed while entering a command.

Command Syntax

```
service advanced-vty
no service advanced-vty
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#service advanced-vty
(config)#no service advanced-vty
```

service password-encryption

Use this command to encrypt passwords created with the enable password command. Encryption helps prevent observers from reading passwords.

Use the no parameter to disable this feature.

Command Syntax

```
service password-encryption
no service password-encryption
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#enable password mypasswd
(config)#service password-encryption
```

service terminal-length

Use this command to set the number of lines that display at one time on the screen for the current terminal session.

Use the no parameter to disable this feature.

Command Syntax

```
service terminal-length <0-512>
no service terminal-length (<0-512>|)
```

Parameters

<0-512>	Number of lines to display. A value of 0 prevents pauses between screens of output.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#service terminal-length 60
```

show clock

Use this command to display the current system time.

Command Syntax

```
show clock
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show clock
12:54:02 IST Fri Apr 29 2016
```

show cli history

Use this command to list the commands entered in the current session. The history buffer is cleared automatically upon reboot.

Command Syntax

```
show cli history
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show cli history
   1 en
   2 show ru
   3 con t
   4 show spanning-tree
   5 exit
```

show logging cli

Use this command to display command history for all users.

Command Syntax

```
show logging cli ((logfile LOGFILENAME)|) (match-pattern WORD |)
show logging cli last <1-9999>
show logging logfile list
```

Parameters

LOGFILENAME	Name of a saved command history log file. The default path is /var/log/messages, but you can specify a full path to override the default.
WORD	Display only lines with this search pattern.
<1-9999>	Number of lines to display from the end of the command history.
logfile list	Display a list of command history files.

Default

LOGFILENAME Name of a saved command history log file. The default path is /var/log/messages, but you can specify a full path to override the default.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh logging cli
2017 Mar 01 16:30:59 : OcNOS : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli logfile ipi
2017 Mar 01 16:30:59 : OcNOS : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli match-pattern root
2017 Mar 01 16:30:59 : OcNOS : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#sh logging cli logfile ipi match-pattern root
2017 Mar 01 16:30:59 : OcNOS : User root@/dev/pts/1 : CLI : 'exit'
2017 Mar 01 16:31:06 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging logfile list'
#show logging cli last 2
2017 Mar 1 16:34:26.302 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging info'
2017 Mar 1 16:34:37.317 : OcNOS : User root@/dev/pts/1 : CLI : 'sh logging cli last 2'
#show logging logfile list
file1
file2
```

show process

Use this command to display the OcNOS daemon processes that are running.

Command Syntax

```
show process
```

Parameters

None

Command Mode

Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show process
 PID NAME             TIME     FD
   1 nsm          00:56:29     7
   2 ripd         00:56:29     11
   3 ripngd       00:56:29     12
   4 ospfd        00:56:29     9
   5 ospf6d       00:56:29     10
   6 bgpd         00:56:29     14
   9 isisd        00:56:29     8
#
```

Table 1-30 explains the output fields.

Table 1-30: show process fields

Entry	Description
PID Name	Process identifier name.
TIME	(S)—Number of system and user CPU seconds that the process has used. (None, D, and E)—Total amount of time that the command has been running.
FD	The Flexible Data-Rates (FD) of the interface.

show running-config

Use this command to show the running system status and configuration.

Command Syntax

```
show running-config
show running-config full
```

Parameters

`full`	Display the full configuration information.

Command Mode

Privileged exec mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config
no service password-encryption
!
no service dhcp
ip domain-lookup
!
mpls propagate-ttl
!
vrrp vmac enable
spanning-tree mode provider-rstp
no data-center-bridging enable
!
interface lo
 ip address 127.0.0.1/8
 ipv6 address ::1/128
 no shutdown
!
interface eth0
 ip address 10.1.2.173/24
 no shutdown
!
interface eth1
 shutdown

!
line con 0
 login
!
end
(config)#
```

show running-config access-list

Use this command to show the running system status and configuration details for access lists.

Command Syntax

```
show running-config access-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#show running-config access-list
!
access-list abc remark annai
access-list abc deny any
access-list abd deny any
!
#
```

show running-config as-path access-list

Use this command to show the running system status and configuration details for access lists based on autonomous system paths.

Command Syntax

```
show running-config as-path access-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#show running-config as-path access-list
!
ip as-path access-list wer permit knsmk
!
(config)#
```

show running-config community-list

Use this command to show the running system status and configuration details for community lists.

Command Syntax

```
show running-config community-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
(config)#show running-config community-list
!
ip community-list standard aspd permit internet
ip community-list expanded cspd deny ljj
ip community-list expanded cspd permit dcv
ip community-list expanded wde permit njhd
ip community-list expanded wer deny sde
(config)#
```

show running-config interface igmp

Use this command to show the running system status and configuration for IGMP.

Command Syntax

```
show running-config interface IFNAME ip igmp
```

Parameters

IFNAME	Interface name.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ip igmp
!
interface eth1
!
```

show running-config interface multicast

Use this command to show the running system status and configuration for a multicast interface.

Command Syntax

```
show running-config interface IFNAME ip multicast
```

Parameters

IFNAME	Interface name.

Command Mode

Privileged exec mode and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ip multicast
!
interface eth1
!
```

show running-config prefix-list

Use this command to display the running system status and configuration details for prefix lists.

Command Syntax

```
show running-config prefix-list
```

Parameters

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config prefix-list
!
ip prefix-list abc seq 5 permit any
ip prefix-list as description annai
ip prefix-list wer seq 45 permit any
!
```

show running-config vrf

Use this command to show the running system status and configuration details for a specified VRF instance name.

Command Syntax

```
show running-config vrf WORD
```

Parameters

WORD	Virtual Routing and Forwarding name

Command Mode

Privileged exec mode, configure mode, router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config vrf xyz
!
ip vrf xyz
 description vrf
 router-id 11.11.11.11
```

show tcp

Use this command to display the Transmission Control Protocol (TCP) connections details.

Command Syntax

```
show tcp
```

Parameters

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show tcp
Proto Recv-Q Send-Q Local Address          Foreign Address        State
tcp        0      0 0.0.0.0:22            0.0.0.0:*              LISTEN
tcp        0      0 127.0.0.1:25          0.0.0.0:*              LISTEN
tcp        0      1 10.12.44.1:57740      127.0.0.1:705          CLOSE_WAIT
tcp       52      0 10.12.44.21:22        10.12.7.89:705         ESTABLISHED
tcp       85      0 10.12.44.21:57742     10.12.44.21:57738      ESTABLISHED
```

Table 1-31: Show tcp output

Entry	Description
Proto	Protocol – TCP
Recv-Q	Number of TCP packets in the Receive Queue.
Send-Q	Number of TCP packets in the Send-Q.
Local Address and port number	Local IP address and the port number.

Table 1-31: Show tcp output (Continued)

Entry	Description
Foreign Address and port number	Foreign (received) IP address and the port number.
State	Current state of TCP connections: ESTABLISHED SYN_SENT SYN_RECV FIN_WAIT1 FIN_WAIT2 TIME_WAIT CLOSE CLOSE_WAIT LAST_ACK LISTEN CLOSING UNKNOWN

show users

Use this command to display information about current users.

Command Syntax

```
show users
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show users
Current user          : (*).  Lock acquired by user : (#).
CLI user              : [C].  Netconf users         : [N].
Location : Applicable to CLI users.
Session  : Applicable to NETCONF users.

      Line      User     Idle     Location/Session      PID     TYPE        Role
(*) 130 vty 0 [C]root   00:00:36      pts/0            20872    Local    network-admin
(#)   NA      [N]root     NA           1                 NA      NA      network-admin
      NA      [N]root     NA           2                 NA      NA      network-admin
    131 vty 1 [C]joyce  00:00:26     pts/1             17593    Remote   network-admin
```

Table 1-32 explains the output fields.

Table 1-32: show users fields

Entry	Description
Current users	
CLI user	
Location	
Session	
Lock acquired by user	
Netconf users	
Line	
User	User name.

Table 1-32: show users fields

Entry	Description
Idle	How long the user has been idle.
Location/Session	
PID	Process identifier name.
Type	
Role	

terminal width

Use this command to set the number of characters to be displayed in one line on the screen. Use the no option to unset the number of characters on the screen.

Note: If user wants to have a fixed terminal length and width, then terminal length should not be set to 0. i.e. CLI “terminal length 0“ should not be used, and only non-zero length to be used.

Command Syntax

```
terminal width <24-511>
terminal no width <24-511>
```

Parameters

<24-511>	Number of lines on screen

Default

Default width value 80 is optionally overridden by kernel.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
host#terminal width 120
```

terminal length

Use this command to set the number of lines displayed on the screen.

Use the no option to unset the number of lines on a screen.

Note: If user wants to have a fixed terminal length and width, then terminal length should not be set to 0. i.e. CLI “terminal length 0“ should not be used, and only non-zero length to be used.

Command Syntax

```
terminal length <0-511>
terminal no length <0-511>
```

Parameters

<0-511>	Number of lines on screen. Specify 0 for no pausing.

Default

Default length value 24 is optionally overridden by kernel.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>enable
#terminal length 0
```

The following example sets the terminal length to 30 lines.

```
#terminal length 30
```

terminal monitor

Use this command to display debugging output on a terminal.

Use one of the optional parameters to display debugging output for the OcNOS user. When the command is used without a parameter, it can be used by a OcNOS user to display the debug output on the terminal for the user local OcNOS. When used with a parameter, it may be used only by a OcNOS user.

The no form of the command terminates the debug output on the terminal. The OcNOS user can use this command. In addition, the OcNOS user can cancel a debug output from a specific VR or all VRs.

Command Syntax

```
terminal monitor
terminal monitor (all|WORD|)
terminal no monitor
terminal no monitor (WORD|)
```

Parameters

`WORD`	Used in the PVR context, and contains the VR name to be included in the debugging session.
`all`	Used the PVR context to include all VR in a PVR debugging session.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>Enable
#terminal monitor
#terminal no monitor
```

write

Use this command to a write the configuration to the file used at startup or to a specified file. This is the same as the copy running-config startup-config command.

Command Syntax

```
write file FILE
write memory
write WORD
```

Parameters

`FILE`	Write to a given path and file. If you do not give a file path, the file is added to `/root`.
`memory`	Write to non-volatile memory.
`WORD`	Write to running configuration file path.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows writing the configuration to the startup configuration file:

```
#write
Building configuration...
[OK]
```

This example shows writing the configuration to a specified file:

```
#write file /home/test.txt
Building configuration...
[OK]
```

CHAPTER 2 IMI Shell Commands

This chapter describes IMI shell commands.

do

Use this command to run several exec mode or privileged exec mode commands from configure mode. The commands that can be run from configure mode using `do` are: `show`, `clear`, `debug`, `ping`, `traceroute`, `write`, and `no debug`.

Command Syntax

```
do LINE
```

Parameters

`LINE`	Command and its parameters.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#(config)#do show interface
Interface lo
  Hardware is Loopback index 1 metric 1 mtu 16436 duplex-half arp ageing
timeout 25
  <UP,LOOPBACK,RUNNING>
  VRF Binding: Not bound
  Label switching is disabled
  No Virtual Circuit configured
  Administrative Group(s): None
  DSTE Bandwidth Constraint Mode is MAM
  inet 4.4.4.40/32 secondary
  inet 127.0.0.1/8
  inet6 ::1/128
  Interface Gifindex: 3
  Number of Data Links: 0
  GMPLS Switching Capability Type:
    Packet-Switch Capable-1 (PSC-1)
  GMPLS Encoding Type: Packet
  Minimum LSP Bandwidth 0
    input packets 10026, bytes 730660, dropped 0, multicast packets 0
    input errors 0, length 0, overrun 0, CRC 0, frame 0, fifo 0, missed 0
    output packets 10026, bytes 730660, dropped 0
    output errors 0, aborted 0, carrier 0, fifo 0, heartbeat 0, window 0
    collisions 0
#
```

logout

Use this command to exit the OcNOS shell.

Command Syntax

```
logout
```

Parameters

None

Default

No default value is specified

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>logout
[root@TSUP40 sbin]#
```

ping

Use this command to send echo messages to another host.

Command Syntax

```
ping WORD (vrf (NAME|management)|)
ping ip WORD (vrf (NAME|management)|)
ping ipv6 WORD (|IFNAME)
ping ipv6 WORD (|IFNAME) (vrf (NAME|management)|)
```

Parameters

WORD	Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.
vrf	Virtual Routing and Forwarding instance.
NAME	Virtual Routing and Forwarding name.
management	Virtual Routing and Forwarding name.
ip	IPv4 echo.
WORD	Destination address in A.B.C.D format or host name.
ipv6	IPv6 echo.
WORD	Destination address in X:X::X:X format or host name.
IFNAME	Name of the interface.

Default

No default value is specified

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>enable
#ping 20.20.20.1 vrf management
Press CTRL+C to exit
PING 20.20.20.1 (20.20.20.1) 56(84) bytes of data.
64 bytes from 20.20.20.1: icmp_seq=1 ttl=64 time=0.032 ms
64 bytes from 20.20.20.1: icmp_seq=2 ttl=64 time=0.035 ms
64 bytes from 20.20.20.1: icmp_seq=3 ttl=64 time=0.033 ms
64 bytes from 20.20.20.1: icmp_seq=4 ttl=64 time=0.034 ms
64 bytes from 20.20.20.1: icmp_seq=5 ttl=64 time=0.034 ms
64 bytes from 20.20.20.1: icmp_seq=6 ttl=64 time=0.036 ms
64 bytes from 20.20.20.1: icmp_seq=7 ttl=64 time=0.036 ms
64 bytes from 20.20.20.1: icmp_seq=8 ttl=64 time=0.036 ms

--- 20.20.20.1 ping statistics ---
8 packets transmitted, 8 received, 0% packet loss, time 6999ms
```

```
rtt min/avg/max/mdev = 0.032/0.034/0.036/0.006 ms

#ping ipv6 3001:db8:0:1::129 vrf management
Press CTRL+C to exit
PING 3001:db8:0:1::129(3001:db8:0:1::129) 56 data bytes
64 bytes from 3001:db8:0:1::129: icmp_seq=1 ttl=64 time=0.038 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=2 ttl=64 time=0.047 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=3 ttl=64 time=0.047 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=4 ttl=64 time=0.049 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=5 ttl=64 time=0.044 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=6 ttl=64 time=0.048 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=7 ttl=64 time=0.046 ms
64 bytes from 3001:db8:0:1::129: icmp_seq=8 ttl=64 time=0.048 ms

--- 3001:db8:0:1::129 ping statistics ---
8 packets transmitted, 8 received, 0% packet loss, time 6999ms
```

interactive ping

Use this command to send echo messages to another host interactively. You are prompted with options supported by the command.

Command Syntax

```
ping
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>enable
#ping
Protocol [ip]:
Target IP address: 20.20.20.1
Name of the VRF : management
Repeat count [5]: 6
Time Interval in Sec [1]: 2.2
Datagram size [100]:
Timeout in seconds [2]:
Extended commands [n]:
Ping Broadcast? Then -b [n]:
PING 20.20.20.1 (20.20.20.1) 100(128) bytes of data.
108 bytes from 20.20.20.1: icmp_seq=1 ttl=64 time=0.038 ms

```

The input prompts are described in Table 2-33:

Table 2-33: ping output fields

Protocol [ip]	IPv4 or IPv6. The default is IPv4 if not specified.
Target IP address	IPv4 or IPv6 address or host name.
Name of the VRF	Name of the Virtual Routing and Forwarding instance.
Repeat count [5]	Number of ping packets to send. The default is 5 if not specified.
Time Interval in Sec [1]	Time interval between two ping packets. The default is 1 second if not specified.
Datagram size [100]	Ping packet size. The default is 100 bytes if not specified.
Timeout in seconds [2]	Time to wait for ping reply. The default is 2 seconds if not specified.
Extended commands [n]	Options for extended ping. The default is “no”.
Source address or interface	Source address or interface.
Type of service [0]	Types of service. The default is 0 if not specified.
Set DF bit in IP header? [no]	Do not fragment bit. The default value is “no” if not specified.
Data pattern [0xABCD]	Specify a pattern.
Ping Broadcast? Then -b [n]	Broadcast ping. The default is “no”. For a broadcast address, the value should be “y”.

privilege level

Use this command to set the command privilege level.

Note: Privilege levels 2-14 are undefined.

Use the no parameter with this command to disable the command privilege level.

Command Syntax

```
privilege level <1-15>
privilege level (16)
no privilege level (<1-15>|)
no privilege level (16)
```

Parameters

16	Maximum privilege level for a line.
<1-15>	Default privilege level for a line.

Default

No default value is specified

Command Mode

Line mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#line vty 0 5
(config-line)#privilege level 15
```

show privilege

Use this command to display the current privilege level. The privilege level range is 1-15.

Command Syntax

```
show privilege
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show privilege
Current privilege level is 15
#
```

telnet

Use this command to open a telnet session.

Command Syntax

```
telnet WORD vrf management|)
telnet WORD PORT
```

Parameters

WORD	IP address or hostname of a remote system.
PORT	TCP port number.
vrf	Virtual Routing and Forwarding
management	Management VRF

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#telnet 2.2.2.2 2602
trying telnet 2.2.2.2 2602...
```

traceroute

Use this command to trace an IPv4/v6 route to its destination.

Command Syntax

```
traceroute WORD
traceroute WORD (vrf (NAME|management)|)
traceroute ip WORD
traceroute ip WORD (vrf (NAME|management)|)
traceroute ipv6 WORD
traceroute ipv6 WORD (vrf (NAME|management)|)
```

Parameters

WORD	Destination address (in A.B.C.D format for IPv4 or X:X::X:X for IPv6) or host name.
vrf	Virtual Routing and Forwarding instance.
NAME	Virtual Routing and Forwarding name.
management	Virtual Routing and Forwarding name.
ip	IPv4 echo.
WORD	Destination address in A.B.C.D format or host name.
ipv6	IPv6 echo.
WORD	Destination address in X:X::X:X format or host name.

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#traceroute ip 10.10.100.126 vrf management
traceroute to 10.10.100.126 (10.10.100.126), 30 hops max, 38 byte packets
 1  10.1.2.1 (10.1.2.1)  0.386 ms  0.315 ms  0.293 ms
 2  10.10.100.126 (10.10.100.126)  1.944 ms  1.497 ms  1.296 ms
#
```

write terminal

Use this command to display the current configuration.

Command Syntax

```
write terminal
```

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#write terminal

Current configuration:
!
hostname ripd
password zebra
log stdout
!
debug rip events
debug rip packet
!
interface lo
!
interface eth0
 ip rip send version 1 2
 ip rip receive version 1 2
!
interface eth1
 ip rip send version 1 2
 ip rip receive version 1 2
!
!

 network 10.10.10.0/24
 network 10.10.11.0/24
 redistribute connected
!
line vty
 exec-timeout 0 0
```

CHAPTER 3 VLOG Commands

This chapter describes virtual router log (VLOG) commands.

show vlog all

Use this command to display the output of all virtual router log `show` commands. For column descriptions, refer to descriptions of the individual commands.

Command Syntax

```
show vlog all
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog all

Type     Name     FD  UserVR  AllVrs  VRCnt
tty   /dev/pts/8  12  vr222    ---        1
tty   /dev/pts/4  13  <PVR>    ---        1

VR-Name  VR-Id  PVR-Terms  VR-Terms                  LogFile
CurSize
<PVR>       0          1        0         /var/local/zebos/log/pvr/my-log
1624320
vr111       1          0        0         n/a
n/a
vr222        2          0        1          /var/local/zebos/log/vr222/log-
vr222        0
vr333        3          0        0          /var/local/zebos/log/vr333/log-
vr333        0

Name  Id  MsgCnt        ConTime              ReadTime
NSM    1       1  Fri May-15 21:05:04  Fri May-15 21:05:04
IMI   19       1  Fri May-15 21:05:02  Fri May-15 21:05:02
```

Table 3-34 explains the output:

Table 3-34: show vlog all details

Name	Name of protocol module
Id	Protocol module identifier

Table 3-34: show vlog all details

MsgCnt	Number of log messages received from protocol module
ConTime	Time the connection was established
ReadTime	Time the last log message was received

Table 3-35 explains the output:

Table 3-35: show vlog all details

Type	Type of terminal
Name	Device name
FD	File descriptor
UserVR	Name of the Virtual Router where in which the user is logged in
AllVRs	Whether the PVR user requested debug output from all VRs
VRCnt	Number of VRs to which a terminal is attached

Table 3-36 explains the output:

Table 3-36: show vlog all details

VR-Name	Virtual router name
VR-Id	Virtual router identifier
PVR-Terms	Number of attached PVR terminals
VR-Terms	Number of attached VR terminals
LogFile	Name of VR log file (this column is empty if writing to a log file is disabled)
CurSize	Log file current size

show vlog clients

Use this command to display all attached virtual router log clients (protocol modules).

Command Syntax

```
show vlog clients
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog clients

Name  Id  MsgCnt          ConTime               ReadTime
NSM    1       1     Fri May-15 21:05:04  Fri May-15 21:05:04
IMI   19       1     Fri May-15 21:05:02  Fri May-15 21:05:02
```

Table 3-37 explains the output:

Table 3-37: show vlog clients details

Name	Name of protocol module
Id	Protocol module identifier
MsgCnt	Number of log messages received from protocol module
ConTime	Time the connection was established
ReadTime	Time the last log message was received

show vlog terminals

Use this command to display all active connections where VLOGD is forwarding log output.

Command Syntax

```
show vlog terminals
```

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog terminals

Type     Name     FD  UserVR  AllVrs  VRCnt
tty   /dev/pts/8  12  vr222    ---        1
tty   /dev/pts/4  13  <PVR>    ---        1
```

Table 3-38 explains the output:

Table 3-38: show virtual router log terminals details

Type	Type of terminal
Name	Device name
FD	File descriptor
UserVR	Name of the Virtual Router where in which the user is logged in
AllVRs	Whether the PVR user requested debug output from all VRs
VRCnt	Number of VRs to which a terminal is attached

show vlog virtual-routers

Use this command to display virtual router statistics such as the number of terminals attached.

Command Syntax

```
show vlog virtual-routers
```

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show vlog virtual-routers

VR-Name  VR-Id  PVR-Terms  VR-Terms LogFile
CurSize
<PVR>         0  1          0        /var/local/zebos/log/pvr/my-log
1624320
vr111         1  0          0        n/a                                    n/a
vr222         2  0          1        /var/local/zebos/log/vr222/log-vr222  0
vr333         3  0          0        /var/local/zebos/log/vr333/log-vr333  0
```

Table 3-39 explains the output:

Table 3-39: show vlog virtual-routers details

VR-Name	Virtual router name
VR-Id	Virtual router identifier
PVR-Terms	Number of attached PVR terminals
VR-Terms	Number of attached VR terminals
LogFile	Name of VR log file (this column is empty if writing to a log file is disabled)
CurSize	Log file current size

CHAPTER 4 System Commands

This chapter is a reference for system commands.

mv

Use this command to rename (move) a file.

Command Syntax

```
mv LINE
```

Parameters

LINE	Source and destination file names

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#mv old-name new-name
```

pwd

Use this command to print the working directory.

Command Syntax

pwd

Parameters

None

Default

No default value is specified

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

#pwd

CHAPTER 5 Licensing and Upgrade Commands

This chapter describes the license and upgrade commands.

license get

Use this command to fetch the license for this device from a network path or a USB mount path. This command validates the license against the device identifier.

Note: The system date must be correct to avoid installation failure.

For HTTP, FTP, or TFTP, ensure that the IP address is reachable from the OcNOS device and that the file location is correct.

If you install a license from a USB stick, insert it, and the contents of the USB are available as `///mnt/usb/`. For example:

```
>license get file:///mnt/usb/IPI-CC37ABBE0340.bin
```

After running the `license get` command, you can immediately use the switch without rebooting.

To verify, run the show license command after giving this command.

Command Syntax

```
license get (|(source-interface IFNAME)) WORD
```

Parameters

`IFNAME`	The interface used to download the license. If not specified, `eth0` is used. If the management interface of the switch is in the “management” VRF, then this command uses the “management” VRF to get the license from the specified path. You do need not to know if the management port is in the default VRF or the “management” VRF.

`WORD`	Where to get the license:
	`ftp://your-server-ip/path/to/file/IPI_deviceId.bin`
	`http://your-server-ip/path/to/file/IPI_deviceId.bin`
	`tftp://your-server-ip/path/to/file/IPI_deviceId.bin`
	`file:///mnt-point/usb/path/to/file/IPI_deviceId.bin`

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>license get http://myServer/IPI-CC37ABBE0340.bin
```

Specify the `source-interface` parameter to set the interface to use:

```
>license get source-interface xe2 http://myServer/IPI-CC37ABBE0340.bin
```

license refresh

Use this command to install a license present on the device. This command is required only when the license get command reports error when installing the license but successfully downloaded the license.

When this command is given without a file name, the device installs the most recently downloaded license file.

Note: Always ensure that the device date is up to date to avoid license installation failures.

Once this command is successful, you can use the device without rebooting. Verify license installation with the show license command.

Command Syntax

```
license refresh (FILENAME|)
```

Parameters

FILENAME	License file name which exists on the device.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.7.

Examples

```
>license refresh
>license refresh IPI-CH3QX42.bin
```

show installers

Use this command to display a list of downloaded images on the device.

Command Syntax

```
show installers
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Examples

```
#show installers
/installers/DELL_S6000_ON-OcNOS-1.3.6.228a-DC_MPLS-S0-P0-installer
#
```

show license

Use this command to display the current license details and errors. The licenses are device locked, which means that a separate license is required for each device.

Command Syntax

```
show license
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>show license
License Type: Trial edition
Remaining day to expires : 21 day(s)
Node Identifier: 1402EC2DA140
Device Software : OCNOS-ENT-IPBASE

>show license
License Type: Evaluation, Limited edition
License Validity: Not Applicable
Node Identifier: A82BB59DCAD9
Device Software : OCNOS-DC-IPBASE
License Error: Invalid license file
```

show sys-update details

Use this command to display upgrade details. The output indicates whether the current version is committed or rolled back.

Command Syntax

```
show sys-update details
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show sys-update details
Previous_version EC_AS5812_54X-OcNOS-1.3.4.265-DC_MPLS_ZEBM-S0-P0
Current_version EC_AS5812_54X-OcNOS-1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer
(committed)
Last_upgraded Wed Sep 26 14:40:06 UTC 2018
Auto Rollback end time NA
```

sys-update commit

Use this command to accept a new version. After a commit, you cannot roll back to a previous version. Until you commit a new version, you cannot save the configuration. Upgrading with an installer file is auto committed.

Command Syntax

```
sys-update commit
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sys-update commit
```

sys-update delete

Use this command to delete a downloaded image.

Command Syntax

```
sys-update delete IMAGE_NAME
```

Parameters

IMAGE_NAME	Installer to delete

Default

None

Command mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Examples

```
#sys-update delete DELL_S6000_ON-OcNOS-1.3.6.228a-DC_MPLS-S0-P0-installer
```

sys-update get

Use this command to download an installer image.

Note: The URL must be compliant with RFC 3986.

Note: At times while downloading installer through TFTP protocol, download progress would show 100% from the start to the end of the download. This behavior is observed whenever the TFTP server doesn't support the TFTP Option Negotiation. Also at times TFTP download takes more time to download the installer though the client and server are part of the same subnet, eventually download operation even times out after 30 minutes. The reason for such issue is the latency, here some of the TFTP server implementations are lagging performance. In such instances we recommend to switch to a different TFTP server. This TFTP download operation is verified in Debian Linux machine against the server present in the `tftpd-hpa` package.

Command Syntax

```
sys-update get ((source-interface IFNAME)|) URL (verbose|)
```

Parameters

`IFNAME`	The interface used to download the new version. If not specified, eth0 is used.

`URL`	Where to get the installer:
	`http://your-server-ip/path/to/file/<abc-installer>`
	`ftp://your-server-ip/path/to/file/<abc-installer>`
	`tftp://your-server-ip/path/to/file/<abc-installer>`
	`file:///mnt/usb/path/to/file/<abc-installer>`

`verbose`	Include download logs in the output.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Examples

```
#sys-update get source-interface xe3 http://myServer/EC_AS5812_54X-OcNOS-1.3.7.52-
DC_IPBASE-S0-P0-installer
```

sys-update install

Use this command to upgrade the current software to a newer version. You can do two types of installation:

- If a `.deb` file is provided, the board is loaded with new binaries.
- If an installer file is provided, the board is completely installed with a new kernel and binaries.

Note:

1. During an upgrade, if a license is not available the existing configuration is not applied. Also, the `ZebOS.conf` file is not created and the terminal monitor command is not allowed.
2. The URL must be compliant with RFC 3986.
3. When this command is executed without the `source-interface` parameter, then eth0 and the default management VRF are used. When this command is executed with the `source-interface` parameter then that interface is used.
4. At times while downloading installer through TFTP protocol, download progress would show 100% from the start to the end of the download. This behavior is observed whenever the TFTP server doesn't support the TFTP Option Negotiation. Also at times TFTP download takes more time to download the installer though the client and server are part of the same subnet, eventually download operation even times out after 30 minutes. The reason for such issue is the latency, here some of the TFTP server implementations are lagging performance. In such instances we recommend to switch to a different TFTP server. This TFTP download operation is verified in Debian Linux machine against the server present in the `tftpd-hpa` package.

Command Syntax

```
sys-update install (|(source-interface IFNAME)) URL (verbose|)
```

Parameters

`IFNAME`	The interface used to download the new version. If not specified, `eth0` is used.

`URL`	Where to get the new version:
	`http://your-server-ip/path/to/file/<abc-updater.deb or abc-installer>`
	`ftp://your-server-ip/path/to/file/<abc-updater.deb or abc-installer>`
	`tftp://your-server-ip/path/to/file/<abc-updater.deb or abc-installer>`
	`file:///mnt/usb/path/to/file/<abc-updater.deb or abc-installer>`

`verbose`	Include upgrade logs in the output.

Default

None

Caution

OcNOS services are using `/usr/local/etc` path to store the device configuration, and this path mounted into a separate partition to isolate system configurations. This partition is meant only for system configuration. It will affect the system stability if the user uses this partition for storing general files. In this problematic state, if the device reboots, OcNOS services will not start properly, that would even create problems to the device connectivity. There will be an impact on normal system configuration operations.

User must take care of this problem just before issuing the following commands:

- `reload/sys-reload` - Reboots the device.
- `sys-shutdown` - This is to shutdown the device, but when users powers the device OcNOS services won't start cleanly.
- `reboot / shutdown` - From Linux shell
- Also includes all copy commands from Linux shell before issuing the user triggered reload commands.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sys-update install source-interface eth2 http://10.12.52.150/myServer/
EC_AS5812_54X-OcNOS-1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer verbose

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-OcNOS-
1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer verbose

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-OcNOS-
1.3.4.266-DC_MPLS_ZEBM-S0-P0-installer

#sys-update install http://10.12.52.150/myServer/EC_AS5812_54X-OcNOS-
1.3.4.266-DC_MPLS_ZEBM-S0-P0-updater.deb
```

sys-update list-version

Use this command to display files and folders. This command supports only FTP and the local file system.

Command Syntax

```
sys-update list-version ((source-interface IFNAME)|) URL
```

Parameters

`IFNAME`	The interface used to download the list. If not specified, `eth0` is used.

`URL`	Where to get the list:
	`ftp://(username@|)serverIP/path/to/file/`
	`file:///mnt/usb/path/to/file/`

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sys-update list-version ftp://10.12.52.150/
```

sys-update rollback

Use this command to roll back to the previous version. After a commit, you cannot roll back. Upgrading with an installer file does not support roll back.

Command Syntax

```
sys-update rollback (verbose|)
```

Parameters

verbose	Include details in the output.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sys-update rollback
#sys-update rollback verbose
```

sys-update un-install

Use this command to un-install the device software remotely using the CLI and NetConf.management interfaces. This command decouples the device console dependency to un-install OcNOS.

This command puts the device in ONIE un-install mode and triggers device reboot. Upon reboot, ONIE detects the un-install mode and performs the un-installation. Once the un-installation completes, the device boots ONIE. To understand more about the un-installation technique, see the U-Boot and x86 Architecture sections at:

https://opencomputeproject.github.io/onie/design-spec/index.html#.

Note: By default, ONIE has SSH and Telnet services running, so you also have the option to trigger the installation through the management connection. For more information about SSH and Telnet connectivity, see:

https://opencomputeproject.github.io/onie/user-guide/index.html#debugging-an-installation.

Command Syntax

```
sys-update un-install
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Examples

```
#sys-update un-install
```

This document contains these chapters:

CHAPTER 1 Common Exec Mode Commands

This chapter is a reference for Exec and Privileged mode commands. All commands are common to multipleprotocols. This chapter includes the following commands:

clear interface fec

Use this command to clear FEC (forward error correction) statistics on a specified interface or on all interfaces.

Note: This command is not supported on loop-back interfaces or the out-of-band (OOB) management interface.

Command Syntax

```
clear interface (IFNAME|) fec
```

Parameters

IFNAME	Physical Interface name.

Default

None

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface ce1/1 fec
```

copy empty-config startup-config

Use this command to clear the contents of the startup configuration.

Command Syntax

```
copy empty-config startup-config
```

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#copy empty-config startup-config
#
```

debug nsm all

Use this command to enable NSM debugging.

Use the no parameter with this command or the undebug command to disable NSM debugging.

Command Syntax

```
debug nsm (all|)
no debug nsm (all|)
undebug nsm (all|)
```

Parameters

all	Enable all debugging.

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug nsm all
#
```

debug nsm bfd

Use this command to enable debugging BFD (Bidirectional Forwarding Detection) events.

Use the no parameter with this command or the undebug command to disable BFD debugging.

Command Syntax

```
debug nsm bfd
no debug nsm bfd
undebug nsm bfd
```

Parameters

None

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug nsm bfd
#
```

debug nsm events

Use this command to enable debugging of NSM events.

Use the no parameter with this command or the undebug command to disable event debugging.

Command Syntax

```
debug nsm events
no debug nsm events
undebug nsm events
```

Parameters

None

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug nsm events
#
```

debug nsm hal

Use this command to enable debugging of NSM HAL (hardware abstraction layer) events.

Use the no parameter with this command or the undebug command to disable HAL debugging.

Command Syntax

```
debug nsm hal (all|) debug
debug nsm hal events
no debug nsm hal (all|)
no debug nsm hal events
undebug nsm hal events
```

Parameters

all	Enable all HAL debugging.
events	Enable debugging of only NSM HAL events.

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug nsm hal all
#
```

debug nsm mpls

Use this command to enable MPLS NSM logs.

Use the no parameter with this command or the undebug command to disable MPLS NSM logs.

Command Syntax

```
debug nsm mpls
no debug nsm mpls
```

Parameters

None

Default

By default, debug command is disabled.

Command Mode

Exec mode, privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS-SP version 3.1.

Example

```
#debug nsm mpls
#
```

debug nsm packet

Use this command to enable debugging of NSM packet events.

Use the no parameter with this command or the undebug command to disable packet debugging.

Command Syntax

```
debug nsm packet (recv|send|) (detail|)
no debug nsm packet (recv|send|) (detail|)
undebug nsm packet (recv|send|) (detail|)
```

Parameters

recv	Specify the debug option-set for receive packet.
send	Specify the debug option-set for send packet.
detail	Sets the debug option to provide detailed information.

Default

By default, debug command is disabled.

Command Mode

Privileged exec mode, and configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug nsm packet
#debug nsm packet recv detail
#
```

reload

Use this command to shut down the device and perform a cold restart. You call this command when:

- You detect a configuration issue such as `show running-config` displaying a configuration but when you try to remove that configuration, you get a message that it is not configured.
- You have replaced the start-up configuration file (in this case you specify the `flush-db` parameter).

Command Syntax

```
reload (flush-db|)
```

Parameters

`flush-db`	Delete the database file and recreate it from the start-up configuration file.

Default

No default value is specified

Caution

OcNOS services are using `/usr/local/etc` path to store the device configuration, and this path mounted into a separate partition to isolate system configurations. This partition is meant only for system configuration. It will affect the system stability if the user uses this partition for storing general files. In this problematic state, if the device reboots, OcNOS services will not start properly, that would even create problems to the device connectivity. There will be an impact on normal system configuration operations.

User must take care of this problem just before issuing the following commands:

- `sys-reload` - Reboots the device.
- `sys-update` - Device reboots after upgrading the NOS software.
- `sys-shutdown` - This is to shutdown the device, but when users powers the device OcNOS services won't start cleanly.
- `reboot / shutdown` - From Linux shell
- Also includes all copy commands from Linux shell before issuing the user triggered reload commands.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows replacing a start-up configuration file and then synchronizing it to the configuration database:

```
#copy file /home/TEST.conf startup-config
Copy Success
#
#reload flush-db
The system has unsaved changes.
Would you like to save them now? (y/n): n
```

```
Configuration Not Saved!
Are you sure you would like to reset the system? (y/n): y
```

For both of these prompts, you must specify whether to save or discard the changes. Abnormal termination of the session without these inputs can impact the system behavior.

For the `unsaved changes` prompt:

`Would you like to save them now?`

You should always say “no” to this prompt because otherwise the command takes the current *running configuration* and applies it to the current start-up configuration.

show cli

Use this command to display the command tree of the current mode.

Command Syntax

```
show cli
```

Parameters

None

Default

None

Command Mode

All command modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show cli
Exec mode:
+-clear
  +-arp-cache [clear arp-cache]
  +-ethernet
    +-cfm
      +-errors
        +-domain
          +-DOMAIN_NAME [clear ethernet cfm errors (domain DOMAIN_NAME|level
LEVEL_ID) (bridge <1-32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain DOMAIN_NAME|level
LEVEL_ID) (bridge <1-32>|)]
        +-level
          +-LEVEL_ID [clear ethernet cfm errors (domain DOMAIN_NAME|level
LEVEL_ID) (bridge <1-32>|)]
            +-bridge
              +-<1-32> [clear ethernet cfm errors (domain DOMAIN_NAME|level
LEVEL_ID) (bridge <1-32>|)]
      +-maintenance-points
        +-remote
          +-domain
            +-DOMAIN_NAME [clear ethernet cfm maintenance-points remote(domain
D
--More--
```

show debugging nsm

Use this command to display debugging information.

Command Syntax

```
show debugging nsm
```

Parameters

None

Default

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging nsm
NSM debugging status:
  NSM event debugging is on
  NSM packet debugging is on
  NSM kernel debugging is on
#
```

show interface fec

Use this command to display the FEC (forward error correction) statistics for an interface.

Note: You can only display FEC statistics for physical interfaces and not for management or logical interfaces.

Command Syntax

```
show interface (IFNAME|) fec
```

Parameters

IFNAME	Physical Interface name.

Default

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface ce1/1 fec

+----------------+--------+-----------------------------------------------+
|  Interface  | FEC  | CORRECTED BLOCK COUNT | UNCORRECTED BLOCK COUNT |
+----------------+--------+-----------------------------------------------+
   ce1/1         off         0                           0
```

Table 1-40 explain the fields in the command output.

Table 1-40: show interface fec

Field	Description
Interface	Name of the configured interface.
FEC	Status of the forwarding equivalence class.
Corrected Block Count	Number of the corrected block count.
Uncorrected Block Count	Number of the uncorrected block count.

show ip rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax

```
show ip rpf A.B.C.D
show ip rpf (vrf NAME|) A.B.C.D
```

Parameters

A.B.C.D	IP address of multicast source.
NAME	Virtual Routing and Forwarding name.

Default

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip rpf 10.10.10.50

RPF information for 10.10.10.50
  RPF interface: eth0
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

show ipv6 rpf

Use this command to display reverse path forwarding (RPF) information for the specified source address.

Command Syntax

```
show ipv6 rpf X:X::X:X
show ipv6 rpf (vrf NAME|) X:X::X:X
```

Parameters

X:X::X:X	IP address of multicast source.
NAME	Virtual Routing and Forwarding name.

Default

None

Command Mode

Exec and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 rpf 10:10::10:50

RPF information for 10.10.10.50
  RPF interface: eth0
  RPF neighbor: 10.1.2.1
  RPF route: 0.0.0.0/0
  RPF type: unicast (kernel)
  RPF recursion count: 0
  Doing distance-preferred lookups across tables
  Distance: 0
  Metric: 0
#
```

Table 1-41 explains the output fields.

Table 1-41: show ipv6 rpf output fields

Field	Description
RPF Interface	Name of the RPF interface.
RPF neighbor	Upstream RPF neighbor.
RPF route	Route table in which the logical interface address is located.
RPF type	Different type of RPF like multicast, unicast, MBGP, DVMRP, or static mroutes.

Table 1-41: show ipv6 rpf output fields

Field	Description
RPF recursion count	Number of times that the router lookups its routing table more than once to find out the immediate next-hop and exiting interface.
Distance	IPv6 address of the remote side of the connection. Doing distance-preferred lookups across tables.
Metric	Metrics are informational units that can be measured and compared.

show list

Use this command to display the commands relevant to the current mode.

Command Syntax

```
show list
```

Parameters

None

Default

None

Command Mode

All command modes except IPv4 access-list and IPv6 access-list mode.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>show list
 clear arp-cache
  clear bgp *
  clear bgp * in
  clear bgp * in prefix-filter
  clear bgp * out
  clear bgp * soft
  clear bgp * soft in
  clear bgp * soft out
  clear bgp <1-4294967295>
  clear bgp <1-4294967295> in
  clear bgp <1-4294967295> in prefix-filter
  clear bgp <1-4294967295> out
  clear bgp <1-4294967295> soft
  clear bgp <1-4294967295> soft in
  clear bgp <1-4294967295> soft out
  clear bgp (A.B.C.D|X:X::X:X)
  clear bgp (A.B.C.D|X:X::X:X) in
  clear bgp (A.B.C.D|X:X::X:X) in prefix-filter
  clear bgp (A.B.C.D|X:X::X:X) out
  clear bgp (A.B.C.D|X:X::X:X) soft
  clear bgp (A.B.C.D|X:X::X:X) soft in
  clear bgp X:X::X:X soft out

--more--
```

show nsm client

Use this command to display NSM client information including the services requested by the protocols, statistics and the connection time

Command Syntax

```
show nsm client
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show nsm client
NSM client ID: 1

NSM client ID: 19
 IMI, socket 23
  Service: Interface Service, Router ID Service, VRF Service
  Messsage received 1, sent 58
  Connection time: Thu Jul 22 11:03:12 2010
  Last message read: Service Request
  Last message write: Link Up
NSM client ID: 25
 ONMD, socket 24
  Service: Interface Service, Bridge service, VLAN service
  Messsage received 2, sent 74
  Connection time: Thu Jul 22 11:03:15 2010
  Last message read: OAM  LLDP msg
  Last message write: Link Up
#
```

show process

Use this command to display a process ID, the name of the process, how long the process has been running and any faults detected on the process.

Command Syntax

```
show process
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show process
 PID NAME             TIME FD
   1 nsm          01:49:24 6

#
```

Table 1-42 explains the output fields.

Table 1-42: show process fields

Entry	Description
PID Name	Process identifier name.
TIME	(S): Number of system and user CPU seconds that the process has used. (None, D, and E): Total amount of time that the command has been running.
FD	The Flexible Data-Rates (FD) of the interface.

show running-config router

Use this command to display the running system router configuration.

Command Syntax

```
show running-config router bgp
show running-config router isis
show running-config router ldp
show running-config router ospf
show running-config router rip
show running-config router rsvp
show running-config router vrrp
```

Parameters

`bgp`	Display Border Gateway Protocol (BGP) information.
`isis`	Display Intermediate System to Intermediate System (IS-IS) information.
`ldp`	Display Label Distribution Protocol (LDP) information.
`ospf`	Display Open Shortest Path First (OSPF) information.
`rip`	Display Routing Information Protocol (RIP) information.
`rsvp`	Display Resource Reservation Protocol (RSVP) information.
`vrrp`	Display Virtual Router Redundancy Protocol (VRRP) information.

Default

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config router vrrp
!
router-id 3.3.3.3
!
```

show running-config switch

Use this command to display the running system switch configuration.

Command Syntax

```
show running-config switch bridge
show running-config switch gmrp
show running-config switch gvrp
show running-config switch lacp
show running-config switch lmi
show running-config switch mstp
show running-config switch radius-server
show running-config switch rpsvt+
show running-config switch rstp
show running-config switch ptp
show running-config switch stp
show running-config switch synce
show running-config switch vlan
```

Parameters

`bridge`	Display Bridge group information.
`gmrp`	Display GARP Multicast Registration Protocol (GMRP) information.
`gvrp`	Display GARP VLAN Registration Protocol (GVRP) information.
`lacp`	Display Link Aggregation Control Protocol (LACP) information.
`lmi`	Display Ethernet Local Management Interface Protocol (LMI) information.
`mstp`	Display Multiple Spanning Tree Protocol (MSTP) information.
`radius-server`	Display RADIUS server information.
`rpvst+`	Display Rapid Per-VLAN Spanning Tree (rpvst+) information.
`rstp`	Display Rapid Spanning Tree Protocol (RSTP) information.
`ptp`	Display Precision time Protocol (PTP)
`stp`	Display Spanning Tree Protocol (STP) information.
`synce`	Display synce information.
`vlan`	Display values associated with a single VLAN.

Default

None

Command Mode

Privileged exec mode, configure mode, router-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#show running-config switch stp
!
bridge 6 ageing-time 45
bridge 6 priority 4096
bridge 6 max-age 7
```

show running-config urpf

Use this command to check uRPF status for this system.

Command Syntax

```
show running-config urpf
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config urpf
ip urpf enable

(config)#show running-config urpf
ip urpf enable
```

show startup-config

Use this command to display the startup configuration.

Command Syntax

```
show startup-config
```

Parameters

None

Default

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show startup-config
!   2001/04/21 11:38:52
!
hostname ripd
password zebra
log stdout
!
debug rip events
debug rip packet
!
interface lo
!
interface eth0
 ip rip send version 1 2
 ip rip receive version 1 2
!
interface eth1
 ip rip send version 1 2
 ip rip receive version 1 2
!
router rip
 redistribute connected
 network 10.10.10.0/24
 network 10.10.11.0/24
!
line vty
 exec-timeout 0 0
```

show version

Use this command to display OcNOS version information.

Command Syntax

```
show version
```

Parameters

None

Default

None

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show version
Software version: EC_AS5812-54X-OcNOS-1.3.4.268-DC_MPLS_ZEBM-S0-P0 09/27/2018
13:44:22
 Copyright (C) 2018 Coriant. All rights reserved

 Software Product: OcNOS, Version: 1.3.4.268
 Hardware Model: Edgecore 5812-54X-O-AC-F
 Software Feature Code: DC-MPLS-ZEBM
 System Configuration Code: S0
 Package Configuration Code: P0
 Software Baseline Version: 1.3.4.208

Installation Information:
 Image Filename: EC_AS5812_54X-OcNOS-1.3.4.268-DC_MPLS_ZEBM-S0-P0-installer
 Install method: http
 ONIE SysInfo: x86_64-accton_as5812_54x-r0
#
```

Table 1-43: Show version output

Entry	Description
Software version	The software version including hardware device name and date.
Software Product	Product name and version.
Hardware Model	Hardware platform.
Software Feature Code	SKU that specifies the capabilities of this version of the software.
System Configuration Code	System configuration number.

Table 1-43: Show version output (Continued)

Entry	Description
Package Configuration Code	ONIE package installer versions.
Software Baseline Version	Version from which this release branch is created.
Installation Information	Information about the installation.
Image Filename	The file name of the installed image.
Install method	The type of server (or USB stick) from which the software was installed.
ONIE SysInfo	ONIE version.

sys-reload

Use this command to cold restart the device.

Note: This command is an alias for the reload command.

Command Syntax

```
sys-reload
```

Parameters

None

Default

None

Caution

OcNOS services are using `/usr/local/etc` path to store the device configuration, and this path mounted into a separate partition to isolate system configurations. This partition is meant only for system configuration. It will affect the system stability if the user uses this partition for storing general files. In this problematic state, if the device reboots, OcNOS services will not start properly, that would even create problems to the device connectivity. There will be an impact on normal system configuration operations.

User must take care of this problem just before issuing the following commands:

- `reload` - Reboots the device.
- `sys-update` - Device reboots after upgrading the NOS software.
- `sys-shutdown` - This is to shutdown the device, but when users powers the device OcNOS services won't start cleanly.
- `reboot / shutdown` - From Linux shell
- Also includes all copy commands from Linux shell before issuing the user triggered reload commands.

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
>sys-reload
The system has unsaved changes.
Would you like to save them now? (y/n): y
Building Configuration...
[OK]
Are you sure you would like to reset the system? (y/n): n
```

sys-shutdown

Use this command to shut down the device gracefully. After giving this command, you can remove the device power cable.

Note: Some of the switch hardwares doesn't support system shutdown. On such devices this command will make the switch to go for a reboot.

Command Syntax

```
sys-shutdown
```

Parameters

None

Default

None

Caution

OcNOS services are using `/usr/local/etc` path to store the device configuration, and this path mounted into a separate partition to isolate system configurations. This partition is meant only for system configuration. It will affect the system stability if the user uses this partition for storing general files. In this problematic state, if the device reboots, OcNOS services will not start properly, that would even create problems to the device connectivity. There will be an impact on normal system configuration operations.

User must take care of this problem just before issuing the following commands:

- `reload/sys-reload` - Reboots the device.
- `sys-update` - Device reboots after upgrading the NOS software.
- `reboot / shutdown` - From Linux shell
- Also includes all copy commands from Linux shell before issuing the user triggered reload commands.

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
>sys-shutdown
The system has unsaved changes.
Would you like to save them now? (y/n): y
Building Configuration...
[OK]
Are you sure you would like to shutdown the system? (y/n): y
For both of these prompts, you must specify whether to save or discard the
changes.
For the unsaved changes prompt:
Would you like to save them now?
```

CHAPTER 2 Common Configure Mode Commands

This chapter provides a reference for the configure mode commands.

automatic-router-id-selection enable

Use this command to assure that OcNOS selects the loopback IP address as the router-id each time the device is rebooted.

Use the no form of this command to remove this constraint.

Command Syntax

```
automatic-router-id-selection enable
no automatic-router-id-selection enable
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#automatic-router-id-selection enable
```

clear router-id

Use this command to clear the current Router-Id and trigger the Router-Id calculation again. The new Router-id is sent to all protocol modules.

- To clear only the router-id for the default VRF, enter `clear router-id`.
- To clear the router-id for a particular VRF, enter `clear router-id vrf VRFNAME`.
- To clear the router-id for all VRFs, enter `clear router-id vrf`.

Note: If router-id is not configured, highest ip address configured on the interface is chosen as router-id. if chosen ip address is unconfigured, make sure to execute clear router-id before configuring a new router-id.

Command Syntax

```
clear router-id (vrf (VRFNAME|))
```

Parameters

VRFNAME	VPN routing/forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#clear router-id
(config)#

#configure terminal
(config)#clear router-id vrf
(config)#
```

clock timezone

Use this command to set the system time zone.

Use no form of this command to set the default system time zone (UTC).

Command Syntax

```
clock timezone (WORD)
no clock timezone
```

Parameters

WORD	Timezone name. Use 'show timezone' to get the list of city names.

Default

By default, system time zone is UTC

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#clock timezone Los_Angeles
```

errdisable cause

Use this command to globally shut down a port when certain errors happen:

- BPDU guard puts an interface configured for Spanning Tree Protocol (STP) Port Fast into the ErrDisable state upon receipt of a STP BPDU to avoid a potential bridging loop.
- If one side of a link-access group (LAG) is configured as a static LAG and the other side as a dynamic LAG, the ports on the side receiving LACP BPDUs go into the ErrDisable state

Note: When link-flap ErrDisable is enabled globally, then all interfaces are enabled. Link-flap ErrDisable can be enabled globally, but disabled for a specific interface with the `no link-flap errdisable` command.

Note: When mac-move-limit ErrDisable is enabled globally, then all interfaces are enabled. mac-move-limit ErrDisable can be enabled globally, but disabled for a specific interface with the `no mac-move-limit errdisable` command.

Note: Stp-Bpdu-Guard is enabled by default on the global level configuration.

Use `no` form of this command to not shut down a port when certain errors happen.

Command Syntax

```
errdisable cause {stp-bpdu-guard|lag-mismatch|link-flap| mac-move-limit  }
no errdisable cause {stp-bpdu-guard|lag-mismatch|link-flap | mac-move-limit  }
```

Parameters

`stp-bpdu-guard`	ErrDisable on stp-bpdu-guard
`lag-mismatch`	ErrDisable on lag-mismatch
`link-flap`	ErrDisable on link-flap
`mac-move-limit`	Enable or Disable Mac-Move-Limit

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#errdisable cause lag-mismatch
```

errdisable link-flap-setting

Use this command to configure the link-flap errdisable feature:

- An interface should change state as up-down to complete one cycle of a link flap.
- The LED does not glow when an interface is in the errdisable state.
- Errdisable is supported only on physical interfaces.
- A LAG interface does not go into the errdisable state when all of its member ports are in the errdisable state
- The error disable computation is based on a sliding window of time. The window size is configurable in seconds. This window is taken as the current time to the last <t> second, where <t> is the configured window size. If the accumulated link flap count reaches the maximum flap count for a particular sliding window, a link flap error disable fault is triggered.

Note: Any previous flapping accumulated is flushed when you execute this command.

Command Syntax

```
errdisable link-flap-setting max-flaps <1-100> time <1-1800>
```

Parameters

<1-100>	Maximum flap count
<1-1800>	Sliding window size in seconds

Default

Five flaps in ten seconds:

Maximum flap count: 5

Sliding window size: 10 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#errdisable link-flap-setting max-flaps 5 time 20
```

errdisable mac-move-limit

Use this command to set the ErrDisable mac movement limit.

Command Syntax

```
errdisable mac-move-limit <1-1000>
```

Parameters

<1-1000>	Allowed Mac movement in 5 seconds

Default

By default, mac-move-limit is 1000

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#errdisable mac-move-limit 50
```

errdisable timeout

Use this command to set the ErrDisable auto-recovery timeout interval.

Command Syntax

```
errdisable timeout interval <10-1000000>
```

Parameters

`<10-1000000>`	Timeout interval in seconds

Default

By default, zero: timer is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#errdisable timeout interval 1000
```

forwarding profile

Use this command to configure different forwarding profiles in hardware.

Note: It is required to save the configuration and reboot the board for the new forwarding profile to come into effect in the hardware.

Use show forwarding profile limit to verify the configured profile.

Command Syntax

```
forwarding profile (kaps (profile-one | profile-two)) | (elk-tcam (profile-one |
  profile-two | profile-three | custom-profile))
```

Parameters

For details about these profiles, see show forwarding profile limit.

`kaps`	Internal KBP routing table
`profile-one`	KAPS profile one
`profile-two`	KAPS profile two
`elk-tcam`	External TCAM routing table
`profile-one`	external TCAM profile one
`profile-two`	external TCAM profile two
`profile-three`	external TCAM profile three
`custom-profile`	external TCAM custom profile
`< 10-90>`	percent of ipv4 routes
`< 10-90>`	percent of ipv6 routes

Default

The default forwarding profile are as below

Table 2-44:

Is ELK-TCAM present	KAPS	ELK-TCAM
Yes	profile-two	profile-one
No	profile-one	N/A

Note:

1. elk-tcam profiles are supported only on hardware models which have external TCAM for routing.
2. forwarding profile-three is applicable on hardware model Agema AGC7648A.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version SP 1.0.

Examples

```
#configure terminal
(config)# forwarding profile elk-tcam profile-one
```

hardware-profile filter

Use this command to enable or disable TCAM filter groups. By default all filter groups will be disabled. Basic and extended groups of similar type are mutually exclusive and only one of them can be enabled at a time.

Disabling a TCAM filter group is not allowed if the group has any entries configured in hardware. Group dependent entries must be explicitly removed before disabling the TCAM group.

Note: The `qos`, `qos-ext`, and `qos-policer` filter groups can only be used for Layer 2 and IPv4 traffic. For IPv6 traffic QoS classification and actions, you must enable the `ingress-ipv6-qos` group and create an IPv6 ACL which can be matched in a class-map for applying QoS actions. For more, see Quality of Service Configuration Guide.

Note: Usually the number of extended ingress filter groups that can be created at the same time is 3. If the PIM bidirectional feature is enabled, only 2 ingress extended filter groups can be created.

For EVPN multi-homing:

- Before enabling EVPN multi-homing (evpn multi-homed command), give this command.
- Before disabling the hardware-profile, disable EVPN multi-homing.

Command Syntax

```
hardware-profile filter (ingress-l2|ingress-l2-ext|ingress-ipv4|ingress-ipv4-
ext|ingress-ipv4-qos|ingress-ipv6|ingress-ipv6-qos|qos-ipv6|ingress-arp|qos|qos-
ext|qos-policer|forwarding-ipv4|egress-l2|egress-ipv4|cfm-domain-name-str)
(enable|disable)
```

Parameter

`ingress-l2`	Ingress L2 ACL filter group.
`ingress-l2-ext`	Ingress L2 ACL, QoS, mirror filter group.
`ingress-ipv4`	Ingress IP ACL filter group.
`ingress-ipv4-ext`	Ingress IP ACL, mirror, PBR filter group.
`ingress-ipv4-qos`	Ingress IPv4 group for ACL match QoS.
`ingress-ipv6`	Ingress IPv6 ACL, mirror, PBR filter group.
`ingress-ipv6-qos`	Ingress IPv6 group for ACL match QoS.
`qos-ipv6`	Ingress QOS IPv6 group for IPv6 QoS support with statistics.
`ingress-arp`	Ingress ARP group.
`qos`	Ingress QoS filter group.
`qos-ext`	Ingress QoS extended filter group.
`qos-policer`	Ingress extended QoS group for hierarchical policer support.
`forwarding-ipv4`	Ingress IPv4 forwarding filter group.
`egress-l2`	Egress L2 ACL filter group.

`egress-ipv4`	Egress IP ACL filter group.
`cfm-domain-name-str`	Egress CFM domain group.
`enable`	Enable filter group.
`disable`	Disable filter group.

Default

By default, all filter groups are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#hardware-profile filter ingress-ipv4 enable
(config)#hardware-profile filter ingress-ipv4 disable

#(config)#hardware-profile filter egress-ipv4 enable
#(config)#hardware-profile filter egress-ipv4 disable
```

Table 2-45: Table 2-56: Supported groups and the feature dependency on the groups

Group	Key Size	Security	QoS	PBR	Mirror	Statistics	
						QMX	QAX
ingress-l2	160	Yes	No	N/A	No	Yes	Yes
ingress-l2-ext	320	Yes	No	N/A	Yes	Yes	Yes
ingress-ipv4	160	Yes	No	No	No	Yes	Yes

qos-ipv6	Source IPv6 (n/w part) Destination IPv6 (n/w part) IPv6 Protocols L4 Ports VLAN ID COS Inner VLAN ID Inner COS Ether Type DSCP
cfm-domain-name-str	MA ID

hardware-profile flowcontrol

Use this command to globally enable or disable hardware-based flow control.

Syntax

```
hardware-profile flowcontrol (disable|enable)
```

Parameters

`disable`	Disable flow control globally
`enable`	Enable flow control globally

Default

By default flow control is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#hardware-profile flowcontrol enable
```

hardware-profile service-queue

Use this command to set the number of service-queue counts to create in hardware.

Note: You must reboot the switch after giving this command for the changes to take effect.

Command Syntax

```
hardware-profile service-queue (profile1| profile2)
```

Parameter

`profile1`	Supports new 4 queue-bundle per service (default)
`profile2`	Supports new 8 queue-bundle per service

Default

By default, `profile1` is enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is only available on Qumran platforms.

Examples

```
#configure terminal
(config)#hardware-profile service-queue profile2
```

hardware-profile statistics

Use this command to enable or disable filter statistics in hardware.

Note: You must reboot the switch after giving this command for the changes to take effect.

Note: If both ACL and QOS statistics are required on the same interface, then both ingress-acl and ingress-qos profiles must be enabled and this will limit other profiles from being enabled. More details on restrictions explained below.

Note: When any two or all of MAC ACL or IP ACL or QoS service-policy are configured on the same interface, their entries will use statistics entries from ingress-acl statistics profile, and as a result the statistics is updated on only one entry based on the hardware-profile filter created later.

Command Syntax

```
hardware-profile statistics (ac-lif|cfm-ccm|cfm-lm|ingress-acl|ingress-qos|egress-
  acl|mpls-ac|mpls-lsp|mpls-pwe|tunnel-lif|voq-full-color|voq-fwd-drop)
  (enable|disable)
```

Parameter

`ac-lif`	VXLAN access ports statistics
`cfm-ccm`	Cfm ccm counter statistics
`cfm-lm`	Cfm Loss Measurements statistics
`tunnel-lif`	VXLAN tunnels statistics
`ingress-acl`	Ingress ACL, QoS, and PBR statistics
`ingress-qos`	Ingress QoS statistics (explicit)
`egress-acl`	Egress ACL statistics
`mpls-ac`	Attachment circuit statistics
`mpls-lsp`	LSP statistics
`mpls-pwe`	Pseudowire logical interfaces statistics
`voq-full-color`	Statistics for all VOQ counters
`voq-fwd-drop`	Statistics for forward drop VOQ counters
`enable`	Enable statistics
`disable`	Disable statistics

Default

By default, only `ingress-acl statistics` profile is enabled. Other statistics profiles are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

```
(config)#hardware-profile statistics mpls-lsp enable
```

Table 2-48 provides details of scalable numbers of each statistics profiles and the applications that use the statistics profiles. For example, the `ingress-acl` profile is used by ACL, QoS, and PBR applications and all of them share the statistics entries from this profile. So, consuming 8k statistics entries for ACL application means that QOS and PBR applications do not get any statistics.

There are limitations on the number of statistics profiles that can be enabled at a time. This limitation is based on the stages that each profile uses. Table 2-48 shows the four stages: ingress, ingress queuing, egress1, and egress2; and only two statistics profiles per stage can be configured.

For example, if both the `ingress-acl` and `mpls-acl` profiles are configured, then no more profiles that use the "ingress stage" can be enabled because only two profiles are allowed per stage. To use another "ingress-based" profile, you must first disable at least one of the profiles that are currently using the ingress stage.

Table 2-48: Statistics profile capacity (maximum numbers in best case scenario)

Statistics profile	Stage	QMX	QAX	Application
ingress-acl	Ingress	~8k	~6k	Ingress ACL, QoS, PBR
egress-acl	Egress1	~8k	~2k	Egress ACL
ingress-qos	Ingress	~8k	~6k	QoS
voq-full-color	Ingress queuing	~13k	~6k	QoS (queue statictics)
voq-fwd-drop	Ingress queuing	~32k	~16k	QoS (queue statictics)
tunnel-lif	Ingress	~16k	N/A	VxLAN (tunnels)
	Egress2			
mpls-acl	Ingress	~32k	~8k	MPLS (attachment circuits)
	Egress2			
mpls-lsp	Ingress	~16k	~8k	MPLS (LSP/tunnel)
	Egress2			
mpls-pwe	Ingress	~16k	~8k	MPLS (pseudowire)
	Egress2			
cfm-ccm	Ingress	~3k	~800	CFM (ccm)
cfm-lm	Ingress	~6k	~1.5k	CFM (loss measurement)
	Egress2			
ac-lif	Ingress	~32k	N/A	VxLAN (access-port)
	Egress2			

ip urpf enable

Use this command to enable uRPF mode on the system.

Use the no form of the command to disable uRPF mode on this system.

Note: The configuration is applied only after a reboot.

Command Syntax

```
ip urpf enable
no ip urpf enable
```

Parameter

None

Default

By default, uRPF mode on the system is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip urpf enable
% System Reboot is required for new URPF configurations to take effect

(config)#no ip urpf enable
% System Reboot is required for new URPF configurations to take effect
```

ip urpf allow-default

Use this command to enable default route check for uRPF mode.

Use no form of this command to disable default route check for uRPF mode.

Command Syntax

```
ip urpf allow-default
no ip urpf allow-default
```

Parameter

None

Default

By default, uRPF mode is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip urpf allow-default

(config)#no ip urpf allow-default
```

ip mroute

Use this command to create a multicast static route.

Multicast static routes are unicast routes which allow multicast and unicast topologies to be incongruous. These routes are used by multicast routing protocols to perform Reverse Path Forwarding (RPF) checks.

Use the no form of this command to clear a multicast static route.

Command Syntax

```
ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|) (A.B.C.D|INTERFACE)
ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|) (A.B.C.D|INTERFACE) <1-
  255>
no ip mroute (vrf NAME|) A.B.C.D/M (static|rip|ospf|bgp|isis|)
```

Parameters

NAME	Virtual Routing and Forwarding name
A.B.C.D/M	Multicast source IP address and mask of the source
static	Static routes.
rip	Routing Information Protocol.
ospf	Open Shortest Patch First protocol.
bgp	Border Gateway Protocol.
isis	Intermediate System to Intermediate System protocol.
A.B.C.D	IP address to use as the RPF address. A host IP address can be a directly connected system or a remote system. For remote systems, a recursive lookup is done from the unicast routing table to find a directly connected system. Recursive lookup is done up to one level.
INTERFACE	Incoming interface name or pseudo interface null. Only specify for non-broadcast interfaces.
<1-255>	Administrative distance for the multicast static route. This value determines whether a unicast route or multicast static route is used for the RPF lookup. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence.

Default

The default administrative distance for the multicast static route is 0.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip mroute 10.10.10.50/24 10.10.10.20 1
```

```
#configure terminal
(config)#ip mroute vrf VRF_A 10.10.10.50/1 10.10.10.20 1
```

ip redirects

Use this global command to trap ICMP redirect packets to the CPU and on interface to enable ICMP redirects in kernel.

Use the no form of this command to disable the ICMP redirect message on an interface.

Note: This command is applicable for both ipv4 and ipv6 interfaces.

Syntax

```
ip redirects
no ip redirects
```

Parameters

None

Default

None

Command Mode

Configure and Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#configure terminal
(config)#ip redirects

(config)#no ip redirects

#configure terminal
(config)#interface xe1/1
(config-if)#ip redirects

#configure terminal
(config)#interface xe1/1
(config-if)#no ip redirects
```

ipv6 mroute

Use this command to create a multicast static route.

Multicast static routes are unicast routes that allow multicast and unicast topologies to be incongruous. These routes are used by multicast routing protocols to perform Reverse Path Forwarding (RPF) checks.

Use the no form of this command to clear a multicast static route.

Command Syntax

```
ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) X:X::X:X INTERFACE
ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) (X:X::X:X|INTERFACE)
ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) X:X::X:X INTERFACE
  <1-255>
ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|) (X:X::X:X|INTERFACE)
  <1-255>
no ipv6 mroute (vrf NAME|) X:X::X:X/M (static|rip|ospf|bgp|isis|)
```

Parameters

NAME	Virtual Routing and Forwarding name
X:X::X:X/M	Specify multicast source IP address and mask
static	Static routes.
rip	Routing Information Protocol.
bgp	Border Gateway Protocol.
ospf	Open Shortest Path First.
isis	Intermediate System to Intermediate System.
X:X::X:X	RPF address for the multicast route. A host IP address can be a directly connected system or a remote system. For remote systems, a recursive lookup is done from the unicast routing table to find a directly connected system. Recursive lookup is done up one level.
INTERFACE	Incoming interface name. Can only be specified for non-broadcast interfaces.
<1-255>	Administrative distance for the multicast static route. This value determines whether a unicast route or multicast static route is used for the RPF lookup. Lower distances have preference. If the multicast static route has the same distance as the other RPF sources, the multicast static route takes precedence.

Default

The default administrative distance for the multicast static route is 0.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#ipv6 mroute 10:10::10:10/64 10:10::10:12 1
```

load-balance enable

Use this command to enable load-balancing configurations in hardware.

Use the no option to reset the load balancing to default settings.

Note: When the command "load-balance enable" is issued, the default load-balance settings are unset. User then has to configure the new load-balancing parameters.

Command Syntax

This form unsets load balancing globally:

```
load-balance enable
```

This form resets load balancing globally to default settings:

```
no load-balance enable
```

By default, load balancing is enabled for ECMP and LAG.

This form sets hashing based on IPv4 fields:

```
load-balance (ipv4 {src-ipv4 | dest-ipv4 | srcl4-port | destl4-port | protocol-id})
no load-balance (ipv4 {src-ipv4 | dest-ipv4 | srcl4-port | destl4-port | protocol-
  id})
```

This form sets hashing based on IPv6 fields:

```
load-balance (ipv6 {src-ipv6 | dest-ipv6 | srcl4-port | destl4-port | protocol-id})
no load-balance (ipv6 {src-ipv6 | dest-ipv6 | srcl4-port | destl4-port | protocol-
  id})
```

This form sets hashing based on L2 fields:

```
load-balance (l2 {dest-mac|src-mac|ether-type|vlan})
no load-balance (l2 {dest-mac|src-mac|ether-type|vlan})
```

This form sets hashing on an MPLS fields:

```
load-balance (mpls {labels})
no load-balance (mpls {labels})
```

Note: The configured load balancing parameters are global and will be applicable to all LAG & ECMP created in the hardware.

Parameters

`ipv4`	Load balance IPv4 packets
`src-ipv4`	Source IPv4 based load balancing
`dest-ipv4`	Destination IPv4 based load balancing

`srcl4-port`	Source L4 port based load balancing
`destl4-port`	Destination L4 port based load balancing
`protocol-id`	Protocol ID based load balancing
`ipv6`	Load balance IPv6 packets
`src-ipv6`	Source IPV6 based load balancing
`dest-ipv6`	Destination IPv6 based load balancing
`srcl4-port`	Source L4 port based load balancing
`destl4-port`	Destination L4 port based load balancing
`l2`	Load balance L2 packets
`dest-mac`	Destination MAC address based load balancing
`src-mac`	Source MAC address based load balancing
`ether-type`	Ether-type based load balancing
`Vlan`	VLAN-based load balancing
`mpls`	Load balance MPLS packets
`labels`	label stack based load balancing.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version SP 1.0.

Examples

```
(config)#load-balance enable
(config)#load-balance ipv4 src-ipv4
```

router-id

Use this command to add a router identifier for this system.

Use the no form of this command to disable this function.

Note: If router-id is not configured, highest ip address configured on the interface is chosen as router-id. if chosen ip address is unconfigured, make sure to execute clear router-id before configuring a new router-id.

Command Syntax

```
router-id A.B.C.D
no router-id (A.B.C.D)
```

Parameters

A.B.C.D	Router identifier in IP address format for this system.

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router-id 123.12.3.123
(config)#
```

show errdisable details

Use this command to display ErrDisable settings.

Command Syntax

```
show errdisable details
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show errdisable details
```

show forwarding profile limit

Use this command to show all the forwarding profile table sizes.

Note: 1k is 1024 entries.

Command Syntax

```
show forwarding profile limit
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version SP 1.0.

Examples

```
OcNOS#show forwarding profile limit

-------------------------------------------------------------------------------
          L3 (Ipv4/Ipv6) KAPS Forwarding Profile
-------------------------------------------------------------------------------
Active (*)   Configured (*)  Profile-type     IPv4-db-size     IPv6-db-size
                             profile-one      NA               NA
   *           *             profile-two      -                200k

            Max Entries: 768k

 NOTE: 1k is 1024 entries

OcNOS#
```

show hardware-profile filters

Use this command to show details of TCAM filter groups which are enabled. By default, all filter groups are disabled.

Command Syntax

```
show hardware-profile filters
```

Parameter

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#show hardware-profile filters

Note: Shared count is the calculated number from available resources.
      Dedicated count provides allocated resource to the group.
      If group shares the dedicated resource with other groups, then dedicated
      count of group will reduce with every resource usage by other groups.

+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |

 INGRESS-QOS-EXT      10495     0     1         10486   2048        8448
```

Table 2-49 explains the output fields.

Table 2-49: show hardware-profile filters

Field	Description
Ingress	Ingress filtering is a method used to prevent suspicious traffic from entering a network.
TCAMS	Number of ternary content addressable memory (TCAM) entries a particular firewall filter.
Free Entries	Number of TCAM filter entries available for use by the filter group.
Used Entries	Number of TCAM filter entries used by the filter group.
Total Entries	Number of TCAM total filter entries to the filter group.

Table 2-49: show hardware-profile filters (Continued)

Field	Description
Dedicated Entries	Number of TCAM filter entries dedicated to the filter group.
Shared Entries	Number of TCAM filter entries shared to the filter groups.

Operational details of TCAM profiles

TCAM group statistics comprises of three parts:

- **Total Entries** – Total configurable entries on the TCAM group. Total has two parts. One is dedicated and other is shared. Dedicated count is the guaranteed entry count for the group. Shared count a logical count calculated for the group from shared pool available at the time of show command execution
- **Used Entries** – Count of entries that have been configured on the TCAM group. Used entries are shown are shown in percentage format as well as an indication of how much TCAM space is used up. However, percentage calculation includes shared pool and subject to change drastically when shared pool is taken up by different group.
- **Free Entries** – Count of possible remaining entries on the TCAM group. Free entries count is not the guaranteed count as the count includes the shared pool count into account.

When a TCAM group is enabled in the device, no hardware resource (bank) is associated with the group. Thus, dedicated count will be initially zero. Total count will be same as shared count which is calculated based on the group width. Group width is determined by width consumed by the qualifiers or width consumed by the actions.

Example of show output when qos-ext group is enabled on QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      10496     0     0         10496   0           10496
```

When an entry is created on the group for the first time, either a single bank or a bank pair is allocated to the group. A group consuming single bank or a bank pair is decided by group width. Groups like qos, ingress-l2, ingress-ipv4, and forwarding-ipv4 consume single bank and groups like qos-ext, qos-policer, ingress-l2-ext, ingress-ipv4-ext, ingress-ipv4-qos, ingress-ipv6, ingress-ipv6-qos, egress-l2, and egress-ipv4 consume a bank pair.

An example of output when a single entry is created in hardware for qos-ext group on QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      10495     0     1         10496   2048        8448
```

In the above example, dedicated entry count has increased to 2048 as a bank pair is allocated for the group. Unallocated banks capacity is calculated for qos-ext group and counted under shared entries as 8448.

An example of output when 2048 entries are created in hardware for qos-ext group and ingress-l2 and ingress-ipv4-ext groups is enabled with no entries created on those groups for QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      8448     20     2048      10496   2048        8448
 INGRESS L2           16896     0     0         16896   0           16896
 INGRESS IPV4-EXT     8448      0     0         8448    0           8448
```

In the above example, note that the number of entries between ingress-l2 and ingress-ipv4-ext groups vary as ingress-l2 group is a 160-bit wide group consuming only one bank at a time. On the other hand, ingress-ipv4-ext group is 320 bit wide group consuming a group pair at a time. With a bank pair already being consumed by qos-ext group, ingress-ipv4-ext group gets possible total entries of 8448 in comparison to 10496 by qos-ext group.

When all the created entry count goes beyond the entries of dedicated bank pair (or a bank), group will be allocated with another bank pair (or a bank) and subsequently shared pool count will reduce across all other groups.

An example of output when 2049 entries are created in hardware for qos-ext group with ingress-l2 and ingress-ipv4-ext groups enabled with no entries created on those groups for QMX device is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      8447      20    2049      10496   4096        6400
 INGRESS L2           12800     0     0         12800   0           12800
 INGRESS IPV4-EXT     6400      0     0         6400    0           6400
```

When a bank is consumed by ingress-l2 group, effect on qos-ext group will still be the count of a bank pair with one bank not usable for qos-ext group even if it is available. The bank can be used by groups which consume single bank.

An example of output when an entry is created in hardware for ingress-l2 group with qos-ext and ingress-ipv4-ext groups in the state as mentioned in above example is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+----------------------------+
|                    | Free    |     Used      |       Total Entries        |
| TCAMS              | Entries |---------------|----------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      6399      24    2049      8448    4096        4352
 INGRESS L2           12799     0     1         12800   2048        10752
 INGRESS IPV4-EXT     4352      0     0         4352    0           4352
```

In the above example scenario, it can be noted that the used entry percentage for qos-ext group jumped from 20 to 24 as a result of drastic reduction in total entry count due to bank movement from shared pool to dedicated bank.

Hardware doesn’t optimize the utilization of banks when entries are removed from one of the banks resulting in entries used shown up less than capacity of one bank but still multiple banks would be dedicated to a group.

An extended example of above scenario with 10 entries removed from qos-ext group is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+---------------------------+
|                    | Free    |     Used      |       Total Entries       |
| TCAMS              | Entries |---------------|---------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 INGRESS-QOS-EXT      6409      24    2039      8448    4096        4352
 INGRESS L2           12799     0     1         12800   2048        10752
 INGRESS IPV4-EXT     4352      0     0         4352    0           4352
```

It can be noted that the used entry count has come down to 2039 which is less than the capacity of bank pair i.e. 2048. However, since entries are used up across two set of bank pairs, both bank pairs will still be dedicated. If there is a need to recover bank pair from dedicated pool, all the entries should be deleted and re-created in hardware.

TCAM groups are further divided into sub-categories which can share the dedicated banks between the groups. TCAM groups such as ingress-l2, ingress-l2-ext, ingress-ipv4, ingress-ipv4-ext, ingress-ipv4-qos, qos, qos-ext, qos-policer are considered under default sub-category and don't serve IPv6 traffic. TCAM groups such as ingress-ipv6, ingress-ipv6-qos, and qos-ipv6 are meant for IPv6 traffic and are considered under IPv6 sub-category.

Only four 320-bit wide groups that belong to same sub-category can be created. For default sub-category, number is limited to three as system group will be created by default.

When three default sub-category groups are created along with one group from IPv6 sub-category, one of the default sub-category group will share the bank pair with IPv6 group. This will result in dedicated count to be shown lesser by the number that the other shared group is consuming. With every single resource consumed by one group will reduce the same number from other shared group.

An example of above scenario is shown below:

```
#show hardware-profile filters
...
+--------------------+---------+---------------+---------------------------+
|                    | Free    |     Used      |       Total Entries       |
| TCAMS              | Entries |---------------|---------------------------|
|                    |         |  %  | Entries | Total | Dedicated | shared |
+--------------------+---------+-----+---------+-------+-----------+--------+
 QOS-EXT              6399      0     1         6400    2048        4352
 INGRESS IPV4-ACL-EXT 6398      0     2         6400    2048        4352
 INGRESS IPV4-QOS     6382      0     1         6383    2031        4352
 INGRESS IPV6-ACL     6382      0     17        6399    2047        4352
```

Note that ingress-ipv4-qos group has shared the resource with ingress-ipv6 group. TCAM group ingress-ipv4-qos has consumed 1 entry and ingress-ipv6 group has consumed 17 entries. Hence, dedicated count for ingress-ipv4-qos group is shown as 2031 (2048 - 17) and dedicated count for ingress-ipv6 group is shown as 2047 (2048 - 1).

Capacity of TCAM profiles

Entries created on other TCAM groups affect the capacity of a particular TCAM group. This dependency is explained in the section Operational details of TCAM profiles.

In this section maximum configurable entries per group when no entries created on other groups are listed below.

Table 2-50: Maximum configurable entries

TCAM Groups	QMX	QAX
ingress-l2	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)
ingress-l2-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 +256 x 1)
ingress-ipv4	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)
ingress-ipv4-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
ingress-ipv4-qos	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
ingress-ipv6	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
ingress-ipv6-qos	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
qos-ipv6	12288 (2048 x 6)	5120 (1024 x 5)
qos	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)
qos-ext	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
qos-policer	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
forwarding-ipv4	41984 (4096 x 10 + 512 x 2)	19456 (2048 x 9 + 512 x 2)
egress-l2	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
egress-ipv4	10496 (2048 x 5 + 256 x 1)	4352 (1024 x 4 + 256 x 1)
cfm-domain-name-str	20992 (2048 x 10 + 256 x 2)	9728 (1024 x 9 + 256 x 2)

Combination of TCAM profiles

Device supports configuration of only one egress group in the system. Hence out of the egress groups cfm-domain-name-str, egress-l2 and egress-ipv4, only one egress group can be enabled.

In other words, solution with CFM features enabled, cannot have egress security filters.

Configuration of ingress groups are subject to the sub-category to which a group belongs. Sub-category of each group is shown below:

Table 2-51: Sub-category of groups

Category	Groups in the category
default (ingress)	ingress-l2 ingress-l2-ext ingress-ipv4 ingress-ipv4-ext ingress-ipv4-qos qos qos-ext qos-policer forwarding-ipv4
ipv6 (ingress)	ingress-ipv6, ingress-ipv6-qos, qos-ipv6
default (egress)	egress-l2, egress-ipv4
cfm (egress)	cfm-domain-name-str

Note: Per sub-category, not more than three groups can be created if the group key size is 320 bits wide.

show interface errdisable status

Use this command to display ErrDisable conditions for an interface.

Command Syntax

```
show interface errdisable status
```

Parameters

None

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface errdisable status
ge1 lag-mismatch-errdisable
ge2 stp-bpdu-guard-errdisable
```

show queue remapping

Use this command to display the traffic class-to-hardware-queue mapping in hardware.

Command Syntax

```
show queue remapping
```

Parameters

N/A

Default

N/A

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is only available on Qumran platforms.

Examples

When service-queue `profile1` is set:

```
#show queue remapping

Port queue remapping:
+------------+-----------------------+
|  Queue/tc  |     hardware-queue    |
+------------+-----------------------+
|      0     |          0            |
|      1     |          1            |
|      2     |          2            |
|      3     |          3            |
|      4     |          4            |
|      5     |          5            |
|      6     |          6            |
|      7     |          7            |
+------------+-----------------------+

Service queue remapping:
+------------+-----------------------+
|  Queue/tc  |     hardware-queue    |
+------------+-----------------------+
|      0     |          0            |
|      1     |          1            |
|      2     |          1            |
|      3     |          1            |
```

```
|      4     |          2            |
|      5     |          2            |
|      6     |          3            |
|      7     |          3            |
+------------+-----------------------+
```

When service-queue `profile2` is set:

```
#show queue remapping

Port queue remapping:
+------------+-----------------------+
|  Queue/tc  |     hardware-queue    |
+------------+-----------------------+
|      0     |          0            |
|      1     |          1            |
|      2     |          2            |
|      3     |          3            |
|      4     |          4            |
|      5     |          5            |
|      6     |          6            |
|      7     |          7            |
+------------+-----------------------+

Service queue remapping:
+------------+-----------------------+
|  Queue/tc  |     hardware-queue    |
+------------+-----------------------+
|      0     |          0            |
|      1     |          1            |
|      2     |          2            |
|      3     |          3            |
|      4     |          4            |
|      5     |          5            |
|      6     |          6            |
|      7     |          7            |
+------------+-----------------------+
```

show router-id

Use this command to display the Router ID of the current system.

Command Syntax

```
show router-id
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show router-id
Router ID: 10.55.0.2 (automatic)
```

show running-config router-id

Use this command to show the running system global router ID configuration.

Command Syntax

```
show running-config router-id
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config router-id
!
router-id 3.3.3.3
!
```

show timezone

Use this command to display the list of timezone names.

Command Syntax

```
show timezone
  (all|africa|america|antarctica|arctic|asia|atlantic|australia|brazil|canada|chil
  e|europe|indian|mexico|pacific|us)
```

Parameters

`africa`	Africa timezone list
`all`	All timezone list
`l2-profile-three`	L2 profile Three (default); the size of the l2 table (Mac address table) and l3 table (Host table) is almost equal
`l3-profile`	L3 profile
`america`	America timezone list
`antarctica`	Antarctica timezone list
`asia`	Asia timezone list
`atlantic`	Atlantic timezone list
`australia`	Australia timezone list
`brazil`	Brazil timezone list
`canada`	Canada timezone list
`chile`	Chile timezone list
`europe`	Europe timezone list
`indian`	Indian timezone list
`mexico`	Mexico timezone list
`pacific`	Pacific timezone list
`us`	US timezone list

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show timezone asia
Asia:
Kuwait
```

```
Samarkand
Novosibirsk
Hebron
Singapore
Dushanbe
Rangoon
Riyadh
Thimphu
Shanghai
Phnom_Penh
Taipei
Qyzylorda
Ho_Chi_Minh
Urumqi
Chita
Khandyga
Nicosia
Jerusalem
Ashkhabad
Gaza
Tel_Aviv
Baghdad
Anadyr
Tehran
Ashgabat
Saigon
Damascus
Sakhalin
Yekaterinburg
Baku
Bangkok
Kashgar
Macao
Seoul
Jakarta
Aden
Katmandu
Amman
Ujung_Pandang
Kuching
Hong_Kong
Ulan_Bator
Dhaka
Macau
Omsk
Vientiane
Pyongyang
Ust-Nera
Manila
Srednekolymsk
Tbilisi
Kamchatka
Magadan
Istanbul
Chongqing
Jayapura
Yerevan
```

```
Makassar
Colombo
Karachi
Hovd
Novokuznetsk
Krasnoyarsk
Irkutsk
Kabul
Kolkata
Dacca
Brunei
Calcutta
Kathmandu
Bishkek
Qatar
Tashkent
Aqtau
Oral
Kuala_Lumpur
Pontianak
Harbin
Aqtobe
Bahrain
Muscat
Vladivostok
Dubai
Tokyo
Chungking
Almaty
Choibalsan
Thimbu
Beirut
Dili
Yakutsk
Ulaanbaatar
```

snmp restart

Use this command to restart SNMP for a given process.

Command Syntax

```
snmp restart (auth | bfd | bgp | cfm | efm | isis | ldp | lldp | mrib | mstp | nsm
  | ospf | ospf6 | pim | rib| rip | rmon | rsvp |vrrp)
```

Parameters

None

Default

By default, SNMP resart is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart nsm
```

watch static-mac-movement

Use this command to watch any MAC movement is detected over static MAC entry for a time period. Notification will be displaying if static MAC movement happens till timer expires.

Command Syntax

```
watch static-mac-movement (<1-300>|)
```

Parameters

<1-300>	Timer value in second.

Default

By default, timer is 10 seconds

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#watch static-mac-movement
```

CHAPTER 3 Common Route-Map Mode Commands

This chapter is a reference for route-map commands. These commands are common to multiple protocols

This chapter includes the following commands:

- set origin
- set originator-id
- set tag
- set vpnv4 next-hop
- set weight
- show route-map
- show running-config route-map

continue

The continue clause provides the capability to execute additional entries in a route map after an entry is executed with a successful match and set clauses (i.e), the continue command allows multiple entries to be evaluated within a single route-map. Continue commands can be assigned optional sequence numbers that indicate the order in which clauses are to be evaluated.

Use the no form of the command (specifying a particular sequence number if desired), to remove individual or all continue clauses from a route-map.

Continue clause with match Clauses

When a match clause exists in a route map with continue clause, then the continue clause is executed only when a successful match occurs. If a match clause does not exist in the route-map and if a continue clause does exist, the continue clause will be evaluated and then go to the specified route-map entry. When a successful match occurs and we have a continue clause, the route-map executes the set clauses and then goes to the specified route-map entry. If continue clause does not exist in the next route map, then the route-map will behave normally. If a continue clause exists in the next route-map but a match is not successful, the route-map will not continue and will *fall through* to the next sequence number if one exists.

Continue clause with set Clauses

Set clauses are executed after the route-map evaluation is done. The set clauses are evaluated and executed in the order in which they were configured. Set clauses are only executed after a successful match occurs. The continue statement proceeds to the specified route-map entry only after configured set actions are performed. If a set action is configured in the first route-map and then the same set action occurs again, but with a different value in a subsequent route-map entry, then the last set action will override the previous set actions, which were configured with the same set command.

Command Syntax

```
continue <2-65535>|)
no continue <2-65535>|)
```

Parameter

<2-65535>	Continue sequence number.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#route-map Rmap1
(config-route-map)#continue ?
  <2-65535>  Route-map entry sequence number
  <cr>
(config-route-map)#continue 10
```

```
(config-route-map)#continue 30
```

match as-path

Use this command to match an autonomous system path access list. This command specifies the autonomous system path to be matched. If there is a match for the specified AS path, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are `not` met then the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to remove a path list entry.

Command Syntax

```
match as-path WORD
no match as-path (WORD|)
```

Parameter

`WORD`	Autonomous system path access list name.

Default

Enabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match as-path myaccesslist
```

match community

Use this command to specify the community to be matched.

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by the `match community` command overrides the global values. The route that does not match at least one match clause is ignored.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to remove the community list entry.

Command Syntax

```
match community (<1-99>|<100-199>|WORD) (exact-match|)
no match community (<1-99>|<100-199>|WORD|) (exact-match|)
```

Parameters

`<1-99>`	Community-list number (standard).
`<100-199>`	Community-list number (expanded).
`WORD`	Community-list name.
`exact-match`	Do exact matching of communities.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match community mylist
```

match extcommunity

Use this command to match BGP external community list

Communities are used to group and filter routes. They are designed to provide the ability to apply policies to large numbers of routes by using match and set commands. Community lists are used to identify and filter routes by their common attributes. This command allows the matching based on community lists.

The values set by this command overrides the global values. The route that does not match at least one match clause is ignored.

Note: This command is valid only for BGP.

Use the no parameter with this command to remove the community list entry.

Command Syntax

```
match extcommunity (<1-99>|<100-199>|WORD) (exact-match|)
no match extcommunity (<1-99>|<100-199>|WORD|) (exact-match|)
```

Parameters

<1-99>	Community-list number (standard).
<100-199>	Community-list number (expanded).
WORD	Name of the community-list.
exact-match	Do exact matching of communities.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match extcommunity mylist
```

match interface

Use this command to define the interface match criterion. This command specifies the next-hop interface name of a route to be matched.

Use the no parameter with this command to remove the specified match criterion.

Command Syntax

```
match interface IFNAME
no match interface (IFNAME|)
```

Parameter

IFNAME	Interface name.

Default

By default, match interface is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match interface eth0
```

match ip address

Use this command to specify the match address of route. If there is a match for the specified IP address, and `permit` is specified, the route is redistributed or controlled, as specified by the set action. If the match criteria are met, and `deny` is specified then the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Command Syntax

```
match ip address (<1-199>|<1300-2699>|WORD)
no match ip address (<1-199>|<1300-2699>|WORD|)
```

Parameters

`WORD`	IP access-list name.
`<1-199>`	IP access-list number (standard range).
`<1300-2699>`	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match ip address List1
```

match ip address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the no parameter with this command too disable this function

Command Syntax

```
match ip address prefix-list WORD
no match ip address prefix-list (WORD|)
```

Parameter

WORD	IP prefix list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip address prefix-list mylist
```

match ip next-hop

Use this command to specify a next-hop address to be matched in a route-map. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the no parameter with this command to disable this function.

Command Syntax

```
match ip next-hop (<1-199>|<1300-2699>|WORD)
no match ip next-hop (<1-199>|<1300-2699>|WORD|)
```

Parameters

WORD	Specify the IP access-list name.
<1-199>	Specify the IP access-list number (standard range).
<1300-2699>	Specify the IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ip next-hop mylist
```

match ip next-hop prefix-list

Use this command to specify the next-hop IP address match criterion using the prefix-list. This command matches the next-hop IP address of a route.

Use the no parameter with this command to remove the specified match criterion.

Command Syntax

```
match ip next-hop prefix-list WORD
no match ip next-hop prefix-list (WORD|)
```

Parameter

WORD	Prefix-list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip next-hop prefix-list list1
```

match ip peer

Use this command to specify the match peer IPv4 address of a route.

Use the no parameter with this command to remove the specified match criterion.

Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD|)
```

Parameter

WORD	IP access-list name.
<1-199>	IP access-list number (standard range).
<1300-2699>	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ip peer 123

(config-route-map)#no match ip peer 123
```

match ipv6 address

Use this command to specify the match address of route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Use the `no` parameter with this command to remove the `match ip address` entry.

Note: This command is valid for BGP, OSPFv3, and RIPng only.

Command Syntax

```
match ipv6 address WORD
no match ipv6 address (WORD|)
```

Parameter

`WORD`	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM deny 1
(config-route-map)#match ipv6 address myRM
```

match ipv6 address prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes, depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP, OSPFv3, and RIPng only.

Use the no parameter with this command to disable this function

Command Syntax

```
match ipv6 address prefix-list WORD
no match ipv6 address prefix-list (WORD|)
```

Parameter

WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 address prefix-list mylist
```

match ipv6 next-hop

Use this command to specify the next-hop address to be matched. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP and IS-IS only.

Use the no parameter with this command to disable this function

Command Syntax

```
match ipv6 next-hop (X:X::X:X|WORD)
no match ipv6 next-hop (X:X::X:X|WORD|)
```

Parameters

X:X::X:X	IPv6 address of the next-hop.
WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop 3ffe::1
```

match ipv6 next-hop prefix-list

Use this command to match entries of a prefix-list. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP and IS-IS only.

Use the no parameter with this command to disable this function

Command Syntax

```
match ipv6 next-hop prefix-list WORD
no match ipv6 next-hop prefix-list WORD
```

Parameters

WORD	IPv6 access list name.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match ipv6 next-hop prefix-list new
```

match ipv6 peer

Use this command to specify the match peer IPv6 address of a route.

Use the no parameter with this command to remove the specified match criterion.

Command Syntax

```
match ipv6 peer (<1-199>|<1300-2699>|WORD)
no match ipv6 peer (<1-199>|<1300-2699>|WORD|)
```

Parameter

WORD	IP access-list name.
<1-199>	IP access-list number (standard range).
<1300-2699>	IP access-list number (expanded range).

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#match ipv6 peer 123

(config-route-map)#no match ipv6 peer 123
```

match metric

Use this command to match a metric of a route. The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid for BGP, OSPF, and IS-IS only.

Use the no parameter with this command to disable this function

Command Syntax

```
match metric <0-4294967295>
no match metric (<0-4294967295>|)
```

Parameters

`<0-4261412864>` Metric value.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#match metric 888999
```

match origin

Use this command to match origin code. The origin attribute defines the origin of the path information. The `egp` parameter is indicated as an `e` in the routing table, and it indicates that the origin of the information is learned via EGP (Exterior Gateway Protocol). The `igp` parameter is indicated as an `i` in the routing table, and it indicates the origin of the path information is interior to the originating AS. The `incomplete` parameter is indicated as a `?` in the routing table, and indicates that the origin of the path information is unknown or learned through other means. If a static route is redistributed into BGP, the origin of the route is incomplete.

This command specifies the origin to be matched. If there is a match for the specified origin, and `permit` is specified when you created the route-map, the route is redistributed or controlled as specified by the set action. If the match criteria are met, and `deny` is specified, the route is not redistributed or controlled. If the match criteria are not met, the route is neither accepted nor forwarded, irrespective of `permit` or `deny` specifications.

The route specified by the policies might not be the same as specified by the routing protocols. Setting policies enable packets to take different routes depending on their length or content. Packet forwarding based on configured policies overrides packet forwarding specified in routing tables.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to disable this matching.

Command Syntax

```
match origin (egp|igp|incomplete)
no match origin (egp|igp|incomplete|)
```

Parameters

`egp`	Remote exterior gateway protocol.
`igp`	Local internal gateway protocol.
`incomplete`	Unknown heritage.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map myroute deny 34
(config-route-map)#match origin egp
```

match route-type

Use this command to match an external route type. AS-external LSA is either Type-1 or Type-2. External type-1 matches only Type 1 external routes and external type-2 matches only Type 2 external routes.

Use the no parameter with this command to turn off the matching.

Command Syntax

```
match route-type external (type-1|type-2)
no match route-type external (type-1|type-2|)
```

Parameters

type-1	Match OSPF External Type 1 metric.
type-2	Match OSPF External Type 2 metric.

Default

By default, match route type external is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match route-type external type-1
```

match tag

Use this command to match the specified tag value.

Use the no parameter with this command to turn off the declaration.

Command Syntax

```
match tag <0-4294967295>
no match tag (<0-4294967295>|)
```

Parameters

`<0-4294967295>` Tag value.

Default

By default, match tag is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap1 permit 10
(config-route-map)#match tag 100
```

route-map

Use this command to enter route-map mode and to permit or deny match/set operations.

This command controls and modifies routing information to allow redistribution of routes. It has a list of `match` and `set` commands associated with it. The `match` commands specify the conditions under which redistribution is allowed, and the `set` commands specify the particular redistribution actions to be performed if the criteria enforced by match commands are met. Route maps are used for detailed control over route distribution between routing processes.

Route maps also allow policy routing, and might route packets to a different route than the obvious shortest path.

Use the `no` parameter with this command to turn off the declaration.

Command Syntax

```
route-map WORD (deny|permit) <1-65535>
no route-map WORD ((deny|permit) <1-65535>|)
```

Parameters

`WORD`	Route-map name (maximum size 63 characters).
`deny`	Route map deny set operations. If this parameter is specified, and the match criteria are met, the route is not redistributed, and any other route maps with the same map tag are not examined.
`permit`	Route map permit set operations. If this parameter is specified, and the match criteria are met, the route is redistributed as specified by the set actions. If the `match` criteria are not met, the next route map with the same tag is tested.
`<1-65535>`	Sequence to insert into or delete from an existing route-map.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map route1 permit 1
(config-route-map)#
```

set aggregator

Use this command to set the AS number for the route map and router ID. An Autonomous System (AS) is a collection of networks under a common administration sharing a common routing strategy. It is subdivided by areas, and is assigned a unique 16-bit number. Use the `set aggregator` command to assign an AS number for the aggregator.

To use the `set aggregator` command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to disable this function

Command Syntax

```
set aggregator as <1-65535> A.B.C.D
no set aggregator as (<1-65535> A.B.C.D|)
```

Parameters

`<1-65535>`	AS number of aggregator.
`A.B.C.D`	IP address of aggregator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set aggregator as 43 10.10.0.3
```

set as-path

Use this command to modify an autonomous system path for a route. By specifying the length of the AS-Path, the router influences the best path selection by a neighbor. Use this command to prepend an AS path string to routes increasing the AS path length.

To use this command, you must first give the `match` and `set` commands configure the conditions for redistributing routes from one routing protocol to another:

- The `match` command specifies the match criteria under which redistribution is allowed for the current route-map.
- The `set` command specifies the set redistribution actions to be performed if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set as-path prepend .<1-65535>
set as-path prepend .<1-4294967295>
no set as-path prepend (.<1-65535>|)
no set as-path prepend (.<1-4294967295>|)
```

Parameters

`<1-65535>`	OcNOS prepends this number to the AS path.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myroute permit 3
(config-route-map)#set as-path prepend 8 24
```

set atomic-aggregate

Use this command to set an atomic aggregate attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to disable this function

Command Syntax

```
set atomic-aggregate
no set atomic-aggregate
```

Parameters

No default value is specified

Default

None

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set atomic-aggregate
```

set comm-list

Use this command to delete the matched communities from the community attribute of an inbound or outbound update when applying route-map.

Use the no parameter with this command to disable this feature.

Command Syntax

```
set comm-list (<1-99>|<100-199>|WORD) delete
no set comm-list (<1-99>|<100-199>|WORD) delete
```

Parameters

<1-99>	Standard community-list number.
<100-199>	Expanded community-list number.
WORD	Name of the community-list.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map myRM permit 3
(config-route-map)#set comm-list 34 delete
```

set community

Use this command to set the communities attribute. and group destinations in a certain community, as well as apply routing decisions according to those communities.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to delete the entry.

Command Syntax

```
set community [<65536-4294901759>|AA:NN|internet|local-AS|no-advertise|no-
  export|none] (additive|)
no set community [AA:NN|internet|local-AS|no-advertise|no-export|none] (additive|)
```

Parameters

`<65536-4294901759>`	Community number
`AA:NN`	The community number in aa:nn format.
`internet`	Internet.
`local-AS`	Do not send outside the local AS (well-known community).
`no-advertise`	Do not advertise this route to eBGP peers
`no-export`	Do not advertise this route to any peer.
`none`	Remove the community attribute from the prefixes that pass the route-map.
`additive`	Add to the existing community.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following examples show the use of the `set community` command with different parameters.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-export no-advertise

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community no-advertise
```

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set community 10:01 23:34 12:14 no-export
```

set dampening

Use this command to enable route-flap dampening and set parameters. Set the unreachability half-life time to be equal to, or greater than, reachability half-life time. The suppress-limit value must be greater than or equal to the reuse limit value.

Use the no parameter with this command to delete the entry.

Command Syntax

```
set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)
no set dampening <1-45> <1-20000> <1-20000> <1-255> (<1-45>|)
```

Parameters

<1-45>	Reachability half-life time in minutes. The time for the penalty to decrease to one-half of its current value.
<1-20000>	Reuse-limit value. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.
<1-20000>	Suppress-limit value. When the penalty for a route exceeds the suppress value, the route is suppressed.
<1-255>	Max-suppress-time. Maximum time that a dampened route is suppressed.
<1-45>	Unreachability half-life time for penalty, in minutes.

Default

Default reachability half-life time: 15 minutes

Default reuse limit value: 750

Default suppress limit value: 2000

Default max-suppress value is 4 times the half-life time (60 minutes)

Default unreachability half-life time value: 15 minutes

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map R1 permit 24
(config-route-map)#set dampening 20 333 534 30
```

set extcommunity

Use this command to set an extended community attribute.

To use this command you must first have a match clause. The `match` and `set` commands define the conditions for redistributing routes from one routing protocol to another:

- The `match` command defines the match criteria under which redistribution is allowed for the current route-map.
- The `set` command defines the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set extcommunity rt .AA:NN (additive|)
set extcommunity soo .AA:NN
set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
no set extcommunity rt (.AA:NN|) (additive|)
no set extcommunity soo (.AA:NN|)
no set extcommunity cost (igp|pre-bestpath|) <0-255> <0-4294967295>
```

Parameters

`rt`	Route target extended community.
`.AA:NN`	VPN extended community
`additive`	Add to the exsisting community.
`soo`	Site-of-origin extended community.
`cost`	Extended cost community.
`igp`	Compare following IGP cost comparison.
`pre-bestpath`	Compare following IGP cost comparison.
`<0-255>`	Community ID.
`<0-4294967295>`	Cost.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 06:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity rt 0.0.0.6:01

#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 06:01

#configure terminal
(config-route-map)#route-map rmap1 permit 3
(config-route-map)#set extcommunity soo 0.0.0.6:01
```

set interface null0

Use this command to discard routes based on policy/rules configured for a route map.

Route maps can be applied to BGP neighbors. When this command is given for a route map and that route map is applied to a BGP neighbor, the discard route entries are added by BGP for the prefix permitted by the route map.

Use the no form of this command to not discard routes based on policy/rules configured for a route map.

Command Syntax

```
set interface null0
no set interface null0
```

Parameters

None

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

To discard 1.1.1.1/24 from BGP neighbor 30.1.1.1:

```
#configure terminal
(config)#ip prefix-list myPrefixList seq 5 permit 1.1.1.1/24 eq 24
(config)#route-map myRM permit 1
(config-route-map)#match ip address prefix-list myPrefixList
(config-route-map)#set interface null0
(config-route-map)#exit
(config)#router bgp 200
(config-router)#neighbor 30.1.1.1 remote-as 200
(config-router)#neighbor 30.1.1.1 route-map myRM in
```

set ip next-hop

Use this command to set the specified next-hop value.

Use the no parameter with this command to turn off the setting.

Note: This command is valid for BGP and OSPF only.

Command Syntax

```
set ip next-hop A.B.C.D
no set ip next-hop (A.B.C.D|)
```

Parameter

A.B.C.D	IP address of the next-hop.

Default

By default, set ip next hop A.B.C.D is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map mymap permit 3
(config-route-map)#set ip next-hop 10.10.0.67
```

set ipv6 next-hop

Use this command to set a next hop-address.

Use the no parameter with this command to delete an entry.

Note: This command is valid for BGP and OSPFv3 only.

Command Syntax

```
set ipv6 next-hop X:X::X:X
set ipv6 next-hop local X:X::X:X
no set ipv6 next-hop (X:X::X:X|)
no set ipv6 next-hop local (X:X::X:X|)
```

Parameters

X:X::X:X	Global IPv6 address of the nexthop.
local	Local IPv6 address of the nexthop.

Default

By default, set ipv6 next hop X:X::X:X is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set ipv6 next-hop local fe80::203:47ff:fe97:66dc
```

set level

Use this command to set the IS-IS level to export a route.

Use the no parameter with this command to disable this function.

Command Syntax

```
set level (level-1|level-2|level-1-2)
no set level (level-1|level-2|level-1-2|)
```

Parameters

`level-1`	Export into a level-1 area.
`level-2`	Export into a level-2 sub-domain.
`level-1-2`	Export into level-1 and level-2.

Default

By default, set level is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set level level-1
```

set local-preference

Use this command to set the BGP local preference path attribute.

Use the no parameter with this command to disable this function.

Command Syntax

```
set local-preference <0-4294967295>
no set local-preference (<0-4294967295>|)
```

Parameters

`<0-4294967295>` Tag value for destination routing protocol.

Default

By default, set local preference is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set local-preference 12
```

set metric

Use this command to set a metric value for a route and influence external neighbors about the preferred path into an Autonomous System (AS). The preferred path is the one with a lower metric value. A router compares metrics for paths from neighbors in the same ASs. To compare metrics from neighbors coming from different ASs, use the `bgp always-compare-med` command.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
set metric WORD
no set metric (WORD|)
```

Parameters

`WORD`	Metric value [+/-] <1-4294967295>

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric 600
```

set metric-type

Use this command to set the metric type for the destination routing protocol. Select a type to be either Type-1 or Type-2 in the AS-external-LSA when the route-map matches the condition.

Note: This command is for OSPF, OSPFv3, or IS-IS only.

Use the no parameter with this command to return to the default.

Command Syntax

```
set metric-type (internal|external)
set metric-type (type-1|type-2)
no set metric-type (internal|external|)
no set metric-type (type-1|type-2|)
```

Parameters

external	IS-IS external metric type.
internal	IS-IS internal metric type.
type-1	OSPF external type 1 metric.
type-2	OSPF external type 2 metric

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In this example the metric type of the destination protocol is set to OSPF external Type 1.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set metric-type 1
```

set origin

Use this command to set the BGP origin code. The origin attribute defines the origin of the path information.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the no parameter with this command to delete an entry.

Command Syntax

```
set origin (egp|igp|incomplete)
no set origin (egp|igp|incomplete|)
```

Parameters

`egp`	Learned through an Exterior Gateway Protocol.
`igp`	Interior to the originating AS. This happens when an Internal Gateway Protocol is redistributed into BGP.
`incomplete`	Unknown or learned through some other means. This happens when a static route is redistributed in BGP and the origin of the route is incomplete.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set origin egp
```

set originator-id

Use this command to set the originator ID attribute.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set originator-id A.B.C.D
no set originator-id (A.B.C.D|)
```

Parameter

`A.B.C.D`	IP address of originator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set originator-id 1.1.1.1
```

set tag

Use this command to set a tag value. The parameter is the route tag that is labeled by another routing protocol (BGP or other IGP when redistributing), because AS-external-LSA has a route-tag field in its LSAs. In addition, when using route-map, OcNOS can tag the LSAs with the appropriate tag value. Sometimes the tag matches with using route-map, and sometimes, the value may be used by another application.

Use the no parameter with this command to unset a tag value.

Command Syntax

```
set tag <0-4294967295>
no set tag (<0-4294967295>|)
```

Parameter

`<0-4294967295>` Tag value for destination routing protocol.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example the tag value of the destination routing protocol is set to 6:

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set tag 6
```

set vpnv4 next-hop

Use this command to set a VPNv4 next-hop address.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

If the packets do not match any of the defined criteria, they are routed through the normal routing process.

Note: This command is valid for BGP only.

Use the `no` parameter with this command to disable this function

Command Syntax

```
set vpnv4 next-hop A.B.C.D
no set vpnv4 next-hop (A.B.C.D|)
```

Parameter

`A.B.C.D`	IP address of originator.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#set vpnv4 next-hop 6.6.6.6
```

set weight

Use this command to set weights for the routing table.

The weight value is used to assist in best path selection. It is assigned locally to a router. When there are several routes with a common destination, the routes with a higher weight value are preferred.

To use this command, you must first have a match clause. `Match` and `set` commands set the conditions for redistributing routes from one routing protocol to another. The `match` command specifies the match criteria under which redistribution is allowed for the current route-map. The `set` command specifies the set redistribution actions to be performed, if the match criteria are met.

Note: This command is valid only for BGP.

Use the `no` parameter with this command to delete an entry.

Command Syntax

```
set weight <0-4294967295>
no set weight (<0-4294967295>|)
```

Parameter

`<0-4294967295>` Weight value.

Default

No default value is specified

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration, all routes that apply to access-list 10 will have the weight set at 400. If the packets do not match any of the defined criteria, they are routed through the normal routing process.

```
#configure terminal
(config)#route-map rmap1 permit 3
(config-route-map)#match as-path 10
(config-route-map)#set weight 400
```

show route-map

Use this command to display route-map information.

Command Syntax

```
show route-map (|WORD)
```

Parameters

WORD	Route-map name (maximum size 63 characters)

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show route-map` command.

```
#show route-map
route-map myRM, permit, sequence 1
  Match clauses:
    metric 200
  Set clauses:
    metric 60
#
```

Table 3-52 explains the output fields.

Table 3-52: show route-map details

Field	Description
route-map	Name of a route map.
permit	Routes that match the match clauses are redistributed according to the conditions defined by the set clauses.
sequence	Position of this route map in sequence of route-maps with the same name.
Match clauses	Routes that match the conditions defined by the match clause are redistributed according to the conditions defined by the set clauses.
Set clauses	Routes that pass the match clause are redistributed according to the conditions defined by the set clauses.

show running-config route-map

Use this command to display the running system status and configuration details for route-maps.

Command Syntax

```
show running-config route-map
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config route-map
!
route-map abc deny 2
 match community 2
!
route-map abc permit 3
 match route-type external type-2
 set metric-type type-1
!
```

CHAPTER 4 Interface Commands

This chapter is a reference for each of the interface commands.

- ipv6 nd retransmission-time
- ipv6 nd suppress-ra
- ipv6 prefix-list
- ipv6 unnumbered
- link-flap errdisable
- load interval
- monitor speed
- monitor queue-drops
- monitor speed threshold
- mtu
- multicast
- port breakout enable
- port bundle enable
- protocol-control
- show hardware-discard-counters
- show interface
- show interface counters
- show interface counters drop-stats
- show interface counters error-stats
- show interface counters (indiscard-stats|outdiscard-stats)
- show interface counters protocol
- show interface counters queue-drop-stats
- show interface counters queue-stats
- show interface counters rate
- show interface counters speed
- show interface counters summary
- show interface protocol-control status
- show ip forwarding
- show ip interface
- show ip prefix-list
- show ip route
- show ip vrf
- show ipv6 forwarding
- show ipv6 interface brief
- show ipv6 route
- show ipv6 prefix-list
- show hosts
- show running-config interface
- show running-config interface ip

- show running-config interface ipv6
- show running-config ip
- show running-config ipv6
- shutdown
- speed
- switchport
- switchport allowed ethertype

admin-group

Use this command to create an administrative group to be used for links. Each link can be a member of one or more, or no administrative groups.

When used in the interface mode, this command adds a link between an interface and a group. The name is the name of the group previously configured. There can be multiple groups per interface. The group is created in configure mode, then interfaces are added to the group in interface mode.

Use the `no` parameter with this command to disable this command.

Command Syntax

```
admin-group NAME
no admin-group NAME
```

Parameters

`NAME`	Name of the admin group to add.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, the `eth3` interface is added to the group `myGroup`:

```
#configure terminal
(config)#interface eth3
(config-if)#admin-group myGroup
```

bandwidth

Use this command to specify a discrete, maximum bandwidth value for the interface.

Use the no parameter resets the interface's bandwidth to the default value.

Command Syntax

```
bandwidth BANDWIDTH
no bandwidth
```

Parameter

BANDWIDTH	<1-999>k for 1 to 999 kilobits/s
	<1-999>m for 1 to 999 megabits/s
	<1-100>g for 1 to 100 gigabits/s

Default

Default bandwidth will be default speed of the interface. For LAG, default bandwidth will be collective bandwidth of its member ports. For VLAN interface, default bandwidth is 1 gigabits/sec.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe4
(config-if)#bandwidth 100m
```

clear hardware-discard-counters

Use this command to clear device level discard counters.

Command Syntax

```
clear hardware-discard-counters
```

Parameters

None

Command Mode

Exec mode

Applicability

The command is introduced before OcNOS version 1.3.

Examples

```
#clear hardware-discard-counters
```

clear interface counters

Use this command to clear the statistics on a specified interface or on all interfaces.

Note: This command is not supported on loopback interfaces or the out-of-band management (OOB) management interface.

Command Syntax

```
clear interface (IFNAME|) counters
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface xe0 counters
```

clear interface cpu counters

Use this command to clear the CPU queue counters.

Command Syntax

```
clear interface cpu counters
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface cpu counters
```

clear ip prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv4 interface.

Command Syntax

```
clear ip prefix-list
clear ip prefix-list WORD
clear ip prefix-list WORD A.B.C.D/M
```

Parameters

WORD	Name of the prefix-list.
A.B.C.D/M	IP prefix and length.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip prefix-list List1
```

clear ipv6 neighbors

Use this command to clear all dynamic IPv6 neighbor entries.

Command Syntax

```
clear ipv6 neighbors
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 neighbors
```

clear ipv6 prefix-list

Use this command to reset the hit count to zero in the prefix-list entries for an IPv6 interface.

Command Syntax

```
clear ipv6 prefix-list
clear ipv6 prefix-list WORD
clear ipv6 prefix-list WORD X:X::X:X/M
```

Parameters

WORD	Name of the prefix-list.
X:X::X:X/M	IP prefix and length.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 prefix-list List1
```

debounce-time

Use this command to set the debounce time for a interface.

The debounce timer avoids frequent updates (churn) to higher layer protocol during interface flapping. If the status of a link changes quickly from up to down and then back to up, the port debounce timer suppresses the link status notification. If the link transitions from up to down, but does not come back up, the port debounce timer delays the link status notification.

Note: Keep the following in mind when using the debounce timer:

- Debounce is not applicable for admin down operations.
- Debounce timer is supported only for physical L2 and L3 interfaces.
- The debounce flap-count refers to the number of flaps OcNOS receives while the debounce timer is running:
  - The flap-count is only updated if the timer is still running and OcNOS receives a link status event for the interface.
  - The flap-count is reset at the subsequent start of the debounce timer.
- Protocol-specific timers such as BFD which depend on the link status should be configured to a minimum of 1.5 times the value of the debounce timer. Otherwise it could affect the protocol states if the debounce timer is still running.

Use the no form of this command to turn-off the debounce timer on a interface.

Command Syntax

```
debounce-time <250-5000>
no debounce-time
```

Parameters

<250-5000>	Timer value in milliseconds.

Default

By default, disabled.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.8.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#debounce-time 4000
```

description

Use this command to assign an description to an interface.

Use the `no` parameter to remove an interface description.

Command Syntax

```
description LINE
no description
```

Parameter

`LINE`	Interface description.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example provides information about the connecting router for interface `eth1`.

```
Router#configure terminal
Router(config)#interface eth1
Router(config-if)#description Connected to Zenith's fas2/0
```

duplex

Use this command to set the duplex mode for each interface.

Use the no parameter to remove the duplex mode.

Command Syntax

```
duplex (half|full)
no duplex
```

Parameter

`half`	Half-duplex mode.
`full`	Full-duplex mode.

Default

By default, duplex mode is full duplex.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#duplex full

(config-if)#no duplex
```

fec

Use this command to configure forward error correction (FEC) on a physical port.

Use no parameter to un-configure FEC.

Command Syntax

```
fec (on|auto)
no fec
```

Parameter

on	Enable FEC.
auto	Enable FEC with autonegotiation.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#fec on

(config-if)#no fec
```

hardware-profile portmode

Use this command to set the global port mode.

Command Syntax

```
hardware-profile portmode (4X10g|40g)
```

Parameter

`4X10g`	Split all the 40G flex ports on the system
`40g`	Disable splitting on all flex ports and make all ports 40G

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#hardware-profile portmode 40g
```

hardware-profile portmode bundle

Use this command to set the global port mode to bundle.

Command Syntax

```
hardware-profile portmode bundle (40g|4X10g)
```

Parameter

`40g`	Bundle four 10G ports to a single 40G port
`4x10g`	Unbundle ports

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#hardware-profile portmode bundle 40g
(config)#exit
(config)#hardware-profile portmode bundle 4x10g
(config)#exit
```

if-arbiter

Use this command to discover new interfaces recently added to the kernel and add them to the OcNOS database.

This command starts the arbiter to check interface information periodically. OcNOS dynamically finds any new interfaces added to the kernel. If an interface is loaded dynamically into the kernel when OcNOS is already running, this command polls and updates the kernel information periodically.

Use the no parameter with this command to revert to default.

Command syntax

```
if-arbiter (interval <1-65535>|)
no if-arbiter
```

Parameter

`interval`	Interval (in seconds) after which NSM sends a query to the kernel.

Default

By default, `if-arbiter` is disabled. When interface-related operations are performed outside of OcNOS (such as when using the `ifconfig` command), enable `if-arbiter` for a transient time to complete synchronization. When synchronization is complete, disable it by giving the `noif-arbiter` command.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#if-arbiter interval 5
```

interface

Use this command to select an interface to configure, and to enter the `Interface` command mode.

Use the `no` parameter with this command to remove this configuration.

Command Syntax

```
interface IFNAME
no interface IFNAME
```

Parameter

`IFNAME`	Name of the interface.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows the use of this command to enter the `Interface` mode (note the change in the prompt).

```
#configure terminal
(config)#interface eth3
(config-if)#
```

ip address A.B.C.D/M

Use this command to specify that an IP address and prefix length will be used by this interface. If the `secondary` parameter is not specified, this command overwrites the primary IP address. If the `secondary` parameter is specified, this command adds a new IP address to the interface. The secondary address cannot be configured in the absence of a primary IP address. The primary address cannot be removed when a secondary address is present.

Use the no parameter with this command to remove the IP address from an interface.

Command Syntax

```
ip address A.B.C.D/M label LINE
ip address A.B.C.D/M (secondary|)
ip address A.B.C.D/M secondary label LINE
no ip address A.B.C.D/M label LINE
no ip address A.B.C.D/M secondary label LINE
no ip address (A.B.C.D/M (secondary|)|)
```

Parameters

`LINE`	Label of this address.
`secondary`	Make the IP address secondary.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24
(config-if)#ip address 10.10.11.50/24 secondary
```

ip address dhcp

Use this command to specify that a DHCP client will be used to obtain an IP address for an interface.

Use the no parameter with this command to remove the IP address from an interface.

Command Syntax

```
ip address dhcp
no ip address dhcp
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth3
(config-if)#ip address 10.10.10.50/24
(config-if)#ip address 10.10.11.50/24 secondary
(config-if)#ip address dhcp
```

ip forwarding

Use this command to turn on IP forwarding.

Use the no parameter with this command to turn off IP forwarding.

Command Syntax

```
ip forwarding
ip forwarding vrf NAME
no ip forwarding
no ip forwarding vrf NAME
```

Parameters

NAME	Virtual Routing and Forwarding name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip forwarding
```

ip prefix-list

Use this command to create an entry for a prefix list.

A router starts to match prefixes from the top of the prefix list and stops whenever a match or deny occurs. To promote efficiency, use the `seq` parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

Use the parameters `ge` and `le` specify the range of the prefix length to be matched. When setting these parameters, set `le` to be less than 32 and `ge` to be less than `le` value.

Use the `no` parameter with this command to delete the prefix-list entry.

Command Syntax

```
ip prefix-list WORD (deny|permit) (A.B.C.D/M|any)
ip prefix-list WORD (deny|permit) A.B.C.D/M eq <0-32>
ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32>
ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32> le <0-32>
ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32>
ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> ge <0-32>
ip prefix-list WORD seq <1-4294967295> (deny|permit) (A.B.C.D/M|any)
ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M eq <0-32>
ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32>
ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> le <0-32>
ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32>
ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ge <0-32>
no ip prefix-list WORD
no ip prefix-list WORD (deny|permit) (A.B.C.D/M|any)
no ip prefix-list WORD (deny|permit) A.B.C.D/M eq <0-32>
no ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32>
no ip prefix-list WORD (deny|permit) A.B.C.D/M ge <0-32> le <0-32>
no ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32>
no ip prefix-list WORD (deny|permit) A.B.C.D/M le <0-32> ge <0-32>
no ip prefix-list WORD seq <1-4294967295> (deny|permit) (A.B.C.D/M|any)
no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M eq <0-32>
no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32>
no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M ge <0-32> le <0-
  32>
no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32>
no ip prefix-list WORD seq <1-4294967295> (deny|permit) A.B.C.D/M le <0-32> ge <0-
  32>
ip prefix-list sequence-number
no ip prefix-list sequence-number
```

```
ip prefix-list WORD description LINE
no ip prefix-list WORD description LINE
no ip prefix-list WORD description
```

Parameters

`WORD`	Name of the prefix list.
`deny`	Reject packets.
`permit`	Accept packets.
`A.B.C.D/M`	IP address mask and length of the prefix list mask.
`eg`	Exact prefix length match
`le`	Maximum prefix length match
`ge`	Minimum prefix length match
`<0-32>`	Prefix length to match
`<1-4294967295>`	Sequence number of the prefix list.
`any`	Take all packets of any length. This parameter is the same as using 0.0.0.0/0 le 32 for `A.B.C.D/M`.
`sequence-number`	To suppress sequence number generation, give the `no ip prefix-list sequence-number` command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the `ip prefix-list` command. To enable sequence number generation, give the `ip prefix-list sequence-number` command.
`LINE`	Up to 80 characters describing this prefix-list.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In this configuration, the `ip prefix-list` command matches all, but denies the IP address range, 76.2.2.0.

```
#conf t
(config)#router bgp 100
(config-router)#network 172.1.1.0
(config-router)#network 172.1.2.0
(config-router)#
(config-router)#neighbor 10.6.5.3 remote-as 300
(config-router)#neighbor 10.6.5.3 prefix-list mylist out
(config-router)#exit
(config)#ip prefix-list mylist seq 5 deny 76.2.2.0/24
```

```
(config)#ip prefix-list mylist seq 10 permit 0.0.0.0/0
```

ip proxy-arp

Use this command to enable the proxy ARP feature on an interface.

Use the no parameter to disable the proxy ARP feature on an interface.

Command Syntax

```
ip proxy-arp
no ip proxy-arp
```

Parameters

None

Default

By default, the ip proxy-arp is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ip proxy-arp
```

ip remote-address

Use this command to set the remote address (far end) on a point-to-point non multi-access link. This command can be used only on unnumbered interfaces. When a new remote-address is configured, the old address gets overwritten.

Use the no parameter to disable this function.

Command Syntax

```
ip remote-address A.B.C.D/M
no ip remote-address
```

Parameter

A.B.C.D/M	IP address and prefix length of the link remote address.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface ppp0
(config-if)#ip unnumbered eth1
(config-if)#ip remote-address 1.1.1.1/32
```

ip unnumbered

Use this command to enable IP processing without an explicit address on a point-to-point non multi-access link. Moreover, this command lets an interface borrow the IP address of a specified interface to enable IP processing on a point-to-point interface without assigning it an explicit IP address. In this way, the IP unnumbered interface can borrow the IP address of another interface already configured on the router to conserve network and address space.

Use the `no` parameter with this command to remove this feature on an interface.

Command Syntax

```
ip unnumbered IFNAME
no ip unnumbered
```

Parameter

`IFNAME`	Interface name.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example creates a tunnel on `eth1`.

```
(config)#interface lo
(config-if)#ip address 127.0.0.1/8
(config-if)#ip address 33.33.33.33/32 secondary
(config-if)#exit
(config)#interface eth1
(config-if)#ip address 10.10.10.145/24
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode gre
(config-if)#ip unnumbered eth1
(config-if)#exit
(config)#router ospf
(config-router)#network 10.10.10.0/24 area 0
```

ip vrf forwarding

This command associates an interface with a VRF.

Use the no parameter with this command to unbind an interface.

Note: When you give this command in interface configuration or subinterface configuration mode of the parent VR, the IP address and other attributes of the interface are deleted from the interface. After giving this command, the IP attributes must then be configured in the context of the VRF.

Note: The Out Of Band (OOB) management port is part of the “management” VRF. Also, this port cannot be moved out of “management” VRF.

Command Syntax

```
ip vrf forwarding WORD
no ip vrf forwarding WORD
```

Parameter

WORD	Name of the VRF.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#exit
(config)#interface eth1
(config-if)#ip vrf forwarding myVRF
```

ipv6 address

Use this command to set the IPv6 address of an interface.

Use the no form of this command to disable this function.

Command Syntax

```
ipv6 address X:X::X:X/M
ipv6 address X:X::X:X/M anycast
no ipv6 address X:X::X:X/M
```

Parameters

`X:X::X:X/M`	IP destination prefix and a mask length.
`anycast`	Make an anycast address which is assigned to a set of interfaces that belong to different devices. A packet sent to an anycast address is delivered to the closest interface (as defined by the routing protocols in use) identified by the anycast address

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 address 3ffe:506::1/64
```

ipv6 forwarding

Use this command to turn on IPv6 forwarding.

Use the no parameter with this command to turn off IPv6 forwarding.

Command Syntax

```
ipv6 forwarding
ipv6 forwarding vrf NAME
no ipv6 forwarding
no ipv6 forwarding vrf NAME
```

Parameters

NAME	Virtual Routing or Forwarding name

Default

No default value is specified

Command Mode

Command mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 forwarding
```

ipv6 nd current-hoplimit

Use this command to set an ND (Neighbor Discovery) advertised hop limit for an interface.

Use the no option of this command to set the current hop limit to its default value.

Command Syntax

```
ipv6 nd current-hoplimit <0-255>
no ipv6 nd current-hoplimit
```

Parameter

<0-255>	Hop limit.

Default

By default, hop limit is 64

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd current-hoplimit 10
(config-if)#no ipv6 nd current-hoplimit
```

ipv6 nd link-mtu

Use this command to set an advertised maximum transmission unit (MTU).

Use the no option with the command to reset the MTU to the default statute.

Command Syntax

```
ipv6 nd link-mtu (<1280-65535>)
no ipv6 nd link-mtu
```

Parameters

<1280-65535>	Link MTU value.

Default

By default, link MTU value is 1500

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd link-mtu 1600
(config-if)#no ipv6 nd link-mtu
```

ipv6 nd managed-config-flag

Use this command to set the managed address configuration flag in the Router Advertisement to be used for the IPv6 address auto-configuration.

Use the no parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd managed-config-flag
no ipv6 nd managed-config-flag
```

Parameters

None

Default

The managed address configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd managed-config-flag
(config-if)#no ipv6 nd managed-config-flag
```

ipv6 nd minimum-ra-interval

Use this command to set a minimum Router Advertisement (RA) interval for the interface.

Use the no option with the command to set the RA interval to its default value.

Command Syntax

```
ipv6 nd minimum-ra-interval <3-1350>
no ipv6 nd minimum-ra-interval (<3-1350>|)
```

Parameter

<3-1350>	Minimum RA interval (in seconds).

Default

By default, RA interval is 180 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd minimum-ra-interval 400
(config-if)#no ipv6 nd minimum-ra-interval
```

ipv6 nd other-config-flag

Use this command to set the other stateful configuration flag in Router Advertisement to be used for IPv6 address auto-configuration.

Use no parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd other-config-flag
no ipv6 nd other-config-flag
```

Parameters

None

Default

Other stateful configuration flag is not set.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd other-config-flag
(config-if)#no ipv6 nd suppress-ra
```

ipv6 nd prefix

Use this command to set IPv6 prefix information that is advertised for address auto-configuration.

Use no parameter with this command to remove an IPv6 prefix.

Command Syntax

```
ipv6 nd prefix X:X::X:X/M <0-4294967295> <0-4294967295> (off-link|) (no-
  autoconfig|)
ipv6 nd prefix X:X::X:X/M
ipv6 nd prefix valid-lifetime <0-4294967295>
ipv6 nd prefix preferred-lifetime <0-4294967295>
ipv6 nd prefix offlink
ipv6 nd prefix no-autoconf
no ipv6 nd prefix X:X::X:X/M
no ipv6 nd prefix valid-lifetime (<0-4294967295>|)
no ipv6 nd prefix preferred-lifetime (<0-4294967295>|)
no ipv6 nd prefix offlink
no ipv6 nd prefix no-autoconf
```

Parameters

`X:X::X:X/M`	IPv6 prefix.
`<0-4294967295>`	Valid lifetime in seconds.
`<0-4294967295>`	Preferred lifetime in seconds.
`off-link`	Do not use prefix for onlink determination.
`no-autoconfig`	Do not use prefix for autoconfiguration.

Default

By default, valid life time is 2592000 seconds and preferred life time is 604800 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Defaults

The default valid lifetime is 2592000 seconds.

The default preferred lifetime is 604800 seconds.

Examples

```
(config)#interface eth3
(config-if)#ipv6 nd prefix 2001:ffff::/64
```

```
(config)#interface eth3
(config-if)#ipv6 nd prefix no-autoconf

(config)#interface eth3
(config-if)#ipv6 nd prefix preferred-lifetime 550000
```

ipv6 nd ra-interval

Use this command to specify the interval between IPv6 Router Advertisements (RA).

Use no parameter with this command to set the value to its default.

Command Syntax

```
ipv6 nd ra-interval <4-1800>
no ipv6 nd ra-interval
```

Parameter

<4-1800>	RA interval in milliseconds.

Default

By default, RA interval is 600 milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-interval 60
(config-if)#ipv6 nd prefix 3ffe:ffff:ffff::/64

(config-if)#no ipv6 nd ra-interval
```

ipv6 nd ra-lifetime

Use this command to specify the Router Advertisement (RA) lifetime for this device to act as a default gateway for the network.

Use no parameter with this command to reset the value to default.

Command Syntax

```
ipv6 nd ra-lifetime <0-9000>
no ipv6 nd ra-lifetime
```

Parameter

<0-9000>	RA lifetime duration in seconds.

Default

The default RA lifetime is 1800 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd ra-lifetime 9000
(config-if)#no ipv6 ra-lifetime 9000
```

ipv6 nd reachable-time

Use this command to specify the reachable time in the Router Advertisement to be used for detecting unreachability of the IPv6 neighbor.

Use the no parameter with this command to set the value to its default.

Command Syntax

```
ipv6 nd reachable-time <0-3600000>
no ipv6 nd reachable-time
```

Parameter

<0-3600000>	Reachable time in milliseconds.

Default

By default, reachable time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd reachable-time 1800000
(config-if)#no ipv6 nd reachable-time 1800000
```

ipv6 nd retransmission-time

Use this command to set an IPv6 advertised retransmission time for the current interface.

Use the no form of the command to set the retransmission time to its default value.

Command Syntax

```
ipv6 nd retransmission-time (0-4294967295)
no ipv6 nd retransmission-time
```

Parameter

`<0-4294967295>` Retransmission time in milliseconds

Default

By default, retransmission time is zero (0) milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd retransmission-time 1200
(config-if)#no ipv6 nd retransmission-time
```

ipv6 nd suppress-ra

Use this command to suppress IPv6 Router Advertisement (RA) transmission for the current interface. Router Advertisement is used for IPv6 stateless auto-configuration.

Use the no parameter with this command to enable Router Advertisement transmission.

Command Syntax

```
ipv6 nd suppress-ra (mtu |)
no ipv6 nd suppress-ra (mtu |)
```

Parameters

mtu	Do not send maximum transmission unit (MTU) in Router Advertisement messages

Default

By default, ipv6 nd suppress-ra is suppressed

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#ipv6 nd suppress-ra
```

ipv6 prefix-list

Use this command to create an entry for an ipv6 prefix-list.

Router starts to match prefixes from the top of the prefix list, and stops whenever a match or deny occurs. To promote efficiency, use the `seq` parameter and place common matches or denials towards the top of the list. The sequence values are generated in the sequence of 5.

The parameters `ge` and `le` specify the range of the prefix length to be matched.

Use the `no` parameter with this command to delete the prefix-list entry.

Command Syntax

```
ipv6 prefix-list WORD (deny|permit) (X:X::X:X/M|any)
ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128>
ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> le <0-128>
ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128>
ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> ge <0-128>
ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) (X:X::X:X/M|any)
ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128>
ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> le <0-
  128>
ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128>
ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ge <0-
  128>
no ipv6 prefix-list WORD
no ipv6 prefix-list WORD (deny|permit) (X:X::X:X/M|any)
no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128>
no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M ge <0-128> le <0-128>
no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128>
no ipv6 prefix-list WORD (deny|permit) X:X::X:X/M le <0-128> ge <0-128>
no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) (X:X::X:X/M|any)
no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128>
no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M ge <0-128> le
  <0-128>
no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128>
no ipv6 prefix-list WORD seq <1-4294967295> (deny|permit) X:X::X:X/M le <0-128> ge
  <0-128>
ipv6 prefix-list sequence-number
no ipv6 prefix-list sequence-number
ipv6 prefix-list WORD description LINE
no ipv6 prefix-list WORD description
```

Parameters

`WORD`	Name of the prefix list.
`deny`	Reject packets.
`permit`	Accept packets.
`X:X::X:X/M`	IP address mask and length of the prefix list mask.
`any`	Take all packets of any length. This is the same as specifying ::/0 for X:X::X:X/M.
`eg`	Exact prefix length match
`le`	Maximum prefix length match
`ge`	Minimum prefix length match
`<0-128>`	Prefix length to match
`<1-4294967295>`	Sequence number of the prefix list.
`sequence-number`	To suppress sequence number generation, give the `no ipv6 prefix-list sequence-number` command. If you disable the generating sequence numbers, you must specify the sequence number for each entry using the sequence number parameter in the `ipv6 prefix-list` command. To enable sequence number generation, give the `ipv6 prefix-list sequence-number` command.
`LINE`	Up to 80 characters describing this prefix-list.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 prefix-list mylist seq 12345 deny 3ffe:345::/16 le 22 ge 14
```

ipv6 unnumbered

Use this command to enable IPv6 processing without an explicit address, on a point-to-point non multi-access link.

This command lets an interface borrow the IPv6 address of a specified interface to enable IPv6 processing on a point-to-point interface without assigning it an explicit IPv6 address. In this way, the IPv6 unnumbered interface can borrow the IPv6 address of another interface already configured on the router to conserve network and address space.

Use the no parameter with this command to remove this feature on an interface.

Command Syntax

```
ipv6 unnumbered IFNAME
no ipv6 unnumbered
```

Parameter

IFNAME	Interface name.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example creates a tunnel on eth1:

```
#configure terminal
(config)#interface lo
(config-if)#ipv6 address::1/128
(config-if)#exit
(config)#interface eth1
(config-if)#ipv6 address fe80::20e:cff:fe6e:56dd/64
(config-if)#exit
(config)#interface Tunnel0
(config-if)#tunnel source 10.70.0.145
(config-if)#tunnel destination 10.70.0.77
(config-if)#tunnel ttl 255
(config-if)#tunnel path-mtu-discovery
(config-if)#tunnel mode gre
(config-if)#ipv6 unnumbered eth1
(config-if)#ipv6 router ospf area 0 tag 1
(config-if)#exit
(config)#router ipv6 ospf 1
(config-router)#router-id 10.70.0.145
```

link-flap errdisable

Use this command to shut down the interface when it continually goes up and down.

The link-flap ErrDisable feature must be enabled globally with the errdisable cause command.

Note: When link-flap ErrDisable is enabled globally, then all interfaces are enabled. Link-flap ErrDisable can be enabled globally, but disabled for a specific interface with the `no link-flap errdisable` command.

Note: This feature is supported only on physical ports.

Use the `no` form of this command to disable this behavior.

Command Syntax

```
link-flap errdisable
no link-flap errdisable
```

Parameter

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#link-flap errdisable
```

load interval

Use this command to configure the interval for which average traffic rate need to be shown. Intervals can be configured in steps of 30 seconds.

Use the no parameter with this command to set the load interval to its default.

Command Syntax

```
load-interval <30-300>
no load-interval
```

Parameter

<30-300>	Load period in multiples of 30 seconds.

Default

By default, load interval is 300 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#load-interval 30
(config-if)#no load-interval
```

monitor speed

Use this command to enable speed monitoring on interface.

Use the no parameter with this command to disable monitoring.

Command Syntax

```
monitor speed
no monitor speed
```

Default

By default, speed monitoring will be disabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#monitor speed
(config-if)#no monitor speed
```

monitor queue-drops

Use this command to enable queue-drops monitoring on interface.

Use the no parameter with this command to disable monitoring.

Command Syntax

```
monitor queue-drops
no monitor queue-drops
```

Default

By default, queue-drops monitoring will be disabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)#monitor queue-drops
(config-if)#no monitor queue-drops
```

monitor speed threshold

Use this command to modify default speed monitor threshold on interface.

Use the no parameter with this command to set the monitor speed threshold to its default.

Note: Warning threshold must be greater than recovery threshold and it is recommended to keep a difference of 10 percent to avoid frequent notifications caused by variations in average speed.

Command Syntax

```
monitor speed threshold warning <1-100> recovery <1-100>
no monitor speed threshold
```

Parameter

<1-100>	Warning level threshold value in percentage
<1-100>	Recovery level threshold value in percentage

Default

By default, warning threshold is 90 percentage and recovery is 80 percentage.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#interface xe1/1
(config-if)# monitor speed threshold warning 80 recovery 70
(config-if)#no monitor speed threshold
```

mtu

Use this command to set the Maximum Transmission Unit (MTU) and Maximum Receive Unit (MRU) for an interface

Use the no parameter with this command to set the MTU to its default.

Command Syntax

```
mtu <64-65536>
no mtu
```

Parameter

<64-65536>	Specify the size of MTU in bytes: <64-16338> for L2 packet <576-9216> for L3 IPv4 packet <1280-9216> for L3 IPv6 packet <576-65536> for IPv4 packet <1280-65536> for IPv6 packet on loopback interface

Default

By default, MTU is 1500 bytes

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#mtu 120
```

multicast

Use this command to set the multicast flag for the interface.

Use the no form of this command to disable this function.

Command Syntax

```
multicast
no multicast
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth3
(config-if)#multicast
```

port breakout enable

Use this command to split a 40G interface to four 10G interfaces or 100G interface to four 10G or four 25G or two 50G interfaces without restarting the device.

You can only break out controlling ports. For example, in the group that contains the `xe1/1`, `xe1/2`, `xe1/3`, and `xe1/4` interfaces, the `xe1/1` interface is the controlling port (first port in the group) and `xe1/2`, `xe1/3`, and `xe1/4` are subsidiary ports (non control ports).

Ports that support the breakout feature display with a "/" in their name. By default, only control ports are active (/1) and remaining ports (/2, /3, and /4) are inactive.

Use the `show interface brief` command to verify if a port is controlling or subsidiary. You can also use the `show interface` command to check the flexport status. The status would be one of the below:

```
Flexport: Control Port (Active): Break Out disabled
Flexport: Control Port (Active): Break Out Enabled
Flexport: Non Control Port (InActive)
Flexport: Non Control Port (Active)
```

The output from commands such as `show running-config` reflect the split port configuration.

The bandwidth of a controlling port is reset to its maximum allowed speed after a split is enabled or disabled.

Any pre-configuration of the subsidiary port is applied directly once it becomes active.

Use the `no` form of this command to return the interface to single-port, 40G/100G operation.

Note: There are some configuration restrictions for Subsidiary ports such as:

1. Port breakout enable/disable is not allowed on Subsidiary ports.
2. Speed, Duplex configurations are not allowed on InActive Subsidiary ports.

Command Syntax

40G port:

```
port breakout enable
no port breakout
```

100G port:

```
port breakout enable (4x10g|4x25g|2x50g)
no port breakout
```

Parameters

`<4x10g>`	Split 100G to 4X10g
`<4x25g>`	Split 100G to 4X25g
`<2x50g>`	Split 100G to 2X50g

Default

By default, only control ports are active (/1) and remaining ports (/2, /3, and /4) are inactive.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to split a 40G port:

```
#configure terminal
(config)#interface xe1/1
(config-if)#port breakout enable
(config-if)#end

#show running-config
!
no service password-encryption
!
logging monitor 7
!
ip vrf management
!
forwarding profile l2-profile-two
ip domain-lookup
bridge 1 protocol rstp vlan-bridge
data-center-bridging enable bridge 1
ethernet cfm enable
!

!
interface xe1/1
 port breakout enable
 switchport
 bridge-group 1
 switchport mode access
 channel-group 1 mode active
!
interface xe1/2
 speed 1g
!
interface xe1/3
 speed 1g
 switchport
 bridge-group 2
 switchport mode trunk
!
interface xe1/4
!
```

This example shows how to split a 100G port:

```
#configure terminal
(config)#interface ce1/1
(config-if)#port breakout enable ?
  2X50g  split to 2X50g
  4X10g  split to 4X10g
  4X25g  split to 4X25g
(config-if)#port breakout enable 4X25g
(config-if)#end
#show running-config
```

```
!
no service password-encryption
!
logging monitor 7
!
ip vrf management
!
forwarding profile l2-profile-two
ip domain-lookup
bridge 1 protocol rstp vlan-bridge
data-center-bridging enable bridge 1

ethernet cfm enable
!
interface ce1/1
port breakout enable 4X25g
```

Similarly, a 100G port can be split into 4x10G ports or 2x50G ports.

port bundle enable

Use this command to bundle four 10G SFP+ interfaces into a single 40G interface without restarting the device. You can use this command only on bundle control ports.

For example, if the xe1 interface is bundle control port then this command can be used and following three ports xe2, xe3, and 4 would be subsidiary ports (non control ports) and would become inactive.

Use the show interface brief command to verify if a port is bundle controlling or subsidiary. You can also use the show interface command to check the flexport status. The status would be one of the below:

Flexport: Bundle Control Port (Active): Bundle disabled

Flexport: Bundle Control Port (Active): Bundle Enabled

Flexport: Non Control Port (InActive)

Flexport: Non Control Port (Active)

The output from commands such as show running-config reflect the bundle port configuration.

Use the no form of this command to revert to four 10G ports.

Note: There are some configuration restrictions for Subsidiary ports such as:

1. Port breakout enable/disable is not allowed on Subsidiary ports.
2. Speed, Duplex configurations are not allowed on InActive Subsidiary ports.

Command Syntax

```
port bundle enable
no port bundle
```

Parameters

None

Default

By default, ports are not bundled and all the ports are active (xe1, xe2, xe3, and xe4).

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to split a 40G port:

```
#show running-config
!
no service password-encryption
!
logging monitor 7
!
ip vrf management
```

```
!
forwarding profile l2-profile-two
ip domain-lookup
bridge 1 protocol rstp vlan-bridge
data-center-bridging enable bridge 1
ethernet cfm enable
!
!
interface xe1
port bundle enable
!
interface xe2
!
interface xe3
!
interface xe4
!
```

protocol-control

Use this command to enable/disable lifting L3 control packets to CPU.

Command Syntax

```
protocol-control enable
protocol-control disable
```

Parameters

`enable`	Enable lifting L3 control packets to CPU
`disable`	Disable lifting L3 control packets to CPU

Default

By default, Protocol Control is enabled

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

The below example shows the configuration procedure to enable/disable protocol control for both L2 and L3 interfaces:

L2 Interface:

```
(config)#interface xe1
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#protocol-control disable
(config-if)#protocol-control enable
```

L3 Interface:

```
#configure terminal
(config)#interface xe1
(config-if)#protocol-control disable
(config-if)#protocol-control enable
```

show hardware-discard-counters

Use this command to check device level discard counters.

Command Syntax

```
show hardware-discard-counters
```

Parameters

None

Command Mode

Exec mode

Applicability

The command is introduced before OcNOS version 1.3.

Qumran devices do not support discard counters per interface. Only global level counters are available for advanced debugging using the show hardware-discard-counters command.

Examples

```
#show hardware-discard-counters
+-------------------------------------------------+--------------------+
| Registers                                       | Core 0             |
+-------------------------------------------------+--------------------+
 CGM_VOQ_SRAM_ENQ_RJCT_PKT_CTR                     437
   Reason : QNUM_NOT_VALID                         Y
 EGQ_PQP_DISCARD_UNICAST_PACKET_COUNTER            8894
   Reason : SRC_EQUAL_DEST_INT                     Y
```

See Table 4-53 and Table 4-54 for details:

Table 4-53: Table detailing about counters supported

Register	Description
CGM_VOQ_SRAM_ENQ_RJCT_PKT_CTR for QAX	Drop is due to PPdecision to drop, or invalid destination received from PPblocks.
IQM_QUEUE_ENQ_DISCARDED_PACKET_COUNTER for QMX	The packet DP (Drop Precedence) is higher than the configured Drop DP.
EGQ_PQP_DISCARD_UNICAST_PACKET_COUNTER	Seen with unknown unicast frames, source and destination learnt from same interface.

Table 4-54: Table detailing about reasons supported

Register	Description
QNUM_NOT_VALID for QAX QUEUE_NOT_VALID_STATUS for QMX	Seen with Vlan Discards, ACL Drops, Storm Control, STP Blocked Port.
DP_LEVEL_RJCT for QAX DP_LEVEL_STATUS for QMX	Seen with Policer Discards.
SRC_EQUAL_DEST_INTF	Seen when traffic is not learned, but is still forwarded/flooded.

show interface

Use this command to display interface configuration and status information.

Command Syntax

```
show interface (IFNAME|)
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1
Interface xe1/1
  Scope: both
  Flexport: Breakout Control Port (Active): Break Out Enabled
  Hardware is ETH  Current HW addr: ecf4.bb6e.934b
  Physical:ecf4.bb6e.934b  Logical:(not set)
  Port Mode is access
  Interface index: 5001
  Metric 1 mtu 1500 duplex-full(auto) link-speed 1g(auto)
  <UP,BROADCAST,RUNNING,MULTICAST>
  VRF Binding: Not bound
  Label switching is disabled
  No Virtual Circuit configured
DHCP client is disabled.
  Last Flapped: 2016 Nov 05 22:40:23 (00:19:25 ago)
  Statistics last cleared: 2016 Nov 05 04:49:55 (18:09:53 ago)
  5 minute input rate 0 bits/sec, 0 packets/sec
  5 minute output rate 256 bits/sec, 0 packets/sec
  RX
    unicast packets 39215813 multicast packets 0 broadcast packets 0
    input packets 39215813 bytes 2666662432
    jumbo packets 0
    runts 0 giants 0 CRC 0 fragments 0 jabbers 0
    input error 0
    input with dribble 0 input discard 0
    Rx pause 0
  TX
    unicast packets 38902 multicast packets 437 broadcast packets 0
    output packets 437 bytes 28018
    jumbo packets 0
    output errors 0 collision 0 deferred 0 late collision 0
    output discard 0
    Tx pause 0
```

Table 4-55 explains the output fields.

Table 4-55: show interface output details

Field	Description
Scope	Interface can be used for communication within the device and outside the device (Both).
Flexport	Specifies whether the ports has Breakout capabilities or is a Non-Control Port.
Breakout Control Port (Active)	Specifies whether Breakout is active or disabled.
Hardware is ETH Current HW addr	The MAC address of the interface.
Physical	Displays the physical MAC address of the interface.
Logical	Displays the logical MAC address (if any) of the interface.
Port Mode	Displays the port mode: Router, VLAN access, switch, or trunk.
Interface index	Index number, Metric, MTU size, duplex-full (auto) or half-duplex, minimum link speed in gigabits, and if the interface is up, broadcasting, and multicasting.
VRF Binding	Show whether the interface is VRF bound and (if bound) with what VRF, if Label Switching is enabled or disabled, and if a virtual circuit is configured.
DHCP client	The state of the DHCP client – whether this interface is connected to a DHCP server.
Last Flapped	Date and time when the interface last flapped.
Statistics last cleared	Date and time when the interface's statistics were cleared.
5 minute input rate	Input rate in bits/second and packets/second
5 minute output rate	Output rate in bits/second and packets/second
RX	Counters for unicast packets, multicast packets, broadcast packets, input packets, bytes, jumbo packets, runts, giants, CRC errors, fragments, jabbers, input errors, input with dribble input discards, and receive pause.
TX	Counters for unicast packets, multicast packets, broadcast packets, output packets, bytes, jumbo packets, output errors, collisions, differed packets, input late collisions, output discards, and transmit pause.

show interface counters

Use this command to display the ingress and egress traffic counters on the interface.

Note: Counters are meant for debugging purpose and the accuracy of the transmit discard counter is not guaranteed in all scenarios.

Command Syntax

```
show interface (IFNAME|) counters (active|)
show interface cpu counters
```

Parameter

IFNAME	Interface name.
active	Statistics for link-up interfaces.
cpu	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters
Interface xe1/1
  Scope: both
  Rx Packets: 1000
  Rx Bytes: 1000000
  Rx Unicast Packets: 1000
  Rx Packets from 512 to 1023 bytes: 1000
  Tx Packets: 3897
  Tx Bytes: 249408
  Tx Multicast Packets: 3897
  Tx Packets with 64 bytes: 3897
  Tx Packet rate: 1 pps
  Tx Bit rate: 255 bps

#show interface cpu counters
CPU Interface
  Tx Packets: 104508
  Tx Bytes: 7106272
  Tx Discard Packets: 89613672
  Tx Discard Bytes: 5735237844
  Rx Discard Packets: 11938
```

Table 4-56 explains the output fields.

Table 4-56: show interface counters output details

Field	Description
Receive Counters	Rx Packets Rx Bytes Rx Unicast Packets Rx Multicast Packets Rx Broadcast Packets Rx Packets with 64 bytes Rx Packets from 65 to 127 bytes Rx Packets from 128 to 255 bytes Rx Packets from 256 to 511 bytes Rx Packets from 512 to 1023 bytes Rx Packets from 1024 to 1518 bytes Rx Packets from 1519 to 2047 bytes Rx Packets from 2048 to 4095 bytes Rx Packets from 4096 to 9216 bytes Rx Jumbo Packets Rx Discard Packets (not applicable for Qumran platform) Rx Packets with error Rx CRC Error Packets Rx Undersized Packets Rx Oversized Packets Rx Fragment Packets Rx Jabber Packets Rx MAC error Packets Rx Pause Packets Rx Unrecognized MAC Control Packets Rx Drop Events Rx Packet rate Rx Bit rate

Table 4-56: show interface counters output details

Field	Description
Transmit Counters	Tx Packets Tx Bytes Tx Unicast Packets Tx Multicast Packets Tx Broadcast Packets Tx Packets with 64 bytes Tx Packets from 65 to 127 bytes Tx Packets from 128 to 255 bytes Tx Packets from 256 to 511 bytes Tx Packets from 512 to 1023 bytes Tx Packets from 1024 to 1518 bytes Tx Packets from 1519 to 2047 bytes Tx Packets from 2048 to 4095 bytes Tx Packets from 4096 to 9216 bytes Tx Jumbo Packets Tx Discard Packets (not applicable for Qumran platform) Tx Packets with error Tx Collisions Tx Late Collisions Tx Excessive Collisions Tx Pause Packets Tx Packet rate Tx Bit rate
CPU Interface Counters	Tx Packets Tx Bytes Tx Discard Packets Tx Discard Bytes Rx Discard Packets

show interface counters drop-stats

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Note: You can only display statistics for physical ports and cpu ports, but not for the out-of-band management (OOB) management port or logical interfaces.

Note: Drops in the CPU queue are listed under `Tx Multicast Queue Drops`, whether the packet is unicast or multicast

Command Syntax

```
show interface (IFNAME|) counters drop-stats
show interface cpu counters drop-stats
```

Parameter

`IFNAME`	Physical interface name
`cpu`	CPU interface

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.1.

For Qumran devices, only error statistics are applicable and discard counters are not applicable. Only global level counters are available for advanced debugging using the command show hardware-discard-counters.

Example

```
#show interface xe32/2 counters drop-stats
+---------------------+----------------+----------------+--------------------+
| Counter Description | Count          | Last Increment | Last Increment Time
|
+---------------------+----------------+----------------+--------------------+
 Rx Bad CRC errors     0                0
 Rx Undersize errors   0                0
 Rx Oversize errors    0                0
 Rx Fragments errors   0                0
 Rx Jabbers errors     0                0
 Rx Port Block Drops   6                1                2016 Nov 09 08:59:33
 Rx Vlan Discards      0                0
 Rx ACL/QOS Drops      0                0
 Rx Policy Discards    0                0
 Rx EGR Port Unavail   38784            5                2016 Nov 09 18:19:31
 Rx IBP Discards       0                0
 Tx Port Block Drops   359              1                2016 Nov 09 08:59:33
 Tx Vlan Discards      0                0
 Tx TTL Discards       0                0
 Tx Unknown Discards   359              1                2016 Nov 09 08:59:33
 Tx Ucast Queue Drops  0                0
 Tx Mcast Queue Drops  0                0
+---------------------+----------------+----------------+--------------------+
```

Table 4-57 explains the output fields.

Table 4-57: show interface counters drop-stats output details

Field	Description
Counter Description	Shows the type of packet and/or the reason why the packet was dropped.
Count	The number of packets dropped for each reason.
Last Increment	Number of packets dropped since this command was last entered.
Last Increment Time	Date and time when the last packet was dropped.
Rx Bad CRC errors	Received packets dropped because they didn't pass the cyclic Redundancy Check (CRC).
Rx Undersize errors	Number of received runt packets dropped.
Rx Oversize errors	Number of received giant packets dropped
Rx Fragments errors	Number of received packet fragments dropped
Rx Jabbers errors	Received packets dropped because of jabber – long packet error.
Rx Port Block Drops	Received packets dropped because port blocking is enabled (not applicable for Qumran platform).
Rx Vlan Discards	VLAN received packets dropped because there is no VLAN configured on the port (not applicable for Qumran platform).
Rx ACL/QOS Drops	Received packets match a field processing entry with a drop or color drop action, such as: User-configured ACL that denies traffic Service policy with a police action that drops the traffic received at a rate higher than the configured limit. (not applicable for Qumran platform)
Rx Policy Discards	Received packets dropped because of device policies violated, such as a storm control rate violation (not applicable for Qumran platform).
Rx EGR Port Unavail	No output port can be determined for these received packets. This counter increments along with other counter types in this table because it is a "catchall" for multiple types of discards as shown below (not applicable for Qumran platform): VLAN check failed MTU check failed ACL/QoS drops Policy discards Source MAC is null Destination IP/source IP address is null Source MAC address and destination MAC address are the same Forwarding lookup failure
Rx IBP Discards	Ingress Back Pressure (ingress congestion) when the ingress packets buffer is full for an interface. (not applicable for Qumran platform)
Tx Port Block Drops	Transmitted packets dropped because port blocking is enabled (not applicable for Qumran platform).
Tx Vlan Discards	Transmitted VLAN packets dropped because there is no VLAN configured on the port (not applicable for Qumran platform).

Table 4-57: show interface counters drop-stats output details (Continued)

Field	Description
Tx TTL Discards	Transmitted packets discarded because their Time To Live (TTL) has ended. (not applicable for Qumran platform)
Tx Unknown Discards	Transmitted packets dropped for unknown reason. May have something to do with the condition/configuration of the port at the other end of the connection (not applicable for Qumran platform).
Tx Ucast Queue Drops	Transmitted packets dropped as a result of Unicast buffer overflow.
Tx Mcast Queue Drops	Transmitted packets dropped as a result of Multicast buffer overflow.

show interface counters error-stats

Use this command to display the ingress error traffic counters on the interface.

Command Syntax

```
show interface (IFNAME|) counters error-stats
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters error-stats
+----------+-------------+--------+----------+---------+-----------+---------+
|Interface |Total errors |Bad CRC |Undersize |Oversize | Fragments | Jabbers |
+----------+-------------+--------+----------+---------+-----------+---------+
 xe1/1      120           8        100        10        2           0
```

Table 4-58 explains the columns in the output.

Table 4-58: error traffic counters

Column	Description	Causes
Interface	Name of the interface	Point of interconnection in network.
Total errors	Total number of all types of errors	Number of errors in network.
Bad CRC	Number of packets received by the port from the network, where the packets have no CRC or a bad CRC.	Packet data modified making the CRC invalid.
Undersize	Total number of packets received that are less than 64 octets long (which exclude framing bits, but include the FCS) and have a good FCS value.	Bad frame generated by the connected device.
Oversize	Number of packets received by the port from the network, where the packets were more than maximum transmission unit size.	Faulty hardware, dot1q, or ISL trunking configuration issues.
Fragments	Total number of frames whose length is less than 64 octets (which exclude framing bits, but which include the FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.
Jabbers	Total number of frames whose length is more than the maximum MTU size. (which exclude framing bits, but which include FCS) and have a bad FCS value.	Ports are configured at half-duplex. Change the setting to full-duplex.

show interface counters (indiscard-stats|outdiscard-stats)

Use this command to display the ingress and egress traffic discard reason counters on the interface.

Note: You can only display statistics for data ports and CPU ports, not for the out-of-band management (OOB) management port or logical interfaces.

Command Syntax

```
show interface (IFNAME|) counters (indiscard-stats|outdiscard-stats)
show interface cpu counters (indiscard-stats|outdiscard-stats)
```

Parameter

IFNAME	Physical Interface name.
indiscard-stats	Discard reasons for ingress dropped packets.
outdiscard-stats	Discard reasons for egress dropped packets.
cpu	CPU Interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on Qumran platforms.

Examples

```
#show interface xe1/3 counters indiscard-stats
+--------------------+----------------+----------------+---------------------+
| Counter Description | Count          | Last Increment | Last Increment Time |
+--------------------+----------------+----------------+---------------------+
 STP Discards          0                0
 Vlan Discards         0                0
 ACL Drops             0                0
 Policy Discards       0                0
 EGR Port Unavail      1092867          1092867          2016 Oct 25 19:54:58
 IBP Discards          0                0
+--------------------+----------------+----------------+---------------------+

#show interface counters indiscard-stats

```

Table 4-59 explain the fields in the command output.

Table 4-59: indiscard statistic output details

Statistic	Description
STP Discards	Packets received when the ingress interface is not in STP forwarding state.
Port Block Drops	Packets discarded on an ingress interface where port blocking is configured.
VLAN Discards	VLAN tagged packets received on a port which is not a member of the VLAN or untagged packets received on a trunk port.
ACL/QoS Drops	Incoming packets match a field processing entry with a drop or color drop action, such as: 1. User-configured ACL that denies traffic 2. Service policy with a police action that drops the traffic received at a rate higher than the configured limit
Policy Discards	Device policies violated, such as a storm control rate violation, source or destination discards when L2 tagged traffic received on router interface.
EGR (Egress) Port Unavail	No output port can be determined for this packet. This counter increments along with other counter types in this table because it is a “catchall” for multiple types of discards as shown below: 1. VLAN check failed 2. MTU check failed 3. ACL/QoS drops 4. Policy discards 5. Source MAC is null 6. Destination IP/source IP address is null 7. Source MAC address and destination MAC address are the same 8. Source MAC is configured as static on other interface 9. Forwarding lookup failure
IBP Drops	Ingress Back Pressure (ingress congestion) when the ingress packet buffer is full for an interface.
Total Discards	Total number of ingress dropped packets.

Table 4-60 explain the fields in the command output.

Table 4-60: outdiscard statistics

Statistics	Description
Port Block Drops	Packets discarded on an egress interface where port blocking is configured.
VLAN Discards	Packets discarded because an invalid VLAN tag is encountered at an egress interface.
TTL Discards	Packets discarded because the Time-To Live (TTL) of the outgoing packet has passed.

Table 4-60: outdiscard statistics

Statistics	Description
Unknown Discards	Packets discarded for other possible reasons like ACL drop in egress or a policer drop in egress. Discards caused by congestion at queues and drops at queues are not counted under unknown discards.
Unicast Queue Drops	Packets dropped in the unicast queues because of congestion.
Multicast Queue Drops	Packets dropped in the multicast queues because of congestion.
Total Discards	Total number of egress dropped packets.

show interface counters protocol

Use this command to display protocol packets received at the CPU by the control plane.

Command Syntax

```
show interface (IFNAME|) counters protocol
```

Parameters

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on Qumran platforms.

Example

```
#show interface counters protocol
Interface ce1/1
  lacp                : 4
  icmp6               : 5
```

Table 4-61 explain the fields in the command output.

Table 4-61: show interface counters protocol output details

Field	Description
Interface	Name of the configured interface.
lacp	Total number of lacp protocol in the interface.
icmp6	Total number of icmp6 protocol in the interface.

show interface counters queue-drop-stats

Use this command to display dropped packets in the CPU queue and the last increment time.

Command Syntax

```
show interface cpu counters queue-drop-stats
```

Parameters

cpu	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
show interface cpu counters queue-drop-stats
+------------------+---------------+----------------+---------------------+
|    Queue Name    |     Count     | Last Increment | Last Increment Time |
+------------------+---------------+----------------+---------------------+
arp                  169735545        9145653          2017 Oct 23 14:33:54
```

Table 4-62 explain the fields in the command output.

Table 4-62: show interface counters queue-drop-stats output details

Field	Description
Queue Name	Name of the protocol.
Count	Number of arp protocols in the interface.
Last Increment	Final increment number in the protocol.
Last Increment time	Time of the last increment in the protocol.

show interface counters queue-stats

Use this command to display transmitted and dropped packet and byte counts of individual queues.

Note: In Qumran devices, all packets dropped in a queue are counted (even policer drops).

Command Syntax

```
show interface (IFNAME|) counters queue-stats
show interface cpu counters queue-stats
```

Parameters

IFNAME	Interface name.
cpu	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Note: Default traffic counters are not supported on Qumran AX.

Example

```
#show interface counters queue-stats
D - Default Queue, U - User-defined Queue
+--------+---------------+------+-----------+------------+------------+---------------+
|Interface|Queue/Class-map|Q-Size|Output pkts|Output bytes|Dropped pkts|Dropped bytes  |
+--------+---------------+------+-----------+------------+------------+---------------+
xe1/1     q1          (D) 0      12          1368         0            0
xe1/1     mc-q7       (D) 0      1           82           0            0
xe25      q1          (D) 0      6           684          0            0

#show interface xe1/1 counters queue-stats
D - Default Queue, U - User-defined Queue
+---------------+------+-------+-  -------+------------+--------------+

```

Table 4-63 explain the fields in the command output.

Table 4-63: queue flags detail

Flag	Meaning
D	Default queue of the port.
U	User defined queue of the port.
E	Outgoing hello packet's queue in the port.
I	Incoming hello packet's queue in the port.
Q	Hello packet's queue size in bytes.

Table 4-64 explain the fields in the command output.

Table 4-64: show interface counters queue-stats output details

Field	Description
Interface	A defined physical interface to which the queue is associated.
Queue/Class-map	Queues associated with a QoS class-map.
Q-Size	The size of a specified queue in bytes.
Output pkts	The number of out bound packets residing in the queues.
Output Bytes	The number of bytes in the outbound queue.
Dropped pkts	The number of packets dropped because of queue overflow.
Dropped bytes	The number of bytes dropped because of queue overflow.
Tx pkts	The number of transmit packets contained in the out bound queue.
Tx bytes	The number of transmit bytes contained in the out bound queue.

show interface counters rate

Use this command to display the average traffic rate over the load interval of the interface.

Command Syntax

```
show interface (IFNAME|) counters rate (kbps|mbps|gbps|)
show interface cpu counters rate (kbps|mbps|gbps|)
```

Parameter

IFNAME	Interface name.
kbps	Kilobits per second.
mbps	Megabits per second.
gbps	Gigabits per second.
cpu	CPU interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface counters rate
+-------------+---------------------------+--------------------------------+
|             |              Rx           |               Tx               |
|  Interface  |---------------------------+--------------------------------|
|             |      bps     |      pps   |      bps      |      pps       |
+-------------+---------------------------+--------------------------------+
 xe1/1         548439552       1008160     544400           1000

#show interface cpu counters rate
Load interval: 30 second
+------------------+--------------+-------------+--------------+-------------+
|    CPU Queue(%)  |    Rx bps    |    Rx pps   |    Tx bps    |    Tx pps   |
+------------------+--------------+-------------+--------------+-------------+
 isis         (  0%) -              -             742            0
 arp          (  0%) -              -             6              0
```

Table 4-65 explain the fields in the command output.

Table 4-65: show interface counters rate output details

Field	Description
Interface	The particular interface.
RX	Number of hello packets received from the neighbor.
TX	Number hello packets transmitted to the neighbor.
bps	Bytes per second.
pps	Packets per second.
CPU Queue	CPU Queues used for various functions. In the example the CPU is maintaining queues for ARP and the IS-IS routing facilities.
Load interval	The length of time for which data is used to compute load statistics.
RX bps	Number of hello packets received from the neighbor in bytes per second.
RX pps	Number of hello packets received from the neighbor in packets per second.
TX bps	Number hello packets transmitted to the neighbor in bytes per second.
Tx pps	Number hello packets transmitted to the neighbor in packets per second.

show interface counters speed

Use this command to display the current average speed on the interface.

Command Syntax

```
show interface (IFNAME|) counters speed (kbps|mbps|gbps|)
```

Parameter

IFNAME	Interface name.
kbps	Kilobits per second.
mbps	Megabits per second.
gbps	Gigabits per second.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show interface counters speed
* indicates monitor is active
+------------+--------------+--------------------+---------------------------
---------------+
|            |              |     Threshold(%)   |          Current average
speed           |
|  interface | configured   +--------------------+-------------+-------+------
-------+-------+
|            | speed ( bps) | Warning | Recovery |  Rx ( bps)  |   %   |  Tx (

0.00
#
```

show interface counters summary

Use this command to display the summary of traffic counters on a specific interface or all interfaces.

Note: This command is supported for the out-of-band management (OOB) management interface.

Command Syntax

```
show interface (IFNAME|) counters summary
```

Parameter

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 counters summary
+-----------+------------------------------+------------------------------+
|           |              Rx              |              Tx              |
| Interface |------------------------------+------------------------------|
|           |    packets    |     bytes    |    packets    |     bytes    |

 xe32/4        7                    766                  7                    766
```

Table 4-66 explain the fields in the command output.

Table 4-66: show interface counters summary output details

Field	Description
Interface	The particular interface.
RX	Number of hello packets received from the neighbor.
TX	Number hello packets transmitted to the neighbor.
bps	Bytes per second.
pps	Packets per second.
RX bps	Number of hello packets received from the neighbor in bytes per second.
RX pps	Number of hello packets received from the neighbor in packets per second.
TX bps	Number hello packets transmitted to the neighbor in bytes per second.
Tx pps	Number hello packets transmitted to the neighbor in packets per second.

show interface protocol-control status

Use this command to display the interfaces on which protocol-control is disabled.

Command Syntax

```
show interface protocol-control status
```

Parameter

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#show interface protocol-control status
Interfaces for which ARP/DHCP/ND Pkts will not be forwarded to CPU
Interface
---------
xe20
```

show ip forwarding

Use this command to display the IP forwarding status.

Command Syntax

```
show ip forwarding
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ip forwarding` command displaying the IP forwarding status.

```
#show ip forwarding
vrf (management) :IP forwarding is on
vrf (default) :IP forwarding is on
#
```

Table 4-67 explain the fields in the command output.

Table 4-67: show ip forwarding

Field	Description
vrf (management)	Management VRF is for management purposes. IP forwarding packet is on.
vrf (default)	The default VRF uses the default routing context for ip forwarding. IP forwarding packet is on.

show ip interface

Use this command to display brief information about interfaces and the IP addresses assigned to them. To display information about a specific interface, specify the interface name with the command.

Command Syntax

```
show ip interface brief
show ip interface IFNAME brief
```

Parameters

`IFNAME`	Interface name.
`brief`	Brief summary of IP status and configuration.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from the `show ip interface brief` command:

```
#show ip interface brief

'*' - address is assigned by dhcp client

Interface            IP-Address      Admin-Status          Link-Status
eth0                *10.10.26.101    up                    up
lo                   127.0.0.1       up                    up
lo.management        127.0.0.1       up                    up
xe1/1                10.1.1.1        up                    up
xe1/2                unassigned      down                  down
xe1/3                unassigned      down                  down
xe1/4                unassigned      down                  down
xe2                  unassigned      up                    down
xe3/1                unassigned      up                    up
xe3/2                unassigned      down                  down
xe3/3                unassigned      down                  down
```

Table 4-68 explain the fields in the command output.

Table 4-68: show ip interface output details

Field	Description
Interface	Interface name, also specifies interface type (eth0, lo, xe1/1, and xe1/2).
IP-Address	The IP address assigned to the interface. An asterisks indicates that the IP address was provided by DHCP.

Table 4-68: show ip interface output details (Continued)

Field	Description
Admin-Status	Interface is up and functioning or down.
Link-Status	Interface is connected and passing traffic.

show ip prefix-list

Use this command to display the prefix list entries for IPv4 interfaces.

Syntax Description

```
show ip prefix-list
show ip prefix-list WORD
show ip prefix-list WORD seq <1-4294967295>
show ip prefix-list WORD A.B.C.D/M
show ip prefix-list WORD A.B.C.D/M longer
show ip prefix-list WORD A.B.C.D/M first-match
show ip prefix-list summary
show ip prefix-list summary WORD
show ip prefix-list detail
show ip prefix-list detail WORD
```

Parameters

`WORD`	Name of a prefix list.
`A.B.C.D/M`	IP prefix <network>/<length> (for example, 35.0.0.0/8).
`first-match`	First matched prefix.
`longer`	Lookup longer prefix.
`<1-4294967295>`	Sequence number.
`detail`	Detail of prefix lists.
`summary`	Summary of prefix lists.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ip prefix-list` command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries
   seq      5 permit 172.1.1.0/16
   seq     10 permit 173.1.1.0/16
   seq     15 permit 174.1.1.0/16
```

show ip route

Use this command to display the IP routing table for a protocol or from a particular table.

When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. All best routes are entered into the FIB and can be viewed using this command. To display all routes (selected and not selected), use the `show ip route database` command.

Command Syntax

```
show ip route A.B.C.D
show ip route A.B.C.D/M
show ip route (database|)
show ip route (database|) (bgp|connected|database|isis|fast-
  reroute|interface|isis|kernel|mbgp|mstatic|next-hop|ospf|rip|static)
show ip route summary
show ip route vrf WORD (database|)
show ip route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static)
```

Parameters

`A.B.C.D`	Network in the IP routing table.
`A.B.C.D/M`	IP prefix <network>/<length>, for example, 35.0.0.0/8.
`bgp`	Border Gateway Protocol.
`connected`	Connected.
`database`	Routing table database.
`fast-reroute`	Fast reroute repair paths.
`interface`	Interface.
`isis`	IS-IS.
`kernel`	Kernel.
`mbgp`	Multiprotocol BGP routes.
`mstatic`	Multicast static routes.
`next-hop`	Next hop address.
`ospf`	Open Shortest Path First.
`rip`	Routing Information Protocol.
`static`	Static routes.
`summary`	Summarize all routes.
`WORD`	Routes for a Virtual Routing/Forwarding instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: Display FIB Routes

The following shows output for the best routes.

```
#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       * - candidate default
Gateway of last resort is 10.30.0.11 to network 0.0.0.0

K*      0.0.0.0/0 via 10.30.0.11, eth0
O       9.9.9.9/32 [110/31] via 10.10.31.16, eth2, 00:18:56
K       10.10.0.0/24 via 10.30.0.11, eth0
C       10.10.31.0/24 is directly connected, eth2
S       10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O       10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:20:54
C       10.30.0.0/24 is directly connected, eth0
S       11.22.11.0/24 [1/0] via 10.10.31.16, eth2
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:18:56
S       16.16.16.16/32 [1/0] via 10.10.31.16, eth2
O       17.17.17.17/32 [110/31] via 10.10.31.16, eth2, 00:20:54
C       45.45.45.45/32 is directly connected, lo
O       55.55.55.55/32 [110/21] via 10.10.31.16, eth2, 00:20:54
C       127.0.0.0/8 is directly connected, lo
```

Header

Each entry in this table has a code preceding it, indicating the source of the routing entry. For example, O indicates OSPF as the origin of the route and K indicates that the route has been learned from the kernel. Table 4-69 shows these codes and modifiers.

Table 4-69 explain the fields in the command output.

Table 4-69: route codes and modifiers

Code	Meaning	Description
K	kernel	Routes added through means other than by using the CLI; for example by using the operating system route command. Static routes added using kernel commands and static routes added using OcNOS commands are different. The kernel static routes are not redistributed when you give the `redistribute static` command in a protocol. However, the kernel static routes can be redistributed using the `redistribute kernel` command.
C	connected	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols. Routes for connected networks always exist in the kernel routing table but as an exception are not marked as kernel routes because OcNOS always calculates entries for these routes upon learning interface information from the kernel.
S	static	Routes manually configured via CLI which are not updated dynamically by IGPs.
The codes below are for routes received and dynamically learned via IGP neighbors. These networks are not directly connected to this device and were announced by some other device on the network. IGPs update these routes as the network topology changes.		
R	RIP	RIP routing process and enter Router mode.
B	BGP	Route is from an Border Gateway Protocol.
O	OSPF	Modifiers for OSPF: IA - OSPF inter area N1 - OSPF NSSA external type 1 N2 - OSPF NSSA external type 2 E1 - OSPF external type 1 E2 - OSPF external type 2
i	IS-IS	Modifiers for IS-IS: L1 - IS-IS level-1 L2 - IS-IS level-2 ia - IS-IS inter area
Other modifiers:		
v	vrf leaked	The device has two or more VRFs configured and each has at least one interface bound to it. While each VRF will have its own routing table, the VRFs can learn each other's routes.
*	candidate default	Route has been added to the FIB. With equal cost paths to a destination, the router does per-packet or per-destination load sharing. An asterisk ("*") means that the route is being used at that instant for forwarding packets. If you run the same `show ip route x.x.x.x` command over and over, you might see the * moving between the route entries.
>	selected route	When multiple routes are available for the same prefix, the best route. When multiple entries are available for the same prefix, OcNOS uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. OcNOS populates the FIB with the *best* route to each destination
p	stale info	A route information that is marked stale due to graceful restart.

After the codes, the header has default gateway information:

```
Gateway of last resort is 10.12.4.1 to network 0.0.0.0
```

The “gateway of last resort”, also called the default gateway, is a static route that routes IP address 0.0.0.0 (all destinations) through a single host (the gateway). The effect of setting a gateway is that if no routing table entry exists for a destination address, packets to that address will be forwarded to the gateway router.

Route Entry Fields

Table 4-70 explains the each route entry fields.

Table 4-70: route entry output details

Field	Description
Codes and modifiers	As explained in Table 4-69.
IP address	IP address of the remote network.
Administrative distance and metric	The administrative distance determines how trustworthy this route is. If there is a similar route but with a smaller administrative distance, it is used instead, because it is more “trustworthy”. The smaller the administrative distance, the more trustworthy the route. Directly connected routes have an administrative distance of 0, which makes them the most trustworthy type of route.The metric varies from protocol to protocol, and for OSPF the metric is cost, which indicates the best quality path to use to forward packets. Other protocols, like RIP, use hop count as a metric. For neighboring routers, the metric value is 1.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.
Duration	Length of time that this route has been present in the routing table. This is also the length of time this route has existed without an update. If the route were removed and then re-added (if the cable was disconnected, for instance), this timer would begin again at 00:00:00.

Route Entry Examples

```
O       10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:20:54
```

- This route in the network 10.10.37.0/24 was added by OSPF.
- This route has an administrative distance of 110 and metric/cost of 11.
- This route is reachable via nexthop 10.10.31.16.
- The outgoing local interface for this route is eth2.
- This route was added 20 minutes and 54 seconds ago.

```
O E2    14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:18:56
```

- This route is the same as the other OSPF route above; the only difference is that it is a Type 2 External OSPF route.

```
C       10.10.31.0/24 is directly connected, eth2
```

- This route is directly connected.
- Route entries for network 10.10.31.0/24 are derived from the IP address of local interface eth2.

```
K       10.10.0.0/24 via 10.30.0.11, eth0
```

- This route in the network 10.10.0.0/24 was learned from the kernel routing table (route was statically added using kernel commands).

- This route is reachable via nexthop 10.30.0.11.
- The outgoing local interface for this route is eth0.

```
K*      0.0.0.0/0 via 10.30.0.11, eth0
```

- This is a default route that was learned from the kernel (route was statically added using kernel commands).
- This route is reachable via nexthop 10.30.0.11.
- The local interface for this route is eth0.

Example: Display OSPF Routes

The following is the output with the `ospf` parameter:

```
#show ip route ospf
O       1.1.1.0/24 [110/20] via 2.2.2.1, eth2, 00:00:44
O IA    4.4.4.0/24 [110/21] via 2.2.2.1, eth2, 00:00:44
#
```

Example: Display Route Summary

The following is the output with the `summary` parameter.

```
#show ip route summary
IP routing table name is Default-IP-Routing-Table(0)
IP routing table maximum-paths is 4
Route Source    Networks
kernel          1
connected       5
ospf            2
Total           8
FIB             2
```

Example: Display RIB Routes

The following shows displaying database routes.

```
#show ip route database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area
       > - selected route, * - FIB route, p - stale info

K    *> 0.0.0.0/0 via 10.30.0.11, eth0
O    *> 9.9.9.9/32 [110/31] via 10.10.31.16, eth2, 00:19:21
K    *> 10.10.0.0/24 via 10.30.0.11, eth0
O       10.10.31.0/24 [110/1] is directly connected, eth2, 00:28:20
C    *> 10.10.31.0/24 is directly connected, eth2
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O       10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
O    *> 10.10.37.0/24 [110/11] via 10.10.31.16, eth2, 00:21:19
K    *  10.30.0.0/24 is directly connected, eth0
C    *> 10.30.0.0/24 is directly connected, eth0
S    *> 11.22.11.0/24 [1/0] via 10.10.31.16, eth2
O E2 *> 14.5.1.0/24 [110/20] via 10.10.31.16, eth2, 00:19:21
O       16.16.16.16/32 [110/11] via 10.10.31.16, eth2, 00:21:19
```

```
S    *> 16.16.16.16/32 [1/0] via 10.10.31.16, eth2
O    *> 17.17.17.17/32 [110/31] via 10.10.31.16, eth2, 00:21:19
C    *> 45.45.45.45/32 is directly connected, lo
O    *> 55.55.55.55/32 [110/21] via 10.10.31.16, eth2, 00:21:19
K    *  127.0.0.0/8 is directly connected, lo
C    *> 127.0.0.0/8 is directly connected, lo
```

The codes and modifier at the start of each route entry are explained in Table 4-69.

Routes in the FIB are marked with a *. When multiple routes are available for the same prefix, the best route is indicated with the > symbol. Unselected routes have neither the * nor the > symbol.

Route Database Entry Examples

This example shows 2 entries in the route database; one learned from the kernel and the other derived from interface information.

```
K    * 10.30.0.0/24 is directly connected, eth0
C    *> 10.30.0.0/24 is directly connected, eth0
```

- Both these routes are in the same network 10.30.0.0/24.
- The first route has originated from the kernel. The * indicates that it has been added to the FIB.
- The second route is derived from the IP address of local interface eth0. It is marked as a connected route. Since a connected route has the lowest administrative distance, it is the selected route.

```
S    *> 10.10.34.0/24 [1/0] via 10.10.31.16, eth2
O      10.10.34.0/24 [110/31] via 10.10.31.16, eth2, 00:21:19
```

- The same prefix was learned from OSPF and from static route configuration.
- Static routes are preferred over OSPF routes, so the static route is selected and installed in the FIB.

  Note: If the static route becomes unavailable, OcNOS automatically selects the OSPF route and installs it in the FIB.

Example: Display VRF Routes

The following is the output with the `vrf` parameter:

```
#show ip route vrf vrf31
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked
* - candidate default

IP Route Table for VRF "vrf31"
O            2.2.2.2/32 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
O            10.1.1.0/24 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
O            20.1.1.0/24 [110/2] via 21.1.1.2, vlan1.4, 00:01:29
C            21.1.1.0/24 is directly connected, vlan1.4, 00:02:54
C            31.31.1.1/32 is directly connected, lo.vrf31, 00:03:02
O            40.40.1.1/32 [110/3] via 21.1.1.2, vlan1.4, 00:00:43
C            127.0.0.0/8 is directly connected, lo.vrf31, 00:03:05

Gateway of last resort is not set
```

The following is the output with the `vrf database` parameter:

```
#show ip route vrf vrf31 database
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked
> - selected route, * - FIB route, p - stale info

IP Route Table for VRF "vrf31"
O    *>  2.2.2.2/32 [110/2] via 21.1.1.2, vlan1.4, 00:01:32

C    *>  31.31.1.1/32 is directly connected, lo.vrf31, 00:03:05
O        31.31.1.1/32 [110/1] is directly connected, lo.vrf31, 00:03:00
O    *>  40.40.1.1/32 [110/3] via 21.1.1.2, vlan1.4, 00:00:46
B     >  50.1.1.0/24 [200/0] via 41.41.41.41, 00:00:18
C    *>  127.0.0.0/8 is directly connected, lo.vrf31, 00:03:08

Gateway of last resort is not set
```

show ip vrf

This command displays routing information about VRFs.

Command Syntax

```
show ip vrf
show ip vrf WORD
```

Parameter

WORD	Virtual Routing and Forwarding name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip forwarding
 vrf (management) :IP forwarding is on
 vrf (default) :IP forwarding is on
```

show ipv6 forwarding

Use this command to display the IPv6 forwarding status.

Command Syntax

```
show ipv6 forwarding
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ipv6 forwarding` command displaying the IPv6 forwarding status.

```
#show ipv6 forwarding
 vrf (management) :IPv6 forwarding is on
 vrf (default) :IPv6 forwarding is on#
```

show ipv6 interface brief

Use this command to display information about interfaces. To display information about a specific interface, include the interface name.

Command Syntax

```
show ipv6 interface brief
show ipv6 interface IFNAME brief
```

Parameters

IFNAME	Name of the interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 interface brief
Interface           IPv6-Address                Admin-Status
lo                  ::1                         [up/up]

gre0                unassigned                  [admin down/down]

eth3                3ffe:abcd:104::1            [up/up]
                    3ffe:abcd:103::1
                    fe80::2e0:29ff:fe6f:cf0

eth1                fe80::260:97ff:fe20:f257    [up/up]

eth2                unassigned                  [admin down/down]

eth3                unassigned                  [admin down/down]

sit0                unassigned                  [admin down/down]

tun24               unassigned                  [admin down/down]

tunl0               unassigned                  [admin down/down]
```

Table 4-71 explains the each interface brief entry.

Table 4-71: show interface brief output details

Field	Description
Interface	Name of the interface.
IPv6-Address	IPv6 address. An asterisk (“*”) means the address was assigned by the DHCPv6 client.
Admin-Status	Status of the interface: The first part of the field indicates if the interface is up. The second part indicates if the interface is running.

show ipv6 route

Use this command to display the IP routing table for a protocol or from a particular table, including database entries known by NSM. When multiple entries are available for the same prefix, NSM uses an internal route selection mechanism based on protocol administrative distance and metric values to choose the best route. The best routes in the FIB can be viewed using `show ipv6 route`.

Command Syntax

```
show ipv6 route vrf WORD (database|)
show ipv6 route vrf WORD (database|) (bgp|connected|isis|kernel|ospf|rip|static)
show ipv6 route (database)
show ipv6 route (database) (bgp|connected|isis|kernel|ospf|rip|static)
show ipv6 route X:X::X:X
show ipv6 route X:X::X:X/M
show ipv6 route summary
```

Parameters

`X:X::X:X`	Network in the IP routing table.
`X:X::X:X/M`	Prefix <network>/<length>, e.g., 35.0.0.0/8
`all`	All IPv6 routes
`bgp`	Border Gateway Protocol.
`connected`	Connected.
`database`	IPv6 routing table database.
`isis`	IS-IS.
`IFNAME`	Interface name
`kernel`	Kernel.
`ospf`	Open Shortest Path First.
`rip`	Routing Information Protocol.
`static`	Static routes.
`summary`	Summarize all routes
`WORD`	Routes from a Virtual Routing and Forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

See Table 4-69 and Table 4-70 for an explanation of the codes and fields in the output.

```
#show ipv6 route
Codes: K - kernel route, C - connected, S - static, R - RIPng, O - OSPFv3,
```

```
       I - IS-IS, B - BGP, > - selected route, * - FIB route, p - stale info.
C> * ::1/128 is directly connected, lo
C> * 3ffe:1::/48 is directly connected, eth1
C> * 3ffe:2:2::/48 is directly connected, eth2
#
```

show ipv6 prefix-list

Use this command to display the prefix list entries for IPv6 interfaces.

Syntax Description

```
show ipv6 prefix-list
show ipv6 prefix-list WORD
show ipv6 prefix-list WORD seq <1-4294967295>
show ipv6 prefix-list WORD X:X::X:X/M
show ipv6 prefix-list WORD X:X::X:X/M longer
show ipv6 prefix-list WORD X:X::X:X/M first-match
show ipv6 prefix-list summary
show ipv6 prefix-list summary WORD
show ipv6 prefix-list detail
show ipv6 prefix-list detail WORD
```

Parameters

`WORD`	Name of prefix list.
`X:X::X:X/M`	IP prefix <network>/<length> (for example, 35.0.0.0/8).
`first-match`	First matched prefix.
`longer`	Look up longer prefix.
`<1-4294967295>`	Sequence number of an entry.
`detail`	Detail of prefix lists.
`summary`	Summary of prefix lists.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show ip prefix-list` command showing prefix-list entries.

```
#show ip prefix-list
ip prefix-list myPrefixList: 3 entries
   seq      5 permit 172.1.1.0/16
   seq     10 permit 173.1.1.0/16
   seq     15 permit 174.1.1.0/16
```

show hosts

Use this command to display the IP domain-name, lookup style and any name server.

Command Syntax

```
show hosts
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show hosts

       VRF: management

DNS lookup is enabled
 Default domain      : .com
 Additional Domain   : .in .ac
 Name Servers        : 10.12.3.23
Host                                                                    Address
----                                                                    -------
test                                                                    10.12.12.67
test                                                                    10::23

 * - Values assigned by DHCP Client.
```

Table 4-72 explains the output fields.

Table 4-72: show hosts fields

Entry	Description
VRF: management	DNS configuration of specified VRF
DNS lookup is enabled	DNS feature enabled or disabled
Default domain	Default domain name used to complete unqualified host names (names without a dotted decimal domain name).
Additional Domain	A list of default domain names used to complete unqualified host names. Each domain in the list is to be tried in turn.
Name Servers	DNS server addresses that are used to translate hostnames to IP addresses.

Table 4-72: show hosts fields

Entry	Description
Host Address test 10.12.12.67 test 10::23	Static hostname-to-address mappings in DNS.
* - Values assigned by DHCP Client.	* in name-server indicates it has been learned dynamically.

show running-config interface

Use this command to show the running system status and configuration for a specified interface, or a specified interface for a specified protocol.

Command Syntax

```
show running-config interface IFNAME
show running-config interface IFNAME bridge
show running-config interface IFNAME ip igmp
show running-config interface IFNAME ip multicast
show running-config interface IFNAME ip pim
show running-config interface IFNAME ipv6 ospf
show running-config interface IFNAME ipv6 rip
show running-config interface IFNAME ipv6 pim
show running-config interface IFNAME isis
show running-config interface IFNAME lacp
show running-config interface IFNAME ldp
show running-config interface IFNAME mpls
show running-config interface IFNAME mstp
show running-config interface IFNAME ospf
show running-config interface IFNAME ptp
show running-config interface IFNAME rip
show running-config interface IFNAME rstp
show running-config interface IFNAME rsvp
show running-config interface IFNAME stp
show running-config interface IFNAME synce
```

Parameters

`bridge`	Bridge.
`ip`	IPv4 (see also show running-config interface ip).
`ipv6`	IPv6 (see also show running-config interface ipv6).
`isis`	Intermediate System to Intermediate System.
`lacp`	Link Aggregation Control Protocol.
`ldp`	Label Distribution Protocol.
`mpls`	Multi-Protocol Label Switching.
`mstp`	Multiple Spanning Tree Protocol.
`ospf`	Open Shortest Path First.
`ptp`	Precision Time Protocol.
`rip`	Routing Information Protocol.

`rstp`	Rapid Spanning Tree Protocol.
`rsvp`	Resource Reservation Protocol.
`stp`	Spanning Tree Protocol.
`synce`	Synchronous Ethernet.

Command Mode

Privileged Exec mode and Config Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 bridge
!
interface eth1
 switchport
 bridge-group 1
 switchport mode access
 user-priority 3
 traffic-class-table user-priority 2 num-traffic-classes 3 value 3 traffic-
class-table user-priority 7 num-traffic-classes 1 value 2 traffic-class-table
user-priority 7 num-traffic-classes 2 value 0 traffic-class-table user-
priority 7 num-traffic-classes 3 value 0 traffic-class-table user-priority 7
num-traffic-classes 4 value 0 traffic-class-table user-priority 7 num-traffic-
classes 5 value 0 traffic-class-table user-priority 7 num-traffic-classes 6
```

show running-config interface ip

Use this command to show the running system status and configuration for a specified IP.

Command Syntax

```
show running-config interface IFNAME ip (igmp|multicast|pim|)
```

Parameters

`IFNAME`	Interface name.
`igmp`	Internet Group Management Protocol.
`multicast`	Multicast.
`pim`	Protocol Independent Multicast.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ip igmp
!
interface eth1
 switchport
```

show running-config interface ipv6

Use this command to show the running system status and configuration for a specified IPv6 protocol.

Command Syntax

```
show running-config interface IFNAME ipv6 (mld|multicast|ospf|pim|rip|)
```

Parameters

`IFNAME`	Interface name.
`mld`	Multicast Listener Discovery
`multicast`	Multicast
`ospf`	Open Shortest Path First
`pim`	Protocol Independent Multicast
`rip`	Routing Information Protocol

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth1 ipv6 rip
!
interface eth1
 switchport
```

show running-config ip

Use this command to show the running system of IP configurations.

Command Syntax

```
show running-config ip (dhcp|mroute|route)
```

Parameters

`dhcp`	Dynamic Host Configuration Protocol.
`mroute`	Static IP multicast route.
`route`	Static IP route.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config ip route
!
ip route 3.3.3.3/32 eth3
ip route 3.3.3.3/32 eth2
ip route 200.0.0.0/16 lo
!
```

show running-config ipv6

Use this command to show the running system status and configuration for IPv6.

Command Syntax

```
show running-config ipv6 (access-list|mroute|neighbor|prefix-list|route|)
```

Parameters

`access-list`	Access list.
`mroute`	Static IPv6 Multicast route.
`neighbor`	Static IPv6 neighbor entry.
`prefix-list`	IPv6 prefix-list.
`route`	Static IPv6 route.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config ipv6 access-list
!
ipv6 access-list abc permit any
!
#show running-config ipv6 prefix-list
!
ipv6 prefix-list sde seq 5 permit any
!
#show running-config ipv6 route
!
ipv6 route 3e11::/64 lo
ipv6 route 3e11::/64 eth2
ipv6 route fe80::/64 eth2
!
```

shutdown

Use this command to shut down an interface.

Use the no form of this command to bring up an interface.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the use of the `shutdown` command to shut down the interface called `eth3`.

```
#configure terminal
(config)#interface eth3
(config-if)#shutdown
```

speed

Use this command to set the link speed of the interface.

Use the no parameter to set the speed to its default value.

On copper ports, auto-negotiation is enabled by default and force speed is not supported.

On fiber optic ports, auto-negotiation is disabled by default. Auto-negotiation is not supported on fiber optic medium/ AOC for speeds 10g and beyond. IP Infusion Inc.does not recommend using auto speed on such transceivers. On DAC cables, both force and auto-negotiation are supported.

IP Infusion Inc. recommends configuring the same speed mode on both peers.

When an interface is configured with the speed auto option:

- The negotiated parameters are speed, duplex, flowcontrol, and fec, each of which is configured separately. Please see the respective command for details.
- If the speed of the optic connected is less than the front-panel port capability, then the interface does not come up in auto mode. To bring up the interface, use the `speed auto <speed>` command to reduce the negotiation capability. For example, if the front panel port is 10g capable and in auto mode and you insert a 1g SFP, then the hardware tries to bring up port in 10g and fails. Use the command `speed auto 1g` to start the negotiation at the 1g speed and the port will come up.

Note: For 10g DAC/AOC, setting speed auto negotiates with a maximum of 1G.

Table 4-73 shows the IP Infusion Inc. recommendations regarding front-panel port speed and transceivers.

Table 4-73: Recommendatons

Suported/ Recommended	Explanation
Not Supported	When front panel port capability is less than the transceiver's capability the behavior is undefined.
Not Recommended	When the transceiver's capability and front panel port capability is the same, reducing the speed is not recommended.
Recommended	When the transceiver's capability is less than the front panel port capability, the behavior is undefined and the link might even come up. So speed needs to be set to match the transceiver's capability.

Table 4-74 show examples with front-panel configurations:

Table 4-74: Front-panel configurations

Front Panel Port	Explanation
Front Panel Port 100g	When 40g transceivers are used, make sure to use the command `speed 40g`. IP Infusion Inc. does not recommend using 40g on 100g speed transceivers.
Front Panel Port 40g	100g transceivers should not be used.

Table 4-74: Front-panel configurations (Continued)

Front Panel Port	Explanation
Front Panel Port 25g	When 10g transceivers are used, make sure to use the `port-group` command to reduce the speed to 10g. IP Infusion Inc. does not recommend to use 10g on 25g speed transceivers. When using 1g transceivers, make sure to set the speed to 1g. Below 25g, port-speed can defer (10g or 1g) for ports under same port-group i.e. 1 port can have 1g & remaining 10g but 1 port 25g & remaining 10g not allowed. When "`no speed`" command is used at interface level it tries to set speed "25g" to one of the port of port-group while other may be at 10g or 1g speed which is not allowed. Use "`no port-group`" command in such case.
Front Panel Port 10g	25g transceivers should not be used. When using 1g transceivers, make sure to set the speed to 1g.
Front Panel Port 1g	10g/25g transceivers should not be used.

Command Syntax

```
speed (10m | 100m | 1g | 2.5g | 10g | 20g | 25g | 40g | 50g | 100g |
  (auto (1g | 10g | 20g | 25g | 40g | 50g | 100g |)))
no speed
```

Parameter

`10m`	10 megabits
`100m`	100 megabits
`1g`	1 gigabit
`2.5g`	2.5 gigabits
`10g`	10 gigabits
`20g`	20 gigabits
`25g`	25 gigabits
`40g`	40 gigabits
`50g`	50 gigabits
`100g`	100 gigabits
`auto`	Negotiate the speed with a connected port

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Enable auto-negotiation up to 1G:

```
#configure terminal
(config)#interface xe0
(config-if)#speed auto 1g
```

switchport

Use this command to set the mode of an interface to switched.

All interfaces are configured `routed` by default. To change the behavior of an interface from switched to routed, you must explicitly give the `no switchport` command.

Note: When you change the mode of an interface from switched to routed and vice-versa, all configurations for that interface are erased.

User should be prompted for confirmation, while executing `switchport/no switchport` command. To support this requirement, please refer the command `enable/disable confirmation-dialog.`

Use the `no` form of this command to set the mode to routed.

Command Syntax

```
switchport
no switchport
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport

(config)#interface eth0
(config-if)#no switchport

#configure terminal
(config)#enable confirmation-dialog
(config)#interface xe5
(config-if)#switchport
Are you sure? (y/n): y
(config-if)#
(config-if)#exit

(config)#disable confirmation-dialog
(config)#
(config)#interface xe5
(config-if)#switchport
(config-if)#
```

switchport allowed ethertype

Use this command to indicate which types of traffic will be allowed on the switchport.

Note: A maximum of 5 Ethertype values can be assigned on an interface.

Command Syntax

```
switchport allowed ethertype {arp|ipv4|ipv6|mpls|ETHTYPE|log}
```

Parameters

`arp`	ARP traffic
`ipv4`	IPv4 traffic
`ipv6`	IPv6 traffic
`mpls`	MPLS traffic
`ETHTYPE`	Traffic of any Ethertype value (0x600 - 0xFFFF).
`log`	Log unwanted ethertype packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

This command is not available on Qumran platforms.

Example

```
(config)#interface xe32/1

(config-if)#switchport
(config-if)#switchport allowed ethertype ipv4
(config-if)#switchport allowed ethertype 0x800
```

CHAPTER 5 Access Control List Commands

This chapter is a reference for the Access Control List (ACL) commands:

- mac access-list remark
- mac access-list resequence
- show access-lists
- show arp access-lists
- show ip access-lists
- show ipv6 access-lists
- show mac access-lists
- show running-config access-list
- show running-config aclmgr
- show running-config ipv6 access-list

arp access-group

Use this command to attach an ARP access list to an interface to filter incoming ARP packets.

When you attach an ARP access list to a LAG interface as well as to a physical interface that is a member of that LAG interface, the priority order is:

1. LAG interface
2. Physical interface

Use the `no` form of this command to detach an ARP access group.

Note: An ARP access-list is supported only on switch ports.

Note: To attach an ARP access-group to an interface, the `ingress-arp` TCAM group should be enabled. See the hardware-profile filter command for details.

Command Syntax

```
arp access-group NAME in
no arp access-group NAME in
```

Parameters

`NAME`	ARP access list name

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#permit ip any mac any
(config-arp-acl)#exit

(config)#interface xe1
(config-if)#arp access-group arp1 in
(config-if)#exit

(config)#interface xe1
(config-if)#no arp access-group arp1 in
(config-if)#exit
```

arp access-list

Use this command to define a named access control list (ACL) that determines whether to accept or drop the ARP packets, based on the ARP request or response option configured.

An ACL is made up of one or more ACL specifications. You can repeat this command and add multiple specifications. Each time you give this command, the specification is added to the end of the list.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. A single-entry ACL with only one deny specification is the same as denying all traffic. You must have at least one permit specification in an ACL or all traffic is blocked.

Use the no form of this command to remove an ACL specification.

Note: An ARP access list is supported only on switch ports.

Command Syntax

```
arp access-list NAME
no arp access-list NAME
```

Parameters

NAME	ARP access list name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#arp access-list arp1
```

arp access-list default

Use this command to modify the default rule action of an access list.

The default rule is applicable only when an access list is attached to an interface. The default rule will have the lowest priority and only ARP packets not matching any of the user defined rules match the default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.

Default

The default rule is `deny-all` when an access list is attached to an interface.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#default permit-all
```

arp access-list remark

Use this command to add a description to a named ARP access control list (ACL).

Use the no form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE	ACL description up to 100 characters.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)# remark Permit arp request packets
```

arp access-list request

Use this command to configure ARP access control entry in an ARP access control list (ACL).

This command determines whether to accept or drop a packet based on the configured match criteria.

Use the no form of this command to remove an ACL specification.

Note: Configuring the same filter again with a change of sequence number or change of action will result in updating the sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit)(request |) ip (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)
  (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (vlan <1-4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>|)(deny|permit)(request |) ip (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) mac (any | ((XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)
  (XX-XX-XX-XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (vlan <1-4094>|) (inner-vlan <1-4094>|)
```

Parameters

<1-268435453>	ARP ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
request	ARP request.
ip	Internet Protocol (IP).
A.B.C.D/M	Source IP prefix and length.
A.B.C.D A.B.C.D	Source IP address and mask.
host A.B.C.D	A single source host IP address.
any	Match any source IP address.
mac	MAC address configuration.
any	Match any source mac address.
XX-XX-XX-XX-XX-XX	Source MAC address (Option 1).
XX:XX:XX:XX:XX:XX	Source MAC address (Option 2).
XXXX.XXXX.XXXX	Source MAC address (Option 3).
XX-XX-XX-XX-XX-XX	Source wildcard (Option 1).
XX:XX:XX:XX:XX:XX	Source wildcard (Option 2).
XXXX.XXXX.XXXX	

Source wildcard (Option 3).

`host (XX-XX-XX-XX-XX-XX)`

A single source host MAC address.

`vlan <1-4094>` VLAN identifier.

`inner-vlan <1-4094>`

Inner VLAN identifier.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#10 permit request ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
(config-arp-acl)#no 10
```

arp access-list resequence

Use this command to modify the sequence numbers of an ARP access list.

Note: IP Infusion Inc. recommends to use a non-overlapping sequence space for a new sequence number set to avoid unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

`<1-268435453>`	Starting sequence number.
`INCREMENT`	Sequence number increment steps.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#resequence 15 15
```

arp access-list response

Use this command to configure an ARP access control entry in an ARP access control list (ACL).

This command determines whether to accept or drop an ARP response packet based on the configured match criteria.

Use the no form of this command to remove an ACL specification.

Note: Configuring the same filter again with a change of sequence number or change of action will result in updating the sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) response ip (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) mac (any | ((XX-XX-XX-
  XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) -XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (any | ((XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))(vlan <1-4094>|) (inner-vlan <1-4094>|)

no (<1-268435453>|)(deny|permit) response ip (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) mac (any | ((XX-XX-XX-
  XX-XX-XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) -XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX))) (any | ((XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) | (host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)))(vlan <1-4094>|) (inner-vlan <1-4094>|)
```

Parameters

<1-268435453>	ARP ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
response	ARP response
A.B.C.D/M	Source/destination IP prefix and length.
A.B.C.D A.B.C.D	Source/destination IP address and mask.
host A.B.C.D	A single source/destination host IP address.
any	Match any source/destination IP address.
mac	MAC address configuration.
any	Match any source/destination MAC address.
XX-XX-XX-XX-XX-XX	Source/destination MAC address (Option 1).
XX:XX:XX:XX:XX:XX	Source/destination MAC address (Option 2).
XXXX.XXXX.XXXX	Source/destination MAC address (Option 3).

`XX-XX-XX-XX-XX-XX`
: Source/destination wildcard (Option 1).

`XX:XX:XX:XX:XX:XX`
: Source/destination wildcard (Option 2).

`XXXX.XXXX.XXXX` Source/destination wildcard (Option 3).

`vlan <1-4094>` VLAN identifier.

`inner-vlan <1-4094>`
: Inner VLAN identifier.

Command Mode

ARP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#arp access-list arp1
(config-arp-acl)#10 permit response ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
(config-arp-acl)#no 10
```

clear access-list

Use this command to clear the access-list counters.

Command Syntax

```
clear access-list (NAME|) counters
```

Parameters

NAME	Access-list name.

Command Mode

Exec mode and Privilege exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear access-list counters
```

clear arp access-list

Use this command to clear the ARP access-list counters.

Command Syntax

```
clear arp access-list (NAME|) counters
```

Parameters

NAME	ARP access list name

Command Mode

Exec mode and privileged exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear arp access-list counters
```

clear ip access-list

Use this command to clear the IP access-list counters.

Command Syntax

```
clear ip access-list (NAME|) counters
```

Parameters

NAME	Access-list name.

Command Mode

Exec mode and Privilege exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip access-list counters
```

clear ipv6 access-list

Use this command to clear the IPv6 access-list counters.

Command Syntax

```
clear ipv6 access-list (NAME|) counters
```

Parameters

NAME	Access-list name.

Command Mode

Exec mode Privilege exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 access-list counters
```

clear mac access-list

Use this command to clear the MAC access-list counters.

Command Syntax

```
clear mac access-list (NAME|) counters
```

Parameters

NAME	Access-list name.

Command Mode

Exec mode Privilege exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear mac access-list counters
```

ip access-group

Use this command to attach an IP access list to an interface or terminal line to filter incoming or outgoing IP packets.

Use the `no` form of this command to detach an IP access list from an interface or terminal line.

Note: An egress IP ACL is supported on physical and lag interfaces only. An egress IP ACL will match only routed traffic and not switched traffic. VLAN and inner-VLAN options in ACL rules will match incoming packet VLANs even when ACL attached at egress.

Command Syntax

```
ip access-group NAME (in|out)
no ip access-group NAME (in|out)
```

Parameters

`NAME`	Access list name.
`in`	Filter incoming packets
`out`	Filter outgoing packets.

Command Mode

Line mode

Interface mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#permit ip any any
(config-ip-acl)#exit

(config)#hardware-profile filter ingress-ipv4-ext enable

(config)#interface xe3
(config-if)#ip access-group mylist in
(config-if)#exit

(config)#interface xe3
(config-if)#no ip access-group mylist in
(config-if)#exit

(config)#line vty
(config-all-line)#ip access-group mylist in
```

Usage: VLANs and LAGs

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Usage: TCAM Groups

An access-group in the egress direction uses the TCAM group used by the QoS output service policy. Therefore, actions are unpredictable when conflicting matches are configured on same interface. IP Infusion Inc. recommends to avoid such a configuration. Otherwise, you need to configure the priority (in QoS) or the sequence number (in ACL) carefully to handle such cases.

To attach an IP ACL in the ingress direction the `ingress-ipv4` or `ingress-ipv4-ext` TCAM group needs to be enabled and to attach an IP ACL in the egress direction the `egress-ipv4` TCAM group needs to be enabled. See the hardware-profile filter commands for details.

Usage: VTY Interfaces

You can create ACLs for VTY interfaces to filter packets from management applications such as SSH, Telnet, NTP, SNMP, and SNMP traps. TCP, UDP, and ICMP are supported.

For an ACL for VTY, you create the ACL, configure it with rules, and associate the ACL to the terminal line in line mode.

VTY ACLs do not support the following:

- The default rule `deny all`. You must explicitly set up a `deny all` rule based on your requirements.
- VLAN-specific rules.
- Rules with TCP flags.
- Rules with `dscp`, `fragments`, `log`, `precedence`, and `sample` parameters.
- Rules with ICMP code and message types.

ip access-list

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming IP packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

Use the no form of this command to remove an ACL.

Command Syntax

```
ip access-list NAME
no ip access-list NAME
```

Parameters

NAME	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
```

ip access-list default

Use this command to modify the default rule action of access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the IP packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl)#default permit-all
```

ip access-list filter

Use this command to configure access control entry in an access control list (ACL).

This determines whether to accept or drop an IP packet based on the configured match criteria.

Use the no form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring the same filter again with change of sequence number or change of action results in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|) (deny|permit) (<0-255>|ahp|any|eigrp|esp|gre|ipip|ipcomp|ipv6ip
  |ospf|pim|rsvp|vrrp) (A.B.C.D/ M|A.B.C.D A.B.C.D|host A.B.C.D|any) (A.B.C.D/
  M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-63>|af11| af12| af13| af21| af22|
  af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7|
  default| ef )|) (precedence (<0-7>| critical| flash | flashoverride| immediate|
  internet| network| priority| routine))|) (vlan <1-4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>|)(deny|permit)(<0-255> |ahp | any | eigrp | esp | gre | ipip |
  ipcomp | ipv6ip | ospf | pim | rsvp| vrrp) (A.B.C.D/ M|A.B.C.D A.B.C.D | host
  A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-63> |af11|
  af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3|
  cs4| cs5|cs6| cs7| default| ef )|) (precedence (<0-7>| critical| flash |
  flashoverride| immediate| internet| network| priority| routine))|) (vlan <1-
  4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>)
```

Parameters

<1-268435453>	IPv4 ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
<0-255>	IANA assigned protocol number.
any	Any protocol packet.
ahp	Authentication Header packet.
eigrp	Enhanced Interior Gateway Routing Protocol packet.
esp	Encapsulating Security Payload packet.
gre	Generic Routing Encapsulation packet.
ipip	IPv4 over IPv4 encapsulation packet.
ipcomp	IP Payload Compression Protocol packet.
ipv6ip	IPv6 over IPv4 encapsulation packet.
ospf	Open Shortest Path First packet.
pim	Protocol Independent Multicast packet
rsvp	Resource Reservation Protocol packet.
vrrp	Virtual Router Redundancy Protocol packet.
A.B.C.D/M	Source IP prefix and length.

`A.B.C.D A.B.C.D`	
	Source IP address and mask.
`host A.B.C.D`	A single source host IP address.
`any`	Match any source IP address.
`A.B.C.D/M`	Destination IP prefix and length.
`A.B.C.D A.B.C.D`	
	Destination IP address and mask.
`host A.B.C.D`	A single destination host IP address.
`any`	Match any destination IP address.
`dscp`	Match packets with given DSCP value.
`<0-63>`	Enter DSCP value between 0-63.
`af11`	AF11 DSCP (001010) decimal value 10.
`af12`	AF12 DSCP (001100) decimal value 12.
`af13`	AF13 DSCP (001110) decimal value 14.
`af21`	AF21 DSCP (010010) decimal value 18.
`af22`	AF22 DSCP (010100) decimal value 20.
`af23`	AF23 DSCP (010110) decimal value 22.
`af31`	AF31 DSCP (011010) decimal value 26.
`af32`	AF32 DSCP (011100) decimal value 28.
`af33`	AF33 DSCP (011110) decimal value 30.
`af41`	AF41 DSCP (100010) decimal value 34
`af42`	AF42 DSCP (100100) decimal value 36.
`af43`	AF43 DSCP (100110) decimal value 38.
`cs1`	CS1 (precedence 1) DSCP (001000) decimal value 8.
`cs2`	CS2 (precedence 2) DSCP (010000) decimal value 16.
`cs3`	CS3 (precedence 3) DSCP (011000) decimal value 24.
`cs4`	CS4 (precedence 4) DSCP (100000) decimal value 32.
`cs5`	CS5 (precedence 5) DSCP (101000) decimal value 40.
`cs6`	CS6 (precedence 6) DSCP (110000) decimal value 48.
`cs7`	CS7 (precedence 7) DSCP (111000) decimal value 56.
`default`	Default DSCP (000000) decimal value 0.
`ef`	EF DSCP (101110) decimal value 46.
`precedence`	Match packets with given precedence value.
`<0-7>`	Enter precedence value 0-7.
`critical`	Match packets with critical precedence (5).
`flash`	Match packets with flash precedence (3).
`flashoverride`	Match packets with flash override precedence (4).
`immediate`	Match packets with immediate precedence (2).
`internet`	Match packets with internetwork control precedence (6).

`network`	Match packets with network control precedence (7).
`priority`	Match packets with priority precedence (1).
`routine`	Match packets with routine precedence (0).
`vlan`	Match packets with given vlan value.
`<1 - 4094>`	VLAN identifier.
`inner-vlan`	Match packets with given inner vlan value.
`<1 - 4094>`	VLAN identifier.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl)#11 permit any 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
(config-ip-acl)#no 11
```

ip access-list icmp

Use this command to permit or deny ICMP packets based on the given source and destination IP address. Even DSCP, precedence, vlan ID and inner vlan ID can be configured to permit or deny with the given values.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmp) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
  (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) ((dscp (<0-63>|af11| af12| af13|
  af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6|
  cs7| default| ef ))| (precedence (<0-7>| critical| flash |
  flashoverride|immediate| internet| network| priority| routine))|) (vlan <1-
  4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>|)(deny|permit) (icmp) (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any) (dscp (<0-63>|af11|
  af12| af13| af21| af22| af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3|
  cs4| cs5|cs6| cs7| default| ef ))| (precedence (<0-7>| critical| flash |
  flashoverride|immediate| internet| network| priority| routine))|) (vlan <1-
  4094>|) (inner-vlan <1-4094>|)
```

Parameters

<1-268435453>	IPv4 ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
icmp	Internet Control Message Protocol packet.
A.B.C.D/M	Source IP prefix and length.
A.B.C.D A.B.C.D	Source IP address and mask.
host A.B.C.D	A single source host IP address.
any	Match any source IP address.
A.B.C.D/M	Destination IP prefix and length.
A.B.C.D A.B.C.D	Destination IP address and mask.
host A.B.C.D	A single destination host IP address.
any	Match any destination IP address.
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.

af22	AF22 DSCP (010100) decimal value 20.
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Enter precedence value 0-7.
critical	Match packets with critical precedence (5).
flash	Match packets with flash precedence (3).
flashoverride	Match packets with flash override precedence (4).
immediate	Match packets with immediate precedence (2).
internet	Match packets with internetwork control precedence (6).
network	Match packets with network control precedence (7).
priority	Match packets with priority precedence (1).
routine	Match packets with routine precedence (0).
vlan	Match packets with given vlan value.
<1-4094>	VLAN identifier.
inner-vlan	Match packets with given inner-vlan value.
<1-4094>	VLAN identifier.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-icmp
(config-ip-acl)#200 permit icmp any any
```

ip access-list remark

Use this command to add a description to a named IPv4 access control list (ACL).

Use the no form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#remark permit the inside admin address
(config-ip-acl)#exit

(config)#ip access-list mylist
(config-ip-acl)#no remark
(config-ip-acl)#exit
```

ip access-list resequence

Use this command to modify sequence numbers of the IP access list specifications.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

`<1-268435453>`	Starting sequence number.
`INCREMENT`	Sequence number increment steps.

Default

None

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list mylist
(config-ip-acl)#resequence 5 5
(config-ip-acl)#end
```

ip access-list tcp|udp

Use this command to define a named access control list (ACL) that determines whether to accept or drop an incoming TCP or UDP IP packet based on the specified match criteria. This form of command filters packets based on source and destination IP address along with protocol (TCP or UDP) and port.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: TCP flags options and range options like neq, gt, lt and range are not supported by hardware in egress direction.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
  ((eq|gt|lt|neq) (<0-65535>|bgp|chargen|cmd|daytime|discard|domain|drip|echo
  |exec|finger|ftp |ftp-data|gopher|hostname|ident|irc|klogin|kshell|login
  |lpd|nntp|pim-auto- rp|pop2|pop3|smtp|ssh|sunrpc|tacacs|talk|telnet|time|
  uucp|whois|www)| range <0-65535> <0-65535>|) (A.B.C.D/M|A.B.C.D A.B.C.D|host
  A.B.C.D|any) ((eq|gt|lt|neq) (<0-65535>|bgp|chargen|cmd|daytime|discard|domain|
  drip|echo|exec|finger|ftp|ftp-data|gopher|hostname|ident|irc|klogin|kshell|login
  |lpd|nntp|pim-auto- rp|pop2|pop3|smtp|ssh|sunrpc|tacacs|talk|telnet

```

Parameters

`<1-268435453>`	IPv4 ACL sequence number.
`deny`	Drop the packet.
`permit`	Accept the packet.
`tcp`	Transmission Control Protocol.
`udp`	User Datagram Protocol.
`A.B.C.D/M`	Source or destination IP prefix and length.
`A.B.C.D A.B.C.D`	Source or destination IP address and mask.
`host A.B.C.D`	Source or destination host IP address.
`any`	Any source or destination IP address.
`eq`	Source or destination port equal to.
`gt`	Source or destination port greater than.
`lt`	Source or destination port less than.
`neq`	Source or destination port not equal to.
`<0-65535>`	Source or destination port number.
`range`	Range of source or destination port numbers:
`<0-65535>`	Lowest value in the range.
`<0-65535>`	Highest value in the range.
`bgp`	Border Gateway Protocol.
`chargen`	Character generator.
`cmd`	Remote commands.
`daytime`	Daytime.
`discard`	Discard.
`domain`	Domain Name Service.
`drip`	Dynamic Routing Information Protocol.
`echo`	Echo.

`exec`	EXEC.
`finger`	Finger.
`ftp`	File Transfer Protocol.
`ftp-data`	FTP data connections.
`gopher`	Gopher.
`hostname`	NIC hostname server.
`ident`	Ident Protocol.
`irc`	Internet Relay Chat.
`klogin`	Kerberos login.
`kshell`	Kerberos shell.
`login`	Login.
`lpd`	Printer service.
`nntp`	Network News Transport Protocol.
`pim-auto-rp`	PIM Auto-RP.
`pop2`	Post Office Protocol v2.
`pop3`	Post Office Protocol v3.
`smtp`	Simple Mail Transport Protocol.
`ssh`	Secure Shell.
`sunrpc`	Sun Remote Procedure Call.
`tacacs`	TAC Access Control System.
`talk`	Talk.
`telnet`	Telnet.
`time`	Time.
`uucp`	UNIX-to-UNIX Copy Program.
`whois`	WHOIS/NICNAME
`www`	World Wide Web.
`nntp`	Range of source or destination port numbers:
`dscp`	Match packets with given DSCP value.
`<0-63>`	Enter DSCP value between 0-63.
`af11`	AF11 DSCP (001010) decimal value 10.
`af12`	AF12 DSCP (001100) decimal value 12.
`af13`	AF13 DSCP (001110) decimal value 14.
`af21`	AF21 DSCP (010010) decimal value 18.
`af22`	AF22 DSCP (010100) decimal value 20.
`af23`	AF23 DSCP (010110) decimal value 22.
`af31`	AF31 DSCP (011010) decimal value 26.
`af32`	AF32 DSCP (011100) decimal value 28.
`af33`	AF33 DSCP (011110) decimal value 30.
`af41`	AF41 DSCP (100010) decimal value 34.

af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
precedence	Match packets with given precedence value.
<0-7>	Precedence.
critical	Match packets with critical precedence (5).
flash	Match packets with flash precedence (3).
flashoverride	Match packets with flash override precedence (4).
immediate	Match packets with immediate precedence (2).
internet	Match packets with internetwork control precedence (6).
network	Match packets with network control precedence (7).
priority	Match packets with priority precedence (1).
routine	Match packets with routine precedence (0).
ack	Match on the Acknowledgment (ack) bit.
established	Matches only packets that belong to an established TCP connection.
fin	Match on the Finish (fin) bit.
psh	Match on the Push (psh) bit.
rst	Match on the Reset (rst) bit.
syn	Match on the Synchronize (syn) bit.
urg	Match on the Urgent (urg) bit.
biff	Biff.
bootpc	Bootstrap Protocol (BOOTP) client.
bootps	Bootstrap Protocol (BOOTP) server.
discard	Discard.
dnsix	DNSIX security protocol auditing.
domain	Domain Name Service.
echo	Echo.
isakmp	Internet Security Association and Key Management Protocol.
mobile-ip	Mobile IP registration.
nameserver	IEN116 name service.
netbios-dgm	Net BIOS datagram service.

`netbios-ns`	Net BIOS name service.
`netbios-ss`	Net BIOS session service.
`non500-isakmp`	Non500-Internet Security Association and Key Management Protocol.
`ntp`	Network Time Protocol.
`pim-auto-rp`	PIM Auto-RP.
`rip`	Routing Information Protocol.
`snmp`	Simple Network Management Protocol.
`snmptrap`	SNMP Traps.
`sunrpc`	Sun Remote Procedure Call.
`syslogS`	ystem Logger.
`tacacs`	TAC Access Control System.
`talk`	Talk.
`tftp`	Trivial File Transfer Protocol.
`time`	Time.
`who`	Who service.
`xdmcp`	X Display Manager Control Protocol.
`vlan`	Match packets with given vlan value.
`<1-4094>`	VLAN identifier.
`inner-vlan`	Match packets with given inner vlan value.
`<1-4094>`	VLAN identifier.

Default

No default value is specified

Command Mode

IP access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ip-acl-02
(config-ip-acl)#deny udp any any eq tftp
(config-ip-acl)#deny tcp any any eq ssh
(config-ip-acl)#end
```

ipv6 access-group in

Use this command to attach an IPv6 access list to an interface to filter incoming IPv6 packets.

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the no form of this command to detach an IPv6 access list.

Note: To attach IPv6 ACL in the ingress direction ingress-ipv6 TCAM group needs to be enabled. See the hardware-profile filter command for details.

Command Syntax

```
ipv6 access-group NAME in
no ipv6 access-group NAME in
```

Parameters

NAME	Access list name.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#permit ipv6 any any
(config-ipv6-acl)#exit
(config)#hardware-profile filter ingress-ipv6 enable

(config)#interface xe3
(config-if)#ipv6 access-group mylist in

(config)#interface xe3
(config-if)#no ipv6 access-group mylist in
```

ipv6 access-list

Use this command to define a IPv6 access control list (ACL) that determines whether to accept or drop an incoming IPv6 packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

Use the no form of this command to remove the ACL.

Command Syntax

```
ipv6 access-list NAME
no ipv6 access-list NAME
```

Parameters

NAME	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ipv6-acl)#exit
```

ipv6 access-list default

Use this command to modify the default rule action of IPv6 access-list. Default rule is applicable only when IPv6 access-list is attached to interface. Default rule will have the lowest priority and only the IPv6 packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip access-list ipv6-acl-01
(config-ipv6-acl)#default permit-all
```

ipv6 access-list filter

Use this command to define an access-control entry in an access control list (ACL) that determines whether to accept or drop an IPv6 packet based on the criteria specified. This form of this command filters packets based on:

- Protocol
- Source IP address
- Destination IP address
- DSCP value
- VLAN identifier

Use the no form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: For IPv6 source and destination address filters, only the network part from the address (upper 64 bits) is supported due to hardware restriction. If the address length is more than 64 bits, it cannot be applied on the interfaces but it can be used with distributed lists in control plane protocols.

Command Syntax

```
(<1-268435453>|) (deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
  |ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|any) (X:X::X:X/
  M|X:X::X:X X:X::X:X|any) (dscp (<0-63>|af11| af12| af13| af21| af22| af23|
  af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef
  )|) (vlan <1-4094>|)
no (<1-268435453>|)(deny|permit)(<0-255>|ahp|any|eigrp|esp|gre|ipipv6|ipcomp
  |ipv6ipv6|ospf|pim|rsvp|vrrp) (X:X::X:X/ M|X:X::X:X X:X::X:X|any) (X:X::X:X/
  M|X:X::X:X X:X::X:X|any) (dscp (<0-63>|af11| af12| af13| af21| af22| af23|
  af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7| default| ef
  )|) (vlan <1-4094>|)
no (<1-268435453>)
```

Parameters

<1-268435453>	IPv6 ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
<0-255>	IANA assigned protocol number.
any	Any protocol packet.
ahp	Authentication Header packet.
eigrp	Enhanced Interior Gateway Routing Protocol packet.
esp	Encapsulating Security Payload packet.
gre	Generic Routing Encapsulation packet.
ipipv6	IPv4 over IPv6 Encapsulation packet.
ipcomp	IP Payload Compression Protocol packet.
ipv6ipv6	IPv6 over IPv6 Encapsulation packet.

ospf	Open Shortest Path First packet.
pim	Protocol Independent Multicast packet
rsvp	Resource Reservation Protocol packet.
vrrp	Virtual Router Redundancy Protocol packet.
X:X::X:X/M	Source Address with network mask length.
X:X::X:X X:X::X:X	
	Source Address with wild card mask.
any	Any source address.
X:X::X:X/M	Destination address with network mask length.
X:X::X:X X:X::X:X	
	Destination address with wild card mask.
any	Any destination address
any	Match any destination IP address.
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value 20.
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.
af33	AF33 DSCP (011110) decimal value 30.
af41	AF41 DSCP (100010) decimal value 34
af42	AF42 DSCP (100100) decimal value 36.
af43	AF43 DSCP (100110) decimal value 38.
cs1	CS1 (precedence 1) DSCP (001000) decimal value 8.
cs2	CS2 (precedence 2) DSCP (010000) decimal value 16.
cs3	CS3 (precedence 3) DSCP (011000) decimal value 24.
cs4	CS4 (precedence 4) DSCP (100000) decimal value 32.
cs5	CS5 (precedence 5) DSCP (101000) decimal value 40.
cs6	CS6 (precedence 6) DSCP (110000) decimal value 48.
cs7	CS7 (precedence 7) DSCP (111000) decimal value 56.
default	Default DSCP (000000) decimal value 0.
ef	EF DSCP (101110) decimal value 46.
vlan	Match packets with given vlan value.
<1-4094>	VLAN identifier.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list ipv6-acl-01
(config-ipv6-acl)#permit ipipv6 any any
(config-ipv6-acl)#end
```

ipv6 access-list icmpv6

Use this command to permit or deny IPv6 ICMP packets with the given source and destination IPv6 address, DSCP value and VLAN ID.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Command Syntax

```
(<1-268435453>|)(deny|permit) (icmpv6) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  (X:X::X:X/ M|X:X::X:X X:X::X:X|any) ((dscp (<0-63>|af11| af12| af13| af21| af22|
  af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7|
  default| ef)|) (vlan <1-4094>|)
```

```
no (<1-268435453>|)(deny|permit) (icmpv6) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  (X:X::X:X/M|X:X::X:X X:X::X:X|any) ((dscp (<0-63>|af11| af12| af13| af21| af22|
  af23| af31|af32| af33| af41| af42| af43| cs1| cs2| cs3| cs4| cs5|cs6| cs7|
  default| ef )|) (vlan <1-4094>|)
```

Parameters

<1-268435453>	IPv6 ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
icmpv6	Internet Control Message Protocol packet.
X:X::X:X/M	Source Address with network mask length.
X:X::X:X X:X::X:X	Source Address with wild card mask.
any	Any source address.
X:X::X:X/M	Destination address with network mask length.
X:X::X:X X:X::X:X	Destination address with wild card mask.
any	Any destination address
dscp	Match packets with given DSCP value.
<0-63>	Enter DSCP value between 0-63.
af11	AF11 DSCP (001010) decimal value 10.
af12	AF12 DSCP (001100) decimal value 12.
af13	AF13 DSCP (001110) decimal value 14.
af21	AF21 DSCP (010010) decimal value 18.
af22	AF22 DSCP (010100) decimal value 20.
af23	AF23 DSCP (010110) decimal value 22.
af31	AF31 DSCP (011010) decimal value 26.
af32	AF32 DSCP (011100) decimal value 28.

`af33`	AF33 DSCP (011110) decimal value 30.
`af41`	AF41 DSCP (100010) decimal value 34
`af42`	AF42 DSCP (100100) decimal value 36.
`af43`	AF43 DSCP (100110) decimal value 38.
`cs1`	CS1 (precedence 1) DSCP (001000) decimal value 8.
`cs2`	CS2 (precedence 2) DSCP (010000) decimal value 16.
`cs3`	CS3 (precedence 3) DSCP (011000) decimal value 24.
`cs4`	CS4 (precedence 4) DSCP (100000) decimal value 32.
`cs5`	CS5 (precedence 5) DSCP (101000) decimal value 40.
`cs6`	CS6 (precedence 6) DSCP (110000) decimal value 48.
`cs7`	CS7 (precedence 7) DSCP (111000) decimal value 56.
`default`	Default DSCP (000000) decimal value 0.
`ef`	EF DSCP (101110) decimal value 46.
`vlan`	Match packets with given vlan value.
`<1-4094>`	VLAN identifier.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit icmpv6 any any
```

ipv6 access-list remark

Use this command to add a description to an IPv6 access control list (ACL).

Use the no form of this command to remove an access control list description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)# remark Permit the inside admin address
```

ipv6 access-list resequence

Use this command to modify sequence numbers of the IPv6 access list specifications.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

`<1-268435453>`	Starting Sequence number.
`INCREMENT`	Sequence number increment steps.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#resequence 15 15
```

ipv6 access-list sctp

Use this command to allow ACL to permit or deny SCTP packets based on the given source and destination IPV6 address. Even DSCP and vlan ID can be configured to permit or deny with the given values.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Range options like neq, gt, lt and range are not supported by hardware in egress direction.

Command Syntax

```
(<1-268435453>|) (deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any) (X:X::X:X/
  M|X:X::X:X X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535> <0-
  65535>)|  } (dscp (<0-63>| af11| af12| af13| af21| af22| af23| af31| af32| af33|
  af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default| ef)|) (vlan <1-
  4094>|)
no (<1-268435453>|) (deny|permit) (sctp) (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  (X:X::X:X/M|X:X::X:X X:X::X:X|any) {(eq|gt|lt|neq) (<0-65535>) | (range <0-65535>
  <0-65535>)| } (dscp (<0-63>| af11| af12| af13| af21| af22| af23| af31| af32| af33|
  af41| af42| af43| cs1| cs2| cs3| cs4| cs5| cs6| cs7| default| ef)|) (vlan <1-
  4094>|)
```

Parameters

<1-268435453>	IPv6 ACL sequence number.
deny	Drop the packet.
permit	Accept the packet.
sctp	Stream Control Transmission Protocol packet.
X:X::X:X/M	Source address with network mask length.
X:X::X:X	Source address with wild card mask.
X:X::X:X	Source address's wild card mask (ignored bits).
any	Any source address.
X:X::X:X/M	Destination address with network mask length.
X:X::X:X	Destination address with wild card mask.
X:X::X:X	Destination address's wild card mask (ignored bits).
any	Any destination address.
eq	Source or destination port equal to.
gt	Source or destination port greater than.
lt	Source or destination port less than.
neq	Source or destination port not equal to.
<0-65535>	Source or destination port number.
range	Range of source or destination port numbers:
<0-65535>	Lowest value in the range.
<0-65535>	Highest value in the range.

`dscp`	Match packets with given DSCP value.
`<0-63>`	DSCP value.
`af11`	AF11 DSCP (001010) decimal value 10.
`af12`	AF12 DSCP (001100) decimal value 12.
`af13`	AF13 DSCP (001110) decimal value 14.
`af21`	AF21 DSCP (010010) decimal value 18.
`af22`	AF22 DSCP (010100) decimal value 20.
`af23`	AF23 DSCP (010110) decimal value 22.
`af31`	AF31 DSCP (011010) decimal value 26.
`af32`	AF32 DSCP (011100) decimal value 28.
`af33`	AF33 DSCP (011110) decimal value 30.
`af41`	AF41 DSCP (100010) decimal value 34
`af42`	AF42 DSCP (100100) decimal value 36.
`af43`	AF43 DSCP (100110) decimal value 38.
`cs1`	CS1 (precedence 1) DSCP (001000) decimal value 8.
`cs2`	CS2 (precedence 2) DSCP (010000) decimal value 16.
`cs3`	CS3 (precedence 3) DSCP (011000) decimal value 24.
`cs4`	CS4 (precedence 4) DSCP (100000) decimal value 32.
`cs5`	CS5 (precedence 5) DSCP (101000) decimal value 40.
`cs6`	CS6 (precedence 6) DSCP (110000) decimal value 48.
`cs7`	CS7 (precedence 7) DSCP (111000) decimal value 56.
`default`	Default DSCP (000000) decimal value 0.
`ef`	EF DSCP (101110) decimal value 46.
`vlan`	Match packets with given vlan value.
`<1-4094>`	VLAN identifier.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#200 permit sctp any any
```

ipv6 access-list tcp|udp

Use this command to define a IPv6 access control list (ACL) specification that determines whether to accept or drop an incoming IPv6 packet based on the criteria that you specify. This form of this command filters packets based on source and destination IPv6 address along with protocol (TCP or UDP) and port.

Use the no form of this command to remove an ACL specification.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Range options such as neq, gt, lt and range are not supported by the hardware in the egress direction.

Command Syntax

```
(<1-268435453>|) (deny|permit) tcp (X:X::X:X/M|X:X::X:X X:X::X:X|any)
  ((eq|gt|lt|neq) <0-65535> |bgp|chargen|cmd|daytime|discard|domain|drip

cs6| cs7| default| ef) | (vlan <1-4094>|)
```

Parameters

`<1-268435453>`	IPv6 ACL sequence number.
`deny`	Drop the packet.
`permit`	Accept the packet.
`tcp`	Transmission Control Protocol.
`udp`	User Datagram Protocol.
`X:X::X:X/M`	Source or destination IPv6 prefix and length.
`X:X::X:X X:X::X:X`	Source or destination IPv6 address and mask.
`any`	Any source or destination IPv6 address.
`eq`	Source or destination port equal to.
`gt`	Source or destination port greater than.
`lt`	Source or destination port less than.
`neq`	Source or destination port not equal to.
`<0-65535>`	Source or destination port number.
`range`	Range of source or destination port numbers:
`<0-65535>`	Lowest value in the range.
`<0-65535>`	Highest value in the range.
`ftp`	File Transfer Protocol (21).
`ssh`	Secure Shell (22).
`telnet`	Telnet (23).
`www`	World Wide Web (HTTP 80).
`tftp`	Trivial File Transfer Protocol (69).
`bootp`	Bootstrap Protocol (BOOTP) client (67).
`bgp`	Border Gateway Protocol.
`chargen`	Character generator.
`cmd`	Remote commands.
`daytime`	Daytime.
`discard`	Discard.
`domain`	Domain Name Service.
`drip`	Dynamic Routing Information Protocol.
`echo`	Echo.
`exec`	EXEC.
`finger`	Finger.

`ftp`	File Transfer Protocol.
`ftp-data`	FTP data connections.
`gopher`	Gopher.
`hostname`	NIC hostname server.
`ident`	Ident Protocol.
`irc`	Internet Relay Chat.
`klogin`	Kerberos login.
`kshell`	Kerberos shell.
`login`	Login.
`lpd`	Printer service.
`nnt`	Network News Transport Protocol.
`pim-auto-rp`	PIM Auto-RP.
`pop2`	Post Office Protocol v2.
`pop3`	Post Office Protocol v3.
`smtp`	Simple Mail Transport Protocol.
`ssh`	Secure Shell.
`sunrpc`	Sun Remote Procedure Call.
`tacacs`	TAC Access Control System.
`talk`	Talk.
`telnet`	Telnet.
`time`	Time.
`uucp`	UNIX-to-UNIX Copy Program.
`whois`	WHOIS/NICNAME
`www`	World Wide Web.
`nntp`	Range of source or destination port numbers:
`dscp`	Match packets with given DSCP value.
`<0-63>`	DSCP value.
`af11`	AF11 DSCP (001010) decimal value 10.
`af12`	AF12 DSCP (001100) decimal value 12.
`af13`	AF13 DSCP (001110) decimal value 14.
`af21`	AF21 DSCP (010010) decimal value 18.
`af22`	AF22 DSCP (010100) decimal value 20.
`af23`	AF23 DSCP (010110) decimal value 22.
`af31`	AF31 DSCP (011010) decimal value 26.
`af32`	AF32 DSCP (011100) decimal value 28.
`af33`	AF33 DSCP (011110) decimal value 30.
`af41`	AF41 DSCP (100010) decimal value 34
`af42`	AF42 DSCP (100100) decimal value 36.
`af43`	AF43 DSCP (100110) decimal value 38.

`cs1`	CS1 (precedence 1) DSCP (001000) decimal value 8.
`cs2`	CS2 (precedence 2) DSCP (010000) decimal value 16.
`cs3`	CS3 (precedence 3) DSCP (011000) decimal value 24.
`cs4`	CS4 (precedence 4) DSCP (100000) decimal value 32.
`cs5`	CS5 (precedence 5) DSCP (101000) decimal value 40.
`cs6`	CS6 (precedence 6) DSCP (110000) decimal value 48.
`cs7`	CS7 (precedence 7) DSCP (111000) decimal value 56.
`default`	Default DSCP (000000) decimal value 0.
`ef`	EF DSCP (101110) decimal value 46.
`biff`	Biff.
`bootpc`	Bootstrap Protocol (BOOTP) client.
`bootps`	Bootstrap Protocol (BOOTP) server.
`discard`	Discard.
`dnsix`	DNSIX security protocol auditing.
`domain`	Domain Name Service.
`echo`	Echo.
`isakmp`	Internet Security Association and Key Management Protocol.
`mobile-ip`	Mobile IP registration.
`nameserver`	IEN116 name service.
`netbios-dgm`	Net BIOS datagram service.
`netbios-ns`	Net BIOS name service.
`netbios-ss`	Net BIOS session service.
`non500-isakmp`	Non500-Internet Security Association and Key Management Protocol.
`ntp`	Network Time Protocol.
`pim-auto-rp`	PIM Auto-RP.
`rip`	Routing Information Protocol.
`snmp`	Simple Network Management Protocol.
`snmptrap`	SNMP Traps.
`sunrpc`	Sun Remote Procedure Call.
`syslog`	System Logger.
`tacacs`	TAC Access Control System.
`talk`	Talk.
`tftp`	Trivial File Transfer Protocol.
`time`	Time.
`who`	Who service.
`xdmcp`	X Display Manager Control Protocol.
`vlan`	Match packets with given vlan value.
`<1-4094>`	VLAN identifier.

Default

No default value is specified

Command Mode

IPv6 access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 access-list mylist
(config-ipv6-acl)#deny udp any eq tftp any
(config-ipv6-acl)#deny tcp fd22:bf66:78a4:10a2::/64 fdf2:860a:746a:e49c::/64 eq ssh
```

mac access-group

Use this command to attach a MAC access list to an interface to filter incoming packets.

When you attach an access list to a VLAN interface or LAG interface as well as to a physical interface that is a member of that LAG and/or VLAN interface, the priority order is:

1. VLAN interface
2. LAG interface
3. Physical interface

For example, if you attach access lists to both a LAG interface and a physical interface that is a member of that LAG, matching traffic rules are applied to the LAG interface, but not to the physical interface.

Use the `no` form of this command to detach a MAC access group.

Note: To attach a MAC ACL in the ingress direction ingress-l2 or ingress-l2-ext TCAM group needs to be enabled and to attach a MAC ACL in the egress direction egress-l2 TCAM group needs to be enabled. See the hardware-profile filter command for details.

Note: An egress ACL is supported on physical and lag interfaces only. VLAN and inner-VLAN options in ACL rules will match incoming packet VLANs even when ACL attached at egress.

Command Syntax

```
mac access-group NAME (in|out)
no mac access-group NAME (in|out)
```

Parameters

`NAME`	Access list name.
`in`	Filter incoming packets.
`out`	Filter outgoing packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)#permit any any
(config-mac-acl)#exit

(config)#hardware-profile filter ingress-l2-ext enable
```

```
(config)#interface xe3
(config-if)#mac access-group mylist in
(config-if)#exit

(config)#interface xe3
(config-if)#no mac access-group mylist in
(config-if)#exit
```

mac access-list

Use this command to define a MAC access control list (ACL) that determines whether to accept or drop an incoming packet based on specifications configured under the ACL. An ACL is made up of one or more ACL specifications.

Each packet that arrives at the device is compared to each specification in each ACL in the order that they are defined. The device continues to look until it has a match. If no match is found and the device reaches the end of the list, the packet is denied by default. For this reason, place the most frequently occurring specifications at the top of the list.

The device stops checking the specifications after a match occurs.

There is an implied deny specification for traffic that is not permitted. Implied specification can be updated to permit if the use-case is to deny a certain set of traffic.

Use the no form of this command to remove an ACL.

Command Syntax

```
mac access-list NAME
no mac access-list NAME
```

Parameters

NAME	Access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#exit
```

mac access-list default

Use this command to modify the default rule action of mac access-list. Default rule is applicable only when access-list is attached to interface. Default rule will have the lowest priority and only the packets not matching any of the user defined rules match default rule.

Command Syntax

```
default (deny-all|permit-all)
```

Parameters

`deny-all`	Drop all packets.
`permit-all`	Accept all packets.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#default permit-all
```

mac access-list filter

Use this command to define an access control entry (ACE) in a mac access control list (ACL) that determines whether to permit or deny packets with the given source and destination MAC, ether type, cos and VLAN values.

Use the no form of this command to remove an ACL specification. ACL specification can be removed using the sequence number as well.

Note: Configuring same filter again with change of sequence number or change of action will result in update of sequence number or filter action.

Note: Ether type option is not supported by hardware in egress direction

Command Syntax

```
(<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (aarp|appletalk|decnet-
  iv|diagnostic|etype-6000|etype-8042 |ip4|ip6|mpls|lat|lavc-sca|mop-console|mop-
  dump|vines-echo|WORD|) (cos <0-7>|)(vlan <1-4094>|) (inner-vlan <1-4094>|)
no (<1-268435453>|)(deny|permit) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (any | (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX) | host (XX-XX-XX-XX-XX-
  XX|XX:XX:XX:XX:XX:XX|XXXX.XXXX.XXXX)) (aarp|appletalk|decnet-
  iv|diagnostic|etype-6000|etype-8042 |ip4|ip6|mpls|lat|lavc-sca|mop-console|mop-
  dump|vines-echo|WORD|) (cos <0-7>|)(vlan <1-4094>|)(inner-vlan <1-4094>|)
no (<1-268435453>)
```

Parameters

deny	Drop the packet.
permit	Accept the packet.
<1-268435453>	IPv4 ACL sequence number.
any	Source/Destination any.
XX-XX-XX-XX-XX-XX	Source/Destination MAC address (Option 1).
XX:XX:XX:XX:XX:XX	Source/Destination MAC address (Option 2).
XXXX.XXXX.XXXX	Source/Destination MAC address (Option 3).
XX-XX-XX-XX-XX-XX	Source/Destination wildcard (Option1).
XX:XX:XX:XX:XX:XX	

	Source/Destination wildcard (Option2).
XXXX.XXXX.XXXX	
	Source/Destination wildcard (Option3).
host	A single source/destination host.
aarp	Ethertype - 0x80f3.
appletalk	Ethertype - 0x809b.
decnet-iv	Ethertype - 0x6003.
diagnostic	Ethertype - 0x6005.
etype-6000	Ethertype - 0x6000.
etype-8042	Ethertype - 0x8042.
ip4	Ethertype - 0x0800.
ip6	Ethertype - 0x86dd.
mpls	Ethertype - 0x8847.
lat	Ethertype - 0x6004.
lavc-sca	Ethertype - 0x6007.
mop-console	Ethertype - 0x6002.
mop-dump	Ethertype - 0x6001.
vines-echo	Ethertype - 0x0baf.
WORD	Any Ethertype value.
cos <0-7>	Cos value.
vlan <1-4094>	VLAN identifier.
inner-vlan <1 - 4094>	
	Inner-VLAN identifier.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mac-acl-01
(config-mac-acl)#permit 0000.1234.1234 0000.0000.0000 any
```

mac access-list remark

Use this command to add a description to a MAC access control list (ACL).

Use the no form of this command to remove an ACL description.

Command Syntax

```
remark LINE
no remark
```

Parameters

LINE	ACL description up to 100 characters.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)# remark Permit the inside admin address
```

mac access-list resequence

Use this command to modify sequence numbers of mac access list specifications.

Note: Use a non-overlapping sequence space for new sequence number sets to avoid possible unexpected rule matches during transition.

Note: Re-sequencing an ACL attached to a management interface clears the ACL counters associated to it.

Command Syntax

```
resequence <1-268435453> INCREMENT
```

Parameters

`<1-268435453>`	Starting sequence number.
`INCREMENT`	Sequence number increment steps.

Default

No default value is specified

Command Mode

MAC access-list mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#mac access-list mylist
(config-mac-acl)#resequence 15 15
```

show access-lists

Use this command to display a list of access list

Command Syntax

```
show access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME	Access-list name.
expanded	Expanded access-list.
summary	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show access-lists expanded
IP access list Iprule1
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
default deny-all
MAC access list Macrule1
10 permit host 0000.1234.1234 any
default deny-all
IPv6 access list ipv6-acl-01
10 deny ahp 3ffe::/64 4ffe::/64
default deny-all

#show access-lists summary
IPV4 ACL Iprule1
statistics enabled
Total ACEs Configured: 1
Configured on interfaces:
xe3/1 - egress (Router ACL)
Active on interfaces:
xe1/3 - ingress (Router ACL)
MAC ACL Macrule1
statistics enabled
Total ACEs Configured: 0
Configured on interfaces:
Active on interfaces:
IPV6 ACL ipv6-acl-01
```

```
statistics enabled
Total ACEs Configured: 2
Configured on interfaces:
xe7/1 - ingress (Router ACL)
Active on interfaces:
```

show arp access-lists

Use this command to display ARP access lists.

Note: Broadcast ARP request packets are counted twice.

Command Syntax

```
show arp access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME	ARP access-list name.
expanded	Expanded access-list.
summary	Access-list summary.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show arp access-lists
ARP access list arp1
        10 permit ip 1.1.1.0/24 mac 0000.0000.0001 FFFF.FFFF.FFF0
        20 deny ip 2.2.2.0/24 mac any
        default deny-all

#show arp access-lists summary
ARP ACL arp1
       statistics enabled
       Total ACEs Configured: 2
       Configured on interfaces:
          xe1 - ingress (Port ACL)
       Active on interfaces:
          xe1 - ingress (Port ACL)
```

show ip access-lists

Use this command to display IP access lists.

Note: In Qumran devices, when both ip access-list and mac access-list configured on the same interface with rules from both access-lists matching the packet, the match packet statistics is incremented only for the access-list whose hardware-profile filter is configured at the last. Also, when qos is configured on the same interface, along with ingress-acl statistics profile, ingress-qos statistics profile need to be enabled in order to get statistics for both qos entries and acl entries.

Note: See hardware-profile filter for filter groups and hardware-profile statistics.

Command Syntax

```
show ip access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME	Access-list name.
expanded	Expanded access-list.
summary	Access-list summary.

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip access-lists
IP access list Iprule2
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
12 deny ip 30.0.0.2 0.0.0.255 182.124.0.3/24
default deny-all

#show ip access-lists summary
IPV4 ACL Iprule3
statistics enabled
Total ACEs Configured: 4
Configured on interfaces:
sa1 - ingress (Port ACL)
sa3 - ingress (Router ACL)
sa8 - ingress (Port ACL)
vlan1.3 - ingress (Router ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

```
xe3/1 - egress (Router ACL)
Active on interfaces:
sa1 - ingress (Port ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show ipv6 access-lists

Use this command to display IPv6 access lists.

Command Syntax

```
show ipv6 access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME	Access-list name.
expanded	Expanded access-list.
summary	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 access-lists
IPv6 access list ipv6-acl-01
10 deny ahp 3ffe::/64 4ffe::/64
20 permit ahp 78fe::1/48 68fe::1/48
30 permit ahp 3333::1/64 4444::1/48 fragments
40 permit ahp 5555::1/64 4444::1/48 dscp af23
default deny-all

#show ipv6 access-lists summary
IPV6 ACL ipv6-acl-01
statistics enabled
Total ACEs Configured: 4
Configured on interfaces:
sa3 - ingress (Router ACL)
vlan1.3 - ingress (Router ACL)
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
Active on interfaces:
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show mac access-lists

Use this command to display MAC access lists.

Note: In Qumran devices, when both ip access-list and mac access-list configured on the same interface with rules from both access-lists matching the packet, match packet statistics is incremented only for the access-list whose hardware-profile filter is configured at the last. Also, when qos is configured on the same interface, along with ingress-acl statistics profile, ingress-qos statistics profile need to be enabled in order to get statistics for both qos entries and acl entries.

Note: See hardware-profile filter for filter groups and hardware-profile statistics.

Command Syntax

```
show mac access-lists (NAME|) (expanded|summary|)
```

Parameters

NAME	Access-list name.
expanded	Expanded access-list.
summary	Summary of access-list.

Default

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mac access-lists
MAC access list Macrule2
default deny-all
MAC access list Macrule3
10 permit host 0000.1234.1234 any
20 deny host 1111.1111.AAAA any 65535
30 permit host 2222.2222.AAAA any 65535
40 permit 0000.3333.3333 0000.0000.FFFF 4444.4444.4444 0000.0000.FFFF
default deny-all [match=1126931077]

# show mac access-lists summary
MAC ACL Macrule3
statistics enabled
Total ACEs Configured: 4
Configured on interfaces:
sa3 - ingress (Router ACL)
sa8 - ingress (Port ACL)
vlan1.3 - ingress (Router ACL)
```

```
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
Active on interfaces:
xe1/1 - ingress (Port ACL)
xe1/2 - ingress (Router ACL)
xe1/3 - ingress (Router ACL)
```

show running-config access-list

Use this command to show the running system status and configuration details for MAC and IP access lists.

Command Syntax

```
show running-config access-list
```

Parameters

None

Default

None

Command Mode

Privileged Exec mode, configure mode, and route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config access-list
ip access-list abd
10 deny any any any
!
mac access-list abc
remark test
10 deny any any
!
```

show running-config aclmgr

Use this command to display the entire access list configurations along with the attachment to interfaces.

Command Syntax

```
show running-config aclmgr (all|)
```

Parameters

`all`	Show running config with defaults

Default

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#show running-config aclmgr
ip access-list ip-acl-01
11 permit ip 30.0.0.1 0.0.0.255 172.124.0.2 0.0.0.255
12 deny ip 30.0.0.2 0.0.0.255 182.124.0.3/24
mac access-list mac-acl-01
10 permit host 0000.1234.1234 any
20 permit host 0000.1111.AAAA any ipv4 cos 3 vlan 3
!
ipv6 access-list ipv6-acl-01
10 deny ipv6 3ffe::/64 4ffe::/64 dscp af43
20 permit ipv6 78fe::/64 68fe::/64 dscp cs3
!
interface xe1/1
ip access-group ip-acl-01 in
!
```

show running-config ipv6 access-list

Use this command to show the running system status and configuration details for IPv6 access lists.

Command Syntax

```
show running-config ipv6 access-list
```

Parameters

None

Default

None

Command Mode

Privileged exec mode, configure mode, and route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config ipv6 access-list
ipv6 access-list test
10 permit any any any
```

CHAPTER 6 Access Control List Commands (Standard)

This chapter is a reference for the standard Access Control List (ACL) commands:

ip access-list standard

Use this command to define a standard IP access control list (ACL) in which multiple specifications can be configured. A specification determines whether to accept or drop an incoming IP packet based on the source IP address, either an exact match or a range of prefixes.

Standard ACL can be used by L3 and SNMP protocols to permit or deny IP packets from a host or a range of prefixes.

Use the no form of this command to remove the ACL.

Note: Standard access-lists are not allowed to be attached on interfaces and are used for protocol level filtering purposes.

Command Syntax

```
ip access-list standard NAME
no ip access-list standard NAME
```

Parameters

NAME	Standard IP access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ip access-list standard ip-acl-01
(config-ip-acl-std)#exit
(config)#no ip access-list standard ip-acl-01
```

ip access-list standard filter

Use this command to configure access control entry in an access control list (ACL).

This command determines whether to accept or drop a packet based on the configured source IP address.

Use the no form of this command to remove an ACL specification.

Command Syntax

```
(deny|permit) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
no (deny|permit) (A.B.C.D/M|A.B.C.D A.B.C.D|host A.B.C.D|any)
```

Parameters

deny	Drop the packet.
permit	Accept the packet.
A.B.C.D/M	Source IP prefix and length.
A.B.C.D A.B.C.D	Source IP address and mask.
host A.B.C.D	A single source host IP address.
any	Match any source IP address.

Default

No default value is specified

Command Mode

Standard IP access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0

Examples

```
#configure terminal
(config)#ip access-list ip-acl-01
(config-ip-acl-std)#permit 30.30.30.0/24
(config-ip-acl-std)#no permit 30.30.30.0/24
```

Ipv6 access-list standard

Use this command to define a standard IPv6 access control list (ACL) in which multiple specifications can be configured. A specification determines whether to accept or drop an incoming IPv6 packet based on the source IPv6 address, either an exact match or a range of prefixes.

Standard IPv6 ACL can be used by L3 protocols to permit or deny IPv6 packets from a host or a range of prefixes.

Use the no form of this command to remove the ACL.

Note: Standard access-lists are not allowed to be attached on interfaces and are used for protocol level filtering purposes.

Command Syntax

```
ipv6 access-list standard NAME
no ipv6 access-list standard NAME
```

Parameters

NAME	Standard IPv6 access-list name.

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ipv6 access-list standard ipv6-acl-01
(config-ipv6-acl-std)#exit
(config)#no ipv6 access-list standard ipv6-acl-01
```

ipv6 access-list standard filter

Use this command to configure access control entry in an access control list (ACL).This determines whether to accept or drop a packet based on the configured IPv6 prefix.

Use the no form of this command to remove an ACL specification.

Command Syntax

```
(deny|permit)(X:X::X:X/M|X:X::X:X X:X::X:X|any)
no(deny|permit)(X:X::X:X/M|X:X::X:X X:X::X:X|any)
```

Parameters

deny	Drop the packet.
permit	Accept the packet.
X:X::X:X/M	Source address with network mask length.
X:X::X:X X:X::X:X	Source address with wild card mask.
any	Any source address.

Default

No default value is specified

Command Mode

Standard IPv6 access-list mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ipv6 access-list standard ipv6-acl-01
(config-ipv6-acl-std)#permit 2000::0/64
(config-ipv6-acl-std)#no permit 2000::0/64
```

Chassis Monitoring Module Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Chassis Management Module Commands

This chapter provides a description, syntax, and examples of CMM feature commands:

You can retrieve the same set of information through SNMP that these commands display. This MIB is defined in `CMM-CHASSIS-MIB.txt:`

IP Infusion Inc. enterprise identifier	36673
Chassis MIB identifier	100

The MIB definition is available at:

- https://github.com/IPInfusion/OcNOS/branches

Navigate to the directory for the version of OcNOS that you are using.

cpu-core-usage

Use this command to configure user threshold values for monitoring CPU core use.

Use no form of this command to set default thresholds.

Command Syntax

```
cpu-core-usage warning <51-100> alarm <91-100>
```

Parameters

<51-100>	Warning threshold
<91-100>	Alarm threshold

Defaul

Check the default thresholds using `show system-information cpu-load` CLI command.

Command Mode

Config Mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
#con t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#
(config)#cpu-core-usage warning 56 alarm 97
(config)#end
#show system-information cpu-load

System CPU-Load Information
===========================

Uptime                    : 64 Days 18 Hours 20 Minutes 12 Seconds

Load Average(1 min)       : 4.24% (Crit Thresh : 40%, Alert Thresh : 50%)
Load Average(5 min)       : 2.87% (Crit Thresh : N/A, Alert Thresh : 50%)

CPU core 2 Usage          : 0.00% (Crit Thresh : 50%, Alert Thresh : 90%)
CPU core 3 Usage          : 4.59% (Crit Thresh : 50%, Alert Thresh : 90%)
CPU core 4 Usage          : 1.82% (Crit Thresh : 50%, Alert Thresh : 90%)
#
```

debug cmm

Use this command to enable or disable debugging for CMM.

Command Syntax

```
debug cmm
no debug cmm
```

Parameters

None

Default

By default, debug command is not configured.

Command Mode

Configuration mode and exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug cmm
(config)#no debug cmm
```

locator led

Use this command to turn on the locator LED.

Use the no form of this command to turn off the locator LED.

Command Syntax

```
locator-led on
no locator-led
```

Parameters

None

Default

By default, locator LED is turned off.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#locator-led on
(config)#no locator-led
```

show hardware-information

Use this command to display hardware information.

Command Syntax

```
show hardware-information (memory|fan|temperature|led|power|transceiver|all)
```

Parameter

`all`	Hardware details of all modules.
`fan`	Fan status of the boards.
`led`	LED status of the boards.
`memory`	Memory information of the boards.
`power`	PSU information.
`temperature`	Temperature sensor information of the boards.
`transceiver`	Transceiver presence status and supported list of transceivers.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show hardware-information all
-------------------------------------------------------
                RAM INFORMATION

Table 1-75 explains the show command output fields.

Table 1-75: show hardware-information all output

Entry	Description
Ram Information	Displays the used memory, free memory, shared, buffers, total swap, and free swap memory.
Hard Disk Information	Displays hard drive serial number, model, firmware revision, cylinders, heads, and sectors, as well as revision number and total size.
Fans	Displays the fan tray numbers, numbers of fans per tray, and their speed in RPM.
Board Temp Sensors Temperature	Displays sensor type, current temperature, and operating range.
BCM Chip Internal Temperature	Displays broadcom chips current internal temperature, Operating range and average temperature.
System Power Information	Displays system power Information. Shows Voltage on all rails, and whether the power is up or has failed.
PSU	Show main power supply statistics – Volts in, Volts out, current in and out Amperes, power in and out in Watts, temperature of each power supply, and fan speed in RPM.
LED	Shows a list of what the LEDs represent, what state the LEDs mean, and a description of what the LEDs current color means.
Transceiver DDM support list	Show a list of transceivers that support Digital Diagnostic Monitoring (DDM) – type, vendor name, part number, and whether DDM is supported.
Port Number	Displays a list of the port numbers, port type (SFP,QSFP, etc) and whether a transceiver is or is not in the port.

show system fru

Use this command to display the system FRU controlled by BMC.

Command Syntax

```
show system fru
```

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show system fru
--------------System FRUs------------------
FRU Device Description : MAINBOARD_FRU
Board Mfg Date        : 2018-09-17 13:34:00
Board Mfg             : UFISPACE
Board Product         : S9500-30XS-Board
Board Serial          : WB2N9470004
Product Manufacturer  : UFISPACE
Product Name          : S9500-30XS
Product Version       : PVT
Product Serial        : WE61A47S00016
Product Asset Tag     : 00

FRU Device Description : PSU0_FRU
Product Manufacturer  : FSPGROUP
Product Name          : VICTO451AM
Product Part Number   : YNEB0450
Product Version       : BM-2R01P10
Product Serial        : T0A060Y322009000053
Product extra 1       : P3H800A03
Product extra 2       : A

FRU Device Description : PSU1_FRU
Product Manufacturer  : FSPGROUP
Product Name          : VICTO451AM
Product Part Number   : YNEB0450
Product Version       : BM-2R01P10
Product Serial        : T0A060Y322009000052
Product extra 1       : P3H800A03
Product extra 2       : A
#
```

show system-information

Use this command to display system information.

Command Syntax

```
show system-information (all|fan|psu|os|cpu|bios|cpu-load|board-info)
```

Parameter

`all`	System information of all modules.
`bios`	BIOS information.
`board-info`	Board EEPROM details.
`cpu`	Processor information.
`cpu-load`	CPU load information.
`fan`	Fan Field Replaceable Units (FRU) EEPROM information.
`os`	OS and Kernel version information.
`psu`	Power Supply Field Replaceable Units (FRU) EEPROM information.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show system-information psu
System PSU FRU Information
=========================
PSU 2 Country of Origin          : CN
PSU 2 PPID Part Number           : 0T9FNW
PSU 2 PPID Part Number Rev       : A00
PSU 2 Manufacturer ID            : 28298
PSU 2 Date Code                  : 52R
PSU 2 Serial Number              : 0298
PSU 2 Part Number                : 0T9FNW
PSU 2 Part Number Revision       : A00
PSU 2 Number of Fans in the tray : 1
PSU 2 Type                       : AC Normal
PSU 2 Service Tag                : AEIOU
```

The following tables explain the show command output fields.

Table 1-76: show system-information topics

Topic	Description
all	Show all topics of system information..
bios	Display BIOS information.
board-info	Display information related to the board.
cpu	Displays Central Processing Unit information
cpu-load	Displays the load on the system’s CPU.
fan	Displays fan information contain in the EEPROM.
os	Displays information regarding the host operating system
psu	Displays information regarding Field Replaceable Units (FRU).

Table 1-77: Show fan topic displays

System Fan FRU Information	Description
Fan Tray “#” PPID Part Number	The vendor’s part number for the fan.
Fan Tray Serial Number	As stated
Service Tag	The Service Tag can help identify your device for on-line support and upgrading drivers
Vendor Name	As stated

Table 1-78: Show system BIOS information

BIOS Information	Description
# dmidecode	The dmidecode is a tool for dumping a computer's DMI table contents in a human-readable format. This table contains a description of the system's hardware components, as well as other useful pieces of information such as serial numbers and BIOS revisions.
SMBIOS	The System Management BIOS (SMBIOS) defines data structures (and access methods) that can be used to read management information produced by the BIOS of a computer. Also, it is involved with the DMI Address –
Handle 0x0000, DMI type 0, 24 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 0 indicates the following information is specific to BIOS properties, and is 24 bytes long.
BIOS Physical Information	• Vendor – The manufacture of the BIOS. • Version – The Version number. • Release Date – as stated. • Address – starting address (in memory) of the BIOS.

Table 1-78: Show system BIOS information (Continued)

BIOS Information	Description
Characteristics	• Is PCI supported. • Is BIOS upgradeable. • Is boot from a CD supported. • Is selectable boot devices supported. • Is BIOS ROM socketed. • Is Enhanced Disk Drive (EDD) vectoring supported. • Is 5.25"/1.2 MB floppy services supported (int 13h) • Is 3.5"/720 kB floppy services supported (int 13h) • Is 3.5"/2.88 MB floppy services supported (int 13h) • Is Print screen service supported (int 5h) • Is 8042 keyboard services supported (int 9h) • Is Serial services supported (int 14h) • Is Printer services supported (int 17h) • Is Advanced Configuration and Power Interface (ACPI) supported • Is USB legacy supported • Is BIOS boot specification supported • Is Targeted content distribution supported • Is Unified Extensible Firmware Interface (UEFI) supported
BIOS Revision	The BIOS revision number.
Handle 0x0043, DMI type 13, 22 bytes	Handle of the Desktop Management Interface (DMI) and the DMI type, where type value identifies what the DMI contains. DMI = 13 indicates the following information is specific to BIOS language information, and is 22 bytes long.
BIOS Language Informantion	• Language Description Format – A term that describes the number of bits used to represent the BIOS Language information parameters. • Installable Languages – The number of languages that can be used by the BIOS at any time. • Currently Installed Language – United States English (or Latin-1) as described by the ISO standard, en|US|iso8859-1.

Table 1-79: Show CPU information

System CPU Information	Description
processor	The processor number of each CPU
model name	Details about each CPU. For example, Intel(R) Atom(TM) CPU C2538 @ 2.40GHz.

Table 1-80: Show system CPU load information

Load Information	Description
Uptime	As stated in days, hours, minutes, and seconds.
Load Average for past 1min	As stated in percent.
Load Average for past 5 min	As stated in percent.

Table 1-80: (Continued)Show system CPU load information

Load Information	Description
Load Average for past 15 min	As stated in percent.
CPU Usage at this instant	As stated in percent.
Max threshold for CPU-usage	As stated in percent.

Table 1-81: Show system board information

System Information	Description
Product Name	Model number of the device.
Serial Number	As stated
Base MAC Address	As stated
Manufacture Date	As state
Platform Name	The platform on which the product is based.
ONIE Version	The version of the Open Network Install Environment (ONIE).
MAC addresses	Number of MAC addresses related to the device.
Manufacture	As stated
Country Code	The code that represents the country of manufacture. For example, US = United States, TW = Taiwan, and so on.
Diag Version	As stated
CRC-32	Cyclic Redundancy Check value.
Switch Chip Revision	As stated
MAIN BOARD REVISION	As stated
CPU CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the CPU.
SW CPLD VERSION	The version of the Complex Programmable Logic Device (CPLD) use by the switch.
MAIN BOARD TYPE	An identifying string for the main board.
CPU BOARD ID	An identifying string for the CPU board.
CPU BOARD VERSION	As stated
SW BOARD ID	NA
SW BOARD VERSION	As stated
VCC 5V	The state of the VCC 5V power rail (Enabled \ Disabled)
MAC 1V	The state of the MAC 1V power rail Enabled \ Disabled

Table 1-81: (Continued)Show system board information

System Information	Description
VCC 1.8V	The state of the VCC 1.8V power rail (Enabled \ Disabled)
MAC AVS 1V	The state of the MAC AVS 1V power rail (Enabled \ Disabled)
HOT SWAP1	Enabled \ Disabled
HOT SWAP2	Enabled \ Disabled

Table 1-82: Show host system details

Host Information	Description
OS Distribution	The operating system on which the device is to run.
Kernel Version	A string that identifies the operating kernel.

show system sensor

Use this command to display system sensors controlled by BMC.

Command Syntax

```
show system sensor
```

Parameter

None

Command Mode

Execution mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show system sensor
-------------------------------------------------System Sensors-------------------------
-------------------------------
Codes: LNR - Lower Non-Recoverable
LCR - Lower Critical
LNC - Lower Non-Critical
UNC - Upper Non-Critical
UCR - Upper Critical
UNR - Upper Non-Recoverable
Note: For discrete sensor, thresholds and value columns are not applicable.

SENSOR          | VALUE      | UNITS      | LNR       | LCR       | LNC       | UNC
| UCR       | UNR       | STATE

#
```

system-load-average

Use this command to configure user threshold values for monitoring system load average for last 1 minute, 5 minute and 15 minute.

Use no form of this command to set default thresholds.

Command Syntax

```
system-load-average (1min warning <41-100> alarm <51-100> 5min alarm <51-100> 15min
  alarm <51-100>)
```

Parameters

`1min`	1min
`warning`	Warning
`<41-100>`	41-100
`alarm`	alarm
`<51-100>`	51-100
`5min`	5min
`alarm`	alarm
`<51-100>`	51-100
`15min`	15min
`alarm`	alarm
`<51-100>`	51-100

Default

Check the default thresholds using `show system-information cpu-load` CLI command.

Command Mode

Config Mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
#con t
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#
(config)#system-load-average 1min warning 45 alarm 55 5min alarm 65 15min
alarm 75

#show system-information cpu-load

System CPU-Load Information
===========================
```

```
Uptime                    : 64 Days 17 Hours 56 Minutes 22 Seconds

Load Average(1 min)       : 5.74% (Crit Thresh : 45%, Alert Thresh : 55%)
Load Average(5 min)       : 3.71% (Crit Thresh : N/A, Alert Thresh : 65%)
Load Average(15 min)      : 3.21% (Crit Thresh : N/A, Alert Thresh : 75%)

CPU core 4 Usage          : 0.93% (Crit Thresh : 50%, Alert Thresh : 90%)
```

CHAPTER 2 Digital Diagnostic Monitoring Commands

This chapter provides a description, syntax, and examples of DDM feature commands:

clear ddm transceiver alarm

Use this command to clear the transceiver alarm in the DDM monitor interface.

Command Syntax

```
clear ddm transceiver alarm.
```

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
OCNOS(config-if)#ddm monitor
OCNOS(config-if)#clear ddm transceiver alarm
OCNOS(config-if)#exit
```

clear ddm transceiver alarm all

Use this command to clear the transceiver DDM alarm for all interface.

Command Syntax

clear ddm transceiver alarm all

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
OCNOS# clear ddm transceiver alarm all
```

ddm monitor

Use this command to enable or disable DDM monitoring for interfaces which have a supported transceiver.

Use the no form of this command to remove DDM monitoring for all transceivers.

Command Syntax

```
ddm monitor (disable|enable)
no ddm monitor
```

Parameters

`enable`	Enable DDM monitoring.
`disable`	Disable DDM monitoring.

Default

By default, DDM monitoring is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#ddm monitor enable
(config-if)#ddm monitor disable
(config-if)#exit

(config)#interface xe1
(config-if)#no ddm monitor
(config-if)#exit
```

ddm monitor all

Use this command to enable DDM monitoring for all transceiver.s

Use the no form of this command to disable DDM monitoring for all transceivers.

Command Syntax

```
ddm monitor all
no ddm monitor all
```

Parameters

None

Default

By default, DDM monitoring is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ddm monitor all

(config)#no ddm monitor all
```

ddm monitor interval

Use this command to set the monitoring interval for the transceiver.

Use no form with this command to set the monitoring interval to its default.

Command Syntax

```
ddm monitor interval <60-3600>
no ddm monitor interval
```

Parameters

<60-3600>	Interval period in seconds.

Default

The default monitoring interval is 60 seconds.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ddm monitor interval 60
```

debug ddm

Use this command to enable or disable debugging for DDM.

Command Syntax

```
debug ddm
no debug ddm
```

Parameters

None

Default

By default, debug command is not configured.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ddm
(config)#no debug ddm
```

service unsupported-transceiver

Use this command to allow an unsupported transceiver to be enabled for DDM monitoring.

Use the no form of this command to disable DDM on an unsupported transceiver.

Command Syntax

```
service unsupported-transceiver
no service unsupported-transceiver
```

Parameters

None

Default

By default, DDM on an unsupported transceiver is disabled.

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#service unsupported-transceiver

(config)#no service unsupported-transceiver
```

show controller details

Use this command to display the EEPROM details of transceiver.s

Command Syntax

```
show interface (IFNAME|) controllers
```

Parameters

IFNAME	Interface name. If not specified, this command displays details of all connected transceivers.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe52/1 controllers

Port Number             : 52
Vendor oui              : 0x0 0x17 0x6a
Vendor name             : AVAGO
Vendor part_no          : AFBR-79E4Z
serial_number           : QB380161

cc_ext                  : 0x28
DDM Support             : yes
```

show supported-transceiver

Use this command to display supported transceivers.

Command Syntax

```
show supported-transceiver
```

Parameters

None

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#show supported-transceiver
-----------------------------------------------------
          Transceiver DDM support list
-----------------------------------------------------
Type                      :SFP
Vendor Name               :FINISAR CORP
Vendor Part Number        :FTLF8519P2BNL
DDM Supported             :Yes

Type                      :SFP
Vendor Name               :EVERTZ
Vendor Part Number        :SFP10G-TR13S
DDM Supported             :Yes

Type                      :QSFP
Vendor Name               :AVAGO
Vendor Part Number        :AFBR-79E4Z
DDM Supported             :Yes
```

show interface transceiver details

Use this command to display details of transceivers and threshold violations.

Command Syntax

```
show interface (IFNAME|) transceiver (detail|threshold violation|)
```

Parameters

`IFNAME`	Interface name. If not specified, this command displays details of all connected transceivers.
`detail`	Transceiver information such as voltage, temperature, power, and current.
`threshold violation`	Transceiver threshold violations.

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface transceiver detail

```

Table 2-83 explains the output fields.

Table 2-83: show interface transceiver details output

Field	Description
Port	The number of the transceiver port.
Temp	Temperature in degrees Celsius of the transceiver.
Voltage	Voltage in Volts on the transceiver.
Current	Current in Milliamperes used by the transceiver.
Rx Power	Power received in Decibel-milliwatts (dBm) by the transceiver.
Tx Power	Power being transmitted in milliWatts by the transceiver.
High Alarm	The level that is needed to be reached to trigger a high alarm.
High Warn	The level that is needed to be reached to trigger a high warning.
Low Warn	The level that is needed to be reached to trigger a low warning.
Low Alarm	The level that is needed to be reached to trigger a low alarm.

Control Plane Policing Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Control Plane Policing Commands

This chapter is a reference for the Control Plane Policing (CoPP) commands.

clear interface cpu counters

Use this command to clear the CPU queue counters.

Command Syntax

```
clear interface cpu counters
```

Parameter

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear interface cpu counters
```

cpu-queue

Use this command to set protocol queues shaper and enable/disable queue monitoring for drop.

Command Syntax

```
cpu-queue (cpu.q0|cpu.q1|cpu.q2|cpu.q3|cpu.q4|cpu.q5|cpu.q6|cpu.q7|
  arp|bfd|bgp|bpdu|dsp|icmp-mpls|icmp-redirect|igmp|isis|link-
  local|nhop|ospf|pim|reserved-mc|rsvp-ldp|sflow|vrrp-rip-dhcp|vxlan)(monitor|no-
  monitor|rate <0-100000>)
no cpu-queue (cpu.q0|cpu.q1|cpu.q2|cpu.q3|cpu.q4|cpu.q5|cpu.q6|cpu.q7|
  arp|bfd|bgp|bpdu|dsp|icmp-mpls|icmp-redirect|igmp|isis|link-
  local|nhop|ospf|pim|reserved-mc|rsvp-ldp|sflow|vrrp-rip-dhcp|vxlan)(monitor|no-
  monitor|rate <0-100000>)
```

Parameters

`arp`	ARP queue parameters
`bfd`	BFD queue parameters
`bgp`	BGP queue parameters
`bpdu`	BPDU queue parameters
`cpu.q0`	cpu.q0
`cpu.q1`	cpu.q1
`cpu.q2`	cpu.q2
`cpu.q3`	cpu.q3
`cpu.q4`	cpu.q4
`cpu.q5`	cpu.q5
`cpu.q6`	cpu.q6
`cpu.q7`	cpu.q7
`dsp`	SP queue parameters
`icmp-mpls`	ICMP/MPLS queue parameters
`icmp-redirect`	ICMP-redirect queue parameters
`igmp`	GMP queue parameters
`isis`	ISIS queue parameters
`link-local`	Link-local queue parameters
`nhop`	Next hop queue parameters
`ospf`	OSPF queue parameters
`pim`	PIM queue parameters
`reserved-mc`	Reserved-mc queue parameters
`rsvp-ldp`	RSVP/LDP queue parameters
`sflow`	Sflow queue parameters
`vrrp-rip-dhcp`	VRRP/RIP/DHCP queue parameters
`vxlan`	VXLAN queue parameters

`monitor`	Monitor CPU queue usage
`no-monitor`	Do not monitor CPU queue usage
`rate`	Set CPU queue rate <0-100000>

Default

CPU queues are set with the default values as shown in Table 1-28 and Table 1-29.

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 2.4.

Example

Use the following command to configure rate/monitor/no-monitor for protocol queues:

```
#configure terminal
(config)#cpu-queue cpu-q0 rate 400
```

Use the following command to verify the rate received on each protocol queue:

```
#show int cpu counters rate kbps

Load interval: 30 second
+-------------------+--------------+-------------+--------------+-------------+
|    CPU Queue(%)   |    Rx kbps   |    Rx pps   |    Tx kbps   |    Tx pps   |
+-------------------+--------------+-------------+--------------+-------------+
 CPU0.q0      (100%) -              -             470.63         58
 bpdu         (  0%) -              -             0.54           1
```

Use the following command to verify the maximum, configured, and default configuration values:

```
#show cpu-queue details

* - Can not configure the parameter
Cpu queue                  Rate In Kbps                    Monitor Status

```

show interface cpu counters queue-stats

Use this command to display the counters of packets destined to the CPU.

For details about this command, see show interface counters queue-stats.

Example

```
#show interface cpu counters queue-stats
E - Egress, I - Ingress, Q-Size is in bytes
+--------------------+--------+-----------------+-------------------+-----------------+-------------------+
|   Queue/Class-map  | Q-Size |     Tx pkts     |     Tx bytes      |  Dropped pkts   |   Dropped bytes   |
+--------------------+--------+-----------------+-------------------+-----------------+-------------------+
igmp              (E) 2097152  151               16258               0                 0
reserved mc       (E) 2097152  62826             6324464             0                 0
ospf              (E) 1048576  3184              308548              0                 0
bgp               (E) 1048576  27587             3938124             0                 0
rsvp/ldp          (E) 1048576  29138             3090385             0                 0
icmp              (E) 1048576  176               20924               0                 0
arp               (E) 1048576  751               48064               0                 0
bpdu              (E) 1048576  26833             3129794             0                 0
bfd               (E) 1048576  38                4028                0                 0
dsp               (E) 78643200 507               34476               0                 0
```

show cpu-queue details

Use this command to display CPU queue details.

Command Syntax

```
show cpu-queue details
```

Parameters

None

Default

Not applicable

Command Mode

Exec mode and Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 2.4.

Example

Use the following command to configure rate/monitor/no-monitor for protocol queues:

```
#configure terminal
(config)#cpu-queue cpu-q0 rate 400
```

Use the following command to verify the maximum, configured, and default configuration values:

```
#show cpu-queue details

* - Can not configure the parameter
Cpu queue                  Rate In Kbps                    Monitor Status

SECTION 5 # Layer 2

Layer 2 Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 Spanning Tree Protocol Configuration

This chapter contains a complete sample Spanning Tree Protocol (STP) configuration.

Spanning Tree Protocol (STP) is a network protocol that ensures a loop-free topology for Ethernet networks. The basic function of STP is to prevent bridge loops. Spanning tree also allows a network design to include redundant links to provide automatic backup paths if an active link fails, thus, eliminating the need to manually enable or disable the backup links.

Topology

The following example is a simple multi-bridge topology.

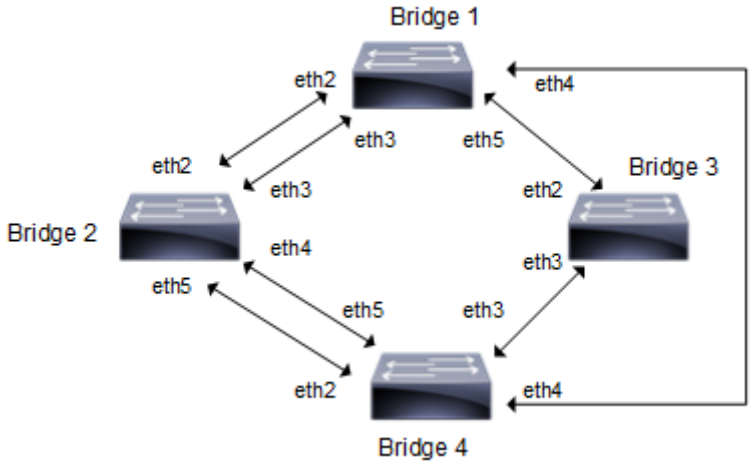

Figure 1-36: STP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configurations

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol ieee`	Add a bridge `(1)` to the spanning tree table
`Bridge1(config)#interface eth2`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode.

`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter interface mode
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol ieee`	Add a bridge (2) to the spanning tree table
`Bridge2(config)#interface eth2`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth4`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter interface mode
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol ieee`	Add a bridge (4) to the spanning tree table
`Bridge4(config)#interface eth2`	Enter interface mode.
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth3`	Enter interface mode.
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth4`	Enter interface mode.

Bridge4(config-if)#switchport	Configure interface as a layer 2 port.
Bridge4(config-if)#bridge-group 4	Associate the interface with bridge group 4.
Bridge4(config-if)#exit	Exit interface mode.
Bridge4(config)#interface eth5	Enter interface mode
Bridge4(config-if)#switchport	Configure interface as a layer 2 port.
Bridge4(config-if)#bridge-group 4	Associate the interface with bridge group 4.
Bridge4(config-if)#exit	Exit interface mode.

Bridge 3

Bridge3#configure terminal	Enter configure mode.
Bridge3(config)#bridge 3 protocol ieee	Add a bridge (3) to the spanning tree table
Bridge3(config)#interface eth2	Enter interface mode.
Bridge3(config-if)#switchport	Configure interface as a layer 2 port.
Bridge3(config-if)#bridge-group 3	Associate the interface with bridge group 3.
Bridge3(config-if)#exit	Exit interface mode.
Bridge3(config)#interface eth3	Enter interface mode.
Bridge3(config-if)#switchport	Configure interface as a layer 2 port.
Bridge3(config-if)#bridge-group 3	Associate the interface with bridge group 3.
Bridge3(config-if)#exit	Exit interface mode.

Validation

CHAPTER 2 RSTP Configuration

This chapter contains a complete sample Rapid Spanning Tree Protocol (RSTP) configuration. RSTP provides rapid convergence of a spanning tree. It speeds up the reconfiguration of the tree after a change by using alternate ports.

Topology

The following example is a simple multi-bridge topology.

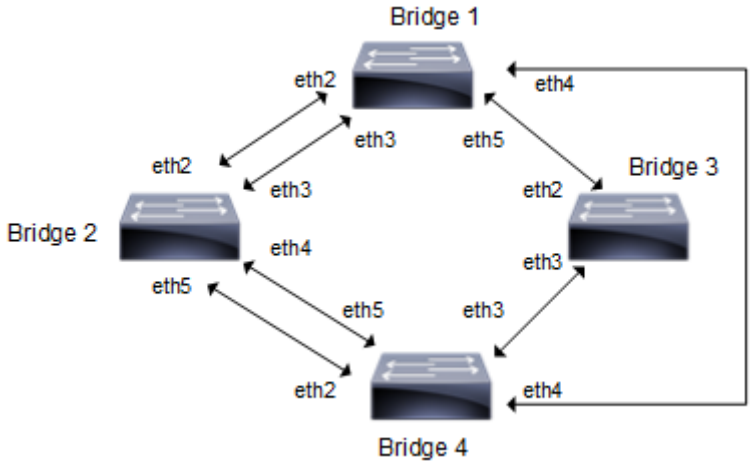

Figure 2-37: RSTP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configuration

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol rstp`	Add a bridge (1) to the rapid spanning tree table
`Bridge1(config)#interface eth2`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.

`Bridge1(config)#interface eth5`	Enter interface mode
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#exit`	Exit interface mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol rstp`	Add a bridge (2) to the rapid spanning tree table
`Bridge2(config)#interface eth2`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth4`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter interface mode
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#exit`	Exit interface mode.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol rstp`	Add a bridge `(3)` to the rapid spanning tree table
`Bridge3(config)#interface eth2`	Enter interface mode.
`Bridge3(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group 3.
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter interface mode.
`Bridge3(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group 3.
`Bridge3(config-if)#exit`	Exit interface mode.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol rstp`	Add a bridge `(4)` to the rapid spanning tree table
`Bridge4(config)#interface eth2`	Enter interface mode.
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth3`	Enter interface mode.
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth4`	Enter interface mode.
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth5`	Enter interface mode
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group 4`	Associate the interface with bridge group 4.
`Bridge4(config-if)#exit`	Exit interface mode.

```

CHAPTER 3 MSTP Configuration

This chapter contains a complete sample Multiple Spanning Tree Protocol (MSTP) configuration. MSTP allows multiple VLANs to be grouped into one spanning-tree instance. Every MST instance has a spanning-tree that is independent of other spanning-tree instances providing multiple forwarding paths for data traffic.

Topology

This example gives a simple multi-bridge topology and its configuration.

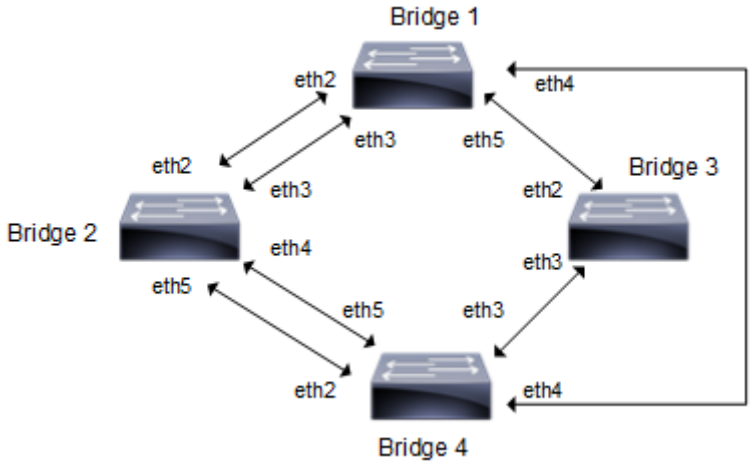

Figure 3-38: MSTP Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Configuration

Bridge 1

`Bridge1#configure terminal`	Enter configure mode.
`Bridge1(config)#bridge 1 protocol mstp`	Add a bridge (1) to the multiple spanning tree table.
`Bridge1(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge1(config-vlan)#vlan 2 bridge 1 state enable`	Enable the state of VLAN 2 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 1.
`Bridge1(config-vlan)#vlan 3 bridge 1 state enable`	Enable the state of VLAN 3 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 1.
`Bridge1(config-vlan)#vlan 4 bridge 1 state enable`	Enable the state of VLAN 4 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 1.
`Bridge1(config-vlan)#vlan 5 bridge 1 state enable`	Enable the state of VLAN 5 on bridge 1. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 1.
`Bridge1(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge1(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree

`Bridge1(config-mst)#bridge 1 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#bridge 1 instance 3 vlan 3`	Create another instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#bridge 1 instance 4 vlan 4`	Create another instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#bridge 1 instance 5 vlan 5`	Create another instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge1(config-mst)#exit`	Exit MST Configuration mode.
`Bridge1(config)#interface eth2`	Enter interface mode for eth2
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth3`	Enter interface mode for eth3.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth4`	Enter interface mode for eth4.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance

`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.
`Bridge1(config)#interface eth5`	Enter interface mode for eth5.
`Bridge1(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge1(config-if)#bridge-group 1`	Associating the interface to bridge-group 1
`Bridge1(config-if)#bridge-group 1 instance 2`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 3`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 4`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#bridge-group 1 instance 5`	Assigning bridge-group 1 to this instance
`Bridge1(config-if)#exit`	Exit interface mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol mstp`	Add a bridge (2) to the multiple spanning
`Bridge2(config)#bridge 2 priority 4096`	Assign priority to this bridge.
`Bridge2(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge2(config-vlan)#vlan 2 bridge 2 state enable`	Enable the state of VLAN 2 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 2.
`Bridge2(config-vlan)#vlan 3 bridge 2 state enable`	Enable the state of VLAN 3 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 2
`Bridge2(config-vlan)#vlan 4 bridge 2 state enable`	Enable the state of VLAN 4 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 2
`Bridge2(config-vlan)#vlan 5 bridge 2 state enable`	Enable the state of VLAN 5 on bridge 2. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 2
`Bridge2(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge2(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree configuration mode
`Bridge2(config-mst)#bridge 2 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge2(config-mst)#bridge 2 instance 3 vlan 3`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge2(config-mst)#bridge 2 instance 4 vlan 4`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge2(config-mst)#bridge 2 instance 5 vlan 5`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge2(config-mst)#exit`	Exit MST Configuration mode.
`Bridge2(config)#interface eth2`	Enter interface mode for eth2

`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2
`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth3`	Enter interface mode for eth3
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2
`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3 priority 16`	Assign bridge-group 2 to this instance and set a port priority in order of 16 for it. MSTP uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies better priority.
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4 priority 16`	Assign bridge-group 2 to this instance and set a port priority in order of 16 for it. MSTP uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies better priority
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode
`Bridge2(config)#interface eth4`	Enter interface mode for eth4
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2
`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode.
`Bridge2(config)#interface eth5`	Enter interface mode for eth5
`Bridge2(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge2(config-if)#bridge-group 2`	Associating the interface to bridge-group 2

`Bridge2(config-if)#bridge-group 2 instance 2`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 3`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 4`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#bridge-group 2 instance 5`	Assigning bridge-group 2 to this instance
`Bridge2(config-if)#exit`	Exit interface mode.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol mstp`	Add a bridge (3) to the multiple spanning tree table
`Bridge3(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge3(config-vlan)#vlan 2 bridge 3 state enable`	Enable the state of VLAN 2 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 3.
`Bridge3(config-vlan)#vlan 3 bridge 3 state enable`	Enable the state of VLAN 3 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 3.
`Bridge3(config-vlan)#vlan 4 bridge 3 state enable`	Enable the state of VLAN 4 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 3.
`Bridge3(config-vlan)#vlan 5 bridge 3 state enable`	Enable the state of VLAN 5 on bridge 3. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 3.
`Bridge3(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge3(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge3(config-mst)#bridge 3 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge3(config-mst)#bridge 3 instance 3 vlan 3`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge3(config-mst)#bridge 3 instance 4 vlan 4`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge3(config-mst)#bridge 3 instance 5 vlan 5`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge3(config-mst)#exit`	Exit MST Configuration mode.
`Bridge3(config)#interface eth2`	Enter interface mode for eth2
`Bridge3(config-if)#switchport`	Configure interface as a layer 2 port.

`Bridge3(config-if)#bridge-group 3`	Associating the interface to bridge-group 3
`Bridge3(config-if)#bridge-group 3 instance 2`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 3`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 4`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 5`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#exit`	Exit interface mode.
`Bridge3(config)#interface eth3`	Enter interface mode for eth3
`Bridge3(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge3(config-if)#bridge-group 3`	Associating the interface to bridge-group 3
`Bridge3(config-if)#bridge-group 3 instance 2`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 3`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 4`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#bridge-group 3 instance 5`	Assigning bridge-group 3 to this instance
`Bridge3(config-if)#exit`	Exit interface mode.

Bridge 4

`Bridge4#configure terminal`	Enter configure mode.
`Bridge4(config)#bridge 4 protocol mstp`	Add a bridge (4) to the multiple spanning tree table
`Bridge4(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge4(config-vlan)#vlan 2 bridge 4 state enable`	Enable the state of VLAN 2 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 2 on bridge 4.
`Bridge4(config-vlan)#vlan 3 bridge 4 state enable`	Enable the state of VLAN 3 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 3 on bridge 4.
`Bridge4(config-vlan)#vlan 4 bridge 4 state enable`	Enable the state of VLAN 4 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 4 on bridge 4.
`Bridge4(config-vlan)#vlan 5 bridge 4 state enable`	Enable the state of VLAN 5 on bridge 4. Specifying an enable state allows forwarding of frames over VLAN 5 on bridge 4.
`Bridge4(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge4(config)#spanning-tree mst configuration`	Enter the Multiple Spanning Tree Configuration mode.
`Bridge4(config-mst)#bridge 4 instance 2 vlan 2`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge4(config-mst)#bridge 4 instance 3 vlan 3`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge4(config-mst)#bridge 4 instance 4 vlan 4`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.

`Bridge4(config-mst)#bridge 4 instance 5 vlan 5`	Create an instance of VLAN. The VLANs must be created before being associating with an MST instance (MSTI). If the VLAN range is not specified the MSTI will not be created.
`Bridge4(config-mst)#exit`	Exit MST Configuration mode.
`Bridge4(config)#interface eth2`	Enter interface mode for eth2
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group  4`	Associating the interface to bridge-group 4
`Bridge4(config-if)#bridge-group 4 instance 2`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 3`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 4`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 5`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth3`	Enter interface mode for eth3
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group  4`	Associating the interface to bridge-group 4
`Bridge4(config-if)#bridge-group 4 instance 2`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 3`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 4`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 5`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth4`	Enter interface mode for eth4
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group  4`	Associating the interface to bridge-group 4
`Bridge4(config-if)#bridge-group 4 instance 2`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 3`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 4`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 5`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#exit`	Exit interface mode.
`Bridge4(config)#interface eth5`	Enter interface mode for eth5
`Bridge4(config-if)#switchport`	Configure interface as a layer 2 port.
`Bridge4(config-if)#bridge-group  4`	Associating the interface to bridge-group 4
`Bridge4(config-if)#bridge-group 4 instance 2`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 3`	Assigning bridge-group 4 to this instance

`Bridge4(config-if)#bridge-group 4 instance 4`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#bridge-group 4 instance 5`	Assigning bridge-group 4 to this instance
`Bridge4(config-if)#exit`	Exit interface mode.

CHAPTER 4 Disable Spanning Tree Configuration

This chapter describes disabling spanning tree operation on a per Multiple Spanning Tree Instance (MSTI) basis.

Topology

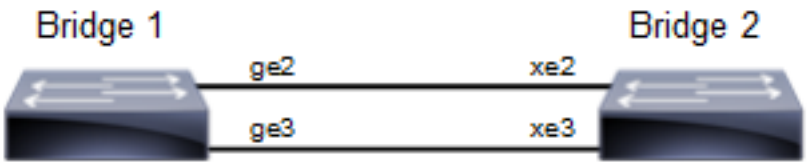

Figure 4-39: Disable Spanning Tree Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Disabling MSTP Configuration

Bridge 1

Disabling MSTP per instance

`Bridge1(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 2
`Bridge1(config-mst)#no bridge 1 instance 3`	Disable spanning tree for MSTP on instance 3

Disabling MSTP globally

`Bridge1(config)#no bridge 1 multiple-spanning-tree enable bridge-forward`	Disable spanning tree globally for MSTP and keeping the ports in forwarding state.

Disabling MSTP per port

`Bridge1(config)#interface ge2`	Enter interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for MSTP and put port on forwarding state. This command disables any type of STP on the port.

Bridge 2

Disabling MSTP per instance

`Bridge2(config-mst)#no bridge 1 instance 2`	Disable spanning tree for MSTP on instance 2
`Bridge2(config-mst)#no bridge 1 instance 3`	Disable spanning tree for MSTP on instance 3

Disabling MSTP globally

`Bridge2(config)#no bridge 1 multiple-spanning-tree enable bridge-forward`	Disable spanning tree globally for MSTP.

Disabling MSTP per port

`Bridge2(config)#interface xe2`	Enter interface mode for xe2.
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for MSTP and put port on forwarding state. This command disables any type of STP on the port.

Validation

Bridge 1

Verify MSTP details with the `show spanning-tree mst detail` command.

```
#show spanning-tree mst detail

interface xe3
bridge-group 1 instance 3
!
```

- Verify MSTP configurations when MSTP instance 2 is disabled

```
#show running-config spanning-tree
!
spanning-tree mst configuration
bridge 1 instance 3
bridge 1 instance 3 vlan 3
!
interface ge3
bridge-group 1 instance 3
!
```

Verify MSTP configurations when spanning-tree is enabled on interface.

```
#show running-config interface ge2
!
interface ge2
switchport
bridge-group 1
switchport mode access
switchport access vlan 2
bridge-group 1 instance 2
!
```

Verify MSTP configurations when spanning-tree is disabled on interface.

```
#show running-config interface ge2
!
interface ge2
switchport
bridge-group 1 spanning-tree disable
switchport mode access
switchport access vlan 2
bridge-group 1 instance 2
```

Verify MSTP details after disabling spanning-tree on interface ge2 with the `show spanning-tree mst details` command.

```
#show spanning-tree mst detail

STP Configuration

Bridge 1

Disabling STP globally

`Bridge1(config)#no bridge 1 spanning-tree enable bridge-forward`	Disable spanning tree globally for STP.

Disabling STP per port

`Bridge1(config)#interface ge2`	Enter interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for STP and put port on forwarding state. This command disables any type of STP on the port.

Bridge 2

Disabling STP globally

`Bridge2(config)#no bridge 1 spanning-tree enable bridge-forward`	Disable spanning tree globally for STP.

Disabling STP per port

`Bridge2(config)#interface xe2`	Enter interface mode for xe2.
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for STP and put port on forwarding state. This command disables any type of STP on the port.

Validation

Bridge 1

Verify STP details when stp is enabled globally and ge2 and ge3 are part of the bridge using the `show spanning-tree` command.

```
#show spanning-tree

RSTP Configuration

Bridge 1

Disabling RSTP globally

`Bridge1(config)#no bridge 1 rapid-spanning-tree enable bridge-forward`	Disable spanning tree globally for RSTP.

Disabling RSTP per port

`Bridge1(config)#interface ge2`	Enter interface mode for ge2.
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for RSTP and put port on forwarding state. This command disables any type of STP on the port.

Bridge 2

Disabling RSTP globally

`Bridge2(config)#no bridge 1 rapid-spanning-tree enable bridge-forward`	Disable spanning tree globally for RSTP.

Disabling RSTP per port

`Bridge2(config)#interface xe2`	Enter interface mode for xe2.
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree per port for RSTP and put port on forwarding state. This command disables any type of STP on the port.

Validation

Bridge 1

Verify RSTP details when rstp is enabled globally and ge2 and ge3 are part of the bridge using the `show spanning-tree` command.

```
#show spanning-tree

CHAPTER 5 VLAN Configuration

This chapter contains an example for VLAN configuration on trunk port.

Configuring VLAN Tags

Topology

This shows configuring a VLAN bridge with VLAN tags on forwarding frames. Link between Bridge 2 and Bridge 3 is configured with VLAN 5 and VLAN 10. Link between Bridge 2 and Bridge 1 is configured as VLAN 5 and link between Bridge 3 and Bridge 1 is configured as VLAN 10.

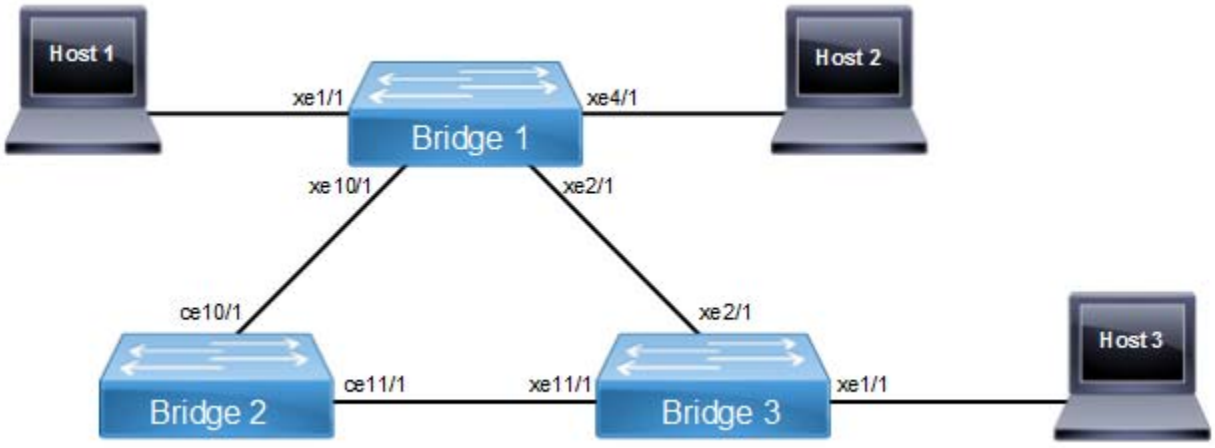

Figure 5-40: VLAN Topology

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Bridge 1

`Bridge1#configure terminal`	Enter configuration mode
`Bridge1(config)#bridge 1 protocol ieee vlan-bridge`	Specify VLAN for bridge 1.
`Bridge1(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge1(config-vlan)#vlan 5 bridge 1 state enable`	Enable VLAN (5) on bridge 1.Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge1(config-vlan)#vlan 10 bridge 1 state enable`	Enable VLAN (10) on bridge 1. Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge1(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge1(config)#interface xe1/1`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure port as L2.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.

`Bridge1(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.
`Bridge1(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge1(config)#interface xe2/1`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure port as L2.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge1(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge1(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge1(config)#interface xe4/1`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure port as L2.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge1(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge1(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge1(config)#interface xe10/1`	Enter interface mode.
`Bridge1(config-if)#switchport`	Configure port as L2.
`Bridge1(config-if)#bridge-group 1`	Associate the interface with bridge group 1.
`Bridge1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge1(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.
`Bridge1(config-if)#exit`	Exit from the interface mode and go config mode.

Bridge 2

`Bridge2#configure terminal`	Enter configure mode.
`Bridge2(config)#bridge 2 protocol ieee vlan-bridge`	Specify VLAN for bridge 2.
`Bridge2(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge2(config-vlan)#vlan 5 bridge 2 state enable`	Enable VLAN (5) on bridge 2. Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge2(config-vlan)#vlan 10 bridge 2 state enable`	Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge2(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge2(config)#interface ce10/1`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure port as L2.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge2(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.

`Bridge2(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge2(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge2(config)#interface ce11/1`	Enter interface mode.
`Bridge2(config-if)#switchport`	Configure port as L2.
`Bridge2(config-if)#bridge-group 2`	Associate the interface with bridge group 2.
`Bridge2(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge2(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.
`Bridge2(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge1(config-if)#exit`	Exit from the interface mode and go config mode.

Bridge 3

`Bridge3#configure terminal`	Enter configure mode.
`Bridge3(config)#bridge 3 protocol ieee vlan-bridge`	Specify VLAN for bridge 3.
`Bridge3(config)#vlan database`	Enter the VLAN configuration mode.
`Bridge3(config-vlan)#vlan 5 bridge 3 state enable`	Enable VLAN (5) on bridge 3. Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge3(config-vlan)#vlan 10 bridge 3 state enable`	Enable VLAN (10) on bridge 3. Specifying the enable state allows forwarding of frames on this VLAN-aware bridge.
`Bridge3(config-vlan)#exit`	Exit the VLAN configuration mode.
`Bridge3(config)#interface xe1/1`	Enter interface mode.
`Bridge3(config-if)#switchport`	Configure port as L2.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group 3.
`Bridge3(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge3(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.
`Bridge3(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge3(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge3(config)#interface xe2/1`	Enter interface mode.
`Bridge3(config-if)#switchport`	Configure port as L2.
`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group 3.
`Bridge3(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge3(config-if)#switchport trunk allowed vlan add 10`	Enable VLAN ID 10 on this port.
`Bridge3(config-if)#exit`	Exit from the interface mode and go config mode.
`Bridge3(config)#interface xe11/1`	Enter interface mode.
`Bridge3(config-if)#switchport`	Configure port as L2.

`Bridge3(config-if)#bridge-group 3`	Associate the interface with bridge group 3.
`Bridge3(config-if)#switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`Bridge3(config-if)#switchport trunk allowed vlan add 5`	Enable VLAN ID 5 on this port.
`Bridge3(config-if)#exit`	Exit from the interface mode and go config mode.

CHAPTER 6 802.1X Configuration

IEEE 802.1x restricts unauthenticated devices from connecting to a switch. Only after authentication is successful, traffic is allowed through the switch.

Topology

In this example, a radius server keeps the client information, validating the identity of the client and updating the switch about the authentication status of the client. The switch is the physical access between the two clients and the server. It requests information from the client, relays information to the server and then back to the client. To configure 802.1x authentication, enable authentication on ports eth1 and eth and specify the radius server IP address and port.

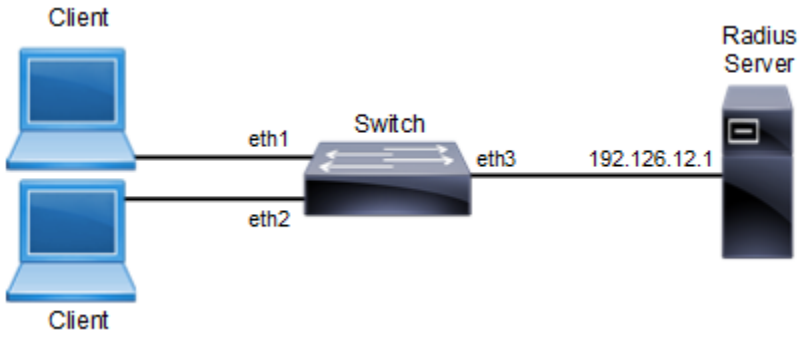

Figure 6-41: 802.1x Topology

Switch Configuration

`Switch#configure terminal`	Enter configure mode.
`Switch(config)#dot1x system-auth-ctrl`	Enable authentication globally.
`Switch(config)#interface eth2`	Enter interface mode.
`Switch(config-if)#dot1x port-control auto`	Enable authentication (via Radius) on port (`eth2`).
`Switch(config-if)#exit`	Exit interface mode.
`Switch(config)#interface eth1`	Enter interface mode.
`Switch(config-if)#dot1x port-control auto`	Enable authentication (via Radius) on port (`eth1`).
`Switch(config-if)#exit`	Exit interface mode.
`Switch(config)#radius-server host 192.126.12.1 auth-port 1812`	Specify the Radius Server address (`192.126.12.1`) and port.
`Switch(config)#radius-server key myKey`	Specify the shared key `myKey` between the radius server and the client.
`Switch(config)#interface eth3`	Enter interface mode.
`Switch(config-if)#ip address 192.126.12.0/24`	Set the IP address on interface `eth3`.

```

CHAPTER 7 Link Aggregation Configuration

This chapter contains a complete sample Link Aggregation Group configuration.

LACP is based on the 802.3ad IEEE specification. It allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree views it as one interface and not as two or three interfaces. When there is a failure in one physical interface, the other interfaces stay up and there is no disruption. Traffic can be load balanced within an LACP trunk group in a controlled manner using the hashing algorithm.The maximum number of physical Ethernet links in a single logical channel depends upon the hardware support.

Note:

- Physical interfaces will inherit the properties of LAG port once it is attached to be part of LAG, irrespective of the configuration present on the physical interface.
- In case of Dynamic LAG, member ports could be moved from one LAG to another LAG, but in case of Static LAG the member port should be unconfigured first then could be aggregated to another Static LAG.
- LAG port should be configured as a switch or router port, before adding member ports into it.

Topology

In Figure 7-42, 3 links are configured between the two switches S1 and S2. These three links are assigned the same administrative key (1) so that they aggregate to form a single channel 1. They are viewed by the STP as one interface.

Figure 7-42: LACP Topology

Dynamic LAG Configuration

S1

`S1#configure terminal`	Enter configure mode.
`S1(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge
`S1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`S1(config)#interface po10`	Enter into port channel interface po10.
`S1(config-if)#switchport`	Configure po10 as a layer 2 port.
`S1(config-if)#bridge-group 1`	Associate bridge to an interface.
`S1(config-if)#switchport mode trunk`	Configure port as a trunk.
`S1(config-if)#switchport trunk allowed vlan all`	Allow all the VLANs on the po10 interface.
`S1(config-if)#exit`	Exit interface mode.

`S1(config)#interface eth1`	Enter interface mode.
`S1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth2`	Enter interface mode.
`S1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth3`	Enter interface mode.
`S1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.

S2

`S2#configure terminal`	Enter configure mode.
`S2(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge
`S2(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`S2(config)#interface po10`	Enter into port channel interface po10.
`S2(config-if)#switchport`	Configure po10 as a layer 2 port.
`S2(config-if)#bridge-group 1`	Associate bridge to an interface.
`S2(config-if)#switchport mode trunk`	Configure port as a trunk.
`S2(config-if)#switchport trunk allowed vlan all`	Allow all the VLANs on the po10 interface.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth2`	Enter interface mode.
`S2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth3`	Enter interface mode.
`S2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth4`	Enter interface mode.
`S2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.

Static LAG Configuration

S1

`S1#configure terminal`	Enter configure mode.
`S1(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge
`S1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`S1(config)#interface sa10`	Enter into port channel interface sa10.
`S1(config-if)#switchport`	Configure po10 as a layer 2 port.
`S1(config-if)#bridge-group 1`	Associate bridge to an interface.

`S1(config-if)#switchport mode trunk`	Configure port as a trunk.
`S1(config-if)#switchport trunk allowed vlan all`	Allow all the VLANs on the po10 interface.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth1`	Enter interface mode.
`S1(config-if)#static-channel-group 10`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth2`	Enter interface mode.
`S1(config-if)#static-channel-group 10`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.
`S1(config)#interface eth3`	Enter interface mode.
`S1(config-if)#static-channel-group 10`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S1(config-if)#exit`	Exit interface mode.

S2

`S2#configure terminal`	Enter configure mode.
`S2(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge
`S2(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`S2(config)#interface sa10`	Enter into port channel interface po10.
`S2(config-if)#switchport`	Configure po10 as a layer 2 port.
`S2(config-if)#bridge-group 1`	Associate bridge to an interface.
`S2(config-if)#switchport mode trunk`	Configure port as a trunk.
`S2(config-if)#switchport trunk allowed vlan all`	Allow all the VLANs on the po10 interface.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth2`	Enter interface mode.
`S2(config-if)#static-channel-group 10`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth3`	Enter interface mode.
`S2(config-if)#static-channel-group 10`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`S2(config-if)#exit`	Exit interface mode.
`S2(config)#interface eth4`	Enter interface mode.

S2(config-if)#static-channel-group 10	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
S2(config-if)#exit	Exit interface mode.

Static LAG Minimum Link Configuration

Configure the minimum number of ports that must be linked up and bundled in the LACP port channel. We can configure the minimum links range from 2 to 32. If the number of ports aggregated to the port channel is less than the minimum number of links configured, then the port channel enters the Protocol Down because of the minimum link state.

Note: Minimum links should be configured the same on both sides for optimal performance.

LACP Minimum-Link, Minimum-Bandwidth Configurations on dynamic, static Channel-Groups with MC-LAG.

Overview

OcNOS allows the configuration of minimum number of the LAG members per LAG group. Both these configurations are meaningful in case the LAG is used for incremental-BW mode. The minimum configuration controls the minimum number of members /bandwidth that must be operationally up / bandwidth available to declare their LAG as operationally UP.

When static/dynamic LAG interface configured with minimum links / minimum bandwidth, the following conditions are to be met:

- Ports which are admin and operational up are considered for min-link.
- The specified minimum number of links should be up.
- Min-link and min-bandwidth cannot co-exist.
- When ports are down due to min-link/min-bandwidth, in show interface brief command output, port down with the corresponding reason code for the failure due to min-link/min-bandwidth.

Minimum Active Members/Bandwidth

The user can specify the minimum number of members that must be operationally up to declare their LAG as operationally UP. Note that this parameter applies to static/dynamic LAG.

```
port-channel min-links <2 - 32>
```

The minimum active member configuration will be allowed to be modified to be greater than the current number of active members. In such configuration, the LAG operational status will become operationally down.

The user can specify the minimum bandwidth, based on the configured value and the ports that satisfy the conditions LAG will be operationally UP. This parameter is applied for static/dynamic LAG.

```
port-channel min-bandwidth BANDWIDTH
```

BANDWIDTH <1-999>k|m for 1 to 999 kilo bits or mega bits <1-1000>g for 1 to 1000 giga bits.

When condition fails, the operational state changes to DOWN.

Note: Do not configure minimum-link, Minimum Bandwidth both on TORS and switches at the same time to avoid flaps of MLAG.

Configuration

TOR1:

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol rstp vlan-bridge end`	Configure bridge type
`configure terminal`	Enter Configure mode
`(config)# vlan database`	Enter vlan database
`(config-vlan)# vlan 600 bridge 1 state enable`	Configure vlans
`(config-if)#end`	
`#configure terminal`	Enter Configure mode.
`(config)#interface mlag1`	Enter Interface mode
`(config-if)# switchport`	Make mlag as layer2 port
`(config-if)# bridge-group 1`	Attach interface to bridge
`(config-if)# switchport mode trunk`	Configure trunk port
`(config-if)# switchport trunk allowed vlan add 600,601,502`	Add interface to vlans
`(config-if)# spanning-tree edgeport`	Configure port as edge port to avoid loops
`(config-if)# spanning-tree bpdu-filter enable`	Enable bpdu filter to avoid loops
`(config-if)#end`	Return to privilege mode
`#configure terminal`	Enter Configure mode.
`(config)#interface mlag3`	Enter Interface mode
`(config-if)# switchport`	Make mlag as layer2 port
`(config-if)# bridge-group 1`	Attach interface to bridge
`(config-if)# switchport mode trunk`	Configure trunk port
`(config-if)# switchport trunk allowed vlan add 600,502`	Add interface to vlans
`(config-if)# spanning-tree edgeport`	Configure port as edge port to avoid loops
`(config-if)# spanning-tree bpdu-filter enable`	Enable bpdu filter to avoid loops
`(config-if)#end`	Return to privilege mode
`#configure terminal`	Enter Configure mode.
`(config)#interface po100`	Enter Interface mode
`(config-if)# switchport`	Make po as layer2 port
`(config-if)# bridge-group 1`	Associate the interface with bridge group 1.
`(config-if)# switchport mode trunk`	Set the switching characteristics of this interface to trunk mode.
`(config-if)# switchport trunk allowed vlan all`	Enable all VLAN identifiers on this interface.
`(config-if)# port-channel load-balance src-dst-mac`	Enable load balance
`(config-if)# mtu 9216`	Configure mtu
`(config-if)#end`	
`#configure terminal`	Enter Configure mode.
`(config)#interface sa1`	Enter Interface mode
`(config-if)# switchport`	Make sa1 as layer2 port

(config-if)# bridge-group 1	Associate the interface with bridge group 1.
(config-if)# switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)# switchport trunk allowed all	Enable all VLAN identifiers on this interface.

LACP Force-Up

In an aggregated environment, there are some parameters that are set for member ports in lag. Whenever the parameters are set and conditions are satisfied, the port channel will be in SYNC. If force-up mode is enabled for the member port, the port channel will always be in SYNC even if the parameters are not set i.e. the traffic will not be affected and the port channel will never go down.

LACP force-up with Dynamic LAG

Topology

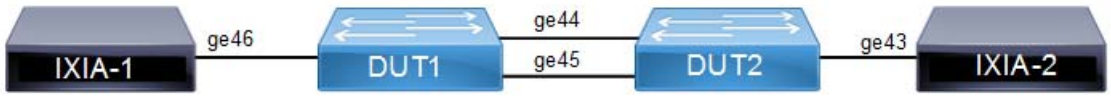

Figure 7-48: LACP force-up with Dynamic LAG

DUT1

`#configure terminal`	Enter configure mode.
`(config)#hostname DUT1`	Configure host name
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a RSTP VLAN bridge on customer side
`(config)#vlan 2-100 bridge 1 state enable`	Configure VLAN for the bridge
`(config)#interface ge46`	Enter interface mode
`(config-if)#switchport`	Make interface as Switchport
`(config-if)#bridge-group 1`	Associate the interface to bridge
`(config-if)#switchport mode hybrid`	Configure the mode as hybrid
`(config-if)#switchport hybrid allowed vlan all`	Configure allowed VLAN all on the interface
`(config-if)#load-interval 30`	Configure load period in multiple of 30 seconds
`(config)#interface po1`	Enter the interface mode
`(config-if)#switchport`	Make the interface as switch port
`(config-if)#bridge-group 1`	Associate the interface to bridge
`(config-if)#switchport mode hybrid`	Configure the mode as hybrid
`(config-if)#switchport hybrid allowed vlan all`	Configure allowed vlan all for the hybrid mode
`(config-if)#load-interval 30`	Configure load period in multiple of 30 seconds
`(config)#interface ge44`	Enter interface mode
`(config-if)#channel-group 1 mode active`	Adding interface to channel-group 1
`(config)#interface ge45`	Enter interface mode
`(config-if)#channel-group 1 mode active`	Adding interface to channel-group 1

DUT2

`#configure terminal`	Enter configure mode.
`(config)#hostname DUT2`	Configure host name
`(config)#bridge 1 protocol provider-rstp edge`	Create provider rstp edge bridge
`(config)#vlan database`	Enter vlan database mode

(config-vlan)#vlan 2-100 type customer bridge 1 state enable	Configure customer VLAN for the bridge
(config-vlan)#vlan 100 type service point-point bridge 1 state enable	Configure service VLAN for the bridge
(config)#exit	Exit vlan database mode
(config)#cvlan registration table map1 bridge 1	Creating registration table
(config)#cvlan 2-100 svlan 100	Mapping cvlan to svlan
(config)#interface ge43	Enter interface mode
(config-if)#switchport	Make interface as Switchport
(config-if)#bridge-group 1	Associate the interface to bridge
(config-if)#switchport mode provider-network	Configure the mode as provider-network
(config-if)# switchport provider-network allowed vlan all	Configure allowed VLAN all on the interface
(config-if)#load-interval 30	Configure load period in multiple of 30 seconds
(config)#interface po1	Enter the interface mode
(config-if)#switchport	Make the interface as switch port
(config-if)#bridge-group 1	Associate the interface with bridge group 1
(config-if)#switchport mode customer-edge hybrid	Set the switching characteristics of this interface to customer-edge hybrid
(config-if)#switchport customer-edge hybrid allowed vlan all	Set the switching characteristics of this interface to customer-edge hybrid and allow vlan all
(config-if)#switchport customer-edge vlan registration map1	Configuring the registration table mapping on lag interface
(config-if)#load-interval 30	Configure load period in multiple of 30 seconds
(config)#interface ge44	Enter interface mode
(config-if)#channel-group 1 mode active	Adding interface to channel-group 1
(config-if)#lacp force-up	Enable lacp force-up for the member port interface
(config)#interface ge45	Enter interface mode
(config-if)#channel-group 1 mode active	Adding interface to channel-group 1

Send L2 traffic with incremental source mac of 1000 and with VLAN 100 from IXIA1 and with incremental source mac of 1000 and with SVLAN 100(TPID 0x88a8), CVLAN 100 from IXIA2.

On server side (DUT1) to make LAG down you can unconfigure the channel-group 1
configurations and verify force-up is getting enabled in DUT2.
To simulate the force-up
```

DUT1(config)#interface ge44	Enter interface mode.
DUT1(config-if)#no channel-group	Removing channel-group configurations from interface.
DUT1(config)#interface ge45	Enter interface mode.
DUT1(config-if)#no channel-group	Removing channel-group configurations from interface.

DUT2

```
DUT2#show interface brief | include po1
po1           AGG   1     customer-edge     up       none    1g
```

```

CHAPTER 8 MC-LAG Configuration

This chapter contains a complete example of Multi-Chassis Link Aggregation (MC-LAG) configuration.

MC-LAG expands the concept of link aggregation so that it provides node-level redundancy by allowing two or more nodes to share a common LAG endpoint. It emulates multiple nodes to represent as a single logical node to the remote node running Link aggregation. As a result even if one of the nodes is down there exists a path to reach the destination through the other nodes.

Note: MC-LAG is only compatible with VPWS.

Note: MC-LAG is supported only in Active-Standby mode.

Note: All MC-LAG nodes must have the same MAC table size – as specified by each node's switching ASIC forwarding profile limit.

Topology

In the below example Switch 1 and Switch 2 forms a MLAG domain.

As shown in Figure 8-49, switch 1 and switch 2 are a single logical switches to switch 3 and switch 4. Even if either switch 1 or switch 2 is down, there exists a path to reach other destinations.

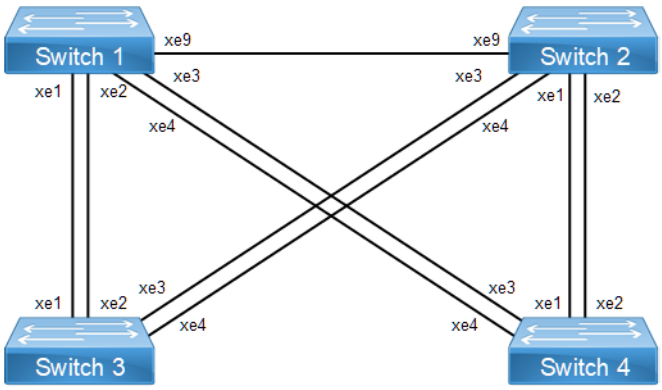

Figure 8-49: MC-LAG Topology

Configuration

Switch 1

`#configure terminal`	Enter configure mode.
`(config)#service-template VLAN2`	Configure a service template for L2VPN.
`(config-svc)# match outer-vlan 2`	Match outer VLAN 2 for L2VPN.
`(config)#service-template VLAN3`	Configure a service template for L2VPN
`(config-svc)# match outer-vlan 3`	Match outer VLAN 3 for L2VPN.
`(config-svc)#exit`	Exit the service template mode.
`(config)#mpls l2-circuit VLAN2 2 10.1.1.1`	Configure the VPWS instance.
`(config)#interface xe1`	Enter interface mode.
`(config-if)#switchport`	Configure the interface as Layer 2

(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#exit	Exit interface mode.
(config)#mcec domain configuration	Enter MCEC mode
(config-mcec-domain)#domain-address 1111.2222.3333	Configure the domain address for the mlag domain.
(config-mcec-domain)#intra-domain link xe9	Configure the intra domain link between mlag domain.
(config-mcec-domain)#domain-system-number 1	Configure the number to identify the node in a domain.
(config-mcec-domain)#exit	Exit MCEC mode.
(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Enable mlag group number.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#mlag 2	Enable mlag group number.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter Interface mode
(config-if)#mpls-l2-circuit VLAN2 service-template VLAN2	Attach VPWS VLAN2 to interface P01.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter Interface mode
(config-if)#mpls-l2-circuit VLAN2 service-template VLAN2	Attach VPWS VLAN2 to interface P01.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter Interface mode

(config-if)#mpls-l2-circuit VLAN3 service-template VLAN3	Attach VPWS VLAN2 to interface P01.
(config-if)#exit	Exit interface mode.

Switch 2

#configure terminal	Enter configure mode.
(config)#service-template VLAN2	Configure a service template for L2VPN
(config)# match outer-vlan 2	Match outer VLAN2 for L2VPN
(config)#service-template VLAN3	Configure a service template for L2VPN
(config)# match outer-vlan 3	Match outer VLAN3 for L2VPN
(config-svc)#exit	Exit the service template mode
(config)#mpls l2-circuit VLAN2 2 10.1.1.1	Configure VPWS instance
(config)# mpls l2-circuit VLAN2 2 10.1.1.1	Configure VPWS instance
(config)#interface xe1	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 2 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#channel-group 2 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter interface mode.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#exit	Exit interface mode.
(config)#mcec domain configuration	Enter MCEC mode
(config-mcec-domain)#domain-address 1111.2222.3333	Configure the domain address for the mlag domain.

(config-mcec-domain)#intra-domain link xe49	Configure the Intra domain link between mlag domain.
(config-mcec-domain)#domain-system-number 2	Configure the number to identify the node in domain.
(config-mcec-domain)#exit	Exit MCEC mode
(config)#interface po1	Enter interface mode.
(config-if)#mlag 1	Enable mlag group number.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#mlag 2	Enable mlag group number.
(config-if)#exit	Exit interface mode.
(config)#interface po1	Enter Interface mode
(config-if)#mpls-l2-circuit VLAN3 service-template VLAN3	Attach VPWS VLAN3 to interface P01.
(config-if)#exit	Exit interface mode.
(config)#interface po2	Enter interface mode.
(config-if)#mpls-l2-circuit VLAN2 service-template VLAN2	Attach VPWS VLAN2 to interface P01.
(config-if)#exit	Exit interface mode.

Switch 3

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Create RSTP bridge 1.
(config)#vlan 2 bridge 1 state enable	Create VLAN 2.
(config)#interface xe1	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.

(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.

Switch 4

#configure terminal	Enter configure mode.
(config)#bridge 1 protocol rstp vlan-bridge	Create RSTP bridge 1.
(config)#vlan 3 bridge 1 state enable	Create VLAN 3.
(config)#interface xe9	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe10	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 1 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.

(config)#interface xe57	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.
(config)#interface xe58	Enter interface mode.
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#bridge-group 1	Associate the interface with bridge group 1.
(config-if)#switchport mode trunk	Set the switching characteristics of this interface to trunk mode.
(config-if)#switchport trunk allowed vlan all	Enable all VLAN identifiers on this interface.
(config-if)#channel-group 2 mode active	Add this interface to channel group 2 and enable link aggregation so that it can be selected for aggregation by the local system.
(config-if)#exit	Exit interface mode.

CHAPTER 9 PW Redundancy with MC-LAG Configuration

This chapter contains configuration for Pseudowire Redundancy with MC-LAG (Active and Standby). It also provides an overview of Pseudowire concepts.

In a single-segment pseudowire (SS-PW) application, the Packet Switched Network (PSN) layer usually provides protection for the PW. One way is by using an RSVP LSP with Fast Reroute (FRR) backup; another way is an end-to-end backup LSP. However, there are some applications where the backup PW terminates on a different target PE node, so PSN protection methods cannot protect against failure of either the target Provider Edge (PE) node or a remote Access Circuit (AC). It is also important for an operator that a particular PW is preferred. For example, the one with the least latency.

PW redundancy supports Label Distribution Protocol (LDP) PW. In the case of PW applications, the PSN layer can provide the protection for PW. Occasionally, a TE LSP signaled by RSVP-TE can be used as a PSN tunnel for a PW. In this scenario, TE can provide FRR to protect the end-to-end LSP in the PSN layer.

FRR-based protection schemes cannot protect against failure of PE nodes and access circuits. However, PW redundancy can protect against these failures.

MC-LAG expands the concept of link aggregation so that it provides node-level redundancy by allowing two nodes to share a common LAG endpoint. This gives PE redundancy for CE node.

CE devices can be connected to two PE nodes for PE-node-level redundancy using MC-LAG.

End-to-End traffic flow decision will take by MC-LAG Active node not by PW-Redundancy node.

Topology

In the below example PE1 and PE2 forms a MLAG domain.

As shown in Figure 9-50, PE1 and PE2 are a single logical switches to P3 and P4. Even if either PE1 or PE2 is down, there exists a path to reach other destinations.

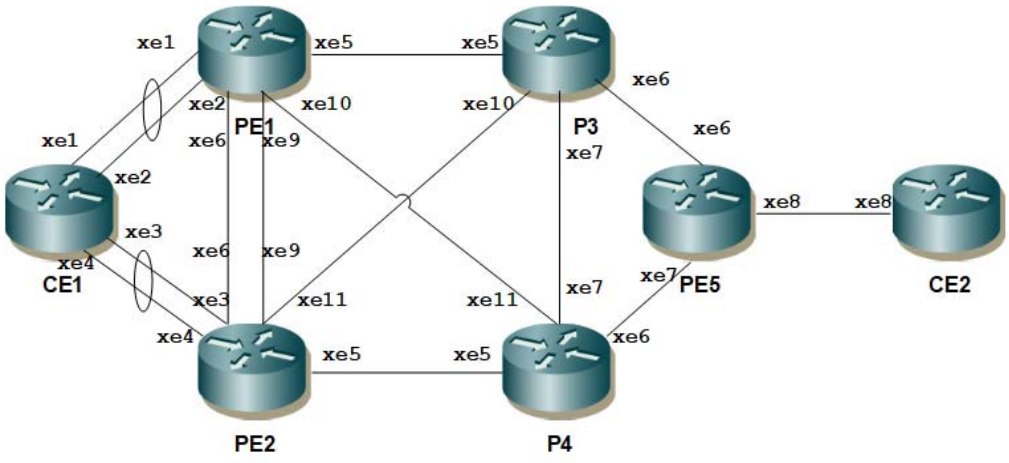

Figure 9-50: MC-LAG Topology

Uplink Interface and OSPF Configuration

PE1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Configure the Loopback interface.
`(config-if)# ip address 35.35.35.35/32 secondary`	Set the IP address of the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe5`	Enter interface mode.
`(config-if)# ip address 10.35.48.1/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe9`	Enter interface mode.
`(config-if)# ip address 10.35.33.1/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe10`	Enter interface mode.
`(config-if)# ip address 10.35.49.1/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Enter the Router mode for OSPF.
`(config-router)#ospf router-id 35.35.35.35`	Configure OSPF router ID.
`(config-router)# bfd all-interfaces`	Configure BFD on OSPF.
`(config-router)#network 10.35.48.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#network 10.35.49.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#network 10.35.33.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#exit`	Exit router mode.

PE2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Configure the Loopback interface.
`(config-if)# ip address 33.33.33.33/32 secondary`	Set the IP address of the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe5`	Enter interface mode.
`(config-if)# ip address 10.33.49.1/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe9`	Enter interface mode.
`(config-if)# ip address 10.35.33.2/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe11`	Enter interface mode.

(config-if)# ip address 10.33.48.1/30	Set the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Enter the Router mode for OSPF.
(config-router)#ospf router-id 33.33.33.33	Configure OSPF router ID.
(config-router)# bfd all-interfaces	Configure BFD on OSPF.
(config-router)#network 10.33.48.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.33.49.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.35.33.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#exit	Exit router mode

P3

#configure terminal	Enter configure mode.
(config)#interface lo	Configure the Loopback interface.
(config-if)# ip address 48.48.48.48/32 secondary	Set the IP address of the loopback interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe5	Enter interface mode.
(config-if)# ip address 10.35.48.2/30	Set the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe6	Enter interface mode.
(config-if)# ip address 10.48.32.1/30	Set the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)# interface xe7	Enter interface mode.
(config-if)# ip address 10.48.49.1/30	Set the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe11	Enter interface mode.
(config-if)# ip address 10.33.48.2/30	Set the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Enter the Router mode for OSPF.
(config-router)#ospf router-id 48.48.48.48	Configure OSPF router ID.
(config-router)# bfd all-interfaces	Configure BFD on OSPF.
(config-router)#network 10.35.48.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.48.49.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.48.32.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.33.48.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#exit	Exit router mode

P4

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Configure the Loopback interface.
`(config-if)# ip address 49.49.49.49/32 secondary`	Set the IP address of the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe5`	Enter interface mode.
`(config-if)# ip address 10.33.49.2/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe6`	Enter interface mode.
`(config-if)# ip address 10.49.32.1/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe7`	Enter interface mode.
`(config-if)# ip address 10.48.49.2/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe10`	Enter interface mode.
`(config-if)# ip address 10.35.49.2/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Enter the Router mode for OSPF.
`(config-router)#ospf router-id 49.49.49.49`	Configure OSPF router ID.
`(config-router)# bfd all-interfaces`	Configure BFD on OSPF.
`(config-router)#network 10.35.49.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#network 10.48.49.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#network 10.49.32.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-router)#network 10.33.49.0/30 area 0.0.0.0`	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
`(config-if)#exit`	Exit interface mode.

P5

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Configure the Loopback interface.
`(config-if)# ip address 32.32.32.32/32 secondary`	Set the IP address of the loopback interface.
`(config-if)#exit`	Exit interface mode.
`(config)# interface xe6`	Enter interface mode.
`(config-if)# ip address 10.48.32.2/30`	Set the IP address of the interface.
`(config-if)#exit`	Exit interface mode.

(config)# interface xe7	Enter interface mode.
(config-if)# ip address 10.49.32.1/30	Set the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Enter the Router mode for OSPF.
(config-router)#ospf router-id 32.32.32.32	Configure OSPF router ID.
(config-router)# bfd all-interfaces	Configure BFD on OSPF.
(config-router)#network 10.48.32.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-router)#network 10.49.32.0/30 area 0.0.0.0	Define the Network on which OSPF runs and associate the area ID (area 0) with the interface.
(config-if)#exit	Exit interface mode.

RSVP Global Configuration

PE1

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the router mode for RSVP.
(config-router)# no-php	Configure no PHP
(config-router)#exit	Exit router mode.
(config)# interface xe5	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe9	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe10	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.

PE2

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the Router mode for RSVP.
(config-router)# no-php	Configure no PHP
(config-router)#exit	Exit router mode.
(config)# interface xe5	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface

(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe9	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface.
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe11	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.

P3

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the Router mode for RSVP.
(config-router)# no-php	Configure no PHP
(config-router)#exit	Exit router mode.
(config)# interface xe5	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe6	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe7	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe11	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.

P4

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the Router mode for RSVP.
(config-router)# no-php	Configure no PHP
(config-router)#exit	Exit router mode.

(config)# interface xe5	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe6	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe7	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe10	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.

P5

#configure terminal	Enter configure mode.
(config)#router rsvp	Enter the Router mode for RSVP.
(config-router)# no-php	Configure no PHP
(config-router)#exit	Exit router mode.
(config)# interface xe6	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe7	Enter interface mode.
(config-if)# label-switching	Enable label switching on the interface
(config-if)# enable-rsvp	Enable RSVP on the interface.
(config-if)#exit	Exit interface mode.

RSVP-LSP Configuration

PE1

#configure terminal	Enter configure mode.
(config)# rsvp-path 35-to-32 mpls	Configure RSVP-Path PE5
(config-path)# 10.35.48.2 strict	Configure Strict hop

(config-path)# 10.48.32.2 strict	Configure Strict hop
(config-path)#exit	Exit RSVP-Path mode
(config)#rsvp-trunk 35-to-32	Configure RSVP-Trunk to PE5
(config-trunk)# primary fast-reroute protection one-to-one	Set FRR one-to-one mode.
(config-trunk)# primary fast-reroute node-protection	Set FRR node protection
(config-trunk)# primary path 35-to-32	Set RSVP path.
(config-trunk)# to 32.32.32.32	Configure RSVP-LSP destination IP address
(config-trunk)#exit	Exit RSVP-Trunk mode

PE2

#configure terminal	Enter configure mode.
(config)# rsvp-path 33-to-32 mpls	Configure RSVP-Path to PE5
(config-path)# 10.33.49.2 strict	Configure Strict hop
(config-path)# 10.49.32.2 strict	Configure Strict hop
(config-path)#exit	Exit RSVP path mode
(config)#rsvp-trunk 33-to-32	Configure RSVP trunk to PE5.
(config-trunk)# primary fast-reroute protection one-to-one	Set FRR one-to-one mode.
(config-trunk)# primary fast-reroute node-protection	Set FRR node protection
(config-trunk)# primary path 33-to-32	Set RSVP path.
(config-trunk)# to 32.32.32.32	Configure RSVP LSP destination IP address.
(config-trunk)#exit	Exit RSVP-Trunk mode

PE5

#configure terminal	Enter configure mode.
(config)# rsvp-path 32-to-35 mpls	Configure RSVP path to PE1
(config-path)# 10.48.32.1 strict	Configure Strict hop
(config-path)# 10.35.48.1 strict	Configure Strict hop
(config-path)#exit	Exit RSVP path mode
(config)# rsvp-path 32-to-33 mpls	Configure RSVP path to PE2
(config-path)# 10.49.32.1 strict	Configure Strict hop
(config-path)# 10.33.49.1 strict	Configure Strict hop
(config-path)#exit	Exit RSVP path mode
(config)#rsvp-trunk 32-to-35	Configure RSVP trunk.to PE1.
(config-trunk)# primary fast-reroute protection one-to-one	Set FRR one-to-one mode.
(config-trunk)# primary fast-reroute node-protection	Set FRR node protection

(config-trunk)# primary path 32-to-35	Set RSVP path
(config-trunk)# to 33.33.33.33	Configure RSVP-LSP destination IP address.
(config-trunk)#exit	Exit RSVP trunk mode

T-LDP Configuration

PE1

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the router mode for LDP.
(config-router)# router-id 35.35.35.35	Configure LDP router ID.
(config-router)# pw-status-tlv	Set PW status TLV
(config-router)# no multicast-hellos	Disable Multicast hellos
(config-router)# targeted-peer ipv4 32.32.32.32	Configure LDP targeted peer to PE5
(config-router-targeted-peer)# exit-targeted-peer-mode	Exit targeted peer mode.
(config-router)#exit	Exit router mode
(config)# interface xe5	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe9	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe10	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.

PE2

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the router mode for LDP.
(config-router)# router-id 33.33.33.33	Configure LDP router ID
(config-router)# pw-status-tlv	Set PW status TLV.
(config-router)# no multicast-hellos	Disable multicast hellos
(config-router)# targeted-peer ipv4 32.32.32.32	Configure LDP targeted peer to PE5
(config-router-targeted-peer)# exit-targeted-peer-mode	Exit targeted peer mode.
(config-router)#exit	Exit router mode
(config)# interface xe5	Enter interface mode.

(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe9	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe11	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.

PE5

#configure terminal	Enter configure mode.
(config)#router ldp	Enter the router mode for LDP.
(config-router)# router-id 32.32.32.32	Configure LDP router ID
(config-router)# pw-status-tlv	Set PW status TLV
(config-router)# no multicast-hellos	Disable multicast hellos
(config-router)# targeted-peer ipv4	Configure LDP targeted peer to PE5
(config-router-targeted-peer)# exit-targeted-peer-mode	Exit targeted peer mode.
(config-router)# targeted-peer ipv4 33.33.33.33	Configure LDP targeted peer to PE5
(config-router-targeted-peer)# exit-targeted-peer-mode	Exit targeted peer mode.
(config-router)#exit	Exit router mode
(config)# interface xe6	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.
(config)# interface xe7	Enter interface mode.
(config-if)# enable-ldp ipv4	Enable IPv4 LDP on the interface.
(config-if)#exit	Exit interface mode.

MC-LAG Configuration

CE1

#configure terminal	Enter configure mode.
(config)#interface po1	Configure the LAG interface
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.

(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
(config-if)#exit	Exit interface mode.
(config)#interface xe3	Enter interface mode.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
(config-if)#exit	Exit interface mode.

PE1

#configure terminal	Enter configure mode.
(config)#mcec domain configuration	Configure MC-LAG global.
(config-mcec-domain)# domain-address 1111.2222.3333	Configure the domain address.
(config-mcec-domain)# domain-system-number 1	Configure Domain System number.
(config-mcec-domain)# intra-domain-link xe6	Configure IDL link.
(config-mcec-domain)#exit	Exit MC-LAG global mode.
(config)#interface po1	Configure the LAG interface
(config-if)#switchport	Configure the interface as Layer 2
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by the local system
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode.
(config-if)#channel-group 1 mode active	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
(config-if)#exit	Exit interface mode.
(config)#interface po1	Configure the LAG interface
(config-if)# mlag 1	Configure MC-LAG domain to LAG interface
(config-if)#exit	Exit interface mode.

PE2

`#configure terminal`	Enter configure mode.
`(config)#mcec domain configuration`	Configure MC-LAG global
`(config-mcec-domain)# domain-address 1111.2222.3333`	Configure the Domain address
`(config-mcec-domain)# domain-system-number 2`	Configure Domain System number.
`(config-mcec-domain)# intra-domain-link xe6`	Configure IDL link.
`(config-mcec-domain)#exit`	Exit MC-LAG global mode.
`(config)#interface po1`	Configure the LAG interface
`(config-if)#switchport`	Configure the interface as Layer 2
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe3`	Enter interface mode.
`(config-if)#channel-group 1 mode active`	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe4`	Enter interface mode.
`(config-if)#channel-group 1 mode active`	Add this interface to channel group 1 and enable link aggregation so that it can be selected for aggregation by
`(config-if)#exit`	Exit interface mode.
`(config)#interface po1`	Configure the LAG interface
`(config-if)# mlag 1`	Configure MC-LAG domain to LAG interface
`(config-if)#exit`	Exit interface mode.

VPWS PW Redundancy Configuration

PE1

`#configure terminal`	Enter configure mode.
`(config)#service-template S-00-00-10`	Configure service template (translate)
`(config-svc)# match outer-vlan 10`	Configure match
`(config-svc)# rewrite ingress translate 20 outgoing-tpid dot1.q`	Configure rewrite action
`(config-svc)#exit`	Exit service template
`(config)# mpls l2-circuit VC1 1001 32.32.32.32`	Configure VPWS to PE5
`(config)#int po1`	Enter interface mode
`(config-if)#mpls-l2-circuit VC1 service-template S-00-00-10`	Attach VPWS to AC interface.
`(config-if)#exit`	Exit interface

PE2

`#configure terminal`	Enter configure mode.
`(config)#service-template S-00-00-10`	Configure service template (translate)
`(config-svc)# match outer-vlan 10`	Configure match
`(config-svc)# rewrite ingress translate 20 outgoing-tpid dot1.q`	Configure rewrite action
`(config-svc)#exit`	Exit service template
`(config)# mpls l2-circuit VC2 1002 32.32.32.32`	Configure VPWS to PE5
`(config)#int po1`	Enter interface mode
`(config-if)#mpls-l2-circuit VC2 service-template S-00-00-10`	Attach VPWS to AC interface.
`(config-if)#exit`	Exit interface

PE5

`#configure terminal`	Enter configure mode.
`(config)#service-template S-00-00-10`	Configure service template (translate)
`(config-svc)# match outer-vlan 10`	Configure match
`(config-svc)# rewrite ingress translate 20 outgoing-tpid dot1.q`	Configure rewrite action
`(config-svc)#exit`	Exit service template
`(config)# mpls l2-circuit VC1 1001`	Configure VPWS to PE1
`(config)# mpls l2-circuit VC2 1002 33.33.33.33`	Configure VPWS to PE2
`(config)#int xe8`	Enter interface mode
`(config-if)# switchport`	Switch to Layer 2 mode.
`(config-if)#mpls-l2-circuit VC1 service-template S-00-00-10`	Attach Primary VPWS to AC interface.
`(config-if)# mpls-l2-circuit VC2 service-template S-00-00-10 secondary`	Attach Secondary VPWS to AC interface.
`(config-if)#exit`	Exit interface

CHAPTER 10 Traffic Mirroring Configuration

This chapter contains a sample local and remote switched port analyzer feature configuration.

SPAN Overview

Switched Port Analyzer (SPAN) refers to selecting network traffic for analysis by a network analyzer. SPAN feature is introduced on switches as the switch forwards traffic that is destined for a MAC address directly to the corresponding port leaving no scope to analyze the traffic.

SPAN monitors the traffic on source port and sends a copy of the traffic to a destination port. The network analyzer, which is attached to the destination port, analyzes the received traffic. Source port can be a single port or multiple ports. A replication of the packets is sent to the destination port for analysis

SPAN is originally referred to port mirroring or port monitoring where all the network traffic on the source port is mirrored to destination port. Port mirroring has three subdivisions.

- Ingress mirroring: Traffic received on the source port will be monitored
- Egress mirroring: Traffic transmitted from the source port will be monitored
- Ingress and egress mirroring: Both received and transmitted traffic on the source port will be monitored.

With enhancements to SPAN, mirroring can be classified into three categories.

Port Mirroring

In port mirroring, source will be a port which could be a physical interface or a port channel. All the traffic on the source port will be mirrored to destination port. Either traffic received on the source port or traffic transmitted from the source port or both can be monitored.

VLAN Mirroring

In VLAN mirroring, the source is a VLAN identifier and the traffic received on all ports with the VLAN identifier matching source VLAN identifier are mirrored to destination port.

Rule Based Mirroring

In rule based mirroring, there is a set of matching criteria for the ingress traffic such as matching destination MAC address, matching frame type, and so on. The traffic matching the rules is mirrored to the destination port

Topology

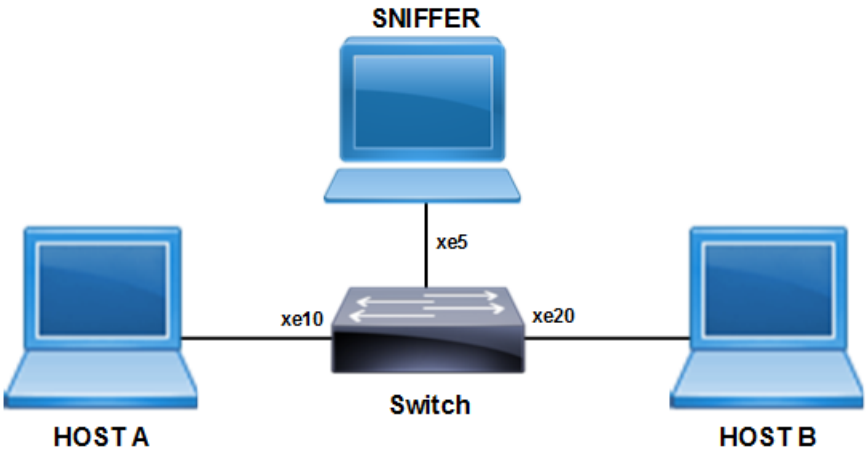

Figure 10-51: SPAN Topology

Port Mirroring Configuration

This example shows detailed configuration of port mirroring.

Note: Use the below command for port mirroring.

```
mirror interface <if-name> direction both|receive|transmit
```

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe5`	Enter interface mode.

(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1	Enter monitor session configuration mode
(config-monitor)# destination interface xe5	Configure the interface as destination port
(config-monitor)# source interface xe10 both	Configure the source interface to mirror ingress as well as egress direction traffic
(config-monitor)# no shut	Activate monitor session
(config-monitor)#end	Exit monitor session configuration mode

Validation

Note: Use the below command for validate the mirroring.

```
show mirror interface <if-name>
```

Enter the below commands to confirm the configurations.

```
#show running-config monitor
!
monitor session 1
 source interface xe10 both
 destination interface xe5
 no shut

#show monitor session all
   session 1
---------------
type              : local
state             : up
source intf       :
    tx            : xe10
    rx            : xe10

VLAN and Rule Based Mirroring

This example shows detailed configuration of VLAN with rule based mirroring.

#configure terminal	Enter configure mode.
(config)# bridge 1 protocol mstp	Configure bridge 1 as MSTP bridge.
(config)# vlan 101-110 bridge 1 state enable	Configure VLANs
(config)#interface xe10	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)# bridge-group 1	Associate bridge to an interface.
(config-if)# switchport mode trunk	Configure port as a trunk.
(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up
(config-if)#exit	Exit interface mode.
(config)#interface xe20	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)# bridge-group 1	Associate bridge to an interface.
(config-if)# switchport mode trunk	Configure port as a trunk.
(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up
(config-if)#exit	Exit interface mode.
(config)#interface xe5	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1	Enter monitor session configuration mode
(config-monitor)# destination interface xe5	Configure the interface as destination port
(config-monitor)# source vlan 101	Configure source VLAN to be mirrored
(config-monitor)# filter src-mac host 0000.0000.0005	Configure the rule to match the source MAC
(config-monitor)# no shut	Activate monitor session
(config-monitor)#end	Exit monitor session configuration mode

Validation

Enter the below commands to confirm the configurations.

```
#show running-config monitor
!
monitor session 1
 source vlan 101
 destination interface xe5
```

```
 filter src-mac host 0000.0000.0005
 no shut

#show monitor session all
   session 1

  match set 1
  ---------------
  source mac address : 0000.0000.0005 (host)
```

RSPAN Overview

When several switches need to be analyzed with a single centralized sniffer, remote switched port analyzer (RSPAN) is used. In RSPAN, all the mirrored traffic will be tagged with a RSPAN VLAN ID and forwarded to remote destination via a port called reflector port. Reflector port will have the same characteristics of a local destination port. RSPAN VLAN ID will be a dedicated VLAN for the monitoring purpose and will not participate in bridging. RSPAN destination switch will strip the RSPAN VLAN tag and send it the sniffer for analysis. RSPAN will have the same sub-categories as SPAN except that the mirrored traffic will be tagged with RSPAN VLAN header and forwarded to destination switch for analysis.

Topology

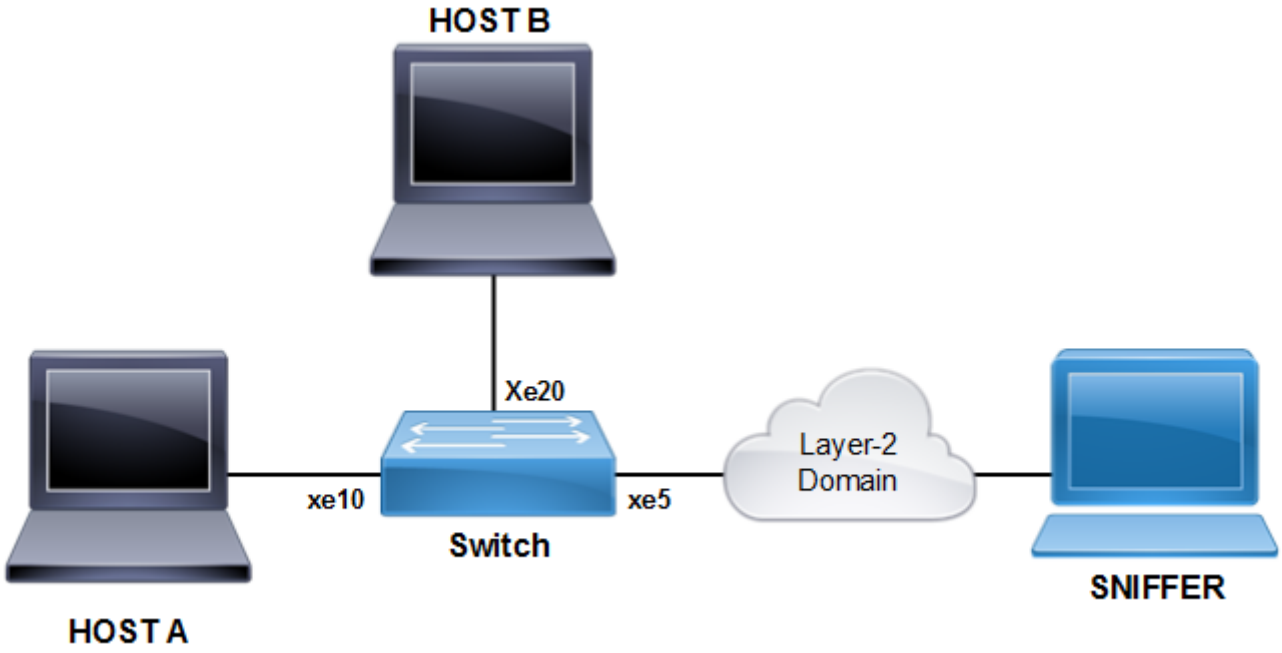

Figure 10-52: RSPAN Topology

Port Mirroring Configuration

This example shows detailed configuration of port mirroring.

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.

(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up.
(config-if)#exit	Exit interface mode.
(config)#interface xe20	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)# bridge-group 1	Associate bridge to an interface.
(config-if)# switchport mode trunk	Configure port as a trunk.
(config-if)# switchport trunk allowed vlan add 101-110	Allow VLANs 101-110 on the interface.
(config-if)# no shutdown	Make interface admin up.
(config-if)#exit	Exit interface mode.
(config)#interface xe5	Enter interface mode.
(config-if)# switchport	Configure interface as a layer 2 port.
(config-if)#exit	Exit interface mode.
(config)# monitor session 1 type remote	Enter monitor session configuration mode.
(config-monitor)# destination remote vlan 100 reflector-port xe5	Configure the interface as remote destination port
(config-monitor)# source interface xe10 both	Configure the source interface to mirror ingress as well as egress direction traffic.
(config-monitor)# no shut	Activate monitor session.
(config-monitor)#end	Exit monitor session configuration mode.

Validation

Enter the commands below to confirm the configurations

```
#show running-config monitor
!
monitor session 1 type remote
 source interface xe10 both
 destination remote vlan 100 reflector-port xe5
 no shut

#show monitor session all
   session 1
---------------
type              : remote
state             : up
source intf       :

    rx            : xe10
    both          : xe10
source VLANs      :
    rx            :
rspan VLAN        : 100
```

```
reflector ports   : xe5
filter count      :

Legend: f = forwarding enabled, l = learning enabled
```

VLAN and Rule Based Mirroring Configuration

This example shows detailed configuration of VLAN with rule based mirroring.

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol mstp`	Configure bridge 1 as MSTP bridge.
`(config)# vlan 101-110 bridge 1 state enable`	Configure VLANs.
`(config)#interface xe10`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe20`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)# bridge-group 1`	Associate bridge to an interface.
`(config-if)# switchport mode trunk`	Configure port as a trunk.
`(config-if)# switchport trunk allowed vlan add 101-110`	Allow VLANs 101-110 on the interface.
`(config-if)# no shutdown`	Make interface admin up.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe5`	Enter interface mode.
`(config-if)# switchport`	Configure interface as a layer 2 port.
`(config-if)#exit`	Exit interface mode.
`(config)# monitor session 1 type remote`	Enter monitor session configuration mode.
`(config-monitor)# destination remote vlan 100 reflector-port xe5`	Configure the interface as remote destination port.
`(config-monitor)# source vlan 101`	Configure source VLAN to be mirrored.
`(config-monitor)# filter src-mac host 0000.0000.0005`	Configure the rule to match the source MAC.
`(config-monitor)# no shut`	Activate monitor session.
`(config-monitor)#end`	Exit monitor session configuration mode.

Validation

Enter the commands below to confirm the configuration.

```
#show running-config monitor
!
monitor session 1 type remote
 source vlan 101
```

```
 destination remote vlan 100 reflector-port xe5
 filter src-mac host 0000.0000.0005
 no shut

#show monitor session all

  ---------------
  source mac address : 0000.0000.0005 (host)
```

CHAPTER 11 Port Security Configuration

The Port Security feature allows network administrators to block unauthorized access to the network. Network administrators can configure each port of the switch to allow network access from only secured MACs, so that the switch forwards traffic from only secured MACs.

Users can limit each port's ingress traffic by limiting MAC addresses (source MACs) that are used to send traffic into ports. Port Security enables users to configure the maximum number of secured MACs for each port. Switches learn secured MAC dynamically (learned by switch during traffic inflow) or statically (User configured MACs). Dynamically Learned or statically programmed MAC addresses cannot exceed the maximum number of secured MACs configured for a particular port. Once the switch reaches the maximum limit for secured MACs, traffic from all other MAC addresses are dropped.

The violated MACs are logged in syslog messages. Refer to `cpu queue portsec-drop` using the command `show interface cpu counter queue-stats` for information on the number of violated MACs.

Secured MACs Learned Dynamically

Figure 11-53: Secured MACs learned dynamically

Send Layer 2 traffic with incremental source MAC of 100 and with VLAN 100 from IXIA1. Because the maximum limit is configured to 3, only 3 secure MAC addresses will be learned by SW1.

SW1

`#configure terminal`	Enter configure mode.
`(config)#hostname SW1`	Set the host name
`(config)#bridge 1 protocol rstp vlan-bridge`	Create a RSTP VLAN bridge on customer side
`(config)#vlan 2-200 bridge 1 state enable`	Configure VLAN for the bridge
`(config)#interface ge1`	Enter interface mode
`(config-if)#switchport`	Make the interface Layer 2
`(config-if)#bridge-group 1`	Associate the interface to bridge
`(config-if)#switchport mode hybrid`	Configure the mode as trunk
`(config-if)#switchport hybrid allowed vlan all`	Configure allowed VLAN all on the interface
`(config-if)#switchport port-security`	Enable port security mode dynamic
`(config-if)#switchport port-security maximum 3`	Limit secure MAC to 3 mac addresses.
`(config-if)#exit`	Exit interface mode
`(config)#interface ge2`	Enter interface mode
`(config-if)#switchport`	Make the interface Layer 2
`(config-if)#bridge-group 1`	Associate the interface to bridge
`(config-if)#switchport mode hybrid`	Configure the mode as trunk

(config-if)#switchport hybrid allowed vlan all	Configure allowed VLAN all on the interface
(config-if)#exit	Exit interface mode
(config)#logging monitor 7	Enable logging level as 7 for debugging

Validation

Validation commands are show port-security, show port-security interface <ifname>, show mac address-table count bridge 1, show bridge, and show mac address-table bridge 1.

```
SW1#show port-security
Port    port-security mode  MAC limit CVLAN  SVLAN  static secure MAC
-------+-------------------+---------+------+------+-----------------
ge1     dynamic             3

SW1#show port-security interface ge1
Port Security Mode     : Dynamic
Secure MAC limit       : 3
Static Secure MAC list :
CVLAN  SVLAN  MAC Address
------+------+----------------

SW1#show mac address-table count bridge 1
MAC Entries for all vlans:
Dynamic Address Count: 3
Static (User-defined) Unicast MAC Address Count: 0
Static (User-defined) Multicast MAC Address Count: 0
Total MAC Addresses in Use: 3

SW1#show bridge
Ageout time is global and if something is configured for vxlan then it will be affected
here also
 Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1         100                  ge1         0000.0300.0500    1     100
 1         100                  ge1         0000.0300.055b    1     100
 1         100                  ge1         0000.0300.055c    1     100

SW1#show mac address-table bridge 1

CVLAN  SVLAN  MAC Address     Type      Ports     Port-security
------+------+---------------+---------+---------+--------------
 100          0000.0300.0500   dynamic   ge1       Enable
 100          0000.0300.055b   dynamic   ge1       Enable
 100          0000.0300.055c   dynamic   ge1       Enable
```

Secured MAC Addresses Learned Statically

1. Stop the traffic from IXIA1 and do a `clear mac address-table dynamic bridge 1` on SW1.
2. Verify all dynamic secured MAC addresses are cleared.
3. Configure 3 static secure MAC addresses using the commands below in port security configured interface.
4. Try to add a fourth static secure MAC address.
5. Verify operator log message is displayed, saying "`port security mac limit reached`."

`(config)#interface ge1`	Enter interface mode
`(config-if)#switchport port-security mac-address 0000.0000.aaaa vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode
`(config-if)#switchport port-security mac-address 0000.0000.aaab vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode
`(config-if)#switchport port-security mac-address 0000.0000.aaac vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode

Validation

```
SW1#show port-security
Port    port-security mode  MAC limit CVLAN  SVLAN  static secure MAC
-------+-------------------+---------+------+------+-----------------

SW1#
```

Remove the port-security configuration method using the two commands below:

`config)#interface ge1`	Enter interface mode
`(config-if)#no switchport port-security`	Set the port-security method to static.

Static Mode

Use the below command to configure the port-security method to static and configure static secure MAC addresses using the commands in static port-security method, below.

`(config)#interface ge1`	Enter interface mode
`(config-if)#switchport port-security static`	Set the port-security method as static.
`(config-if)#switchport port-security max 3`	Limit static secure MAC to 3 mac addresses.
`(config-if)#switchport port-security mac-address 0000.0000.aaaa vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode.
`(config-if)#switchport port-security mac-address 0000.0000.aaab vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode.
`(config-if)#switchport port-security mac-address 0000.0000.aaac vlanId 100`	Add static secure MAC address for VLAN 100 in interface mode .

Verify the 3 secure static MAC addresses are added in interface ge1 using show running-config and also verify the port-security method should be static using below show commands.

Validation

```
SW1#show running-config interface ge1
interface ge1
 switchport
bridge-group 1
 switchport mode hybrid
 switchport hybrid allowed vlan all
 switchport port-security static
 switchport port-security maximum 3
 switchport port-security mac-address 0000.0000.aaaa vlanId 100
 switchport port-security mac-address 0000.0000.aaab vlanId 100
```

```
 switchport port-security mac-address 0000.0000.aaac vlanId 100

100           0000.0000.aaac  static    ge1       Enable
```

Configure one more static secure MAC address on interface ge1 and try to verify “`port security mac limit reached`” operator log message is displayed.

Start sending Layer-2 traffic with incremental source MAC of 100 and with VLAN 100 from IXIA1, and verify no dynamic secure MAC addresses are being learned using all the validation commands used.

CHAPTER 12 ErrDisable for Link-Flapping Configuration

If a link flaps continuously, the interface goes into ErrDisable state. When a port is the ErrDisable state, it is effectively shut down and no traffic is sent or received on that port. The port can be recovered from the ErrDisable state manually (shutting down the interface) or automatically (setting a timeout value).

Note:

- An interface should change state as up-down to complete one cycle of a link flap.
- Admin shut/no shut will not change interface into errdisable state
- The LED does not glow when an interface is in the errdisable state.
- Errdisable is supported only on physical interfaces.
- A LAG interface does not go into the errdisable state when all of its member ports are in the errdisable state
- The error disable computation is based on a sliding window of time. The window size is configurable in seconds. This window is taken as the current time to the last <t> second, where <t> is the configured window size. If the accumulated link flap count reaches the maximum flap count for a particular sliding window, a link flap error disable fault is triggered.

Topology

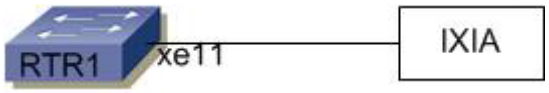

Figure 12-54: ErrDisable

Automatic Recovery

By default, an interface goes into the ErrDisable state when a link flaps 5 times in 10 seconds. An interface is recovered from the ErrDisable state when the configured non-zero errdisable time-out interval value expires.

RTR1

`#configure terminal`	Enter configure mode.
`(config)#errdisable cause link-flap`	Enable ErrDisable due to link-flap
`(config)#errdisable link-flap-setting max-flaps 2 time 30`	Configure Link flap settings. Max link flap count and interval for linkFlap Timer
`(config)#errdisable timeout interval 50`	Configure interval to recover from error disable state

Note: Automatic recovery timeout is disabled, if you configure `errdisable timeout interval 0`

Validation

```
#show errdisable details

 Error Disable Recovery Timeout Interval : 50 secs
 Link Flap Timer Interval : 30 secs
 Link Flaps allowed Max. count : 2
```

```
ErrDisable Cause     Status
---------------      ------
Link-Flap            Enabled
Lag-Mismatch         Disabled
Stp-Bpdu-Guard       Enabled
Mac-move-limit       Disabled
```

Note: Stp-Bpdu-Guard is enabled by default on the global level configuration.

```
#show interface errdisable status
Interfaces that will be enabled at the next timeout
Interface    ErrDisable Cause   Time left(secs)
---------    ----------------   ---------------
xe11         link-flap          38

#show interface brief | include ED
       ED - ErrDisabled, PD - Protocol Down, AD - Admin Down, IA - InActive
xe11       ETH   --    --                down    ED      10g   --       No  No
#
```

Note: Interface xe11 went into the ErrDisable state after flapping 2 times in 30 seconds.

Log Message

`Edge1-SiteX#configure terminal`	Enter configure mode.
`Edge1-SiteX(config)#logging level nsm 4`	Enable Operational log to display recovery message

```
2017 Sep 18 11:52:12 : NSM : CRITI : [IFMGR_IF_DOWN_2]: Interface xe11 changed state to
down
(config-if)#no shut
(config-if)#2017 Sep 18 11:52:15 : NSM : CRITI : [IFMGR_IF_UP_2]: Interface xe11 changed
state to up
2017 Sep 18 11:52:15 : NSM : WARN : [VXLAN_OPR_ACCESSPORT_UP_4]: VXLAN Access port on
xe11 is up
2017 Sep 18 11:52:15 : NSM : CRITI : [IFMGR_ERR_DISABLE_DOWN_2]: Interface xe11 moved to
errdisable state due to link-flap
2017 Sep 18 11:52:15 : NSM : CRITI : [IFMGR_IF_DOWN_2]: Interface xe11 changed state to
down
```

Note: Interface xe11 recovered from the ErrDisable state after a 50 second time-out.

Manual Recovery

An interface can be recovered manually from the Errdisable state, when configure shutdown followed by no shutdown using CLI. Shutdown will recover the interface from errdisable state and No shutdown will make the interface up state.

RTR1

`#configure terminal`	Enter configure mode.
`(config)#errdisable cause link-flap`	Enable errdisable due to link-flap
`(config)#errdisable link-flap-setting max-flaps 3 time 20`	Configure Link flap settings. Max link flap count and interval for linkFlap Timer

```
#show running-config | include errdisable
errdisable cause link-flap
errdisable link-flap-setting max-flaps 3 time 20

#show errdisable details

 Link Flap Timer Interval : 20 secs
 Link Flaps allowed Max. count : 3

ErrDisable Cause     Status
---------------      ------
Link-Flap            Enabled
Lag-Mismatch         Disabled
Stp-Bpdu-Guard       Disabled
Mac-move-limit       Disabled
```

Note: Interface xe11 went into the ErrDisable state after flapping 3 times in 20 seconds.

```
(config)#do show interface errdisable status
Interfaces that will be enabled at the next timeout
Interface    ErrDisable Cause   Time left(secs)
---------    ----------------   ---------------
xe11         link-flap          NA
(config)#do show int brief | include ED
       ED - ErrDisabled, PD - Protocol Down, AD - Admin Down, IA - InActive
xe11       ETH   --    --                down    ED      10g   --       No  No
```

Note: Interface xe11 recovered from the ErrDisable state after entering `shutdown` followed by `no shutdown`.

```
(config)#interface xe11
(config-if)#shutdown
2017 Sep 18 13:02:20 : NSM : WARN : [IFMGR_ERR_DISABLE_UP_4]: Interface xe11 recovered
from link-flap errdisable
(config-if)#no shut
(config-if)#2017 Sep 18 13:02:21 : NSM : CRITI : [IFMGR_IF_UP_2]: Interface xe11 changed
state to up
2017 Sep 18 13:02:21 : NSM : WARN : [VXLAN_OPR_ACCESSPORT_UP_4]: VXLAN Access port on
xe11 is up

config)#do show interface errdisable
(config)#do show interface brief | include ED
       ED - ErrDisabled, PD - Protocol Down, AD - Admin Down, IA - InActive
```

```
(config)#
```

If you configure `no errdisable cause link-flap`, at the global level, it recovers all the interfaces from the ErrDisable state

Errdisable at the Interface Level

If you enable errdisable globally, by default all physical interfaces enable link-flap errdisable. To turn off errdisable for an interface, configure the commands below.

`#configure terminal`	Enter configure mode.
`(config)#interface xe11`	Enter into interface level
`(config-if)#no link-flap errdisable`	Disable link-flap errdisable for interface

Note: If you configure “no link-flap errdisable” in interface level, either it won’t allow the interface move to errdisable state or it will recover interface from errdisable state

Validation

```
#show run int xe11
!
interface xe11
 description *1/2 member of PO3 - Connected to IXIA 6/6*
 channel-group 3 mode active
 no link-flap errdisable
!
```

CHAPTER 13 Private VLAN Configuration

A private VLANs (PVLAN) splits a primary VLAN domain into multiple isolated broadcast sub-domains. PVLAN, also known as port isolation, is a technique where a VLAN contains switch ports that are restricted such that they can only communicate with a given uplink.

Topology

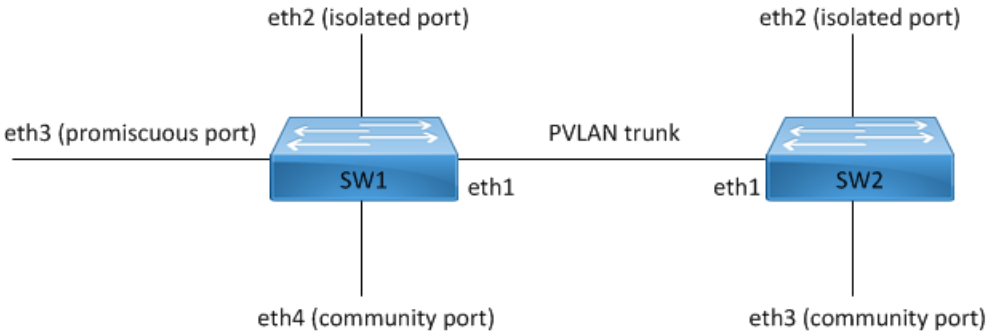

Figure 13-55: PVLAN configuration

Configure PVLAN Trunk and Promiscuous Trunk Port

SW1

`SW1#configure terminal`	Enter configuration mode
`SW1(config)#bridge 1 protocol ieee vlan-bridge`	Create bridge
`SW1(config)#vlan database`	Enter VLAN configuration mode
`SW1(config-vlan)#vlan 10 bridge 1 state enable`	Create VLAN 10
`SW1(config-vlan)#vlan 20 bridge 1 state enable`	Create VLAN 20
`SW1(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100
`SW1(config-vlan)#private-vlan 10 isolated bridge 1`	Configure VLAN 10 as isolated VLAN
`SW1(config-vlan)#private-vlan 20 community bridge 1`	Configure VLAN 20 as community VLAN
`SW1(config-vlan)#private-vlan 100 primary bridge 1`	Configure VLAN 100 as primary VLAN
`SW1(config-vlan)#private-vlan 100 association add 10 bridge 1`	Associate secondary isolated VLAN 10 with primary VLAN 100

`SW1(config-vlan)#private-vlan 100 association add 20 bridge 1`	Associate secondary community VLAN 20 with primary VLAN 100
`SW1(config-vlan)#exit`	Exit VLAN configuration mode
`SW1(config)#interface eth1`	Enter interface configuration mode for eth1
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface as trunk
`SW1(config-if)#switchport trunk allowed vlan add 10,20,100`	Configure VLAN 10,20,100 (primary, secondary VLANs)
`SW1(config-if)#exit`	Exit interface mode
`SW1(config)#interface eth3`	Enter interface configuration mode for eth3
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode trunk`	Set the switching characteristics of this interface as trunk
`SW1(config-if)#switchport mode private-vlan promiscuous`	Configure the interface as promiscuous port for private-vlan
`SW1(config-if)#switchport trunk allowed vlan add 100`	Configure VLAN 100 (primary VLAN)
`SW1(config-if)#switchport private-vlan mapping 100 add 10`	Associate port with primary and secondary VLAN of private-vlan
`SW1(config-if)#switchport private-vlan mapping 100 add 20`	Associate port with primary and secondary VLAN of private-vlan
`SW1(config-if)#exit`	Exit interface mode
`SW1(config)#interface eth4`	Enter interface configuration mode for eth4
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode access`	Set the switching characteristics of this interface as access
`SW1(config-if)#switchport mode private-vlan host`	Configure the interface as host port for private-vlan
`SW1(config-if)#switchport access vlan 20`	Configure VLAN 20 (community VLAN)
`SW1(config-if)#switchport private-vlan host-association 100 add 20`	Associate port with primary and secondary VLAN of private-vlan
`SW1(config-if)#exit`	Exit interface mode
`SW1(config)#interface eth2`	Enter interface configuration mode for eth2
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode access`	Set the switching characteristics of this interface as access
`SW1(config-if)#switchport mode private-vlan host`	Configure the interface as host port for private-vlan
`SW1(config-if)#switchport access vlan 10`	Configure VLAN 10 (isolated VLAN)
`SW1(config-if)#switchport private-vlan host-association 100 add 10`	Associate port with primary and secondary VLAN of private-vlan
`SW1(config-if)#exit`	Exit interface mode
`SW1(config)#exit`	Exit configuration mode

SW2

`SW2#configure terminal`	Enter configuration mode
`SW2(config)#bridge 1 protocol ieee vlan-bridge`	Create bridge
`SW2(config)#vlan database`	Enter VLAN configuration mode
`SW2(config-vlan)#vlan 10 bridge 1 state enable`	Create VLAN 10
`SW2(config-vlan)#vlan 20 bridge 1 state enable`	Create VLAN 20
`SW2(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100
`SW2(config-vlan)#private-vlan 10 isolated bridge 1`	Configure VLAN 10 as isolated VLAN
`SW2(config-vlan)#private-vlan 20 community bridge 1`	Configure VLAN 20 as community VLAN
`SW2(config-vlan)#private-vlan 100 primary bridge  1`	Configure VLAN 100 as primary VLAN
`SW1(config-vlan)#private-vlan 100 association add 10 bridge 1`	Associate secondary isolated VLAN 10 with primary VLAN 100
`SW1(config-vlan)#private-vlan 100 association add 20 bridge 1`	Associate secondary community VLAN 20 with primary VLAN 100
`SW2(config-vlan)#exit`	Exit VLAN configuration mode
`SW2(config)#interface eth1`	Enter interface configuration mode for eth1
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode trunk`	Set the switching characteristics of this interface as trunk
`SW2(config-if)#switchport trunk allowed vlan add 10,20,100`	Configure VLAN 10,20,100 (primary, secondary VLANs)
`SW2(config-if)#exit`	Exit interface mode
`SW2(config)#interface eth2`	Enter interface configuration mode for eth2
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode access`	Set the switching characteristics of this interface as access
`SW2(config-if)#switchport mode private-vlan host`	Configure the interface as host port for private-vlan
`SW2(config-if)#switchport access vlan 10`	Configure VLAN 10 (isolated VLAN)
`SW2(config-if)#switchport private-vlan host-association 100 add 10`	Associate port with primary and secondary VLAN of private-vlan
`SW2(config-if)#exit`	Exit interface mode
`SW2(config)#interface eth3`	Enter interface configuration mode for eth3
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode access`	Set the switching characteristics of this interface as access
`SW2(config-if)#switchport mode private-vlan host`	Configure the interface as host port for private-vlan

SW2(config-if)#switchport access vlan 20	Configure VLAN 20 (community VLAN)
SW2(config-if)#switchport private-vlan host-association 100 add 20	Associate port with primary and secondary VLAN of private-vlan
SW2(config-if)#exit	Exit interface mode
SW1(config)#exit	Exit configuration mode

Validation

```
SW1#show vlan private-vlan bridge 1

SW1(config-if)#switchport mode access	Set the switching characteristics of this interface as access
SW1(config-if)#switchport mode private-vlan host	Configure the interface as host port for private-vlan
SW1(config-if)#switchport access vlan 10	Configure VLAN 10 (isolated VLAN)
SW1(config-if)#switchport private-vlan host-association 100 add 10	Associate port with primary and secondary VLAN of private-vlan
SW1(config-if)#exit	Exit interface mode
SW1(config)#exit	Exit configuration mode

SW2

`SW2#configure terminal`	Enter configuration mode
`SW2(config)#bridge 1 protocol ieee vlan-bridge`	Create bridge
`SW2(config)#vlan database`	Enter VLAN configuration mode
`SW2(config-vlan)#vlan 10 bridge 1 state enable`	Create VLAN 10
`SW2(config-vlan)#vlan 20 bridge 1 state enable`	Create VLAN 20
`SW2(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100
`SW2(config-vlan)#private-vlan 10 isolated bridge 1`	Configure VLAN 10 as isolated VLAN
`SW2(config-vlan)#private-vlan 20 community bridge 1`	Configure VLAN 20 as community VLAN
`SW2(config-vlan)#private-vlan 100 primary bridge  1`	Configure VLAN 100 as primary VLAN
`SW1(config-vlan)#private-vlan 100 association add 10 bridge 1`	Associate secondary isolated VLAN 10 with primary VLAN 100
`SW1(config-vlan)#private-vlan 100 association add 20 bridge 1`	Associate secondary community VLAN 20 with primary VLAN 100
`SW2(config-vlan)#exit`	Exit VLAN configuration mode
`SW2(config)#interface eth1`	Enter interface configuration mode for eth1
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode trunk`	Set the switching characteristics of this interface as trunk
`SW2(config-if)#switchport trunk allowed vlan add 10,20,100`	Configure VLAN 10,20,100 (primary, secondary VLANs)
`SW2(config-if)#exit`	Exit interface mode
`SW2(config)#interface eth2`	Enter interface configuration mode for eth2
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode access`	Set the switching characteristics of this interface as access
`SW2(config-if)#switchport mode private-vlan host`	Configure the interface as host port for private-vlan
`SW2(config-if)#switchport access vlan 10`	Configure VLAN 10 (isolated VLAN)
`SW2(config-if)#switchport private-vlan host-association 100 add 10`	Associate port with primary and secondary VLAN of private-vlan
`SW2(config-if)#exit`	Exit interface mode
`SW2(config)#interface eth3`	Enter interface configuration mode for eth3
`SW2(config-if)#switchport`	Configure switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode access`	Set the switching characteristics of this interface as access

SW2(config-if)#switchport mode private-vlan host	Configure the interface as host port for private-vlan
SW2(config-if)#switchport access vlan 20	Configure VLAN 20 (community VLAN)
SW2(config-if)#switchport private-vlan host-association 100 add 20	Associate port with primary and secondary VLAN of private-vlan
SW2(config-if)#exit	Exit interface mode
SW1(config)#exit	Exit configuration mode

Validation

```
SW1#show vlan private-vlan bridge 1
 PRIMARY       SECONDARY          TYPE         INTERFACES
 -------        ---------       ----------      ----------
     100              10          isolated      eth1,eth2,
     100              20         community      eth1,eth4,
SW1#

```

CHAPTER 14 Layer 2 Subinterface Configuration

This chapter contains examples of configuring L2 Subinterfaces.

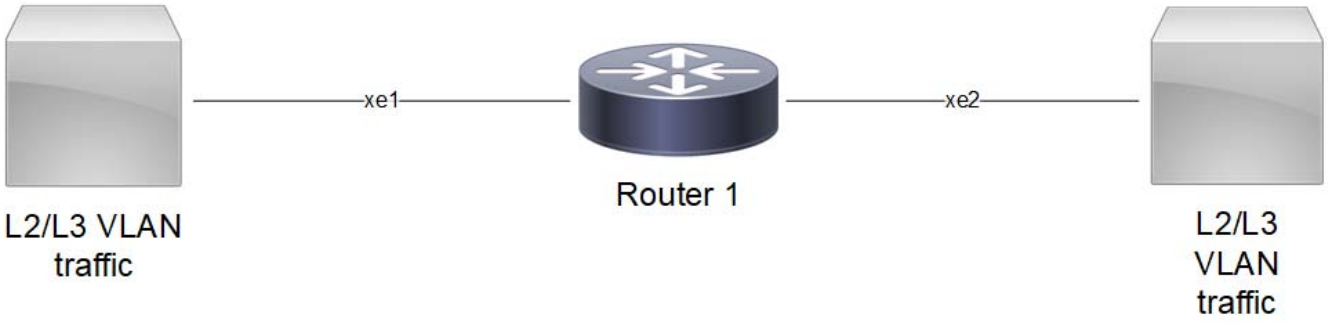
A subinterface is a virtual interface created by dividing a physical interface into multiple logical interfaces. A subinterface on a router uses the parent physical interface for sending and receiving data.

Subinterfaces are used for a variety of purposes. Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN identifiers. Because VLANs allow you to keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances.

Note: Refer to the release note for features supported by L2 Sub-interface.

Topology

Below figure shows and example of subinterface configuration for one node with cross-connect. In this example, there is one router R1 with 2 connections



The xe1.10 and xe2.10 subinterface is created on R1

Subinterfaces can be created on physical and LAG interfaces in Layer 2 mode (switchport).

Note: Use switchport dot1q ethertype (8100 | 88a8 | 9100 | 9200) command to configure the service-tpid value on parent port of a subinterface. By this the tpid used for service tag for a subinterface may be inherited from the one applied to parent interface.

Note: For any dot1ad subinterface to be functional, switchport dot1q ethertype should be set to desired value as 88a8/9100/9200. Default value is 8100. To verify the ethertype value for the interface use show interface <subinterface> command.

Configure L2 Subinterface with cross-connect

`#configure terminal`	Enter configure mode.
`(config)#interface xe1`	Enter interface mode
`(config-if)# switchport dot1q ethertype 88a8`	Configure interface with tpid value as 88a8
`(config-if)#interface xe1.10 switchport`	Creates a L2 sub-interface as xe1.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching vlan 10
`(config)#interface xe2`	Enter interface mode
`(config-if)# switchport dot1q ethertype 88a8`	Configure interface with tpid value as 88a8
`(config-if)#interface xe2.10 switchport`	Creates a L2 sub-interface as xe2.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching vlan 10
`(config)# cross-connect CC1`	Create cross-connect with name CC1
`(config-xc)# interface xe1.10`	Attach interface xe1.10
`(config-xc)# interface xe2.10`	Attach interface xe2.10

Creating a Subinterface with Encapsulation

Single encapsulation as dot1q with vlan range

```
configure terminal (config)#interface xe1.100 switchport
(config-if)# encapsulation dot1q 100-200
```

Single encapsulation as dot1ad with vlan range

```
configure terminal (config)#interface xe1.100 switchport
(config-if)# encapsulation dot1ad 100-200
```

Double encapsulation as dot1q

```
configure terminal (config)#interface xe1.100 switchport
(config-if)# encapsulation dot1q 10 inner-dot1q 10
```

Double encapsulation as dot1ad

```
configure terminal (config)#interface xe1.200 switchport
(config-if)# encapsulation dot1ad 20 inner-dot1q 20
```

Encapsulation as default

```
configure terminal (config)#interface xe1.101 switchport
(config-if)# encapsulation default
```

Encapsulation as untagged

```
configure terminal (config)#interface xe1.102 switchport
(config-if)# encapsulation untagged
```

Rewrite with push

```
configure terminal (config)#interface xe1.10 switchport
(config-if)# encapsulation dot1q 10
(config-if)# rewrite push 0x8100 100
(config-if)#interface xe2.20 switchport
(config-if)# encapsulation dot1q 100 inner-dot1q 10
```

```
(config)# cross-connect CC1
(config-xc)# interface xe1.10
(config-xc)# interface xe2.10
```

Note: At interface xe1.10, for incoming traffic "rewrite push" will add vlan as 100 with tpid values 8100.

Note: At interface xe1.10, for outgoing traffic "rewrite push" will pop the vlan.

Rewrite with translate

```
configure terminal (config)# interface xe1
(config-if)# switchport dot1q ethertype 9100
(config-if)#interface xe1.10 switchport
(config-if)# encapsulation dot1ad 200
(config-if)# rewrite translate 0x9100 100
(config-if)#interface xe2
(config-if)# switchport dot1q ethertype 9100
(config-if)#interface xe2.20 switchport
(config-if)# encapsulation dot1ad 100
(config)# cross-connect CC1
(config-xc)# interface xe1.10
(config-xc)# interface xe2.10
```

Note: At interface xe1.10, for incoming traffic "rewrite translate" will update vlan as 100 with tpid values 9100.

Note: At interface xe1.10, for outgoing traffic "rewrite translate" will update vlan as 200 with tpid values 9100.

Rewrite with pop

```
#configure terminal (config)#interface xe1.10 switchport
(config-if)# encapsulation dot1q 100
(config-if)# rewrite pop
(config-if)#interface xe2.20 switchport
(config-if)# encapsulation untagged
(config)# cross-connect CC1
(config-xc)# interface xe1.10
(config-xc)# interface xe2.10
```

Note: At interface xe1.10, for incoming traffic "rewrite pop" will pop the vlan.

Note: At interface xe1.10, for outgoing traffic "rewrite pop" will add vlan as 100 with tpid values 8100.

Note: Push, pop and translate rewrite operations are supported with tpid values 8100/88a8/9100/9200 as symmetric operation.

No subinterfaces

```
#configure terminal (config)#interface xe1
(config-if)# no subinterfaces
```

Note: no Subinterfaces will remove all the Subinterfaces.

Note: Same physical interface will support both L2 and L3 subinterfaces.

L2SI Statistics

Enable below commands to get L2SI statistics

```
#configure terminal (config)# hardware-profile statistics ac-lif enable
```

Note: Reload the node, and then only statistics command will get effective.

Verification commands

Subinterfaces appear as any physical interface in the show running-config or the show ip interface brief output and can be configured as any other interface.

The following examples display subinterface information from various show commands.

show interface brief

```
R1#show interface brief | include xe1
xe1        ETH   --    routed            up      none    10g   --
xe1.10        SUBINTERFACE     up      --     N/A
```

show interface <>

```
R1#show interface xe1.10
Interface xe1.10

Layer 2 Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Common Commands

This chapter provides a description, the syntax, and examples of common Layer 2 commands.

flowcontrol

Use this command to enable or disable flow control.

Flow control enables connected Ethernet ports to control traffic rates during periods of congestion by allowing congested nodes to pause link operations at the other end. If one port experiences congestion and cannot receive any more traffic, it notifies the other port to stop sending until the condition clears. When a local device detects congestion at its end, it notifies the remote device by sending a pause frame. On receiving a pause frame, the remote device stops sending data packets, which prevents loss of data packets during the period of congestion.

Use the `no` parameter with this command to disable flow control.

Command Syntax

```
flowcontrol both
flowcontrol send on
flowcontrol send off
flowcontrol receive on
flowcontrol receive off
no flowcontrol
```

Parameters

`both`	Specify flow control mode for sending or receiving.
`send`	Specify flow control mode for sending.
`receive`	Specify the flow control mode for receiving.
`off`	Turn off flow control.
`on`	Turn on flow control.

Default

The flow control is enabled globally and auto-negotiation is on, flow control is enabled and advertised on 10/100/1000M ports. If auto-negotiation is off or if the port speed was configured manually, flow control is neither negotiated with nor advertised to the peer.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#flowcontrol receive off

#configure terminal
(config)#interface eth1
(config-if)#flowcontrol receive on
```

```
(config)#interface eth1
(config-if)#no flowcontrol
```

hardware register get

Use this command to get the value of a chip register.

Command Syntax

```
hardware register get ADDR
```

Parameters

ADDR	Register address in 0xhhhh format

Default

By default, hello time is 2 seconds

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#hardware register get 0x3000
```

hardware register set

Use this command to set the value of a chip register.

Command Syntax

```
hardware register set ADDR VALUE
```

Parameters

ADDR	Register address in 0xhhhh format
VALUE	Value

Default

By default, hello time is 2 seconds

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#hardware register set 0x3000 10
```

show flowcontrol

Use this command to display flow control information.

Command Syntax

```
show flowcontrol
show flowcontrol interface IFNAME
```

Parameters

`interface IFNAME`	Specify the name of the interface to be displayed.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of the `show flowcontrol interface` command displaying flow control information:

```
#show flowcontrol interface ge1
Port    Send FlowControl    Receive FlowControl RxPause TxPause

        admin    oper        admin    oper

-----   ------- --------    ------- --------     ------- -------
ge1      on       on           on       on            0       0
#
```

Table 1-84 explains the show command output fields.

Table 1-84: show flow control output

Entry	Description
Port	Interface being checked for flowcontrol.
Send admin	Displays whether the flowcontrol send process is administratively on or off.
FlowControl oper	Displays whether send flowcontrol is on or off on this interface.
Received admin	Displays whether the flowcontrol receive process is administratively on or off.
FlowControl oper	Displays whether receive flowcontrol is on or off on this interface.
RxPause	Number of received pause frames.
TxPause	Number of transmitted pause frames.

show interface capabilities

Use this command to display interface capabilities

Command Syntax

```
show interface (IFNAME|) capabilities
```

Parameters

IFNAME	Displays the name of a specific interface for which status and configuration data is desired.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show interface xe1/1 capabilities
xe1/1
Speed(FD) : 10MB,100MB,1000MB,10GB,20GB,40GB
Interface : xgmii
Medium : copper
Loopback : none,MAC,PHY
Pause : pause_tx,pause_rx,pause_asymm
Flags : autoneg
Encap : IEEE,HIGIG,HIGIG2
```

Table 1-85 explains the show command output fields.

Table 1-85: show interface capabilities output details

Field	Description
Interface number	The identifying ID number of the interface – eht0, xe1, etc.
Speed (FD)	The Flexible Data-Rates (FD) of the interface
interface	XAUI is a standard for extending the XGMII (10 Gigabit Media Independent Interface) between the MAC and PHY layer of Gigabit Ethernet.
Medium	Members have to have the same medium type configured. This only applies to Ethernet port-channel. Copper, fiber optics, etc.
Loop back	The loop back between the MAC and PHY layers.
Pause	Pause transmit, pause receive, pause asymmetrically.

Table 1-85: show interface capabilities output details

Field	Description
Flags	Interface flags set for Auto-negotiation.
Encap	Encapsulation – IEEE, HIGIG, and HIGIG2 specifications – HIGIG is a proprietary protocol that is implemented by Broadcom. The HIGIG protocol supports various switching functions. The physical signaling across the interface is XAUI, four differential pairs for receive and transmit (SerDes), each operating at 3.125 Gbit/s.

snmp restart mstp

Use this command to restart SNMP in Multiple Spanning Tree Protocol (MSTP).

Command Syntax

```
snmp restart mstp
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart mstp
```

CHAPTER 2 Bridge Commands

This chapter provides a description, syntax, and examples of the bridge commands. It includes the following commands:

bridge acquire

Use this command to enable a bridge to learn station location information for an instance. This helps in making forwarding decisions.

Use the no parameter with this command to disable learning.

Note: OcNOS supports only configuration of a single bridge.

Command Syntax

```
bridge <1-32> acquire
no bridge <1-32> acquire
```

Parameter

<1-32>	Bridge group ID.

Default

By default, learning is enabled for all instances.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 3 acquire
(config)#no bridge 3 acquire
```

bridge address

Use this command to add a static forwarding table entry for the bridge.

Use the no parameter with this command to remove the entry for the bridge

Command Syntax

```
bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME
bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094>
bridge <1-32> address XXXX.XXXX.XXXX  (forward|discard) IFNAME vlan <2-4094> svlan
  <2-4094>
no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME
no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094>
no bridge <1-32> address XXXX.XXXX.XXXX (forward|discard) IFNAME vlan <2-4094>
  svlan <2-4094>
```

Parameters

<1-32>	Bridge identifier
XXXX.XXXX.XXXX	Media Access Control (MAC) address in HHHH.HHHH.HHHH format.
forward	Forward matching frames.
discard	Discard matching frames.
IFNAME	Interface on which the frame comes out.
vlan	Identity of the VLAN in the range of <2-4094>.
svlan	Identity of the SVLAN in the range of <2-4094>.

Defaul

By default, bridge address is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 1 address 0000.000a.0021 forward eth0
(config)#no bridge 1 address 0000.000a.0021 forward eth0
```

bridge ageing

Use this command to specify the aging time for a learned MAC address. A learned MAC address persists until this specified time.

Note: The bridge aging time affects the ARP entries which are dependent upon the MAC addresses in hardware. If a MAC address ages out, it causes the corresponding ARP entry to refresh.

Note: On Qumran, the MAC aging time can vary by up to 16%. For example, if the MAC aging time is set to 60 seconds, the aging time can happen anywhere between 50-60 seconds.

Use the `no` form of this command to set the MAC address aging time to its default (300).

Use the `disable` form of this command to turn off MAC address aging completely.

Command Syntax

```
bridge <1-32> ageing-time <10-572>
no bridge <1-32> ageing-time
bridge <1-32> ageing disable
```

Parameters

`<1-32>`	Bridge group ID.
`<10-572>`	Aging time in seconds.
`disable`	Turn off MAC address aging completely.

Default

By default, the aging time is 300 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 3 ageing-time 1000
(config)#no bridge 3 ageing-time
```

bridge forward-time

Use this command to set the time (in seconds) after which (if this bridge is the root bridge) each port changes states to learning and forwarding. This value is used by all instances.

Use the no parameter with this command to restore the default value of 15 seconds.

Command Syntax

```
bridge <1-32> forward-time <4-30>
no bridge <1-32> forward-time
```

Parameters

<1-32>	Specify the bridge group ID.
<4-30>	Specify the forwarding time delay in seconds.

Note: Care should be exercised if the value is to be made below 7 seconds.

Default

By default, value is 15 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 3 forward-time 6
(config)#no bridge 3 forward-time
```

bridge hello-time

Use this command to set the hello-time, the time in seconds after which (if this bridge is the root bridge) all the bridges in a bridged LAN exchange Bridge Protocol Data Units (BPDUs). A very low value of this parameter leads to excessive traffic on the network, while a higher value delays the detection of topology change.This value is used by all instances.

Configure the bridge instance name before using this command. The allowable range of values is 1-10 seconds. However, make sure that the value of hello time is always greater than the value of hold time (2 seconds by default).

Use the no parameter to restore the default value of the hello time.

Note: A Bridge shall enforce the following relationships for Hello-time, Max-age and Forward-delay.

- 2 × (Bridge_Forward_Delay – 1.0 seconds) >= Bridge_Max_Age
- Bridge_Max_Age >= 2 × (Bridge_Hello_Time + 1.0 seconds)

Command Syntax

```
bridge <1-32> hello-time <1-10>
no bridge <1-32> hello-time
```

Parameters

<1-32>	Specify the bridge group ID.
<1-10>	Specify the hello BPDU interval in seconds.

Default

By default, value is 2 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 3 hello-time 3

(config)#no bridge 3 hello-time
```

bridge mac-priority-override

Use this command to set a MAC priority override.

Use the no parameter with this command to unset a MAC priority override.

Command Syntax

```
bridge <1-32> mac-priority-override mac-address MAC interface IFNAME vlan VLANID
  (static|static-priority-override|static-mgmt|static-mgmt-priority-overide)
  priority <0-7>
no bridge <1-32> mac-priority-override mac-address MAC interface IFNAME vlan VLANID
```

Parameters

`<1-32>`	Specify the bridge group ID.
`mac-address`	Enter a MAC address in HHHH.HHHH.HHHH format.
`interface`	Interface information
`vlan`	Add the values associated with a single VLAN
`static`	The MAC is a static entry
`static-mgmt`	The MAC is a Static Management
`static-mgmt-priority-overide`	The MAC is a Static Management with priority override
`static-priority-override`	The MAC is a static with priority override
`priority`	priority <0-7> priority value

Default

No default address is specified

Command Mode

Configuration Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 mac-priority-override mac-address 1111.1111.1111 interface
eth1 vlan 2 static priority 2

(config)#no bridge 1 mac-priority-override mac-address 1111.1111.1111
interface eth1 vlan 2
```

bridge max-age

Use this command to set the maximum age for a bridge. This value is used by all instances.

Maximum age is the maximum time in seconds for which (if a bridge is the root bridge) a message is considered valid. This prevents the frames from looping indefinitely. The value of maximum age should be greater than twice the value of hello time plus 1, but less than twice the value of forward delay minus 1. The allowable range for max-age is 6-40 seconds. Configure this value sufficiently high, so that a frame generated by root can be propagated to the leaf nodes without exceeding the maximum age.

Use the `no` parameter with this command to restore the default value of the maximum age.

Note: A Bridge shall enforce the following relationships for Hello-time, Max-age and Forward-delay.

- 2 × (Bridge_Forward_Delay – 1.0 seconds) >= Bridge_Max_Age
- Bridge_Max_Age >= 2 × (Bridge_Hello_Time + 1.0 seconds)

Command Syntax

```
bridge <1-32> max-age <6-40>
no bridge <1-32> max-age
```

Parameters

`<1-32>`	Specify the bridge group ID.
`<6-40>`	Specify the maximum time, in seconds, to listen for the root bridge <6-40>.

Default

By default, bridge maximum age is 20 seconds

Command Mode

Configure Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 max-age 12

(config)#no bridge 2 max-age
```

bridge max-hops

Use this command to specify the maximum allowed hops for a BPDU in an MST region. This parameter is used by all the instances of the MST. Specifying the maximum hops for a BPDU prevents the messages from looping indefinitely in the network. When a bridge receives an MST BPDU that has exceeded the allowed maximum hops, it discards the BPDU.

Use the no parameter with this command to restore the default value.

Command Syntax

```
bridge <1-32> max-hops <1-40>
no bridge <1-32> max-hops
```

Parameters

<1-32>	Specify the bridge-group ID.
<1-40>	Specify the maximum hops for which the BPDU will be valid <1-40>.

Default

By default, maximum hops in an MST region are 20

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 3 max-hops 25

#configure terminal
(config)#no bridge 3 max-hops
```

bridge priority

Use this command to set the bridge priority for the common instance. Using a lower priority indicates a greater likelihood of the bridge becoming root. The priority values can be set only in increments of 4096.

Use the no form of the command to reset it to the default value.

Command Syntax

```
bridge (<1-32> | ) priority <0-61440>
no bridge (<1-32> | )priority
```

Parameters

<1-32>	Specify the bridge group ID.
<0-61440>	Specify the bridge priority in the range of <0-61440>.

Default

By default, priority is 32768 (or hex 0x8000).

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 priority 4096

(config)#no bridge 2 priority
```

bridge shutdown

Use this command to disable a bridge.

Use the no parameter to reset the bridge.

Command Syntax

```
bridge shutdown <1-32>
bridge shutdown <1-32> bridge-forward
no bridge shutdown <1-32>
```

Parameters

<1-32>	Specify the bridge group ID.
bridge-forward	Put all ports of the bridge into forwarding state

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge shutdown 4
(config)#no bridge shutdown 4
```

bridge transmit-holdcount

Use this command to set the maximum number of transmissions of BPDUs by the transmit state machine.

Use the no parameter with this command to restore the default transmit hold-count value.

Command Syntax

```
bridge <1-32> transmit-holdcount <1-10>
no bridge <1-32> transmit-holdcount
```

Parameters

<1-32>	Specify the bridge group ID.
<1-10>	Transmit hold-count value.

Default

By default, transmit hold-count is 6

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 transmit-holdcount 5

(config)#no bridge 1 transmit-holdcount
```

bridge-group

Use this command to bind an interface with a bridge specified by the parameter.

Use the no parameter with this command to disable this command.

Command Syntax

```
bridge-group (<1-32>)
no bridge-group (<1-32>)
```

Parameters

<1-32>	Specify the bridge group ID.

Default

By default, bridge-group is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 2

(config)#interface eth1
(config-if)#no bridge-group 2
```

bridge-group path-cost

Use this command to set the cost of a path associated with a bridge group. The lower the path cost, the greater the likelihood of the bridge becoming root.

Use the no parameter with this command to restore the default priority value.

Command Syntax

```
bridge-group <1-32> path-cost <1-200000000>
no bridge-group <1-32> path-cost
```

Parameters

<1-32>	Specify the bridge group ID.
path-cost	Specify the path-cost of a port.
<1-200000000>	Specify the cost to be assigned to the group.

Default

By default, bridge-group is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 3 path-cost 123

(config-if)#no bridge-group 3 path-cost
```

bridge-group priority

Use this command to set the port priority for a bridge. A lower priority indicates a greater likelihood of the bridge becoming root.

Command Syntax

```
bridge-group <1-32> priority <0-240>
no bridge-group <1-32> priority
```

Parameters

<1-32>	Specify the bridge group ID.
<0-240>	Specify the port priority range (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bridge-group 4 priority 96

(config)#interface eth1
(config-if)#no bridge-group 4 priority
```

clear allowed-ethertype

Use this command to clear statistics for each ethertype per interfaces.

```
clear allowed-ethertype statistics (IFNAME|)
```

Parameters

IFNAME	Interface name.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear allowed-ethertype statistics xe54/1

#show allowed-ethertype statistics xe54/1
Interface xe54/1
arp: 0 Packets, 0 Bytes
ipv4: 0 Packets, 0 Bytes
ipv6: 0 Packets, 0 Bytes
dropped: 0 Packets, 0 Bytes
```

clear mac address-table

Use this command to clear the filtering database for the bridge. This command can be issued to do the following:

- clear the filtering database
- clear all filtering database entries configured through CLI (static)
- clear all multicast filtering database entries
- clear all multicast filtering database entries for a given VLAN or interface
- clear all static or multicast database entries based on a mac address

Command Syntax

```
clear mac address-table (dynamic|static|multicast) bridge <1-32>
clear mac address-table (dynamic|static|multicast) (address MACADDR | interface
  IFNAME | vlan VID ) bridge <1-32>
clear mac address-table (dynamic|static|multicast) (address MACADDR | interface
  IFNAME | vlan VID ) (instance INST) bridge <1-32>
clear mac address-table (dynamic|static|multicast) cvlan VID svlan VID bridge <1-
  32>
```

Parameters

`dynamic`	Clears all dynamic entries.
`multicast`	Clears all multicast filtering database entries.
`static`	Clears all entries configured through management.
`address`	Clear the specified MAC Address.
`MACADDR`	When filtering database, entries are cleared based on the MAC address.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`cvlan`	Clears all MAC address for the specified CVLAN. Value range is 1-4094.
`svlan`	Clears all mac address for the specified SVLAN. Value range is 1-4094.
`interface`	Clears all MAC address for the specified interface.
`bridge`	Clears the bridge group ID. Value range is 1-32.
`instance`	Clears MSTP instance ID. Value range is <1-63>.
`vlan`	Clears all MAC address for the specified VLAN. Value range is 1-4094.
`bridge`	Clears the bridge group ID. Value range is 1-32.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows how to clear all filtering database entries configured through CLI:

```
#clear mac address-table static bridge 1
```

This example shows how to clear multicast filtering database entries:

```
#clear mac address-table multicast bridge 1
```

This example shows how to clear all filtering database entries for a given interface:

```
#clear mac address-table static interface eth0 bridge 1
```

This example shows how to clear multicast filtering database entries for a given VLAN.

```
#clear mac address-table multicast vlan 2 bridge 1
```

This example shows how to clear static filtering database entries for a given MAC address:

```
#clear mac address-table static address 0202.0202.0202 bridge 1
```

This example shows how to clear all filtering database entries learned through bridge operation for a given MAC address.

```
#clear mac address-table dynamic address 0202.0202.0202 bridge 1
```

show allowed-ethertype

Use this command to show allowed and denied traffic statistics.

Note: Dropped slow protocol packets provides the count of slow protocol packets among the total dropped count. Total drop count is fetched from hardware and slow protocol packet count is fetched from software. Hence there can be one or two packet difference.

Command Syntax

```
show allowed-ethertype statistics (IFNAME|)
```

Parameters

IFNAME	Interface name.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show allowed-ethertype statistics
Interface po1
arp : 0 Packets, 0 Bytes
ipv4 : 511016709 Packets, 184897169366 Bytes
ipv6 : 0 Packets, 0 Bytes
dropped : 220 Packets, 28160 Bytes
dropped slow protocol pkts : lacp 220, efm 0, others 0
Interface xe47
arp : 0 Packets, 0 Bytes
ipv4 : 169763534 Packets, 61427990740 Bytes
ipv6 : 0 Packets, 0 Bytes
dropped : 0 Packets, 0 Bytes
Interface xe48
arp : 0 Packets, 0 Bytes
ipv4 : 0 Packets, 0 Bytes
ipv6 : 0 Packets, 0 Bytes
dropped : 0 Packets, 0 Bytes
```

show bridge

Use this command to display the filtering database for the bridge. The filtering database is used by a switch to store the MAC addresses that have been learned and which ports that MAC address was learned on.

Command Syntax

```
show bridge (ieee|rpvst+|mstp|)
```

Parameters

`ieee`	STP bridges.
`rpvst+`	RPVST+ bridges.
`mstp`	MSTP bridges.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bridge
Ageout time is global and if something is configured for vxlan then it will be affected
here also
 Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1         1                   eth1        5254.0029.929c    1     0
 1         2                   eth1        5254.004c.dcc6    1     297
 1         1                   eth1        5254.004c.dcc6    1     291
```

Table 2-86 explains the show command output fields.

Table 2-86: show bridge output fields

Field	Description
Bridge	Bridge identifier.
VLAN, SVLAN, BVLAN	CVLAN, SVLAN, and BVLAN identifiers.
Port	Interface name.
MAC Address	Learned MAC address.
FWD	Whether frames for the MAC addresses are forwarded.
Time-out	How long the learned MAC address persists.

show interface switchport

Use this command to display the characteristics of the interface with the current VLAN.

Command Syntax

```
show interface switchport bridge <1-32>
```

Parameter

`bridge`	Bridge name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is an output of this command displaying the characteristics of this interface on bridge 2.

```
#show interface switchport bridge 2
 Interface name         : eth5
 Switchport mode        : access
 Ingress filter         : disable
 Acceptable frame types : all
 Vid swap               : disable
 Default vlan           : 2
 Configured vlans       :    2
 Interface name         : eth4
 Switchport mode        : access
 Ingress filter         : disable
 Acceptable frame types : all
 Vid swap               : disable
 Default vlan           : 1
 Configured vlans       :    1
```

Table 2-87 explains the show command output fields.

Table 2-87: show interface switchport output fields

Field	Description
Interface name	Display the name of interface.
Switchport mode	Port that used to connect between switches and access port.
Ingress filter	Ingress filtering examines all inbound packets and then permits or denies entry to the network.
Acceptable frame types	Type of acceptable frame in the interface.
VID swap	Displays the status of the VID swap.

Table 2-87: show interface switchport output fields (Continued)

Field	Description
Default vlan	Default value for the VLAN.
Configured vlans	Displays the information on configured VLANs.

show mac address-table count bridge

Use this command to display a count of MAC entries from the filtering database.

Command Syntax

```
show mac address-table (local|remote|) count bridge <1-32> ({(dynamic | multicast |
  static) | address MAC | interface IFNAME | vlan <1-4094> | svlan <1-4094>}|)
```

Parameter

`local`	Local dynamic FDB entries
`remote`	Remote dynamic FDB entries
`<1-32>`	Bridge group
`dynamic`	Dynamic entries
`multicast`	Multicast entries
`static`	Static entries
`MAC`	MAC address in HHHH.HHHH.HHHH format
`IFNAME`	Name of the interface
`<1-4094>`	VLAN identifier
`<1-4094>`	SVLAN identifier

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mac address-table count bridge 1
MAC Entries for all vlans:
Dynamic Address Count: 3
Static (User-defined) Unicast MAC Address Count: 0
Static (User-defined) Multicast MAC Address Count: 0
Total MAC Addresses in Use: 3
```

Table 2-88 explains the show command output fields.

Table 2-88: show mac address-table count output fields

Field	Description
Dynamic Address Count	Number of dynamic addresses.
Unicast MAC Address Count	Number of unicast addresses.
Multicast MAC Address Count	Number of multicast addresses.
Total MAC Addresses	Total number of addresses.

show mac address-table bridge

Use this command to display MAC entries from the filtering database.

Note: The hardware can learn the MAC address at line rate, but OcNOS will learn the MAC address at a much slower rate. The learning in OcNOS will also depend upon the current load in the system. Under normal conditions OcNOS can learn the mac-address at approximately 3000 MACs per sec.

Command Syntax

```
show mac address-table (local|remote|) bridge <1-32> ({(dynamic | multicast |
  static) | address MAC | interface IFNAME | vlan <1-4094> | svlan <1-4094>}|)
```

Parameter

`local`	Local dynamic FDB entries
`remote`	Remote dynamic FDB entries
`<1-32>`	Bridge group
`dynamic`	Dynamic entries
`multicast`	Multicast entries
`static`	Static entries
`MAC`	MAC address in HHHH.HHHH.HHHH format
`IFNAME`	Name of the interface
`<1-4094>`	VLAN identifier
`<1-4094>`	SVLAN identifier

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mac address-table bridge 1
 CVLAN  SVLAN  MAC Address       Type      Ports     Port-security
------+------+---------------+---------+---------+-------------
 100   200    1111.2222.1111  static    xe12      Disable
 102   202    1111.2222.1111  static    xe12      Disable
       201    1111.1111.1111  static    xe14      Disable
       202    1111.1111.1111  static    xe14      Disable
       203    1111.1111.1111  static    xe14      Disable
       201    0000.0700.0d00  dynamic   xe14      Disable
       202    0000.0700.0d00  dynamic   xe14      Disable
       203    0000.0700.0d00  dynamic   xe14      Disable
       204    0000.0700.0d00  dynamic   xe14      Disable
       205    0000.0700.0d00  dynamic   xe14      Disable
       206    0000.0700.0d00  dynamic   xe14      Disable
       207    0000.0700.0d00  dynamic   xe14      Disable
       208    0000.0700.0d00  dynamic   xe14      Disable
       209    0000.0700.0d00  dynamic   xe14      Disable
```

```
103   203    0000.0700.0b00  dynamic   xe12      Disable
101   201    0000.0700.0b00  dynamic   xe12      Disable
100   200    0000.0700.0b00  dynamic   xe12      Disable
102   202    0000.0700.0b00   dynamic     xe12        Disable
```

Table 2-89 explains the show command output fields.

Table 2-89: show mac address-table output fields

Field	Description
VLAN	VLAN identifier.
MAC Address	Media Access Control address.
Type	Dynamic, multicast, or static.
Ports	Interface name.

switchport

Use this command to set the mode of an interface to switched.

All interfaces are configured routed by default. To change the behavior of an interface from switched to routed, you must explicitly give the `no switchport` command.

Note: When you change the mode of an interface from switched to routed and vice-versa, all configurations for that interface are erased.

Use the `no` form of this command to set the mode to routed.

Command Syntax

```
switchport
no switchport
```

Parameters

None

Default

All interfaces are configured routed by default. To change the behavior of an interface from switched to routed, you must explicitly give the no switchport command.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport

(config)#interface eth0
(config-if)#no switchport
```

switchport allowed ethertype

Use this command to allow a set of ethertype on the access port and deny remaining traffic.

Use the no command to remove ethertype configuration.

Command Syntax

```
switchport allowed ethertype {arp|ipv4|ipv6|mpls|WORD|log}
no switchport allowed ethertype ({arp|ipv4|ipv6|mpls|WORD|log}|)
```

Parameters

`arp`	Ethertype 0x0806.
`ipv4`	Ethertype 0x0800.
`ipv6`	Ethertype 0x086dd.
`mpls`	Ethertype 0x8847.
`WORD`	Any Ethertype value (0x600 - 0xFFFF).
`log`	Log unwanted ethertype packets.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#switchport allowed ethertype arp ipv4 ipv6 log

(config-if)#no switchport allowed ethertype ipv4
```

CHAPTER 3 Spanning Tree Protocol Commands

This chapter provides a description, syntax, and examples of the Spanning Tree Protocol (STP), Rapid Spanning Tree Protocol (RSTP) and Multiple Spanning Tree Protocol (MSTP) commands. It includes the following commands:

bridge cisco-interoperability

Use this command to enable/disable Cisco interoperability for MSTP (Multiple Spanning Tree Protocol).

If Cisco interoperability is required, all OcNOS devices in the switched LAN must be Cisco-interoperability enabled. When OcNOS inter operates with Cisco, the only criteria used to classify a region are the region name and revision level. VLAN-to-instance mapping is not used to classify regions when interoperating with Cisco.

Command Syntax

```
bridge <1-32> cisco-interoperability (enable | disable)
```

Parameters

`<1-32>`	Specify the bridge group ID
`enable`	Enable Cisco interoperability for MSTP bridge
`disable`	Disable Cisco interoperability for MSTP bridge

Default

By default, cisco interoperability is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

To enable Cisco interoperability on a switch for a bridge:

```
#configure terminal
(config)#bridge 2 cisco-interoperability enable
```

To disable Cisco interoperability on a switch for a particular bridge:

```
#configure terminal
(config)#bridge 2 cisco-interoperability disable
```

bridge instance

Use this command to add an MST instance to a bridge.

Use the no form of this command to delete an MST instance identifier from a bridge.

Command Syntax

```
bridge (<1-32> | backbone) instance (<1-63>)
no bridge (<1-32> | backbone) instance (<1-63>)
```

Parameters

<1-32>	Bridge identifier.
backbone	Backbone bridge.
<1-63>	MST instance identifier.

Default

The bridge instance default is 1.

Command Mode

MST configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 4 protocol mstp
(config)#spanning-tree mst configuration
(config-mst)#bridge 4 instance 3
...
(config-mst)#no bridge 4 instance 3
```

bridge instance priority

Use this command to set the bridge instance priority.

Use the no form of this command to reset the priority to its default.

Command Syntax

```
bridge (<1-32> | backbone) instance <1-63> priority <0-61440>
no bridge (<1-32> | backbone) instance <1-63> priority
```

Parameters

<1-32>	Specify the bridge identifier.
backbone	Specifies the backbone bridge.
<1-63>	Specify the instance identifier.
priority	Specify the bridge priority for the instance. The lower the priority of the bridge, the better the chances is of the bridge becoming a root bridge or a designated bridge for the LAN. The priority values can be set only in increments of 4096. The default value is 32768.
<0-61440>	Specify the bridge priority.

Default

By default, bridge instance priority is 32768

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#bridge 4 instance 3 priority 1
```

bridge instance vlan

Use this command to simultaneously add multiple VLANs for the corresponding instance of a bridge.The VLANs must be created before being associated with an MST instance (MSTI). If the VLAN range is not specified, the MSTI will not be created.

Use the no form of this command to simultaneously remove multiple VLANs for the corresponding instance of a bridge.

Command Syntax

```
bridge (<1-32> | backbone) instance (<1-63>) vlan VLANID
no bridge (<1-32> | backbone) instance (<1-63>) vlan VLANID
```

Parameters

<1-32>	Bridge identifier.
backbone	Backbone bridge.
<1-63>	MST instance identifier.
VLANID	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list. For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Default

The bridge instance VLAN ID Interfaces default-switch is VLAN100 100 ae0.0 ae1.0 ae2.0.

Command Mode

MST configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

To associate multiple VLANs, in this case VLANs 10 and 20 to instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
(config-mst)#bridge 1 instance 1 vlan 10,20
```

To associate multiple VLANs, in this case, VLANs 10, 11, 12, 13, 14, and 15 to instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
(config-mst)#bridge 1 instance 1 vlan 10-15
```

To delete multiple VLANs, in this case, VLANs 10 and 11 from instance 1 of bridge 1:

```
#configure terminal
(config)#bridge 1 protocol mstp
(config)#spanning-tree mst configuration
```

```
(config-mst)#no bridge 1 instance 1 vlan 10,11
```

bridge multiple-spanning-tree

Use this command to enable MSTP on a bridge.

Use the no form of this command to disable MSTP on the bridge.

Command Syntax

```
bridge <1-32> multiple-spanning-tree enable
no bridge <1-32> multiple-spanning-tree enable (bridge-forward|bridge-block)
```

Parameters

`<1-32>`	Specify the bridge-group ID.
`enable`	Enables the spanning tree protocol.
`bridge-forward`	Puts all ports of the specified bridge into forwarding state.
`bridge-block`	Puts all ports of the specified bridge into blocking state.

Default

If the bridge-forward option is entered when using the no parameter, the default behavior is to put all bridge ports in forwarding state.

If the bridge-block option is entered when using the no parameter, the behavior is to put all bridge ports in blocking state.

If no options are defined after the command `no bridge <1-32> multiple-spanning-tree enable`, then the default behavior is same as `bridge-block` command.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 multiple-spanning-tree enable

#configure terminal
(config)#no bridge 2 multiple-spanning-tree enable bridge-forward
```

bridge protocol ieee

Use this command to add a IEEE 802.1d Spanning Tree Protocol bridge.

After creating a bridge instance, add interfaces to the bridge using the `bridge-group` command. Bring the bridge instance into operation with the `no shutdown` command in interface mode.

Use the `no` parameter with this command to remove the bridge.

Command Syntax

```
bridge <1-32> protocol ieee (vlan-bridge|)
no bridge <1-32>
```

Parameters

`<1-32>`	Specify the bridge group ID.
`vlan-bridge`	Specify this as a VLAN-aware bridge.

Default

The bridge protocol default value is 2 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 3 protocol ieee

(config)#bridge 4 protocol ieee vlan-bridge
```

bridge protocol mstp

Use this command to create a multiple spanning-tree protocol (MSTP) bridge of a specified parameter. This command creates an instance of the spanning tree and associates the VLANs specified with that instance.

The MSTP bridges can have different spanning-tree topologies for different VLANs inside a region of “similar” MSTP bridges. The multiple spanning tree protocol, like the rapid spanning tree protocol, provides rapid reconfiguration capability, while providing load balancing ability. A bridge created with this command forms its own separate region unless it is added explicitly to a region using the `region name` command.

Use the `no` parameter with this command to remove the bridge.

Command Syntax

```
bridge <1-32> protocol mstp (ring|)
no bridge <1-32>
```

Parameters

`<1-32>`	Specify the bridge group ID.
`ring`	(Optional) Enable rapid ring spanning-tree.

Default

The bridge protocol mstp default value is 50 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 protocol mstp

#configure terminal
(config)#bridge 2 protocol mstp ring
```

bridge protocol rstp

Use this command to add an IEEE 802.1w Rapid Spanning Tree Protocol (RSTP) bridge.

After creating a bridge instance, add interfaces to the bridge using the `bridge-group` command. Bring the bridge instance into operation with the `no shutdown` command in Interface mode.

Use the `no` parameter with this command to remove the bridge.

Command Syntax

```
bridge <1-32> protocol rstp
bridge <1-32> protocol rstp (vlan-bridge|)(ring|)
no bridge <1-32>
```

Parameters

`<1-32>`	Specify the bridge group ID.
`ring`	(Optional) Add an RSTP bridge for a ring topology.
`vlan-bridge`	(Optional) Adds a VLAN-aware bridge.

Default

By default, bridge protocol rstp is enabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 protocol rstp

#configure terminal
(config)#bridge 3 protocol rstp vlan-bridge
```

bridge rapid-spanning-tree

Use this command to enable or disable RSTP on a specific bridge. Use the `bridge-forward` option with the `no` form of the command to place all ports on the specified bridge into the forwarding state.

Use the `no` form of the command to disable the Rapid Spanning Tree protocol on a bridge.

Command Syntax

```
bridge <1-32> rapid-spanning-tree enable
no bridge <1-32> rapid-spanning-tree enable (bridge-forward|bridge-block)
```

Parameters

`<1-32>`	Specify the bridge group ID.
`enable`	Enables the spanning tree protocol.
`bridge-forward`	(Optional) Puts all ports of the specified bridge into forwarding state.
`bridge-block`	(Optional) Puts all ports of the specified bridge into blocking state.

Default

When the `bridge-forward` option is used with the `no` parameter, the default behavior puts all bridge ports in the forwarding state.

If the bridge-block option is entered when using the no parameter, the behavior is to put all bridge ports in blocking state.

If no options are defined after the command `no bridge <1-32> rapid-spanning-tree enable`, then the default behavior is same as `bridge-block` command.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
 configure terminal
(config)#bridge 2 rapid-spanning-tree enable

 configure terminal
(config)#no bridge 2 rapid-spanning-tree enable bridge-forward
```

bridge region

Use this command to create an MST region and specify its name. MST bridges of a region form different spanning trees for different VLANs.

Use the no form of the command to disable the Rapid Spanning Tree protocol on a region.

Command Syntax

```
bridge <1-32> region REGION_NAME
no bridge <1-32> region
```

Parameters

<1-32>	Specify the bridge group ID.
REGION_NAME	Specify the name of the region.

Default

By default, each MST bridge starts with the region name as its bridge address. This means each MST bridge is a region by itself, unless specifically added to one.

Command Mode

MST configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 3 region myRegion

(config)#spanning-tree mst configuration
(config-mst)#no bridge 3 region
```

bridge revision

Use this command to specify the number for configuration information.

Command Syntax

```
bridge <1-32> revision <0-65535>
```

Parameters

<1-32>	Specify the bridge group ID in the range of <1-32>.
<0-65535>	Specify a revision number in the range of <0-65535>.

Default

By default, revision number is 0

Command Mode

MST configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 3 revision 25
```

bridge spanning-tree

Use this command to enable the Spanning Tree Protocol on a bridge.

Use the no parameter to disable the Spanning Tree Protocol on the bridge.

Command Syntax

```
bridge <1-32> spanning-tree enable
no bridge <1-32> spanning-tree enable (bridge-forward|bridge-block)
```

Parameters

<1-32>	Specify the bridge group ID.
enable	Enables the spanning tree protocol on this bridge.
bridge-forward	Puts all ports of the specified bridge into the forwarding state.
bridge-block	Puts all ports of the specified bridge into the blocking state.

Default

If the bridge-forward option is entered when using the no parameter, the default behavior is to put all bridge ports in forwarding state.

If the bridge-block option is entered when using the no parameter, the behavior is to put all bridge ports in blocking state.

If no options are defined after the command `no bridge <1-32> spanning-tree enable`, then the default behavior is same as `bridge-block` command.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 2 spanning-tree enable

#configure terminal
(config)#no bridge 2 spanning-tree enable bridge-forward
```

bridge spanning-tree errdisable-timeout

Use this command to enable the error-disable-timeout facility, which sets a timeout for ports that are disabled due to the BPDU guard feature.

The BPDU guard feature shuts down the port on receiving a BPDU on a BPDU-guard enabled port. This command associates a timer with the feature such that the port gets enabled back without manual intervention after a set interval.

Use the no parameter to disable the error-disable-timeout facility.

Command Syntax

```
bridge <1-32> spanning-tree errdisable-timeout enable
no bridge <1-32> spanning-tree errdisable-timeout enable
```

Parameters

`<1-32>`	Specify the bridge group ID.
`enable`	Enable the timeout mechanism for the port to be enabled back

Default

By default, the port is enabled after 300 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 spanning-tree errdisable-timeout enable
```

bridge spanning-tree force-version

Use this command to set the version for the bridge. A version identifier of less than a value of 2 enforces the spanning tree protocol. Although the command supports an input range of 0-4, for RSTP, the valid range is 0-2. When the force-version is set for a bridge, all ports of the bridge have the same spanning tree version set.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the no parameter with this command to disable the version for the bridge.

Command Syntax

```
bridge <1-32> spanning-tree force-version <0-4>
no bridge <1-32> spanning-tree force-version
```

Parameters

`<1-32>`	Specify the bridge group ID.
`force-version`	Specify a force version identifier:
`0`	STP
`1`	Not supported
`2`	RSTP
`3`	MSTP

Default

By default, spanning tree force version is 0

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

Set the value to enforce the spanning tree protocol:

```
#configure terminal
(config)#bridge 1 spanning-tree force-version 0

(config)#no bridge 1 spanning-tree force-version
```

bridge spanning-tree pathcost

Use this command to set a spanning-tree path cost method.

If the short parameter is used, the switch uses a value for the default path cost a number in the range 1 through 65,535. If the long parameter is used, the switch uses a value for the default path cost a number in the range 1 through 200,000,000. Use the show spanning-tree to view the administratively configured and current running pathcost method running on a bridge.

Use the no option with this command to return the path cost method to the default setting.

Command Syntax

```
bridge <1-32> spanning-tree pathcost method (short|long)
no bridge <1-32> spanning-tree pathcost method
```

Parameters

`<1-32>`	Specify the bridge group ID.
`method`	Method used to calculate default port path cost.
`long`	Use 16-bit based values for default port path costs.
`short`	Use 32-bit based values for default port path costs.

Default

By default, path cost method for STP is short and for MSTP/RSTP is long.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bridge 1 spanning-tree pathcost method short

(config)#no bridge 1 spanning-tree pathcost method
```

bridge spanning-tree portfast

Use this command to set the portfast BPDU (Bridge Protocol Data Unit) guard or filter for the bridge.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the `no` parameter with this command to disable the BPDU filter for the bridge.

BPDU Filter

All ports that have their BPDU filter set to default take the same value of BPDU filter as that of the bridge. The Spanning Tree Protocol sends BPDUs from all ports. Enabling the BPDU Filter feature ensures that PortFast-enabled ports do not transmit or receive any BPDUs.

BPDU Guard

When the BPDU guard feature is set for a bridge, all portfast-enabled ports of the bridge that have the BPDU guard set to default shut down the port on receiving a BPDU. In this case, the BPDU is not processed. You can either bring the port back up manually by using the `no shutdown` command, or configure the errdisable-timeout feature to enable the port after the specified time interval.

Command Syntax

```
bridge <1-32> spanning-tree portfast bpdu-guard
bridge <1-32> spanning-tree portfast bpdu-filter
no bridge <1-32> spanning-tree portfast bpdu-guard
no bridge <1-32> spanning-tree portfast bpdu-filter
```

Parameters

`<1-32>`	Specify the bridge group ID.
`bpdu-filter`	Specify to filter the BPDUs on portfast enabled ports.
`bpdu-guard`	Specify to guard the portfast ports against BPDU receive.

Default

By default, portfast for STP is enabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 3 spanning-tree portfast bpdu-filter

#configure terminal
(config)#bridge 1 spanning-tree portfast bpdu-guard
```

bridge te-msti

Use this command to enable or disable a Multiple Spanning Tree Instance (MSTI).

The te-msti always refers to the MST instance indexed by the pre-defined macro constant MSTP_TE_MSTID internally. This is the only MST instance which supports the disabling of spanning trees.

Use the no form of this command to remove the configuration.

Command Syntax

```
bridge (<1-32> | backbone) te-msti
no bridge (<1-32> | backbone) te-msti
```

Parameters

<1-32>	Specify the bridge group ID.
backbone	Identity of the backbone bridge group.
te-msti	MSTI to be the traffic engineering MSTI instance.

Default

By default, bridge te-msti is disabled

Command Mode

TE-MSTI Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#bridge 2 te-msti

(config-te-msti)#no bridge 2 te-msti
```

bridge te-msti vlan

Use this command to enable or disable a Multiple Spanning Tree Instance (MSTI). When an MSTI is shutdown (disabled) each VLAN in the MSTI is set to the forwarding state on all bridge ports which the VLAN as a member of. When and MSTI is enabled (no shutdown), normal MSTP operation is started for the MSTI.

The te-msti always refers to the MST instance indexed by the pre-defined macro constant MSTP_TE_MSTID internally. This is the only MST instance which supports the disabling of spanning trees. All VLANs that do not want spanning tree topology computation need to be assigned to this te-msti instance.

This command is intended for supporting Traffic Engineering (TE) Ethernet tunnels. All VLANs allocated for traffic engineering should be assigned to one MSTI. That MSTI can in turn shutdown the spanning tree operation so that each VLAN path through the network can be manually provisioned.

Use the no form of this command to remove the configuration.

Command Syntax

```
bridge (<1-32> | backbone) te-msti vlan <1-4094>
no bridge (<1-32> | backbone) te-msti vlan <1-4094>
```

Parameters

<1-32>	Specify the bridge group ID.
backbone	Identity of the backbone bridge group.
vlan	Specify a VLAN.
<1-4094>	Specify a VLAN identifier to be associated.

Note: This designated instance is defined in 802.1Qay clause 8.9 to be 0xFFE.

Default

By default, te-msti vlan is vlan1.

Command Mode

TE-MSTI Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#bridge 2 te-msti vlan 10
(config-te-msti)#no bridge 2 te-msti vlan 10
```

bridge-group instance

Use this command to assign a Multiple Spanning Tree (MST) instance to a port.

Use the no form of this command to remove the interface from the MST instance.

Command Syntax

```
bridge-group (<1-32> | backbone) instance (<1-63> | te-msti)
no bridge-group (<1-32> | backbone) instance (<1-63> | te-msti)
```

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	Multiple spanning tree instance identifier.
`te-msti`	Traffic engineering MSTI instance.
	For Provider Backbone Bridging (PBB), bridge-group <1-32> refers to the I-component or PB bridge while the <backbone> bridge group refers to the B-component. Usually for a BEB (Backbone Edge Bridge) device, the backbone bridge-group is used for traffic engineering.
	For a PB (Provider Bridge) device used as BCB (Backbone Core Bridge), bridge group <1-32> is used for traffic engineering.

Default

By default, the bridge port remains in the listening and learning states for 15 seconds before transitional to the forwarding state.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#bridge-group 1
(config-if)#bridge-group 1 instance te-msti
```

bridge-group instance path-cost

Use this command to set a path cost for a multiple spanning tree instance.

Before you can give this command, you must explicitly add an MST instance to a port using the `bridge-group instance` command.

Use the `no` form of this command to set the path cost to its default which varies depending on bandwidth.

Command Syntax

```
bridge-group (<1-32> | backbone) instance <1-63> path-cost <1-200000000>
no bridge-group ( <1-32> | backbone) instance <1-63> path-cost
```

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Specify the backbone bridge.
`<1-63>`	Set the MST instance identifier.
`<1-200000000>`	Path cost for a port (a lower path cost means greater likelihood of becoming root).

Default

Assuming a 10 Mb/s link speed, the default value is 200,000.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 4 instance 3 vlan 3
(config-mst)#exit
(config)#interface eth1
(config-if)#bridge-group 4 instance 3
(config-if)#bridge-group 4 instance 3 path-cost 1000
```

bridge-group instance priority

Use this command to set the priority of a multiple spanning tree instance.

The Multiple Spanning Tree Protocol uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies a better priority. In the case of the same priority, the interface index will serve as the tiebreaker, with the lower-numbered interface being preferred over others.

Command Syntax

```
bridge-group (<1-32>) instance (<1-63>) priority <0-240>
no bridge-group (<1-32>) instance (<1-63>) priority
```

Parameters

`<1-32>`	Bridge identifier.
`backbone`	Backbone bridge.
`<1-63>`	Multiple spanning tree instance identifier.
`<0-240>`	Port priority. A lower value means greater likelihood of becoming root. Set the port priority in increments of 16.

Default

By default, the port priority is 128

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface eth2
(config-if)#bridge-group 2
(config-if)#bridge-group 2 instance 4
(config-if)#bridge-group 2 instance 4 priority 64
```

bridge-group path-cost

Use this command to set the cost of a path. Before you can use this command to set a path-cost in a VLAN configuration, you must explicitly add an MST instance to a port using the `bridge-group instance` command.

Use the `no` parameter with this command to restore the default cost value of the path which varies depending on the bandwidth.

Command Syntax

```
bridge-group <1-32> path-cost <1-200000000>
no bridge-group <1-32> path-cost
```

Parameters

`<1-32>`	Specify the bridge group ID.
`path-cost`	Specify the cost of path for a port.
`<1-200000000>`	Specify the cost of the path (a lower cost means a greater likelihood of the interface becoming root).

Default

Assuming a 10 Mb/s link speed, the default value is 200,000.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#bridge 4 instance 3 vlan 3
(config-mst)#exit
(config)#interface eth1
(config-if)#bridge-group 4
(config-if)#bridge-group 4 path-cost 1000
```

bridge-group priority

Use this command to set the port priority for a bridge group.

The Multiple Spanning Tree Protocol uses port priority as a tiebreaker to determine which port should forward frames for a particular instance on a LAN, or which port should be the root port for an instance. A lower value implies a better priority. In the case of the same priority, the interface index will serve as the tiebreaker, with the lower-numbered interface being preferred over others.

Command Syntax

```
bridge-group (<1-32> | backbone) priority <0-240>
no bridge-group (<1-32> | backbone) priority
```

Parameters

`<1-32>`	Specify the bridge group ID.
`backbone`	Backbone bridge.
`<0-240>`	Specify the port priority (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, port priority for each instance is 128

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#bridge-group 4 priority 80
```

bridge-group spanning-tree

This command is used to enable or disable the spanning-tree on a configured bridge.

Command Syntax

```
bridge-group <1-32> spanning-tree (disable|enable)
```

Parameters

`<1-32>`	Specify the bridge group ID.
`disable`	Disable spanning tree on the interface.
`enable`	Enable spanning tree on the interface.

Default

By default, spanning-tree is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface eth1
(config-if)#bridge-group 1 spanning-tree enable
```

clear spanning-tree detected protocols

Use this command to clear the detected protocols for a specific bridge or interface. This command begins the port migration as per IEEE 802.1w-2001, Section 17.26. After issuing this command, the migration timer is started on the port, only if the force version is RSTP or MSTP (greater versions of RSTP).

Command Syntax

```
clear spanning-tree detected protocols bridge <1-32>
```

Parameters

<1-32>	Specify the bridge group ID.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear spanning-tree detected protocols bridge 2
```

clear spanning-tree statistics

Use this command to clear all STP BPDU statistics.

Command Syntax

```
clear spanning-tree statistics bridge <1-32>
clear spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <1-4094>)
  bridge <1-32>
clear spanning-tree statistics (interface IFNAME| (instance (<1-63>)| vlan <2-
  4094>)) bridge <1-32>
```

Parameters

<1-32>	Specify the bridge identifier.
IFNAME	Specify the name of the interface on which protocols have to be cleared.
<1-63>	MST instance ID.
<1-4094>	VLAN identifier where spanning tree is located <2-4094>

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear spanning-tree statistics bridge 32
```

customer-spanning-tree customer-edge path-cost

Use this command to set the cost of a path associated with a customer edge port on a customer edge spanning tree.

Use the no form of this command to remove the cost of a path associated with a customer edge port on a customer edge spanning tree.

Command Syntax

```
customer-spanning-tree customer-edge path-cost <1-200000000>
no customer-spanning-tree customer-edge path-cost
```

Parameters

`path-cost`	Specify the path-cost of a port.
`<1-200000000>`	Specify the cost to be assigned to the group.

Default

Assuming a 10 Mb/s link speed, the default value is 200,000

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree customer-edge path-cost 1000
```

customer-spanning-tree customer-edge priority

Use this command to set the port priority for a customer-edge port in the customer spanning tree.

Command Syntax

```
customer-spanning-tree customer-edge priority <0-240>
```

Parameters

`priority`	Specify the port priority.
`<0-240>`	Specify the port priority range (a lower priority indicates greater likelihood of the interface becoming a root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree customer-edge priority 100
```

customer-spanning-tree forward-time

Use this command to set the time (in seconds) after which (if this bridge is the root bridge) each port changes states to learning and forwarding. This value is used by all instances.

Use the no form of this command to restore the default value of 15 seconds.

Command Syntax

```
customer-spanning-tree forward-time <4-30>
no customer-spanning-tree forward-time
```

Parameters

<4-30>	Specify the forwarding time delay in seconds.

Note: Care should be exercised if the value is set to less than 7 seconds.

Default

By default, priority is 15 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree forward-time 6

(config-if)#no customer-spanning-tree forward-time
```

customer-spanning-tree hello-time

Use this command to set the hello-time, the time in seconds after which (if this bridge is the root bridge) all the bridges in a bridged LAN exchange Bridge Protocol Data Units (BPDUs). Avoid a very low value of this parameter as this can lead to excessive traffic on the network; a higher value delays the detection of topology change. This value is used by all instances.

Use the `no` option with this command to restore the default value of the hello-time.

Command Syntax

```
customer-spanning-tree hello-time <1-10>
no customer-spanning-tree hello-time
```

Parameters

`<1-10>`	Specify the hello BPDU interval in seconds.

Default

By default, level is 2 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree hello-time 3

(config-if)#no customer-spanning-tree hello-time
```

customer-spanning-tree max-age

Use this command to set the max-age for a bridge.

Max-age is the maximum time in seconds for which (if a bridge is the root bridge) a message is considered valid. This prevents the frames from looping indefinitely. The value of max-age should be greater than twice the value of hello-time plus one, but less than twice the value of forward delay minus one. The allowable range for max-age is 6-40 seconds. Configure this value sufficiently high, so that a frame generated by a root can be propagated to the leaf nodes without exceeding the max-age.

Use the no parameter with this command to restore the default value of max-age.

Command Syntax

```
customer-spanning-tree max-age <6-40>
no customer-spanning-tree max-age
```

Parameters

<6-40>	Specify the maximum time in seconds to listen for the root bridge.

Default

By default, bridge max-age is 20 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree max-age 12

(config-if)#no customer-spanning-tree max-age
```

customer-spanning-tree priority

Use this command to set the bridge priority for the spanning tree on a customer edge port. Using a lower priority indicates a greater likelihood of the bridge becoming root. This command must be used to set the priority of the customer spanning tree running on the customer edge port.

Use the no form of the command to reset it to the default value.

Command Syntax

```
customer-spanning-tree priority <0-61440>
no customer-spanning-tree priority
```

Parameters

<0-61440>	Specify the bridge priority in the range <0-61440>. Priority values can be set only in increments of 4096.

Default

By default, priority is 61440

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree priority 4096

(config-if)#no customer-spanning-tree priority
```

customer-spanning-tree provider-edge path-cost

Use this command to set the cost of a path associated with a provider edge port on a customer edge spanning tree.

Use the no form of this command to remove the cost of a path associated with a provider edge port on a customer edge spanning tree.

Command Syntax

```
customer-spanning-tree provider-edge svlan <1-4094> path-cost <1-200000000>
no customer-spanning-tree provider-edge svlan <1-4094> path-cost
```

Parameters

<1-4094>	Specify the SVLAN identifier of provider edge port.
<1-200000000>	Specify the cost to be assigned to the group.

Default

Assuming a 10 Mb/s link speed, the default value is 200,000

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree provider-edge svlan 2 path-cost 1000

(config-if)#no customer-spanning-tree provider-edge svlan 2 path-cost
```

customer-spanning-tree provider-edge priority

Use this command to set the port priority for a provider-edge port in the customer spanning tree.

Command Syntax

```
customer-spanning-tree provider-edge svlan <1-4094> priority <0-240>
```

Parameters

`<1-4094>`	Specify the SVLAN identifier of provider edge port.
`<0-240>`	Specify the port priority (a lower priority means greater likelihood of the interface becoming root). The priority values can only be set in increments of 16.

Default

By default, priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree provider-edge svlan 2 priority 0
```

customer-spanning-tree transmit-holdcount

Use this command to set the transmit-holdcount for a bridge.

Use the no parameter with this command to restore the default value of `transmit-holdcount`.

Command Syntax

```
customer-spanning-tree transmit-holdcount <1-10>
no customer-spanning-tree transmit-holdcount
```

Parameters

`<1-10>`	Specify the maximum number that can be transmitted per second.

Default

By default, bridge transmit hold count is 6

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#customer-spanning-tree transmit-holdcount 3

(config-if)#no customer-spanning-tree transmit-holdcount
```

debug mstp

Use this command to turn on, and turn off, debugging and echoing data to the console, at various levels.

Note: This command enables MSTP, RSTP, and STP debugging.

Use the no parameter with this command to turn off debugging.

Command Syntax

```
debug mstp all
debug mstp cli
debug mstp packet rx
debug mstp packet tx
debug mstp protocol
debug mstp protocol detail
debug mstp timer
debug mstp timer detail
no debug mstp all
no debug mstp cli
no debug mstp packet rx
no debug mstp packet tx
no debug mstp protocol
no debug mstp protocol detail
no debug mstp timer
no debug mstp timer detail
```

Parameters

`all`	Echoes all spanning-tree debugging levels to the console.
`cli`	Echoes spanning-tree commands to the console.
`packet`	Echoes spanning-tree packets to the console.
`rx`	Received packets.
`tx`	Transmitted packets.
`protocol`	Echoes protocol changes to the console.
`detail`	Detailed output.
`timer`	Echoes timer start to the console.
`detail`	Detailed output.

Command Mode

Exec, Privileged Exec, and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug mstp all
(config)#debug mstp cli
(config)#debug mstp packet rx
(config)#debug mstp protocol detail
(config)#debug mstp timer
```

show debugging mstp

Use this command to display the status of debugging of the MSTP system.

Command Syntax

```
show debugging mstp
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging mstp
MSTP debugging status:
MSTP debugging status:
 MSTP timer debugging is on
 MSTP protocol debugging is on
 MSTP detailed protocol debugging is on
 MSTP cli echo debugging is on
 MSTP transmitting packet debugging is on
 MSTP receiving packet debugging is on
#
```

show spanning-tree

Use this command to show the state of the spanning tree for all STP or RSTP bridge-groups, including named interface and VLANs.

Command Syntax

```
show spanning-tree
show spanning-tree interface IFNAME
show spanning-tree mst
show spanning-tree mst config
show spanning-tree mst interface IFNAME
show spanning-tree mst detail
show spanning-tree mst detail interface IFNAME
show spanning-tree mst instance (<1-63>) interface IFNAME
show spanning-tree mst instance (<1-63> | te-msti)
show spanning-tree statistics bridge <1-32>
show spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <2-4094>)
  bridge <1-32>
show spanning-tree statistics (interface IFNAME | (instance (<1-63>) | vlan <1-
  4094>)) bridge <1-32>
show spanning-tree vlan range-index
```

Parameters

`interface`	Display interface information
`mst`	Display MST information
`statistics`	Display statistics of the BPDUs
`vlan range-index`	Display a VLAN range-index value
`config`	Display configuration information
`detail`	Display detailed information
`instance`	Display instance information
`<1-63>`	Specify the instance identifier
`te-msti`	Display Traffic Engineering MSTI instance
`<1-32>`	Specify the bridge identifier
`IFNAME`	Display the interface name
`<2-4094>`	Specify a VLAN identifier, associated with the instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command displaying spanning tree information.

```
#show spanning-tree
% 1: Bridge up - Spanning Tree Enabled
% 1: Root Path Cost 0 - Root Port 0 - Bridge Priority 32768

```

Table 3-90 Explains the show command output fields.

Table 3-90: show spanning-tree interface output fields

Field	Description
Bridge up	A network bridge is a computer networking device that creates a single aggregate network from multiple communication networks or network segments.
Root Path Cost	Root cost for the interface.
Root Port	Interface that is the current elected root port for this bridge.
Bridge Priority	Used for the common instance.
Forward Delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hello Time	Configured number of seconds between transmissions of configuration BPDUs.
Max Age	Maximum age of received protocol BPDUs.
Port Id	Logical interface identifier configured to participate in the MSTP instance.
Role Designated	Designated role for the packets in the interface.
State Forwarding	State of the forwarding packets in the interface.
Designated Path Cost	Designated cost for the interface.

Field	Description
Configured Path Cost	Configured cost for the interface.
Designated Port Id	Port ID of the designated port for the LAN segment this interface is attached to.
Priority	Specify the port priority.
Message Age	Number of seconds elapsed since the most recent BPDU was received.
Forward Timer	The forward delay timer is the time interval that is spent in the listening and learning state.
Msg Age Timer	The message age contains the length of time that has passed since the root bridge initially originated the BPDU.
Received RSTP	Number of times the received the RSTP.
Send RSTP	Number of times transmitted the RSTP.

show spanning-tree mst

Use this command to display the filtering database values. This command displays the number of instances created, and VLANs associated with it.

Command Syntax

```
show spanning-tree mst
show spanning-tree mst config
show spanning-tree mst detail
show spanning-tree mst detail interface IFNAME
show spanning-tree mst instance (<1-63>) interface IFNAME
show spanning-tree mst instance (<1-63> | te-msti)
show spanning-tree mst interface IFNAME
```

Parameters

`config`	Display configuration information.
`detail`	Display detailed information.
`interface`	Display interface information.
`instance`	Display instance information.
`<1-63>`	Specify the instance identifier.
`te-msti`	Traffic Engineering MSTI instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show spanning-tree mst
% 1: Bridge up - Spanning Tree Enabled
% 1: CIST Root Path Cost 0 - CIST Root Port 0 - CIST Bridge
Priority 32768
% 1: Forward Delay 15 - Hello Time 2 - Max Age 20 - Max-hops 20
% 1: CIST Root Id 80000002b328530a
% 1: CIST Reg Root Id 80000002b328530a
% 1: CIST Bridge Id 80000002b328530a
% 1: 2 topology change(s) - last topology change Wed Nov 19 22:43:21 2008
% 1: portfast bpdu-filter disabled
% 1: portfast bpdu-guard disabled
% 1: portfast errdisable timeout disabled
% 1: portfast errdisable timeout interval 300 sec%
% Instance VLAN
% 0:        1
% 2:        3-4
```

Table 3-91 Explains the show command output fields.

Table 3-91: show spanning-tree mst output fields

Field	Description
Bridge up	A network bridge is networking process that creates a single aggregate network from multiple communication networks or network segments.
CIST Root Path Cost	Calculated cost to reach the regional root bridge from the bridge where the command is entered.
CIST Root Port	Interface that is the current elected CIST root port for this bridge.
CIST Bridge	A CIST bridge is networking process that creates a single aggregate network from multiple communication networks.
Priority	Specify the port priority.
Forward Delay	Configured time an STP bridge port remains in the listening and learning states before transitioning to the forwarding state.
Hello Time	Configured number of seconds between transmissions of configuration BPDUs.
Max Age	Maximum age of received protocol BPDUs.
Max-hops	Configured maximum number of hops a BPDU can be forwarded in the MSTP region.

show spanning-tree statistics

Use this command to display detailed BPDU statistics for a spanning tree instance.

Command Syntax

```
show spanning-tree statistics bridge <1-32>
show spanning-tree statistics interface IFNAME (instance (<1-63>)| vlan <2-4094>)
  bridge <1-32>
show spanning-tree statistics (interface IFNAME | (instance (<1-63>) | vlan <1-
  4094>)) bridge <1-32>
```

Parameters

<1-32>	Bridge identifier.
<1-63>	MST instance identifier.
IFNAME	Displays the interface name.
<2-4094>	Specify a VLAN identifier, associated with the instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, bridge-group 1 is configured for IEEE on the eth2 interface.

```
#show spanning-tree statistics interface eth2 bridge 1

Table 3-92 Explains the show command output fields.

Table 3-92: show spanning-tree statistics output fields

Field	Description
BPDU Related Parameters	Details of the BPDU related parameters.
PORT Based Information & Statistics	Information of the port and interface for which the statistics are being displayed.

Field	Description
STATUS of Port Timers	Status of the port timers.
Other Port-Specific Info	Specific information about the port.
Other Bridge information & Statistics	Information about bridge and statistics being displayed.

spanning-tree autoedge

Use this command to assist in automatic identification of the edge port.

Use the no parameter with this command to disable this feature.

Command Syntax

```
spanning-tree autoedge
no spanning-tree autoedge
```

Default

By default, spanning-tree autoedge is disabled

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree autoedge
```

spanning-tree edgeport

Use this command to set a port as an edge-port and to enable rapid transitions.

Use the no parameter with this command to set a port to its default state (not an edge-port) and to disable rapid transitions.

Note: This command is an alias to the `spanning-tree portfast` command. Both commands can be used interchangeably.

Command Syntax

```
spanning-tree edgeport
no spanning-tree edgeport
```

Default

By default, spanning-tree edgeport is disabled

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree edgeport
```

spanning-tree guard

Use this command to enable the root guard feature for the port. This feature disables reception of superior BPDUs.

The root guard feature makes sure that the port on which it is enabled is a designated port. If the root guard enabled port receives a superior BPDU, it goes to a Listening state (for STP) or discarding state (for RSTP and MSTP).

Use the `no` parameter with this command to disable the root guard feature for the port.

Command Syntax

```
spanning-tree guard root
no spanning-tree guard root
```

Parameters

`root`	Set to disable reception of superior BPDUs

Default

By default, spanning-tree guard root is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree guard root
```

spanning-tree instance restricted-role

Use this command to set the restricted role value for the instance to TRUE.

Use the no parameter with this command to set the restricted role value for the instance to FALSE.

Command Syntax

```
spanning-tree instance <1-63> restricted-role
no spanning-tree instance <1-63> restricted-role
```

Parameters

<1-63>	Specify the instance ID range.

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree instance 2 restricted-role
```

spanning-tree instance restricted-tcn

Use this command to set the restricted TCN value for the instance to TRUE.

Command Syntax

```
spanning-tree instance <1-63> restricted-tcn
no spanning-tree instance <1-63> restricted
```

Parameters

<1-63>	Specify the instance ID range.

Default

By default, restricted TCN value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree instance 2 restricted-tcn
```

spanning-tree link-type

Use this command to enable or disable point-to-point or shared link types.

RSTP has a backward-compatible STP mode, `spanning-tree link-type shared`. An alternative is the `spanning-tree force-version 0`.

Use the no parameter with this command to disable rapid transition.

Command Syntax

```
spanning-tree link-type auto
spanning-tree link-type point-to-point
spanning-tree link-type shared
no spanning-tree link-type
```

Parameters

`auto`	Sets to either point-to-point or shared based on duplex state.
`point-to-point`	Enables rapid transition.
`shared`	Disables rapid transition.

Default

By default, spanning-tree link-type is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree link-type point-to-point

(config-if)#no spanning-tree link-type
```

spanning-tree mst configuration

Use this command to enter the Multiple Spanning Tree Configuration mode.

Command Syntax

```
spanning-tree mst configuration
```

Parameters

None

Default

No default value is specified.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree mst configuration
(config-mst)#
```

spanning-tree bpdu-filter

Use this command to set the BPDU filter value for individual ports. When the `enable` or `disable` parameter is used with this command, this configuration takes precedence over bridge configuration. However, when the `default` parameter is used with this command, the bridge level BPDU filter configuration takes effect for the port.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the `no` parameter with this command to revert the port BPDU filter value to default.

Command Syntax

```
spanning-tree bpdu-filter (enable|disable|default)
no spanning-tree bpdu-filter
```

Parameters

`default`	Sets the bpdu-filter to the default level.
`disable`	Disables the BPDU-filter.
`enable`	Enables the BPDU-filter.

Default

By default, spanning-tree bpdu-filter is default option

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree bpdu-filter enable

(config-if)#no spanning-tree bpdu-filter
```

spanning-tree bpdu-guard

Use this command to enable or disable the BPDU Guard feature on a port.

This command supersedes the bridge level configuration for the BPDU Guard feature. When the `enable` or `disable` parameter is used with this command, this configuration takes precedence over bridge configuration. However, when the `default` parameter is used with this command, the bridge-level BPDU Guard configuration takes effect.

Use the `show spanning tree` command to display administratively configured and currently running values of the BPDU filter parameter for the bridge and port (see show spanning-tree).

Use the no parameter with this command to set the BPDU Guard feature on a port to default.

Command Syntax

```
spanning-tree bpdu-guard (enable|disable|default)
no spanning-tree bpdu-guard
```

Parameters

`default`	Sets the BPDU-guard to the default level.
`disable`	Disables the BPDU-guard.
`enable`	Enables the BPDU-guard.

Default

By default, spanning-tree bpdu-guard is default

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree bpdu-guard enable

(config-if)#no spanning-tree bpdu-guard
```

spanning-tree restricted-domain-role

Use this command to set the restricted-domain-role value of the port to TRUE.

Use the no parameter with this command to set the restricted-domain-role value of the port to FALSE.

Command Syntax

```
spanning-tree restricted-domain-role
no spanning-tree restricted-domain-role
```

Parameters

None

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-domain-role
```

spanning-tree restricted-role

Use this command to set the restricted-role value of the port to TRUE.

Use the no parameter with this command to set the restricted-role value of the port to FALSE.

Command Syntax

```
spanning-tree restricted-role
no spanning-tree restricted-role
```

Parameters

None

Default

By default, restricted-role value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-role
```

spanning-tree restricted-tcn

Use this command to set the restricted TCN value of the port to TRUE.

Use the no parameter with this command to set the restricted TCN value of the port to FALSE.

Command Syntax

```
spanning-tree restricted-tcn
no spanning-tree restricted-tcn
```

Parameters

None

Default

By default, restricted TCN value is FALSE

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#spanning-tree restricted-tcn
```

spanning-tree te-msti configuration

This command is used to put the terminal into the `te-msti` configuration mode.

After creating a bridge instance and adding VLAN to that bridge instance, use this command to enter `te-msti` configuration mode.

Command Syntax

```
spanning-tree te-msti configuration
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#spanning-tree te-msti configuration
(config-te-msti)#
```

storm-control

Use this command to set the rising threshold level for broadcast, multicast, or destination lookup failure traffic. The storm control action occurs when traffic utilization reaches this level.

Storm control is used to block the forwarding of unnecessary flooded traffic. A packet storm occurs when a large number of broadcast packets are received on a port. Forwarding these packets can cause the network to slow down or time out.

Use the no form of this command to disable storm control.

Note: Minimum granularity for storm-control is 64kbps.

Command Syntax

```
storm-control (broadcast|multicast|dlf) (level LEVEL | <0-1000000000>
  (kbps|mbps|gbps))
no storm-control (broadcast|multicast|dlf)
```

Parameters

`broadcast`	Broadcast rate limiting.
`multicast`	Multicast rate limiting.
`dlf`	Destination lookup failure limiting.
`level`	Sets the percentage of the threshold.
`LEVEL`	The percentage of the threshold; percentage of the maximum speed (pps) of the interface <0.0000-1000.0000>.
`<0-1000000000>`	Sets absolute threshold value <0-1000000000>
`kbps`	specifies the units of Kilobits per second.
`mbps`	specifies the units of Megabits per second.
`gbps`	specifies the units of Gigabits per second.

Default

By default, storm control is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#storm-control broadcast level 30

(config)#interface eth0
(config-if)#storm-control multicast level 30

(config)#interface eth0
```

```
(config-if)#storm-control multicast 300 mbps

(config)#interface eth0
(config-if)#no storm-control multicast
```

CHAPTER 4 Link Aggregation Commands

This chapter describes link aggregation commands.

channel-group mode

Use this command to add an interface to an existing link aggregation group.

After you execute this command, the interface loses its properties and takes the properties of the aggregated interface.

Use the no parameter with this command to remove an interface from a dynamic link aggregation group. When you remove an interface from a LAG, the interface acquires the default interface properties.

Command Syntax

```
channel-group <1-65535> mode (active|passive)
channel-group <1-16383> mode (active|passive)
no channel-group
```

Parameters

`<1-65535>`	Specify a channel group number (without DRNI).
`<1-16383>`	Specify a channel group number (with DRNI).
`mode`	Specify a channel mode.
`active`	Enable LACP negotiation.
`passive`	Disable LACP negotiation.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#channel-group 1 mode active
(config-if)#exit

#sh run in po1
!
interface po1
 switchport
```

The is an example of `no channel-group`:

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#no channel-group
(config-if)#exit

#sh run in xe1
!
interface xe1
```

```
!
#sh run in po1
!
interface po1
 switchport

!
```

clear lacp

Use this command to clear the counters of all LACP aggregators or a given LACP aggregator.

Command Syntax

```
clear lacp <1-65535> counters
clear lacp counters
```

Parameters

<1-65535>	Clears a channel-group number.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear lacp 2 counters
```

debug lacp

Use this command to enable LACP debugging.

Use the no parameter with this command to disable debugging.

Command Syntax

```
debug lacp (event|cli|timer|packet|sync|ha|all|rx|tx)
no debug lacp (event|cli|timer|packet|sync|ha|allrx|tx)
undebug all
```

Parameters

`all`	Enables all LACP debugging.
`cli`	Echo commands to console.
`event`	Sets the debug options for LACP events.
`ha`	Echo High availability events to console.
`packet`	Sets the debug option for LACP packets.
`sync`	Echo synchronization to console.
`timer`	Echo timer expiry to console.
`rx`	Echo receiving of lacpdus to console.
`tx`	Echo transmission of lacpdus to console.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug lacp all
```

interface po

Use this command to create a dummy dynamic link aggregate interface (by default an L3 LAG interface).

Use the no form of this command to remove a dynamic link aggregate group and also it remove the properties of the po from all member ports.

Note: Switchport/routed mode needs to be set for the PO before adding member ports to it.

Command Syntax

```
interface po<1-16383>
no interface po<1-16383>
```

Parameters

<1-16383>	Channel group number.

Default

By default, interface po is L3 LAG interface

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface po1
(config-if)#switchport
(config-if)#exit
```

interface sa

Use this command to create a dummy static link aggregate interface (by default an L3 LAG interface) and to add an interface to an existing static link aggregation group.

Use the no form of this command to remove a static link aggregate group and also remove the properties of the po from all member ports.

Command Syntax

```
interface sa<1-16383>
no interface sa<1-16383>
```

Parameters

<1-16383>	Channel group number.

Default

By default, interface sa is L3 LAG interface

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface sa1
(config-if)#switchport
(config-if)#exit
```

lacp destination-mac

Use this command to set the address type to use for sending LACPDUs (Link Aggregation Control Protocol Data Units).

Note: The interface must be an aggregation port.

Use the no form of this command to set the address type to its default (multicast group address).

Command Syntax

```
lacp destination-mac  (customer-bridge-group-address | multicast-group-address |
  non-tmpr-group-address)
no lacp destination-mac
```

Parameters

`customer-bridge-group-address`

Customer bridge group address

`multicast-group-address`

Multicast group address (default)

`non-TPMR-group-address`

Non-Two-Port Media Access Control Relay (TPMR) group address

Default

By default, lacp destination-mac is multicast-group-address

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#interface eth1
(config-if)#lacp destination-mac customer-bridge-group-address
```

lacp discard wrong conversation

Use this command to enable or disable discarding frames with an incorrect port conversation identifier.

Note: The interface must be a dynamic port-channel.

Command Syntax

```
lacp discard wrong conversation (disable|enable)
```

Parameters

`disable`	Do not discard frames with an incorrect port conversation identifier
`enable`	Discard frames with an incorrect port conversation identifier

Default

By default, lacp discard wrong conversation is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#interface po1
(config-if)#lacp discard wrong conversation enable
```

lacp force-up

Use this command to make a port immediately begin forwarding packets and not wait for an LACPDU. After you execute this command, the member port is forcefully up even if LACP is not in sync (only if no other member in the aggregator is in sync).

If a force-up port stops receiving LACPDUs, the port ignores the time-out and remains in operation.

This command can be configured on one member interface of a port channel.

Note: This command can only be given after executing the channel-group mode command on an interface. Force-up mode is not supported for LACP passive mode.

Note: For MC-LAG, only configure a force-up port on either on the master node or the slave node to prevent traffic drops/loops.

Use the no form of this command to disable force-up mode.

Command Syntax:

```
lacp force-up
no lacp force-up
```

Parameters

None

Default

By default, LACP force-up mode is disabled.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS version 1.3.6.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#channel-group 1 mode active
(config-if)#lacp force-up
(config-if)#exit
```

lacp port-priority

Use this command to set the priority of a channel. Channels are selected for aggregation based on their priority with the higher priority (numerically lower) channels selected first.

Use the no parameter with this command to set the priority of port to the default value (32768).

Command Syntax

```
lacp port-priority <1-65535>
no lacp port-priority
```

Parameters

<1-65535>	Specify the LACP port priority.

Default

By default, lacp port priority is 32768

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#lacp port-priority 34
```

lacp system-priority

Use this command to set the LACP system priority. This priority determines the system responsible for resolving conflicts in the choice of aggregation groups.

Note: A lower numerical value has a higher priority.

Use the no parameter with this command to set the system priority to its default value (32768).

Command Syntax

```
lacp system-priority <1-65535>
no lacp system-priority
```

Parameters

<1-65535>	System priority.

Default

By default, system priority is 32768

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#lacp system-priority 6700
```

lacp timeout

Use this command to set either a short or long timeout value on a port. The timeout value is the number of seconds before invalidating a received LACP data unit (DU).

Command Syntax

```
lacp timeout (short|long)
```

Parameters

`short`	LACP short timeout. 3 seconds.
`long`	LACP long timeout. 90 seconds.

Default

By default, lacp timeout is long.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following sets the LACP short timeout on a port.

```
#configure terminal
(config)#interface eth0
(config-if)#lacp timeout short

#configure terminal
(config)#interface eth0
(config-if)#lacp timeout long
```

port-channel min-links

Use this command to set the minimum number of aggregated links that need to be up in the LAG interface.

When a the minimum number of links are configured for a LAG, if the active links for that interface become less than the configured value, then the whole LAG is brought down. When the number of active links become the same or more than the configured value, then the whole LAG is restored.

Use the no form of this command to remove the minimum number of aggregated links that need to be up in the LAG interface.

Note: The minimum number of aggregated links should be same across both ends of an aggregation interface. If not configured, then on one of the nodes the LAG port will be treated as up and on the other as down and traffic will be discarded.

Note: When a LAG port is moved to the down state because it does not have the minimum number of required links up and running, then the traffic on the remaining interfaces in the LAG will be counted as port-block discards.

Command Syntax

```
port-channel min-links <2-32>
no port-channel min-links
```

Parameters

<2-32>	Minimum number of links

Default

By default, port channel min-link is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface po1
(config-if)#port-channel min-links 10
(config-if)#exit
```

show debugging lacp

Use this command to display the status of the debugging of the LACP system.

Command Syntax

```
show debugging lacp
```

Parameters

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging lacp

LACP debugging status:
LACP timer debugging is on
```

show etherchannel

Use this command to display information about link aggregation groups.

Command Syntax

```
show etherchannel
show etherchannel <1-65535>
```

With MLAG:

```
show etherchannel (<1-16383>|) detail
show etherchannel (<1-16383>|) load-balance
show etherchannel (<1-16383>|) summary
```

Without MLAG:

```
show etherchannel (<1-65535>|) detail
show etherchannel (<1-65535>|) load-balance
show etherchannel (<1-65535>|) summary
```

Parameters

`<1-65535>`	Specify channel-group number.
`<1-16383>`	Specify channel-group number.
`detail`	Specify detailed etherchannel information.
`load-balance`	Specify load balancing.
`summary`	Specify Etherchannel summary information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show etherchannel summary
% Aggregator po1 185
% Aggregator Type: Layer3
% Admin Key: 0001 - Oper Key 0001
%   Link: eth3 (5) sync: 0
-------------------------------------
% Aggregator po4 186
% Admin Key: 0004 - Oper Key 0004
%   Link: eth2 (4) sync: 0
-------------------------------------
% Aggregator po5 187
% Admin Key: 0005 - Oper Key 0005
%   Link: eth1 (3) sync: 0
```

```
#show etherchannel detail
% Aggregator po1 185
% Aggregator Type: Layer3
%  Mac address: 08:00:27:36:f5:7d
%  Admin Key: 0001 - Oper Key 0001
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0001
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 0
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth3 (5) sync: 0
%  Collector max delay: 5
-------------------------------------------------
% Aggregator po4 186
%  Mac address: 08:00:27:76:0c:57
%  Admin Key: 0004 - Oper Key 0004
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0004
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 1
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth2 (4) sync: 0
%  Collector max delay: 5
-------------------------------------------------
% Aggregator po5 187
%  Mac address: 08:00:27:2f:d5:ae
%  Admin Key: 0005 - Oper Key 0005
%  Actor LAG ID- 0x8000,08-00-27-fa-4b-0e,0x0005
%  Receive link count: 0 - Transmit link count: 0
%  Individual: 0 - Ready: 0
%  Partner LAG ID- 0x0000,00-00-00-00-00-00,0x0000
%   Link: eth1 (3) sync: 0
%  Collector max delay: 5
```

Table 4-93 explains the show command output fields.

Table 4-93: show etherchannel detail output

Field	Description
Aggregator	Link aggregators name and ID number.
Mac address	Unique MAC address for link identification.
Admin Key	LACP administrative key – automatically configured value on each port configured to use LACP.
Oper Key	LACP operator key on Partner – automatically configured value on each port configured to use LACP.
Actor LAG ID	LAG ID consisting of MAC address plus aggregator ID number for this Actor.
Receive link count	The number of link received from the peer LAG.
Transmit link count	The number of links contained transmitted to the peer LAG.
Individual	The individual physical network interfaces or ports contained in the LAG.
Ready	The number of links in the active state on this Actor.
Partner LAG ID	Partner LAG ID consisting of MAC address plus aggregator ID number.

Table 4-93: show etherchannel detail output (Continued)

Field	Description
Link	Interface and ID number of the link.
sync	MAC address synchronization enables a MC-LAG Partner to forward Layer 3 packets arriving on this interfaces with either its own MAC address or its Partner's.
Collector max delay	Maximum period of wait time between sending of two subsequent Ethernet frames on a link.

show lacp sys-id

Use this command to display the LACP system identifier and priority.

Command Syntax

```
show lacp sys-id
```

Parameters

`sys-id`	Display LACP system ID and priority

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show lacp sys-id
% System 8000,00-0e-0c-83-37-27
```

show lacp-counter

Use this command to display the packet traffic on all ports of all present LACP aggregators, or a given LACP aggregator.

Command Syntax

```
show lacp-counte
show lacp-counter <1-65535>
```

Parameters

<1-65535>	Channel-group number

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show lacp-counter 555

Port      LACPDUs         Marker          Pckt err
        Sent    Recv    Sent    Recv    Sent    Recv
```

show port etherchannel

Use this command to display details about a PO and its members' interfaces or to display details of a single member interface of a PO.

Command Syntax

```
show port etherchannel IFNAME
```

Parameters

IFNAME	Interface name

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show port etherchannel ce29/1

Note: Most of the output of this command is duplicated in the show etherchannel command (see also the 802.3ad specificiation). The output of the `show port etherchannel` command is primarily a list of state machine values. An explanation of the state machine bits follows. See Figure 4-56.

Table 4-94 explains the show command output fields.

Table 4-94: show port etherchannel detailed output

Entry	Description
Actor/Partner state	The Actor's and Partner's state variables, encoded as individual bits within a single octet.
ACT	LACP_Activity is encoded in bit 0. Active LACP is encoded as a 1; Passive LACP as a 0.

Table 4-94: show port etherchannel detailed output (Continued)

Entry	Description
TIM	LACP_Timeout is encoded in bit 1. Short Timeout is encoded as a 1; Long Timeout as a 0.
AGG	Aggregability is encoded in bit 2. Aggregatable is encoded as a 1; Individual is encoded as a 0.
SYN	Synchronization is encoded in bit 3. In_Sync is encoded as a 1; Out_Of_Sync is encoded as a 0.
COL	Collecting is encoded in bit 4. True is encoded as a 1; False is encoded as a 0.
DIS	Distributing is encoded in bit 5. True is encoded as a 1; False is encoded as a 0.
DEF	Defaulted is encoded in bit 6.
EXP	Defaulted is encoded in bit 7.

Bits 7 and 8 are reserved; these are ignored on receipt and transmitted as zero. However, the received value of these bits is recorded on receipt to accurately reflect the actor's view of the partner's state in outgoing PDUs.

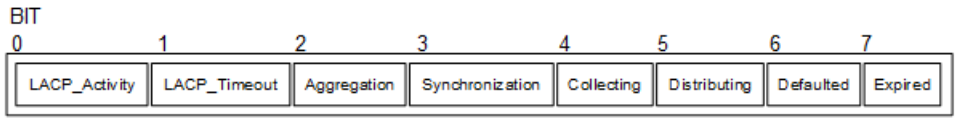

Figure 4-56: Diagram of state machine octet

show static-channel-group

Use this command to display the types of load-balancing port selection criteria (PSC) used on configured static aggregators.

Command Syntax

```
show static-channel-group  (<1-12>|)
```

Parameters

<1-12>	Specify channel-group number.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is an example of the output of this command:

```
#show  static-channel-group 1
% Static Aggregator: sa1
% Member:
   eth1
```

show static-channel load-balance

Use this command to display information about static channel groups.

Command Syntax

```
show static-channel (<1-12>|) load-balance
```

Parameters

<1-12>	Specify static-channel-group number.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS Version 1.0.

Examples

The following is an example of the output of this command:

```
#show static-channel load-balance
% Static Aggregator: sa5
Flow based division
```

snmp restart lacp

Use this command to restart SNMP in LACP.

Command Syntax

```
snmp restart lacp
```

Parameters

None

Default

By default, snmp restart lacp is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#snmp restart lacp
```

static-channel-group

Use this command to create a static link aggregation group or to add an interface to an existing link aggregation group.

Use the `no` form of this command to remove an interface from a static link aggregation group without removing the static link aggregation group itself.

Command Syntax

```
static-channel-group <1-12>
no static-channel-group
```

Parameter

`<1-12>`	Channel group number.

Default

By default, static channel group is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#static-channel-group 1
(config-if)#exit

#sh run in sa1
!
interface sa1
 switchport
```

This is an example of `no static-channel-group`:

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#no static-channel-group
(config-if)#exit

#sh run in xe1
!
interface xe1
!
#sh run in sa1
!
interface sa1
 switchport
```

!

CHAPTER 5 Multi-chassis Link Aggregation Commands

This chapter describes the Multi-Chassis Link Aggregation commands.

Multi-Chassis Link Aggregation is also called MC-LAG, MLAG, or Distributed Resilient Network Interconnect (DRNI). In this document, it is called MC-LAG.

clear mcec statistics

Use this command to clear the statistics related to hello and information PDUs in the MCEC domain.

Command Syntax

```
clear mcec statistics
```

Parameters

None

Command Mode

Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 4.0.

Examples

```
#clear mcec statistics
```

domain-address

Use this command to configure domain address, which helps to identify the mcec domain.

Use the no form of this command to remove the domain address.

Command Syntax

```
domain-address <domain-id>
no domain-address
```

Parameters

```
domain-id  domain address in HHHH.HHHH.HHHH format
```

Command Mode

MCEC mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#domain-address 1111.2222.3333
```

debug mcec

Use this command to view debugging logs for MLAG.

Use the no form of this command to remove debugging logs for MLAG.

Command Syntax

```
debug mcec (timer|event|hello|info|cli|mac-sync|all)
no debug mcec (timer|event|hello|info|cli|mac-sync|all)
```

Parameters

`all`	ALL
`cli`	CLI
`event`	Event
`hello`	Hello
`info`	Info
`mac-sync`	Mac Sync
`timer`	Timer

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug mcec all
#no debug mcec all
```

domain hello timeout

Use this command to specify the domain hello-timeout value.

Command Syntax

```
domain-hello-timeout (long|short)
```

Parameters

`long`	Long Timeout
`short`	Short Timeout

Command Mode

MCEC mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#domain-hello-timeout long
```

domain priority

Use this command to specify the priority value associated with mcec domain.

Use the no form of this command to remove the priority value associated with mcec domain.

Command Syntax

```
domain-priority <1-65535>
no domain-priority
```

Parameters

<1-65535>	Priority Value

Command Mode

MCEC mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#domain-priority 2
```

domain-system-number

Use this command to configure domain system number, which uniquely identifies domain system in mcec domain.

Use the no form of this command to configure domain system number.

Command Syntax

```
domain-systm-number <1-2>
no domain-systm-number
```

Parameters

<1-2>	Domain System Number

Command Mode

MLAC mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#domain-system-number 2
```

intra-domain-link

Use this command to map an interface as intra domain link that connects the domain system with its neighbor in a mcec domain.

Use the no form of this command to unmap the interface configured as intra domain link that connects the domain system with its neighbor in a mcec domain.

Command Syntax

```
intra-domain-link <IFNAME>
no intra-domain-link
```

Parameters

IFNAME	Interface name

Command Mode

MCEC mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#intra-domain-link eth2
```

mcec domain configuration

Use this command to enter MCEC Domain configuration mode to configure mcec domain information.

Command Syntax

```
mcec domain configuration
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#config terminal
(config)#mcec domain configuration
(config-mcec-domain)#
```

mlag

Use this command to map a port-channel to mlag instance.

Note: The interface must be a dynamic port channel.

Note: All MLAG nodes must use the same MAC table size.

Use the no form of this command to un-map the port channel from mlag instance.

Command Syntax

```
mlag <1-256>
no mlag
```

Parameters

<1-256>	MC-LAG identifier

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#config terminal
(config)#interface po1
(config-if)#mlag 1
```

mode

Use this command to set the MC-LAG mode.

Use the no form of this command to turn off this feature.

Command Syntax

```
mode (active-standby)
no mode (active-standby)
```

Parameters

`active-standby` The interface is ready for transition to the active state if a failure occurs in the other node

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS-SP version 4.0.

Examples

```
(config)#
(config)#interface mlag1
(config-if)#mode active-standby
```

show mlag detail

Use this command to display details about MC-LAG configuration and status.

Command Syntax

```
show mlag <1-256> detail
```

Parameters

<1-256>	MLAG group number

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh mlag 1 detail

MLAG-1
Mapped Aggregator : po1
Admin Key : 32769
Oper Key: 16385
Physical properties Digest : dd 9c f 76 dd b6 5f 2f eb a1 d3 bb 8d 96 fc 82

Neigh Admin Key: 16385
Neigh Physical Digest: dd 9c f 76 dd b6 5f 2f eb a1 d3 bb 8d 96 fc 82
Info RCV State : Current
Info Periodic Time State : Standby
Mlag Sync: IN_SYNC
```

Table 5-95 Shows the output details.

Table 5-95: Show mlag output details

Entry	Description
Mapped Aggregator	Map the output of the aggregator in the interface which is active transformation.
Admin Key	MLAG administrative key – automatically configured value on each port configured to use MLAG.
Oper Key	MLAG operator key on Partner – automatically configured value on each port configured to use MLAG.
Physical properties Digest	Physical properties of the digest.
Neigh Admin Key	Neigh administrative key – automatically configured value on each port configured to use MLAG.
Neigh Physical Digest	Neigh physical properties of the digest.

Table 5-95: Show mlag output details

Entry	Description
Info RCV State	Details of the RCV.
Info Periodic Time State	A simple state space formulation of a general digital periodic time series is constructed.
Mlag Sync	MAC address synchronization enables a MC-LAG Partner to forward Layer 3 packets arriving on this interfaces with either its own MAC address or its Partner's.

show mlag domain

Use this command to display MC-LAG configuration and status.

Command Syntax

```
show mlag domain <details|summary>
```

Parameters

details	details
summary	summary

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show mlag domain summary
-----------------------------------
Domain Configuration
-----------------------------------
Domain System Number : 2
Domain Address: 1111.2222.3333
Domain Priority: 1000

show mcec statistics

Use this command to display all the statistics related to hello and info pdu's in mcec domain.

Command Syntax

```
show mcec statistics
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#sh mcec statistics
Unknown MCCPDU received on the system : 0

-------------------------------------
IDP xe49
-------------------------------------
Valid RX Hello PDUs : 109
Valid TX Hello PDUs : 201
Valid RX Info PDUs: 23
Valid TX Info PDUs : 28
Valid RX Mac Sync PDUs : 5
Valid TX Mac Sync PDUs : 4

MLAG 1
Valid RX Info PDUs : 5
Valid TX Info PDUs : 7
```

Table 5-95 Shows the output details.

Table 5-97: Show mcec statistics details

Entry	Description
RX Hello PDUs	Total number of received hello PDUs.
TX Hello PDUs	Total number of transmitted hello PDUs.
RX Info PDUs	Total number of received Info PDUs.
TX Info PDUs	Total number of transmitted Info PDUs.
RX Mac Sync PDUs	Total number of received Mac Sync PDUs.
TX Mac Sync PDUs	Total number of transmitted Mac Sync PDUs.

show spanning-tree mlag operational-config

Use this command to display the operational information for MC-LAG.

Command Syntax

```
show spanning-tree mlag operational-config
```

Parameters

None

Command Mode

Privilege exec mode

Applicability

This command was introduced before OcNOS-SP version 4.0.

Examples

```
#show spanning-tree mlag operational-config
Operational Configuration
----------------------------------------
Bridge Priority : 32768
Pathcost method : Long
Interface : mlag1
Pathcost : 1000
Priority : 0
```

show spanning-tree mlag sync-detail

Use this command to display the spanning-tree properties shared with the domain peer node.

Command Syntax

```
show spanning-tree mlag sync-detail
```

Parameters

None

Command Mode

Privilege exec mode

Applicability

This command was introduced before OcNOS-SP version 4.0.

Examples

```
#show spanning-tree mlag sync-detail
Domain Digest Parameters
----------------------------------------
Max Age : 20
BPDU Filter : Disabled
BPDU Guard : Disabled
Hello time : 2
Forward Delay : 15
Force Version : 2
Err-disable status : Disabled
Err-disable timeout : 300
MSTP Enabled : Enabled
MSTP Bridge Forward : Disabled
Interface Digest parameters
----------------------------
Port Name : mlag1
Admin Root Guard : Disabled
Admin Edge port : Disabled
Portfast configuration : Disabled
Restricted TCN : Disabled
Admin BPDU filter : Default
Admin BPDU guard : Default
```

switchover type

Use this command to set the MC-LAG switchover type.

Use the no form of this command to turn off switchover.

Command Syntax

```
switchover type revertive <1-255>
switchover type non-revertive
no switchover type (revertive | non-revertive)
```

Parameters

`revertive` If a failure happens that triggers a switchover, after failure recovery the initially-active node becomes active again

`<1-255>` Switch back to the initially-active node this many seconds after failure recovery

non-revertive Do not switch back to the initially-active node after failure recovery

Default

Revertive time as 10 second is the default time.

Command Mode

Privilege exec mode

Applicability

This command was introduced before OcNOS-SP version 4.0.

Examples

```
(config)#
(config)#interface mlag1
(config-if)#switchover type revertive 20
(config)#
(config)#interface mlag1
(config-if)#switchover type non-revertive
```

CHAPTER 6 Traffic Mirroring Commands

This chapter provides a description of syntax, and examples for Traffic Mirroring. It includes the following commands:

monitor session

Use this command to create a local or remote monitor session. By default, a local monitor session is created.

A monitor session consists of:

- A single destination interface, referred to as a mirror-to port or a single remote destination
- One or more source interfaces (egress, ingress, or both)
- One or more VLAN sources in the ingress direction
- One or more filters that can be applied to filter the mirrored packets

Use the `no` parameter to delete a monitor session.

Command Syntax

```
monitor session <1-18> ( | type ( local | remote ))
no monitor session ( <1-18> | all )
```

Parameters

`<1-18>`	Session number
`local`	Create a local session
`remote`	Create a remote source node session
`all`	All sessions

Default

By default, monitor session type is local and will not be active by default

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#monitor session 1
(config-monitor)#exit
(config)#monitor session 3 type remote
(config-monitor)#exit
(config)#no monitor session 1
```

monitor session shut

Use this command to deactivate one or all monitor sessions.

Use the no parameter to activate one or all monitor sessions.

Command Syntax

```
monitor session (<1-18> | all) shut
no monitor session (<1-18> | all) shut
```

Parameters

<1-18>	Session number
all	All sessions

Default

Monitor session will not be active by default

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#monitor session 3 shut

(config)#no monitor session 3 shut
```

source port

Use this command to configure a source port per monitor session in either ingress or egress or both directions. Source port can be physical interface or a trunk port.

Use the no parameter to remove the source port.

Command Syntax

```
source interface IFNAME ( rx | tx | both | )
no source interface IFNAME ( rx | tx | both | )
```

Parameters

IFNAME	Interface name
rx	Ingress direction
tx	Egress direction
both	Both directions

Default

Source port will be mirrored for both directions if the direction is not specified

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 1
(config-monitor)#source interface xe1 both
(config-monitor)#no source interface xe1 tx
```

source vlan

Use this command to configure one or more VLANs as source per monitor session. A VLAN as source will be mirrored only in the ingress direction. Up to 32 VLANs can be configured as source per monitor session.

Use the no parameter to remove vlan source from monitor session.

Command Syntax

```
source vlan VLAN_RANGE
no source vlan VLAN_RANGE
```

Parameters

VLAN_RANGE	VLAN identifier or VLAN identifier range

Default

A trunk port is a member of all VLANs by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 1
(config-monitor)#source vlan 2
(config-monitor)#source vlan 4-10
(config-monitor)#no source vlan 2-5,10
```

destination port

Use this command to configure a mirror-to port per local monitor session. A destination port can be a physical port or a trunk port.

Use the no parameter to remove the destination port from a local monitor session.

Command Syntax

```
destination interface IFNAME
no destination interface IFNAME
```

Parameters

IFNAME	Interface name

Default

No default value is specified

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface xe3
(config-if)#switchport
(config-if)#exit
(config)#monitor session 1
(config-monitor)#destination interface xe3
(config-monitor)#no destination interface xe3
```

no shut

Use this command to activate a monitor session

Command Syntax

```
no shut
```

Parameters

None

Default

Monitor session will not be active by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#no shut
```

shut

Use this command to de-activate a monitor session.

Command Syntax

```
shut
```

Parameters

None

Default

Monitored session is not active by default.

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#shut
```

filter

Use this command to add filters to the monitor session. Filters can be applied only in case of ingress mirroring.

Use the no parameter to remove the filter from monitor session.

Command Syntax

```
filter {vlan <2-4094> | cos <0-7> | dest-mac (host XXXX.XXXX.XXXX | XXXX.XXXX.XXXX
  XXXX.XXXX.XXXX) | src-mac (host XXXX.XXXX.XXXX | XXXX.XXXX.XXXX XXXX.XXXX.XXXX) |
  frame-type (ETHTYPE | arp (req | resp|) (sender-ip A.B.C.D|) (target-ip A.B.C.D|)
  | ipv4 (src-ip (A.B.C.D | A.B.C.D/M)|) (dest-ip (A.B.C.D | A.B.C.D/M)|) | ipv6
  (src-ip X:X::X:X/M |) (dest-ip X:X::X:X/M |))}
no filter {vlan <2-4094> | cos <0-7> | dest-mac (host XXXX.XXXX.XXXX |
  XXXX.XXXX.XXXX XXXX.XXXX.XXXX) | src-mac (host XXXX.XXXX.XXXX | XXXX.XXXX.XXXX
  XXXX.XXXX.XXXX) | frame-type (ETHTYPE | arp (req | resp|) (sender-ip A.B.C.D|)
  (target-ip A.B.C.D|) | ipv4 (src-ip (A.B.C.D | A.B.C.D/M)|) (dest-ip (A.B.C.D |
  A.B.C.D/M)|) | ipv6 (src-ip X:X::X:X/M |) (dest-ip X:X::X:X/M |))}
```

Parameters

<2-4094>	VLAN identifier
<0-7>	COS number
XXXX.XXXX.XXXX	MAC address
ETHTYPE	Ethertype
arp	ARP frames
req	Request frames
resp	Response frames
A.B.C.D	Single IP address
A.B.C.D/M	IP addresses with mask
X:X::X:X/M	IPv6 addresses with mask

Default

No default value is specified.

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#filter dest-mac host 0000.0001.2421 frame-type ipv4
(config-monitor)#filter cos 3 frame-type arp req sender-ip 2.2.2.1
(config-monitor)#no filter dest-mac host 0000.0001.2421 frame-type ipv4
(config-monitor)#no filter cos 3 frame-type arp req sender-ip 2.2.2.1
```

description

Use this command to add a description to the monitor session.

Use the no parameter to delete a description of the monitor session.

Command Syntax

```
description LINE
no description
```

Parameters

LINE	Enter the description string

Default

No default value is specified.

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#monitor session 3
(config-monitor)#description “port mirror rx”
(config-monitor)#no description
```

remote destination

Use this command to configure a destination VLAN and the reflector port for the remote monitor session.

Use the no parameter to remove a destination from a remote monitor session.

Command Syntax

```
destination remote vlan <2-4094> reflector-port IFNAME
no destination remote
```

Parameters

<2-4094>	VLAN identifier
IFNAME	Interface name

Default

No default value is specified

Command Mode

Monitor configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#no vlan 900 bridge 1
(config)#interface xe3
(config-if)#switchport
(config)#monitor session 1
(config-monitor)#destination remote vlan 900 reflector-port xe3
(config-monitor)#no destination remote
```

show monitor

Use this command to display states of all monitor sessions. If a session is down, the reason is displayed.

Command Syntax

```
show monitor
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show monitor
Session   State          Reason               Description
------- ----------- ---------------------- --------------------------------
1       down        No sources configured
2       down        Dst in wrong mode
```

show monitor session

Use this command to display the configuration details of one or more monitor sessions.

Command Syntax

```
show monitor session (<1-18>|all|(range RANGE)) (brief|)
```

Parameters

`<1-18>`	Session number
`all`	All sessions
`RANGE`	Session number range (n1-n2)
`brief`	Brief information

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show monitor session 1
session 1
---------------
type              : local
state             : down (Session admin shut)
source intf       :
tx                : xe1 xe3 xe4
rx                : xe2 xe3 xe4
both              : xe3 xe4
source VLANs      :
rx                : 2,5-10,15,18-20
destination ports : xe5
filter count      :

Legend: f = forwarding enabled, l = learning enabled
#
```

Table 6-98 Explains the show command output fields

Table 6-98: Show monitor session output fields

Field	Description
Type	Type of monitor session.
State	State of the security flow filter.
Rx	Incoming flow (source and destination IP addresses).
Tx	Reverse flow (source and destination IP addresses).

Field	Description
Both	Incoming and reverse flow (source and destination IP address)
Destination Port	Name of the destination port to be matched.
Source intf	Number of maximum intf central source session.
Source VLANs	Number of maximum VLANs central source session.
Filter count	Used to count number of lines in a file or table.

show filter

Use this command to display filters for one or more monitor sessions.

Command Syntax

```
show monitor session (<1-18>|all|(range RANGE)) filter
```

Parameters

`<1-18>`	Session number
`all`	All sessions
`RANGE`	Session number range (n1-n2)

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show monitor session 1 filter
session 1
---------------
filter count : 3
---------------

match set 1
---------------
destination mac address : 0000.0002.4451 (host)
source mac address : 0000.0012.2288 (host)
---------------

match set 2
---------------
frame type : arp
sender ip address : 2.2.2.5
target ip addres : 2.2.2.8
---------------

match set 3
---------------
destination mac address : 0000.0001.1453 (host)
frame type : ipv4
source ip address : 3.3.3.5
#
```

show monitor running configuration

Use this command to display the mirror-related running configuration.

Command Syntax

```
show running-config monitor (all|)
```

Parameters

`all`	Show running configuration with defaults

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config monitor
!
monitor session 1
 source interface xe10 rx
 destination interface po1
 no shut

#
```

monitor session shut

Use this command to deactivate one or all monitor sessions.

Use the no parameter to activate one or all monitor sessions.

Command Syntax

```
monitor session (<1-18> | all) shut
no monitor session (<1-18> | all) shut
```

Parameters

<1-18>	Session number
all	All sessions

Default

Monitor session will not be active by default

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#monitor session 3 shut

(config)#no monitor session 3 shut
```

show mirror interface <if-name>

Use this command to display mirror interface details.

Command Syntax

```
show mirror interface <if-name>
```

Parameters

IFNAME	Interface name

Default

None.

Command Mode

Exec mode or Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show mirror interface eth0
Mirror Test Port Name: eth1
Mirror option: Enabled
Mirror direction: both
Monitored Port Name: eth0
```

mirror interface <if-name> direction

Use this command to display mirror interface details.

Command Syntax

```
mirror interface <if-name> direction both|receive|transmit
```

Parameters

IFNAME	Interface name
direction	mirroring direction

Default

None.

Command Mode

Interface Config mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#interface eth1
mirror interface eth0 direction both
```

CHAPTER 7 VLAN and Private VLAN Commands

This chapter has the commands used to manage VLANs and Private VLANs. A private VLAN contains switch ports that cannot communicate with each other, but can access other networks. This chapter includes the following commands:

private-vlan association

Use this command to associate a secondary VLAN to a primary VLAN. Only one isolated VLAN can be associated to a primary VLAN. Multiple community VLANs can be associated to a primary VLAN.

Use the no form of this command to remove association of all the secondary VLANs to a primary VLAN.

Command Syntax

```
private-vlan association add VLAN_RANGE
private-vlan association remove VLAN_RANGE
no private-vlan association
```

Parameters

add	Add a VLAN to private VLAN list.
remove	Removes values associated with a single VLAN.
VLAN_RANGE	Specify VLAN ID 1-4094 or range(s): 1-5, 10 or 2-5,7-19 of the private VLANs to be configured

Default

By default, functionality is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan association add 3-4
(config-vlan)#private-vlan association remove 3-4
(config-vlan)#no private-vlan association
```

private-vlan community

Use this command to set a VLAN type for a private (community) VLAN.

Use the no form of this command to remove the specified private VLAN.

Command Syntax

```
private-vlan <2-4094> community bridge <1-32>
no private-vlan <2-4094> community bridge <1-32>
```

Parameters

<2-4094>	Specify a private VLAN identifier.
bridge	Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan 4 community bridge 1
```

private-vlan isolated

Use this command to create an isolated private VLAN.

Use the no form of this command to remove the specified private VLAN.

Command Syntax

```
private-vlan <2-4094> isolated bridge <1-32>
no private-vlan <2-4094> isolated bridge <1-32>
```

Parameters

`<2-4094>`	Specify a private VLAN identifier.
`bridge`	Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan 3 isolated bridge 1
```

private-vlan primary

Use this command to create a primary VLAN.

Use the no form of this command to remove the specified private VLAN.

Command Syntax

```
private-vlan <2-4094> primary bridge <1-32>
no private-vlan <2-4094> primary bridge <1-32>
```

Parameters

<2-4094>	Specify a private VLAN identifier.
bridge	Specify the bridge identifier.

Default

By default, private vlan is disabled

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan database
(config-vlan)#private-vlan 2 primary bridge 1
```

show vlan

Use this command to display information about static, dynamic or all VLANs.

Command Syntax

```
show vlan (all|static|dynamic|auto) bridge <1-32>
```

Parameters

`<1-32>`	Displays the bridge group ID.
`all`	Displays all VLANs (static and dynamic).
`static`	Displays static VLANs.
`dynamic`	Displays dynamic VLANs.
`auto`	Displays auto configured VLANs.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh vlan all bridge 1
Bridge  VLAN ID     Name         State   H/W Status      Member ports
                                                      (u)-Untagged, (t)-Tagged
======= ======= ================ ======= ========== ==========================
1       1       default          ACTIVE  Up         xe2(u) xe10(u)
1       2       vlan2            ACTIVE  Up         xe10(t)
1       10      VLAN0010         ACTIVE  Up         xe2(t) xe10(t)
1       20      VLAN0020         ACTIVE  Up         xe2(t) xe10(t)
1       30      VLAN0030         ACTIVE  Up         xe10(t)
1       40      VLAN0040         ACTIVE  Up         xe10(t)
1       50      VLAN0050         ACTIVE  Up         xe10(t)
1       60      VLAN0060         ACTIVE  Up         xe10(t)
#
```

Table 7-99 Explains the show command output fields.

Table 7-99: show vlan output fields

Field	Description
Bridge	Number of bridge in the interface.
VLAN ID	VLAN identifier of the VLAN listed.
Name	Name of the VLAN.
State	Indicates whether the physical link is operational and can pass packets.

Field	Description
H/W Status	Indicates that the hardware is operational.
Member ports	The tagged interfaces to which a VLAN is associated.

show vlan brief

Use this command to display brief VLAN information for all bridges.

Command Syntax

```
show vlan (brief | <2-4094>)
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output from this command when using the `all` parameter.

```
#show vlan brief

Bridge          VLAN ID  Name            State   Member ports
                                                 (u)-Untagged, (t)-Tagged
=============== ======= ================ ======= ==============================
1               1       default          ACTIVE  eth2(u)

0               1       default          ACTIVE
0               2       new              ACTIVE
```

Table 7-100 Explains the show command output fields.

Table 7-100: show vlan brief output fields

Field	Description
Bridge	Number of bridge in the interface.
VLAN ID	VLAN identifier of the VLAN listed.
Name	Name of the VLAN.
State	Indicates whether the physical link is operational and can pass packets.
H/W Status	Indicates that the hardware is operational.
Member ports	The tagged interfaces to which a VLAN is associated.

show vlan classifier

Use this command to display information on configured VLAN classifier groups, interfaces configured for a VLAN group or all the groups, or all configured VLAN classifier rules.

If either a group ID or rule ID is not specified, all configured VLAN classifier rules are shown. If either a group ID or rule ID is specified, a specific configured VLAN classifier rule is shown.

Command Syntax

```
show vlan classifier group interface IFNAME
show vlan classifier group (<1-16>|)
show vlan classifier rule(<1-256>|)
```

Parameters

`group`	Displays group activated information.
`<1-16>`	Displays the group ID
`interface`	Displays interface information.
`interface`	Displays interface group information.
`group`	Displays group activated information.
`<1-16>`	Displays the group ID.
`rule`	Displays VLAN classifier rule ID.
`<1-256>`	Displays rule ID information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example displays groups for VLAN classifier groups:

```
#show vlan classifier group 1
vlan classifier group 1 add rule 1
```

This example displays interfaces for all VLAN classifier groups:

```
#show vlan classifier interface group
vlan classifier group 1 interface fe2
vlan classifier group 1 interface fe3
vlan classifier group 2 interface fe5
vlan classifier group 3 interface fe7
```

This example displays interfaces for VLAN classifier group 1:

```
#show vlan classifier interface group 1
vlan classifier group 1 interface fe2
vlan classifier group 1 interface fe3
```

This example displays interfaces for VLAN classifier rule 1:

```
#show vlan classifier rule 1
vlan classifier rule 1 mac 222.2222.2222 vlan 2
```

switchport access

Use this command to change the default VLAN on the current interface.

Note: IP Infusion Inc. does not recommend using VLAN identifier 1 because of interoperability issues with other vendors' equipment.

Use the no parameter to remove an existing VLAN.

Command Syntax

```
switchport access vlan <2-4094>
no switchport access vlan
```

Parameter

<2-4094>	Specify the VLAN identifier.

Default

The switchport access vlan default value is 3968.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows the steps of a typical VLAN session, creating and destroying a VLAN.

```
#configure terminal
(config)#interface eth0
(config-if)#switchport access vlan 3

(config)#interface eth0
(config-if)#no switchport access vlan
```

switchport hybrid

Use this command to set the switching characteristics of the interface to hybrid. Both tagged and untagged frames will be classified over hybrid interfaces.

For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Use the no parameter to turn off allowed hybrid switching.

Command Syntax

```
switchport hybrid allowed vlan all
switchport hybrid vlan <2-4094>
switchport hybrid allowed vlan none
switchport hybrid allowed vlan except VLAN_ID
switchport hybrid allowed vlan remove VLAN_ID
switchport hybrid allowed vlan add VLAN_ID egress-tagged (enable|disable)
no switchport hybrid
no switchport hybrid vlan
```

Parameters

`all`	Allow all VLANs to transmit and receive through the interface.
`none`	Allow no VLANs to transmit and receive through the interface.
`except`	Allow all VLANs except these VLANs to transmit and receive through the interface.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`remove`	Remove these VLANs from the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`add`	Add these VLANs to the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`egress-tagged`	Whether to tag outgoing frames.
`enable`	Enable egress tagging for outgoing frames.
`disable`	Disable egress tagging for outgoing frames.

Default

By default, switchport hybrid is enabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following shows adding a single VLAN to the member set.

```
(config-if)#switchport hybrid allowed vlan add eg
switchport hybrid allowed vlan add 2 egress-tagged enable
```

The following shows adding a range of VLANs to the member set.

```
(config-if)#switchport hybrid allowed vlan add eg
switchport hybrid allowed vlan add 2-4 egress-tagged enable
```

switchport mode

Use this command to set the switching characteristics of the Layer 2 interface.

Command Syntax

```
switchport mode (access|hybrid|trunk|provider-network|customer-edge
|customer-network|private-vlan)
```

Parameters

`access`	Access.
`hybrid`	Hybrid.
`trunk`	Trunk.
`provider-network`	Provider network.
`customer-network`	Customer network.

Default

By default, switchport hybrid is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode access
```

switchport mode access ingress-filter

Use this command to set the switching characteristics of the interface to access mode, and classify untagged frames only. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax

```
switchport mode access ingress-filter (enable|disable)
```

Parameters

`ingress-filter`	Set the ingress filtering for the received frames.
`enable`	Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode access ingress-filter enable
```

switchport mode hybrid acceptable-frame-type

Use this command to set the interface acceptable frame types. This processing occurs after VLAN classification.

Command Syntax

```
switchport mode hybrid acceptable-frame-type (all|vlan-tagged)
```

Parameters

`all`	Set all frames can be received
`vlan-tagged`	Accept only classified frames that belong to the port's member set.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode hybrid acceptable-frame-type vlan-tagged
```

switchport mode hybrid ingress-filter

Use this command to set the switching characteristics of the interface as hybrid, and classify both tagged and untagged frames. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax

```
switchport mode hybrid ingress-filter (enable|disable)
```

Parameters

`enable`	Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode hybrid ingress-filter enable
```

switchport mode trunk ingress-filter

Use this command to set the switching characteristics of the interface as trunk, and specify only tagged frames. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax

```
switchport mode trunk ingress-filter (enable|disable)
```

Parameters

`ingress-filter`	Set the ingress filtering for the received frames.
`enable`	Set the ingress filtering for received frames. Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded. This is the default value.
`disable`	Turn off ingress filtering to accept frames that do not meet the classification criteria.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode trunk ingress-filter enable
```

switchport trunk allowed

Use this command to set the switching characteristics of the interface to trunk.

For a VLAN range, specify two VLAN identifiers: the lowest and then the highest separated by a hyphen. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces between the hyphens or commas.

Use the no parameter to remove all VLAN identifiers configured on this port.

Command Syntax

```
switchport trunk allowed vlan all
switchport trunk allowed vlan none
switchport trunk allowed vlan add VLAN_ID
switchport trunk allowed vlan except VLAN_ID
switchport trunk allowed vlan remove VLAN_ID
no switchport trunk
```

Parameters

`all`	Allow all VLANs to transmit and receive through the interface.
`none`	Allow no VLANs to transmit and receive through the interface.
`add`	Add these VLANs to the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`except`	All VLANs except these VLANs are part of the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.
`remove`	Remove these VLANs from the member set.
`VLAN_ID`	VLAN identifier(s) <2-4094>. You can specify a single VLAN, a VLAN range, or a VLAN list.

Default

Received frames that cannot be classified in the previous step based on the acceptable frame type parameter (access/trunk) are discarded.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following shows adding a single VLAN to the port's member set.

```
(config)#interface eth0
(config-if)#switchport trunk allowed vlan add 2
```

The following shows adding a range of VLANs to the port's member set.

```
(config)#interface eth0
(config-if)#switchport trunk allowed vlan add 2-4
```

switchport trunk native

Use this command to configure native VLANs for this port. The native VLAN is used for classifying the incoming untagged packets.

Use the no parameter to revert the native VLAN to the default VLAN identifier 1.

Command Syntax

```
switchport trunk native vlan VLAN_ID
no switchport trunk native vlan
```

Parameter

VLAN_ID	VLAN identifier(s) <1-4094>. You can specify a single VLAN, or a VLAN list. For a VLAN list, specify the VLAN identifiers separated by commas. Do not enter spaces in between the hyphens or commas.

Default

The default is that ingress filtering is off and all frame types are classified and accepted.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport trunk native vlan 2

(config)#interface eth0
(config-if)#no switchport trunk native vlan
```

switchport mode private-vlan

Use this command to make a Layer 2 port a host port, promiscuous port, or trunk port.

Use the no form of this command to remove the configuration.

Command Syntax

```
switchport mode private-vlan (host | promiscuous)
no switchport mode private-vlan (host | promiscuous)
```

Parameters

host	This port type can communicate with all other host ports assigned to the same community VLAN, but it cannot communicate with the ports in the same isolated VLAN. All communications outside of this VLAN must pass through a promiscuous port in the associated primary VLAN.
promiscuous	A promiscuous port can communicate with all interfaces, including the community and isolated ports within a private VLAN

Default

By default, switchport mode private-vlan is host.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode private-vlan host
(config)#interface eth1
(config-if)#switchport mode private-vlan promiscuous
(config)#interface eth2
(config-if)#no switchport mode private-vlan promiscuous
```

switchport private-vlan host-association

Use this command to associate a primary VLAN and a secondary VLAN to a host port. Only one primary and secondary VLAN can be associated to a host port.

Use the no form of this command to remove the association.

Command Syntax

```
switchport private-vlan host-association <2-4094> add <2-4094>
no switchport private-vlan host-association
```

Parameters

<2-4094>	VLAN identifier of the primary VLAN.
add	Adds the secondary VLAN.
<2-4094>	VLAN identifier of the secondary VLAN (either isolated or community).

Default

By default, switchport mode private-vlan value is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport private-vlan host-association 2 add 3

#configure terminal
(config)#interface eth0
(config-if)#no switchport private-vlan host-association
```

switchport private-vlan mapping

Use this command to associate a primary VLAN and a set of secondary VLANs to a promiscuous port.

Use the no form of this to remove all the association of secondary VLANs to primary VLANs for a promiscuous port.

Command Syntax

```
switchport private-vlan mapping <2-4094> add VLAN_ID
switchport private-vlan mapping <2-4094> remove VLAN_ID
no switchport private-vlan mapping
```

Parameters

<2-4094>	VLAN identifier of the primary VLAN.
add	Adds the secondary VLAN.
remove	Removes the secondary VLAN.
VLAN_ID	VLAN identifier <2-4094> of the secondary VLAN (either isolated or community).

Default

By default, switchport mode private-vlan mapping value is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport private-vlan mapping 2 add 3-4
(config-if)#switchport private-vlan mapping 2 remove 3-4

(config-if)#no switchport private-vlan mapping
```

vlan classifier activate

Use this command to activate the VLAN classifier.

Use no form of this command to deactivate the VLAN classifier.

Command Syntax

```
vlan classifier activate <1-16> vlan <2-4096>
no vlan classifier activate <1-16>
```

Parameters

<1-16>	Indicates the VLAN classifier activate identifier.
<2-4094>	VLAN identifier of the primary VLAN.

Default

By default, vlan classifier activate value is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth2
(config-if)#vlan classifier activate 1 vlan 2

(config-if)#no vlan classifier activate 1
```

vlan classifier group

Use this command to create a subnet-based VLAN classifier group. A group indicates a VLAN classifier group ID.

Command Syntax

```
vlan classifier group <1-16> (add | delete) rule <1-256>
no vlan classifier group <1-16>
```

Parameters

`add`	Adds a rule to a group.
`delete`	Deletes a rule from a group.
`rule`	Indicates the VLAN classifier rule identifier `<1-256>`.

Default

By default, vlan classifier group value is 1

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan classifier group 1 delete rule 1
(config)#no vlan classifier group 2
```

vlan classifier rule ipv4

Use this command to create a subnet-based VLAN classifier rule and map it to a specific VLAN. If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax

```
vlan classifier rule <1-256> ipv4 A.B.C.D/M
no vlan classifier rule <1-256>
```

Parameters

A.B.C.D/M	Indicates the IPv4 address classification. Enter the address in A.B.C.D/M format.

Default

By default, vlan classifier rule is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan classifier rule 2 ipv4 20.20.20.2/24
(config)#no vlan classifier rule 2
```

vlan classifier rule mac

Use this command to create a subnet-based VLAN classifier rule and map it to a specific VLAN.

If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax

```
vlan classifier rule <1-256> mac WORD
no vlan classifier rule <1-256>
```

Parameters

WORD	Indicate the Mac address classification. Enter the address in HHHH.HHHH.HHHH format.

Default

By default, vlan classifier rule value is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan classifier rule 2 mac fe80::22e::b5ff:fee8:6/64
(config)#no vlan classifier rule 2
```

vlan classifier rule proto

Use this command to create a subnet-based VLAN classifier rule for a protocol and map it to a specific VLAN. If the source IP address matches the IP subnet specified in the VLAN classifier rule, received packets are mapped to the designated VLAN.

Command Syntax

```
vlan classifier rule <1-256> proto (ip|ipv6|ipx|x25|arp|rarp|atalkddp|atalkaarp|
  atmmulti|atmtransport|pppdiscovery|pppsession|xeroxpup|xeroxaddrtrans|g8bpqx25|
  ieeepup|ieeeaddrtrans|dec|decdnadumpload|decdnaremoteconsole|decdnarouting|
  declat|decdiagnostics|deccustom|decsyscomm|<0-65535>)
no vlan classifier rule <1-256>
```

Parameters

`<0-65535>`	Ethernet decimal
`arp`	Address Resolution Protocol
`atalkaarp`	Appletalk AARP
`atalkddp`	Appletalk DDP
`atmmulti`	MultiProtocol Over ATM
`atmtransport`	Frame-based ATM Transport
`dec`	DEC Assigned
`deccustom`	DEC Customer use
`decdiagnostics`	EC Diagnostics
`decdnadumpload`	DEC DNA Dump/Load
`decdnaremoteconsole`	DEC DNA Remote Console
`decdnarouting`	DEC DNA Routing
`declat`	DEC LAT
`decsyscomm`	DEC Systems Comms Arch
`g8bpqx25`	G8BPQ AX.25
`ieeeaddrtrans`	Xerox IEEE802.3 PUP Address Translation
`ieeepup`	Xerox IEEE802.3 PUP
`ip`	IP address
`ipv6`	IPv6 address
`ipx`	IPX address
`pppdiscovery`	PPPoE discovery
`pppsession`	PPPoE session
`rarp`	Reverse Address Resolution
`x25`	CCITT X.25
`xeroxaddrtrans`	Xerox PUP Address Translation
`xeroxpup`	Xerox PUP

`ethv2`	Ethernet v2
`nosnapllc`	Indicates LLC without snap encapsulation
`snapllc`	Indicates LLC snap encapsulation

Default

By default, vlan classifier rule value is VLAN1

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#vlan classifier rule 2 proto ip
(config)#no vlan classifier rule 2
```

vlan database

Use this command to enter the VLAN configuration mode to add, delete, or modify values associated with a single VLAN.

Command Syntax

```
vlan database
```

Parameters

None

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In the following example, note the change to VLAN configuration mode from Configure mode:

```
#configure terminal
(config)#vlan database
(config-vlan)#
```

vlan state

This command enables or disables the state of a particular VLAN on the bridge.

Command Syntax

```
vlan <2-4094> bridge <1-32> (state (enable|disable)|)
```

Parameters

`<1-32>`	Specify bridge group ID
`state`	Indicates the operational state of the VLAN
`enable`	Sets VLAN into a enable state.
`disable`	Sets VLAN into a disable state.
`name`	The VLAN name
`WORD`	The name of the VLAN

Default

By default, vlan bridge state is disabled.

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#vlan database
(config-vlan)#vlan 45 bridge 1 state enable
```

vlan VLAN_RANGE bridge

.This command allows you to create a single/range of VLAN’s on the VLAN aware bridges.

Use the no form of this command to delete the VLAN.

Command Syntax

```
vlan VLAN_RANGE bridge <1-32>
vlan VLAN_RANGE bridge <1-32> (name WORD|) state (enable | disable)
no vlan VLAN_RANGE bridge <1-32>
```

Parameters

VLAN_RANGE	The vlan-id or range of vlan-id's separated by ','&'-'
bridge	Specify the bridge group ID in the range <1-32>.
state	Indicates the operational state of the VLAN.
enable	Sets VLAN into an enable state.
disable	Sets VLAN into a disable state.

Default

By default, vlan bridge state is disabled

Command Mode

Configuration Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#vlan 3-40,56 bridge 4
(config)#no vlan 2-5 bridge 2
```

CHAPTER 8 802.1x Commands

This chapter provides a description, syntax, and examples of the 802.1X commands. It includes the following commands:

auth-mac disable

Use this command to disable MAC authentication on an interface. See the auth-mac enable command to enable MAC authentication on a interface.

Command Syntax

```
auth-mac disable
```

Parameters

`disable`	Disable MAC authentication on an interface.

Default

No default value is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#auth-mac disable
```

auth-mac enable

Use this command to enable MAC authentication on an interface. See the auth-mac disable command to disable MAC authentication on an interface.

Command Syntax

```
auth-mac enable
```

Parameters

`enable`	Enable MAC authentication on an interface.

Default

By default, MAC authentication is globally disabled on the device.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#auth-mac enable
```

auth-mac system-auth-ctrl

Use this command to enable MAC authentication globally. If MAC authentication is not enabled, other MAC authentication related commands throw an error when issued.

Use the no parameter with this command to disable MAC authentication globally.

Command Syntax

```
auth-mac system-auth-ctrl
no auth-mac system-auth-ctrl
```

Parameters

None

Default

Authentication system messages are not displayed.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#auth-mac system-auth-ctrl

(config)#no auth-mac system-auth-ctrl
```

debug dot1x

Use this command to turn on or turn off 802.1x debugging at various levels.

Use the no parameter with this command or the undebug command to turn off debugging.

Command Syntax

```
debug dot1x (all|)
debug dot1x event
debug dot1x nsm
debug dot1x packet
debug dot1x timer
no debug dot1x (all|)
no debug dot1x event
no debug dot1x nsm
no debug dot1x packet
no debug dot1x timer
undebug dot1x (all|)
undebug dot1x event
undebug dot1x packet
undebug dot1x nsm
undebug dot1x timer
```

Parameters

all	Sets debugging for all 802.1x levels.
event	Sets debugging for 802.1x events.
nsm	Sets debugging for 802.1x NSM information.
packet	Sets debugging for 802.1x packets.
timer	Sets debugging for 802.1x timer.

Default

No default value is specified.

Command Mode

Exec, Privileged Exec, and Configure modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug dot1x all
(config)#debug dot1x event
```

dot1x port-control

Use this command to force a port state.

Use the no parameter with this command to remove a port from the 802.1x management.

Command Syntax

```
dot1x port-control (force-unauthorized|force-authorized|auto)
no dot1x port-control
```

Parameters

`auto`	Specify to enable authentication on port.
`force-authorized`	Specify to force a port to always be in an authorized state.
`force-unauthorized`	Specify to force a port to always be in an unauthorized state.

Default

The dot1x port-control default is active.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x port-control auto

(config)#interface eth0
(config-if)#no dot1x port-control
```

dot1x protocol-version

Use this command to set the protocol version of dot1x to 1 or 2. The protocol version must be synchronized with the Xsupplicant being used in that interface.

Use the no parameter with this command to set the protocol version to the default value (2).

Command Syntax

```
dot1x protocol-version <1-2>
no dot1x protocol-version
```

Parameters

<1-2>	Indicates the EAP Over LAN (EAPOL) version.

Default

The default dot1x protocol version is 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x protocol-version 2

(config)#interface eth0
(config-if)#no dot1x protocol-version
```

dot1x quiet-period

Use this command to set the quiet-period time interval.

When a switch cannot authenticate a client, the switch remains idle for a quiet-period interval of time, then tries again. By administratively changing the quiet-period interval, by entering a lower number than the default, a faster response time can be provided.

Use the no parameter with this command to set the configured quiet period to the default (60 seconds).

Command Syntax

```
dot1x quiet-period <1-65535>
no dot1x quiet-period
```

Parameter

<1-65535>	Seconds between the retrial of authentication.

Default

The default dot1x protocol version is 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x quiet-period 200
```

dot1x reauthMax

Use this command to set the maximum reauthentication value, which sets the maximum number of reauthentication attempts after which the port will be unauthorized.

Use the no parameter with this command to set the reauthentication maximum to the default value (2).

Command Syntax

```
dot1x reauthMax <1-10>
no dot1x reauthMax
```

Parameter

<1-10>	Indicates the maximum number of reauthentication attempts after which the port will be unauthorized.

Default

The default is 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following sets the maximum reauthentication value to 5.

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x reauthMax 5
```

The following sets the reauthentication maximum to the default value.

```
#configure terminal
(config)#interface eth0
(config-if)#no dot1x reauthMax
```

dot1x reauthentication

Use this command to enable reauthentication on a port.

Use the no parameter to disable reauthentication on a port.

Command Syntax

```
dot1x reauthentication
no dot1x reauthentication
```

Parameters

None

Default

The dot1x reauthentication default is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x reauthentication
```

dot1x system-auth-ctrl

Use this command to enable globally authentication.

Use the no parameter to disable globally authentication.

Command Syntax

```
dot1x system-auth-ctrl
no dot1x system-auth-ctrl
```

Parameters

None

Default

Authentication is off by default.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#dot1x system-auth-ctrl
```

dot1x timeout re-authperiod

Use this command to set the interval between reauthorization attempts.

Use the no parameter to disable the interval between reauthorization attempts.

Command Syntax

```
dot1x timeout re-authperiod <1-4294967295>
no dot1x timeout re-authperiod
```

Parameter

`<1-4294967295>` Specify the seconds between reauthorization attempts.

Default

Default time is 3600 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x timeout re-authperiod 25
```

dot1x timeout server-timeout

Use this command to set the authentication sever response timeout.

Use the no parameter to disable the authentication sever response timeout.

Command Syntax

```
dot1x timeout server-timeout <1-65535>
no dot1x timeout server-timeout
```

Parameter

<1-65535>	Specify the authentication server response timeout.

Default

Default timeout is 30 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x timeout server-timeout 555

(config)#interface eth0
(config-if)#no dot1x timeout server-timeout
```

dot1x timeout supp-timeout

Use this command to set the interval for a supplicant to respond.

Use the no parameter to disable the authentication sever response timeout.

Command Syntax

```
dot1x timeout supp-timeout <1-65535>
no dot1x timeout supp-timeout
```

Parameter

<1-65535>	Specify the authentication server response timeout.

Default

Default timeout is 30 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x timeout supp-timeout 40

(config)#interface eth0
(config-if)#no dot1x timeout supp-timeout
```

dot1x timeout tx-period

Use this command to set the interval between successive attempts to request an ID.

Use the no parameter to disable the interval between successive attempts to request an ID.

Command Syntax

```
dot1x timeout tx-period <1-65535>
no dot1x timeout tx-period
```

Parameter

<1-65535>	Specify the authentication server response timeout.

Default

Default timeout is 30 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#dot1x timeout tx-period 34

(config)#interface eth0
(config-if)#no dot1x timeout tx-period
```

ip radius source-interface

Use this command to set the local address sent in packets to the radius server.

Use the no parameter to clear the local address.

Command Syntax

```
ip radius source-interface IP-address PORT
no ip radius source-interface
```

Parameters

IP-address	RADIUS client dotted IP address.
PORT	Specify the radius client port number. The default port number is 1812.

Default

The default port number is 1812.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip radius source-interface 12.12.12.1 1812

(config)#no ip radius source-interface
```

radius-server dot1x host

Use this command to specify the IP address of the remote radius server host and assign authentication and accounting destination port numbers. Multiple radius-server host commands can be used to specify multiple hosts. The software searches for hosts in the order they are specified. If no host-specific timeout, retransmit, or key values are specified, the global values apply to that host.

If the auth-port parameter is not specified, it will take the default value of the auth-port. If you do not specify the auth-port to unconfigure, and the default value of the auth-port does not match the port you are trying to unconfigure, the specified radius-server host will not be unconfigured.

Use the no form of the command to unconfigure a specified radius-server.

Command Syntax

```
radius-server dot1x host (A.B.C.D)(|(key ((0 WORD) | (7 WORD) | (WORD))(|(auth-port
  <0-65535> (|(timeout <1-60> (|(retransmit <1-100>)))))))
no radius-server dot1x host (A.B.C.D)(|(key ((0 WORD) | (7 WORD)
| (WORD))(|(auth-port <0-65535> (|(timeout (|(retransmit <1-100>)))))))
```

Parameters

dot1x	IEEE 802.1X Port-Based Access Control.
A.B.C.D	IPv4 address of the RADIUS server.
auth-port	RADIUS server's port for authentication.
key	Specify the global shared key.
retransmit	Global RADIUS server retransmit count.
timeout	Specify the RADIUS server timeout(default: 5 seconds).
0	To specify shared key in clear-text form.
7	To specify shared key in encrypted form.
WORD	RADIUS shared secret(clear text) (Max Size 63).
<0-65535>	Port number.
<0-100>	Global RADIUS server retransmit count.
<1-60>	RADIUS server timeout period in seconds.

Default

The default value of auth-port is 1645.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server dot1x host 12.12.12.1 auth-port 1233 timeout 1
retransmit 2

(config)#no radius-server dot1x host 12.12.12.1 auth-port 1233
```

radius-server dot1x retransmit

Use this command to specify the number of times the router transmits each radius request to the server before giving up.

Use the no form of this command to disable retransmission.

Command Syntax

```
radius-server dot1x retransmit RETRIES
no radius-server dot1x retransmit
```

Parameter

dot1x	IEEE 802.1X Port-Based Access Control.
RETRIES	Specify the retransmit value. Enter a value in the range 1 to 100. If no retransmit value is specified, the global value is used.

Default

The default value is 3.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server dot1x retransmit 12

(config)#no radius-server dot1x retransmit
```

radius-server dot1x timeout

Use this command to specify the number of seconds a router waits for a reply to a radius request before retransmitting the request.

Use the no parameter to use the default value.

Command Syntax

```
radius-server dot1x timeout <1-60>
no radius-server dot1x timeout
```

Parameter

dot1x	IEEE 802.1X Port-Based Access Control.
<1-60>	RADIUS server timeout period in seconds.

Default

The default value is 5 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#radius-server dot1x timeout 20

#configure terminal
(config)#no radius-server dot1x timeout
```

show debugging dot1x

Use this command to display the status of the debugging of the 802.1x system.

Command Syntax

```
show debugging dot1x
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging dot1x
802.1X debugging status:
```

show dot1x

Use this command to display the state of the whole system.

Command Syntax

```
show dot1x
show dot1x all
show dot1x diagnostics interface IFNAME
show dot1x interface IFNAME
show dot1x sessionstatistics (interface IFNAME|)
show dot1x statistics interface IFNAME
```

Parameters

`all`	Display all information.
`diagnostics`	Display diagnostics information.
`interface`	Display diagnostics interface information.
`interface`	Display interface information.
`sessionstatistics`	Display session statistics.
`interface`	Display session statistics interface information.
`statistics`	Display statistics information.
`interface`	Display statistics interface information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Displayed Output

The following tables describes the output for the show dot1x all command and the show dot1x interface command.

Table 8-101: Port variables

Entry	Description
portEnabled	Interface operational status (Up-true/down-false)
portControl	Current control status of the port for 802.1x control
portStatus	802.1x status of the port (authorized/unauthorized)
reAuthenticate	Reauthentication enabled/disabled status on port
reAuthPeriod	Value holds meaning only if reAuthentication is enabled

Table 8-102: Supplicant PAE related global variables

Entry	Description
abort	Indicates that authentication should be aborted when set to true
fail	Indicates failed authentication attempt when set to false
start	Indicates authentication should be started when set to true
timeout	Indicates authentication attempt timed out when set to true
success	Indicates authentication successful when set to true

Table 8-103: 802.1x Operational State of Interface

Entry	Description
mode	Configured 802.1x mode
reAuthCount	Reauthentication count
quietperiod	Time between reauthentication attempts
reAuthMax	Maximum reauthentication attempts

Table 8-104: Backend Authentication state machine variables and constants

Entry	Description
state	State of the state machine
reqCount	Count of requests sent to server
suppTimeout	Supplicant timeout
serverTimeout	Server timeout
maxReq	Maximum requests to be sent

Table 8-105: Controlled Directions State machine

Entry	Description
adminControlledDirections	Administrative value (Both/In)
operControlledDirections	Operational Value (Both/In)

Table 8-106: KR -- Key receive state machine

Entry	Description
rxKey	True when EAPOL-Key message is received by supplicant or authenticator. false when key is transmitted

Table 8-107: Key Transmit State machine

Entry	Description
keyAvailable	False when key has been transmitted by authenticator, true when new key is available for key exchange
keyTxEnabled	Key transmission enabled/disabled status

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is an output of this command displaying the state of the system.

```
#show dot1x
% 802.1x authentication enabled
% Radius server address: 192.168.1.1.1812
% Radius client address: dhcp128.mySite.com.12103
% Next radius message id: 0
```

The following is an output of this command displaying detailed information for all ports.

```
#show dot1x all
% 802.1x authentication enabled
% Radius server address: 192.168.1.1.1812
% Radius client address: dhcp128.mySite.com.12103
% Next radius message id: 0
% Dot1x info for interface eth1 - 3
%  portEnabled: true - portControl: auto
%  portStatus: unauthorized - currentId: 11
%  reAuthenticate: disabled
%  abort:F fail:F start:F timeout:F success:F
%  PAE: state: connecting - portMode: auto
%  PAE: reAuthCount: 2 - rxRespId: 0
%  PAE: quietPeriod: 60 - reauthMax: 2 - txPeriod: 30
%  BE: state: idle - reqCount: 0 - idFromServer: 0
%  BE: suppTimeout: 30 - serverTimeout: 30 - maxReq: 2
%  CD: adminControlledDirections: in - operControlledDirections: in
%  CD: bridgeDetected: false
%  KR: rxKey: false
%  KT: keyAvailable: false - keyTxEnabled: false
```

CHAPTER 9 Layer 2 Subinterface Commands

This chapter is a reference for the Layer 2 subinterface commands.

cross-connect

Use this command to create an AC-to-AC cross-connect between the L2 subinterfaces. It creates a separate mode with endpoint1 and endpoint2 being L2 subinterfaces. It is possible to bind L2 subinterface to cross-connect only when encapsulation is configured on it.

Use the no form of this command to remove the given cross-connect.

Command Syntax

```
cross-connect <WORD> (interface <IFNAME>) (interface <IFNAME>) (description)
  (disable)
no cross-connect <WORD>
```

Parameters

WORD	XC name
IFNAME	AC interface name
description	Characters describing AC cross-connect
disable	disables the cross-connect

Default

None

Command Mode

Configure mode for cross-connect

Cross-connect mode for IFNAME, description and disable

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#cross-connect c1
(config-xc)#interface xe1.1
(config-xc)#interface xe1.2
(config-xc)#description XC1
(config-xc)#disable
(config-xc)#exit
(config)#no cross-connect c1
(config)#
```

encapsulation

Use this command to configure encapsulation-type for a L2 subinterface. With this command, a Layer 2 subinterface can be configured as single-tagged with single/multiple vlans or double-tagged, or default or untagged. Operational state of the layer 2 subinterface is DOWN before configuring the encapsulation and it becomes UP once the encapsulation is configured.

Use the no form of this command to unconfigure the encapsulation.

Command Syntax

```
encapsulation ((dot1q | dot1ad | default | untagged) (vlan-id | vlanid-range)
  (inner-dot1q vlan-id))
no encapsulation
```

Parameters

dot1q	IEEE802.1Q VLAN-tagged packets
dot1ad	IEEE802.1ad VLAN-tagged packets
default	IEEE default packets
untagged	IEEE untagged packets
VLAN_RANGE	VLAN ID 2-4094 or range(s): 2-5 10 or 2-5 7-19
inner-dot1q	Inner-VLAN for double-tagged

Default

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#interface xe1.1 switchport
(config-if)#encapsulation dot1q 10
(config-if)#ex
(config)#interface xe1.2 switchport
(config-if)#encapsulation dot1ad 11
(config-if)#ex
(config)#interface xe1.3 switchport
(config-if)#encapsulation default
(config-if)#ex
(config)#interface xe1.4 switchport
(config-if)#encapsulation untagged
(config-if)#ex
(config)#interface xe1.5 switchport
(config-if)#encapsulation dot1q 15-20
(config-if)#ex
(config)#interface xe1.6 switchport
```

```
(config-if)#encapsulation dot1ad 21-25
(config-if)#ex
(config)#interface xe1.7 switchport
(config-if)#encapsulation dot1q 100 inner-dot1q 10
(config-if)#ex
(config)#interface xe1.8 switchport
(config-if)#encapsulation dot1ad 200 inner-dot1q 20
(config-if)#ex
(config)#interface xe1.1 switchport
(config-if)#no encapsulation
(config-if)#ex
(config)#
```

interface IFNAME.SUBINTERFACE_ID switchport

Use this command to configure a L2 subinterface. An L2 sub-interfaces makes it possible for a logical interface to be created on an Ethernet physical interface as well as on dynamic/static LAG interfaces to handle one slice of its resource. The supported method for this resource slicing is vlan credential based which can be a single tagged or double-tagged or untagged or default along with encapsulation types as either dot1q or dot1ad.

Use no form of this command to unconfigure a sub-interface.

Command Syntax

```
interface IFNAME.SUBINTERFACE_ID switchport
no interface IFNAME.SUBINTERFACE_ID
```

Parameters

IFNAME	Interface name, such as xe1, po1 or sa1
SUBINTERFACE_ID	Subinterface identifier <1-2000>
switchport	L2 subinterface

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#interface xe1.1 switchport
(config-if)#exit
(config)#no interface xe1.1
(config)#interface po1.1 switchport
(config-if)#exit
(config)#no interface po1.1
(config)#interface sa1.1 switchport
(config-if)#exit
(config)#no interface sa1.1
(config)#exit
#
```

rewrite

Use this command to manipulate the VLAN tags in the incoming packet. Supported operations are PUSH, POP and TRANSLATE on the outer vlan tag with any of these ethertype – 8100/ 88a8/ 9100/ 9200.

Use the no form of this command to unconfigure rewrite.

Command Syntax

```
rewrite ((pop| push | translate) (TPID_VALUE) (VID_RANGE))
no rewrite
```

Parameters

pop	Pop the outer vid
push	Push the outer vid
translate	Translate the outer vid
VALUE	Set service tpid value as 0x8100/0x88a8/0x9100/0x9200
VID_RANGE	<2-4094>

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#interface xe1.1 switchport
(config-if)#rewrite pop
(config-if)#exit
(config)#interface xe1.2 switchport
(config-if)#rewrite push 9100 3
(config-if)#exit
(config)#interface xe1.10 switchport
(config-if)#rewrite translate 9200 4
(config-if)#exit
(config)#interface xe1.1 switchport
(config-if)#no rewrite
(config-if)#ex
```

show cross-connect

Use this command to display the cross-connected subinterfaces along with their status and total number of cross-connects configured in the system.

Command Syntax

```
show cross-connect <WORD>
```

Parameters

WORD	Cross-connect name

Default

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#show cross-connect
cross-connect status
XC name                         Ep1              Ep2              Status
-------------------------------+----------------+----------------+-------
c1                              xe1.1            xe1.2            UP
-------------------------------+----------------+----------------+-------
AC cross-connect summary
Total : 1
Up    : 1
Down  : 0
#show cross-connect c1
cross-connect status
XC name                         Ep1              Ep2              Status
-------------------------------+----------------+----------------+-------
c1                              xe1.1            xe1.2            UP
-------------------------------+----------------+----------------+-------
```

switchport dot1q ethertype

Use this command to configure the service-tpid value on parent port of a subinterface. By this the tpid used for service tag for a subinterface may be inherited from the one applied to parent interface.

Use no form of this command to revert the value to default.

Note: For any dot1ad subinterface to be functional, switchport dot1q ethertype should be set to desired value as 88a8/9100/9200.

Command Syntax

```
switchport dot1q ethertype (8100 | 88a8 | 9100 | 9200)
no switchport dot1q ethertype
```

Parameters

ETHERTYPE	Physical Interface name. Ethertype value (in 0xhhhh hexadecimal notation. Allowed ethertype values are 0x8100 (default) or 0x88a8 0r 0x9100 or 0x9200)

Default

Default value is 8100

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#interface xe1
(config-if)#switchport dot1q ethertype 9100
(config-if)#exit
(config)#interface xe1
(config-if)#no switchport dot1q ethertype
(config-if)#exit
```

no subinterfaces

Use this command to unconfigure all the subinterfaces of any type (layer 2 or layer 3) created under a parent port.

Command Syntax

```
no subinterfaces
```

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
(config)#interface xe1
(config-if)#no subinterfaces
(config-if)#exit
```

CHAPTER 10 Port Security Commands

This chapter describes the port security commands.

port-security

Use this command to enable or disable port security globally.

Command Syntax

```
port-security (enable | disable)
```

Parameters

`enable`	Enable port security globally
`disable`	Disable port security globally

Default

By default, port security is enabled globally.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
(config)#port-security enable
(config)#
```

show port-security

Use this command to display the port security configuration for all interfaces or for a particular interface.

Command Syntax

```
show port-security (interface IFNAME |)
```

Parameters

IFNAME	Interface name

Default

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#show port-security
Port port-security mode MAC limit CVLAN SVLAN static secure MAC
-----------------------------------------------------------------
ge1  dynamic            3         2           0000.0000.1112
                                  10          0000.0000.3333

#show port-security interface ge1
Port Security Mode : Dynamic
Secure MAC limit : 3
Static Secure MAC list :
CVLAN SVLAN MAC Address
--------------------------
2           0000.0000.1112
10          0000.0000.3333
```

switchport port-security

Use this command to enable port security on an interface.

Use the no form of this command to disable port security on an interface. This command removes configured secured MAC, if any, on this interface.

Note: These commands are supported for physical, LAG, and MLAG (active) interfaces only. Enabling port security on an interface removes learned MAC addresses of interfaces (whether learned by static or dynamic means), and then relearns the secure MAC addresses. Multicast MAC addresses are not considered as part of the MAC learning limit.

Command Syntax

```
switchport port-security (static |)
no switchport port-security
```

Parameters

`static`	Static mode

Default

By default this feature is disabled; the default mode of port security is to dynamically learn. In dynamic mode, devices learn MAC addresses dynamically. You can program static MACs, however, dynamic MAC learning will not be allowed in static mode for port security.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#configure terminal
(config)#interface ge1
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#switchport mode hybrid
(config-if)#switchport hybrid allowed vlan all
(config-if)#switchport port-security
```

switchport port-security logging

Use this command to enable violated MAC logging on a port security enabled interface.

Use the `disable` parameter with this command to disable violated mac logging on a port security enabled interface.

Command Syntax

```
switchport port-security logging (enable | disable)
```

Parameters

`enable`	Enable violated MAC logging
`disable`	Disable violated MAC logging

Default

By default logging is disabled.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#configure terminal
(config)#interface ge1
(config-if)#switchport port-security logging enable
```

switchport port-security mac-address

Use this command to add static secure MAC addresses.

Use the no form of this command to remove static secure MAC addresses.

Command Syntax

```
switchport port-security mac-address XXXX.XXXX.XXXX
no switchport port-security mac-address XXXX.XXXX.XXXX
switchport port-security mac-address XXXX.XXXX.XXXX vlanId <2-4094>
no switchport port-security mac-address XXXX.XXXX.XXXX vlanId <2-4094>
switchport port-security mac-address XXXX.XXXX.XXXX svlanId <2-4094>
no switchport port-security mac-address XXXX.XXXX.XXXX svlanId <2-4094>
switchport port-security mac-address XXXX.XXXX.XXXX vlanId <2-4094> svlanId <2-
  4094>
no switchport port-security mac-address XXXX.XXXX.XXXX vlanId <2-4094> svlanId <2-
  4094>
```

Parameters

`XXXX.XXXX.XXXX`	Static secure MAC address
`vlanId`	VLAN identifier
`<2-4094>`	VLAN identifier
`svlanId`	SVLAN identifier
`<2-4094>`	SVLAN identifier

Default

N/A

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#configure terminal
(config)#interface ge1
(config-if)#switchport port-security mac-address 0000.0000.1112 vlan 2
```

switchport port-security maximum

Use this command to set the MAC address learning limit for an interface.

Note: This command is supported for physical, LAG, and MLAG (active) interfaces only. When a newly configured maximum learn limit is less than the previous value, you must remove/flush-out the unwanted MACs to stop traffic forwarding from the unwanted source MAC addresses. MAC addresses can be removed using the clear mac address-table command.

Command Syntax

```
switchport port-security maximum <1-1000>
```

Parameters

<1-1000>	Maximum MAC address learning limit

Default

The default MAC address learning limit is 1.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#configure terminal
(config)#interface ge1
(config-if)#switchport port-security maximum 3

#configure terminal
(config)#interface po1
(config-if)#switchport port-security maximum 3

#configure terminal
(config)#interface mlag1
(config-if)#switchport port-security maximum 3
```

SECTION 6 # Layer 3

Layer 3 Unicast Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 BGP

This chapter contains basic Border Gateway Protocol configuration examples.

Enable BGP Routers in the Same Autonomous System

Figure 1-57 shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network 10.10.10.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

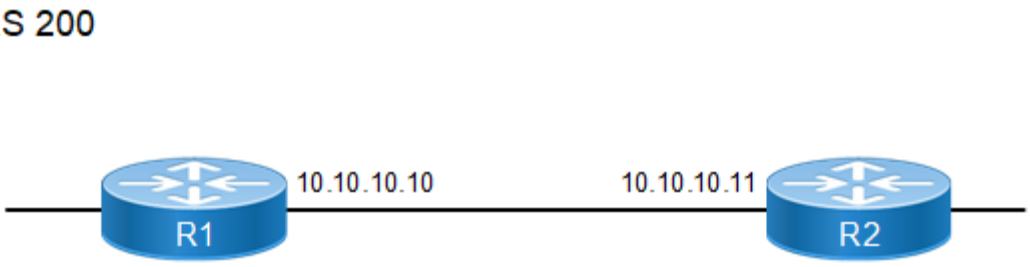

Figure 1-57: Routers in the Same Autonomous System

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `200` is the neighbor's AS number.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.

Validation

```
#show ip bgp summary
BGP router identifier 192.168.52.2, local AS number 200
BGP table version is 1
0 BGP AS-PATH entries
0 BGP community entries
```

```
Neighbor                 V    AS    MsgRcv    MsgSen TblVer    InQ    OutQ    Up/
Down    State/PfxRcd
10.10.10.11              4    200   387        390       1       0       0

Foreign host: 10.10.10.11, Foreign port: 33931
Nexthop: 10.10.10.10
Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
```

Enable BGP Between Different Autonomous Systems

This example shows the minimum configuration required for enabling BGP on an interface, when the routers belong to different autonomous systems. R1 and R2 are two routers in different autonomous system, AS200 and AS300, connecting to network 10.10.10.0/24.

Topology

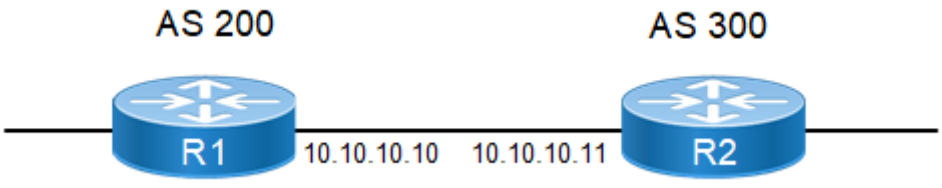

Figure 1-58: Routers in Different Autonomous Systems

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remote-as 300`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `300` is the neighbor's AS number.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 300`	Define the routing process. The number `300` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.

Validation

```
#show ip bgp neighbors
BGP neighbor is 10.10.10.10, remote AS 200, local AS 300, external link
  BGP version 4, local router ID 192.168.52.3, remote router ID 192.168.52.2
  BGP state = Established, up for 00:00:15
  Last read 00:00:15, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 2 messages, 0 notifications, 0 in queue
  Sent 2 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds

00:00:50                0

Total number of neighbors 1

Total number of Established sessions 1
```

Route-Map

Use route maps to filter incoming updates from a BGP peer. In this example, the prefix-list ABC on R1 is configured to deny entry of any routes with the IP address 1.1.1.0/M (M = 26, 27, 28). To test the filter, R2 is configured to generate network addresses 1.1.1.0/27 and 1.1.2.0/24. To verify, use the `show ip bgp` command on R1; it displays R1 receiving updates from only 1.1.2.0/24.

Topology

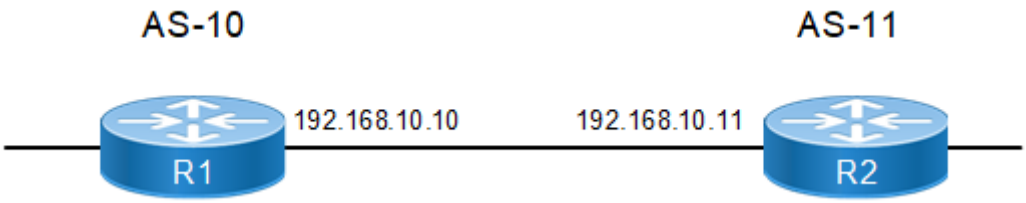

Figure 1-59: Configure Route-Map

R1

`#configure terminal`	Enter configure mode.
`(config)#ip prefix-list ABC seq 5 deny 1.1.1.0/24 ge 26 le 28`	Create an entry in the prefix-list. The ABC parameter is the name of the map that is created above. 5 specifies the sequence number or position of this specific route map. deny specifies the packets are to be rejected. 26 and 28 are the minimum and maximum prefix lengths to be matched.
`(config)#ip prefix-list ABC seq 10 permit any`	Create another entry in the ABC map. 10 specifies the sequence number or position of this specific route map. The permit parameter any specifies accept all packets of any length.
`(config)#route-map ABC permit 1`	Enter Route-map mode to set the match operation.
`(config-route-map)#match ip address prefix-list ABC`	Set the match criteria. In this case, if the route-map name matches ABC, the packets from the first sequence are denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 10`	Define the routing process, and establish a TCP session. The number 10 specifies the AS number of R1.
`(config-router)#neighbor 192.168.10.11 remote-as 11`	Define BGP neighbors, and establish a TCP session. 192.168.10.11 is the IP address of the neighbor (R2), and 11 is the neighbor's AS number.

(config-router)#neighbor 192.168.10.11 route-map ABC in	Apply a route map to routes. 192.168.10.11 specifies the IP address of BGP neighbor. The ABC parameter is the name of the route map, and in specifies that the access list applies to incoming advertisements.
(config-router)#exit	Exit router mode.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 1.1.1.1/27 secondary	Specify the interface address.
(config-if)#ip address 1.1.2.1/24 secondary	Specify the interface address.
(config-if)#exit	Exit loopback interface mode.
(config)#router bgp 11	Define the routing process, and establish a TCP session. The number 11 specifies the AS number of R2.
(config-router)#neighbor 192.168.10.10 remote-as 10	Define BGP neighbors, and establish a TCP session. 192.168.10.10 is the IP address of the neighbor (R1), and 10 is the neighbor's AS number.
(config-router)#network 1.1.1.0/27	Specify the network to be advertised by the BGP routing process.
(config-router)#network 1.1.2.0/24	Specify the network to be advertised by the BGP routing process.
(config-router)#exit	Exit router mode.

Validation

```
#show  ip bgp

Route Reflector

The configurations in this section apply to BGP Route Reflectors (RR).

Reduce the iBGP Mesh Inside an Autonomous System

Use Route Reflectors to reduce the iBGP mesh inside an Autonomous System (AS).

Topology

In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with the RR only, but not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to R2. This reduces the iBGP peer connections in AS1.

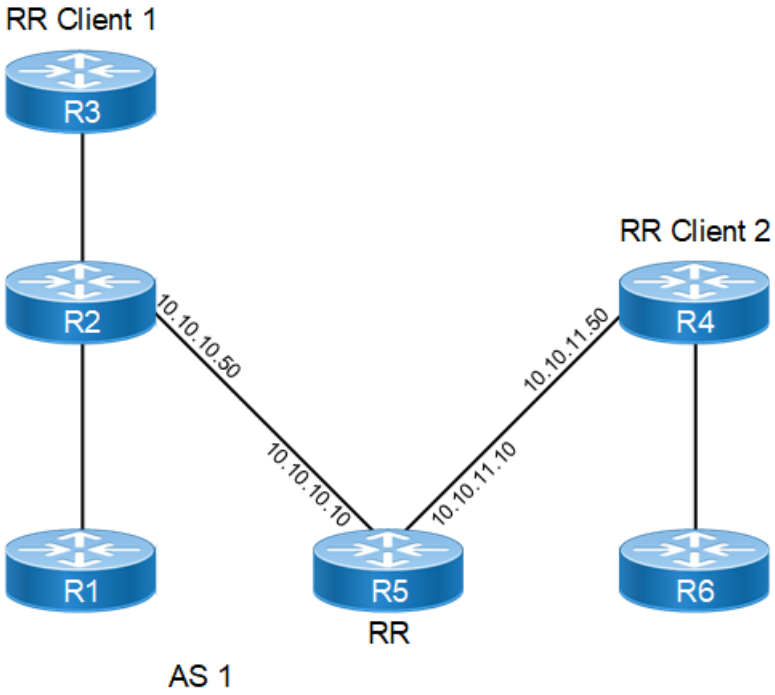

Figure 1-60: BGP Route Reflector

RR (R5)

`#configure terminal`	Enter configure mode.
`(config)#router bgp 1`	Define the routing process. The number `1` identifies the AS number of R5.
`(config-router)#neighbor 10.10.10.50 remote-as 1`	Define the BGP neighbor, and establish a TCP session. `10.10.10.50` is the IP address of one of the neighbors (R2), and `1` is the neighbor's AS number.
`(config-router)#neighbor 10.10.10.50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R2 as its client.
`(config-router)#neighbor 10.10.11.50 remote-as 1`	Define the BGP neighbor, and establish a TCP session. `10.10.11.50` is the IP address of one of the neighbors (R4), and `1` is the neighbor's AS number.
`(config-router)#neighbor 10.10.11.50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R4 as its client.
`(config-router)#exit`	Exit router mode.

RR Client 1 (R2)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remote-as 1`	Define the BGP neighbor, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R5), and `1` is the neighbor's AS number.
`(config-router)#exit`	Exit router mode.

RR Client 2 (R4)

`(config)#router bgp 1`	Define the routing process. The number `1` identifies the AS number of R4.
`(config-router)#neighbor 10.10.11.10 remote-as 1`	Define BGP neighbor, and establish a TCP session. `10.10.11.10` is the IP address of the neighbor (R5), and `1` is the neighbor's AS number.
`(config-router)#exit`	Exit router mode.

Validation

R5

```

Multiple Route Reflectors

The basic rule of BGP is that a BGP speaker cannot advertise a route to an iBGP neighbor if that route was learned from another iBGP neighbor. Configuring a route reflector provides a means to circumvent this rule. The entire route reflector process is transparent to the clients, and no configuration is necessary on these clients.

Whenever an iBGP-speaking router receives a route update, it forwards the route to the neighbor without changing the nexthop IP address, thus making it an unreachable route, unless verified by an iGP (for example, neighbor x.x.x.x route-reflector-client).

- If a router is configured as a Route Reflector, it forwards the routes received by changing the nexthop address as itself, thus making the nexthop reachable.
- If a route is received from a client, the route is forwarded to the clients.
- If a route is received from a non-client, the route is forwarded to the clients and non-clients.

Topology

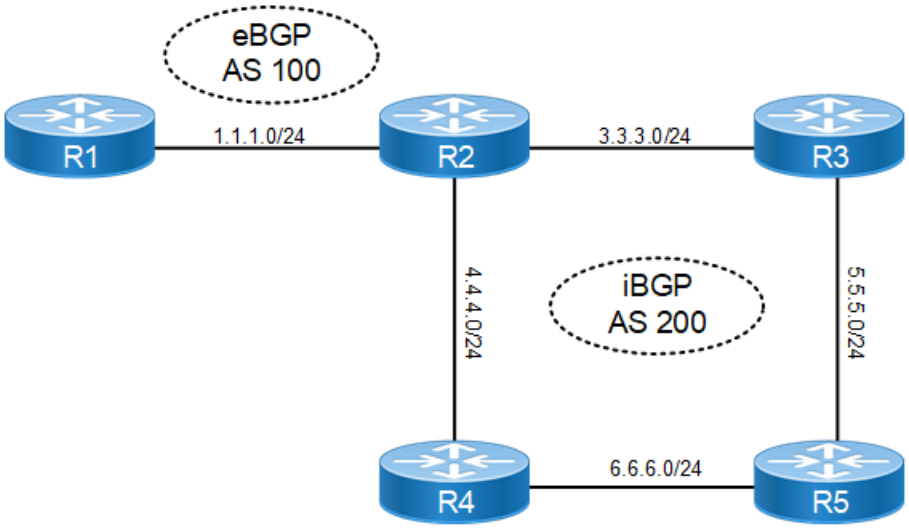

Figure 1-61: eBGP and iBGP Route Reflector Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip addr 1.1.1.1/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 100.100.100.100/32 secondary`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Define the eBGP neighbor (R2).
`(config-router)#network 100.100.100.100/32`	Advertise a route via eBGP connection to R2.
`(config-router)#exit`	Exit router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 1.1.1.2/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 3.3.3.2/24`	Specify IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth3`	Enter interface mode

(config-if)#ip address 4.4.4.2/24	Specify IP address for the interface.
(config-if)#exit	Exit interface mode
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 1.1.1.1 remote-as 100	Define the eBGP neighbor (R1).
(config-router)#neighbor 4.4.4.1 remote-as 200	Define the iBGP neighbor (R4).
(config-router)#neighbor 3.3.3.1 remote-as 200	Define the iBGP neighbor (R3).
(config-router)#bgp cluster-id 4	Define a cluster ID (4) when multiple Route Reflectors exist.
(config-router)#neighbor 3.3.3.1 route-reflector-client	Configure R2 as the Route-Reflector and neighbor R3 as its client.
(config-router)#neighbor 4.4.4.1 route-reflector-client	Configure R2 as the Route-Reflector and neighbor R4 as its client.
(config-router)#exit	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 3.3.3.1/24	Assign an IP address
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip addr 5.5.5.1/24	Assign an IP address
(config-if)#exit	Exit interface mode
(config)#router bgp 200	Define the routing process with AS number 200.
(config-router)#neighbor 3.3.3.2 remote-as 200	Define the iBGP neighbor (R2).
(config-router)#neighbor 5.5.5.2 remote-as 200	Define the iBGP neighbor (R5).
(config-router)#neighbor 5.5.5.2 route-reflector-client	Configure R3 as the Route-Reflector and neighbor R5 as its client.
(config-router)#exit	Exit router mode.

R4

`#configure terminal`	Enter configure mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 6.6.6.1/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth4`	Enter interface mode
`(config-if)#ip address 4.4.4.1/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 4.4.4.2 remote-as 200`	Define the iBGP neighbor (R2).
`(config-router)#neighbor 6.6.6.2 remote-as 200`	Define the iBGP neighbor (R5).
`(config-router)#exit`	Exit router mode.

R5

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 5.5.5.2/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#interface eth2`	Enter interface mode
`(config-if)#ip address 6.6.6.2/24`	Specify an IP address for the interface.
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 5.5.5.1 remote-as 200`	Define the iBGP neighbor (R3).
`(config-router)#neighbor 6.6.6.1 remote-as 200`	Define the iBGP neighbor (R4).
`(config-router)#exit`	Exit router mode.

Validation

BGP Confederations

In BGP, nodes running iBGP protocols must be interconnected forming a full mesh. Confederation solves the iBGP full-mesh network complexity and inefficiency by splitting a large autonomous system domain into smaller autonomous system domains, called member autonomous systems. Member autonomous systems can form eBGP connections among themselves, to prevent full-mesh connections among each iBGP-running node.

The `bgp confederation identifier` command tells the router that it is a member of a confederation and the confederation ID. The `bgp confederation peers` command lists the member AS to which the router is connected.

In the following example, R1, R2, and R3 are members of the same confederation with different AS numbers.

Topology

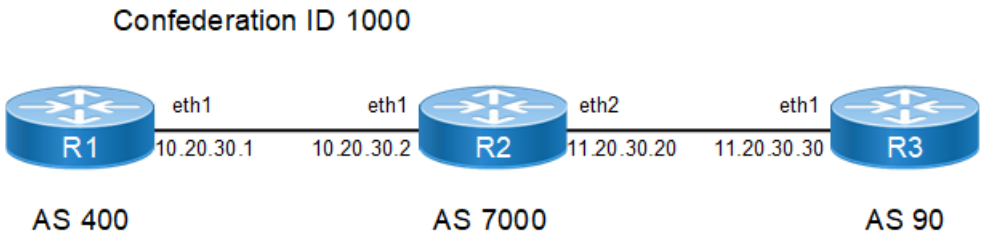

Figure 1-62: BGP Confederation

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID, the externally visible autonomous system number that identifies the BGP confederation as a whole.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).
`(config-router)#end`	Exit router and configure mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 7000`	Assign the ASN value (`7000`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400 90`	Specify the neighbor ASN values for confederation membership.

`#configure terminal`	Enter configure mode.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400`).
`(config-router)#neighbor 11.20.30.30 remote-as 90`	Specify the neighbor's IP address (`11.20.30.30`) and the ASN value of the neighbor (`90`).
`(config-router)#end`	Exit router and configure mode

R3

`#configure terminal`	Enter configure mode.
`(config-router)#router bgp 90`	Assign the ASN value (`90`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 11.20.30.20 remote-as 7000`	Specify the neighbor's IP address (`11.20.30.20`) and the ASN value of the neighbor (`7000`).
`(config-router)#end`	Exit router and configure mode

Multiple Autonomous Systems

In the following example, R1 and R2 are members of the same confederation with the same AS numbers, and R3 is a member of the same confederation with a different AS number.

Topology

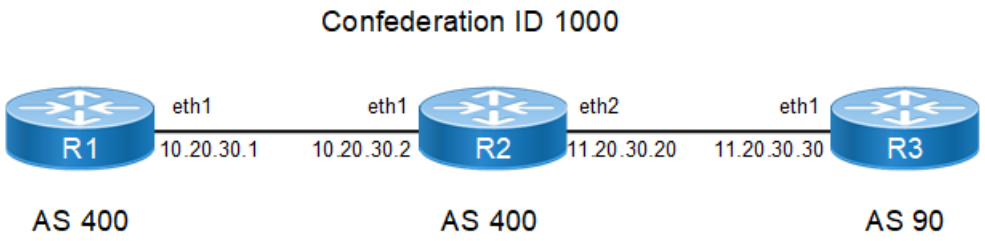

Figure 1-63: BGP Confederation with Multiple AS

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#neighbor 10.20.30.2 remote-as 400`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`400`).

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 90`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400`).
`(config-router)#neighbor 11.20.30.30 remote-as 90`	Specify the neighbor's IP address (`11.20.30.30`) and the ASN value of the neighbor (`90`).

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 90`	Assign the ASN value (`90`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 11.20.30.20 remote-as 400`	Specify the neighbor's IP address (`11.20.30.20`) and the ASN value of the neighbor (`400`).

Outside Autonomous System

In the following example, R1 and R2 are members of the same confederation with different AS numbers, and R3 is a member outside the confederation.

Topology

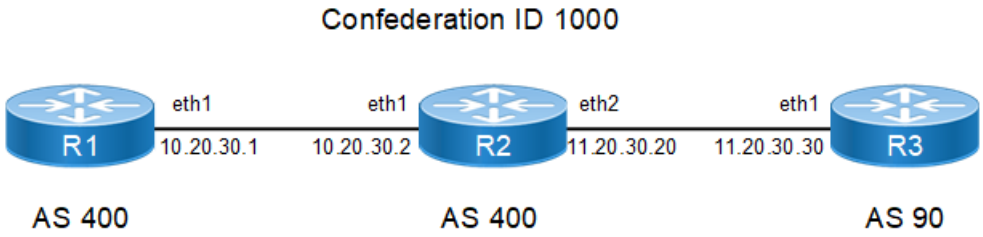

Figure 1-64: Single Confederation with Outside AS

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Assign the ASN value (`400`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 7000`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 7000`	Assign the ASN value (`7000`) to the router.
`(config-router)#bgp confederation identifier 1000`	Specify the BGP confederation ID.
`(config-router)#bgp confederation peers 400`	Specify the neighbor ASN value for confederation membership.
`(config-router)#neighbor 10.20.30.1 remote-as 400`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400`).
`(config-router)#neighbor 11.20.30.30 remote-as 90`	Specify the neighbor's IP address (`11.20.30.30`) and the ASN value of the neighbor (`90`).

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 90`	Assign the ASN value (`90`) to the router.
`(config-router)#neighbor 11.20.30.20 remote-as 1000`	Specify the neighbor's IP address (`11.20.30.20`) and the BGP confederation ID (`1000`).

BGP Authentication

BGP authentication allows users to receive selected routing information, enhancing security of their network traffic. When BGP authentication is enabled on a router, the router verifies routing packets it receives by exchanging a password that is configured on both the sending and receiving routers.

In this example, both R1 and R2 have ABC as the password. Configure the same password on all routers that are to communicate using BGP in a network.

Topology

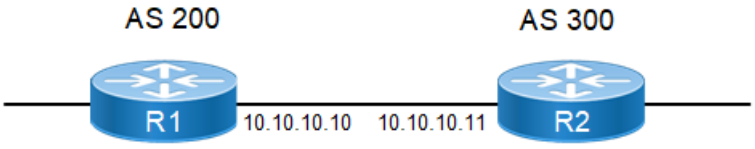

Figure 1-65: BGP Authentication

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)#neighbor 10.10.10.11 remote-as 300`	Define BGP neighbors, and establish a TCP session. `10.10.10.11` is the IP address of the neighbor (R2), and `300` is the neighbor's AS number.
`(config-router)#neighbor 1.1.1.1 authentication-key 0 ABC`	Specify the key.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 300`	Define the routing process. The number `300` specifies the AS number of R2.
`(config-router)#neighbor 10.10.10.10 remote-as 200`	Define BGP neighbors, and establish a TCP session. `10.10.10.10` is the IP address of the neighbor (R1), and `200` is the neighbor's AS number.
`(config-router)#neighbor 1.1.1.1 authentication-key 0 ABC`	Specify the key.

Dynamic BGP Peering

BGP Dynamic Neighbors is a quick way of setting up BGP on device like a Hub router where user is expecting numerous BGP neighbors. Before dynamic neighbors, user had to provide a large amount of configuration to work with all these neighbors. This new feature dramatically reduces the amount and complexity of CLI configuration on the router and save CPU and memory usage.

BGP dynamic neighbor support allows BGP peering to a group of remote neighbors that are defined by a range of IP addresses. Each range can be configured as a subnet IP address. BGP dynamic neighbors are configured using a range of IP addresses and BGP peer groups.

After a subnet range is configured for a BGP peer group and a TCP session is initiated by another router for an IP address in the subnet range, a new BGP neighbor is dynamically created as a member of that group. After the initial

configuration of subnet ranges and activation of the peer group, dynamic BGP neighbor creation does not require any further CLI configuration on the initial router. Other routers can establish a BGP session with the initial router, but the initial router need not establish a BGP session to other routers if the IP address of the remote peer used for the BGP session is not within the configured range.

A dynamic BGP neighbor will inherit any configuration for the peer group. In larger BGP networks, implementing BGP dynamic neighbors can reduce the amount and complexity of CLI configuration and save CPU and memory usage. Both IPv4 and IPV6 peering is supported.

IPv4 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

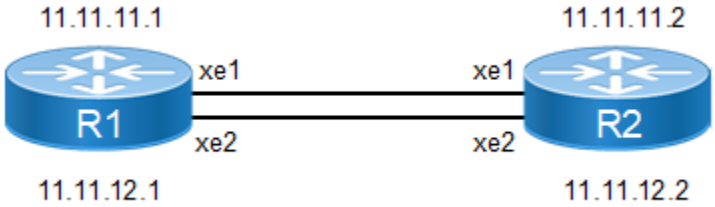

Figure 1-66: IPv4 IBGP Peering

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip add 11.11.12.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor IPV4_IBGP_PEER peer-group range 11.11.0.0/16`	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16
`(config-router)#neighbor IPV4_IBGP_PEER remote-as 100`	Assign a remote AS for the peer-group, IPV4_IBGP_PEER.

#configure terminal	Enter configure mode.
(config-router)#network 33.33.33.33/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ip address 22.22.22.22/32 secondary	Assign a secondary IP address.
(config-if)#exit	Exit interface mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)#ip address 11.11.11.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ip add 11.11.12.2/24	Assign IP address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11.11.11.1 remote-as 100	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
(config-router)#neighbor 11.11.12.1 remote-as 100	Create a static BGP neighbor 11.11.12.1 in remote AS 100.
(config-router)#network 22.22.22.22/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

IPv4 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with vrf enabled on the device and interface being part of vrf. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

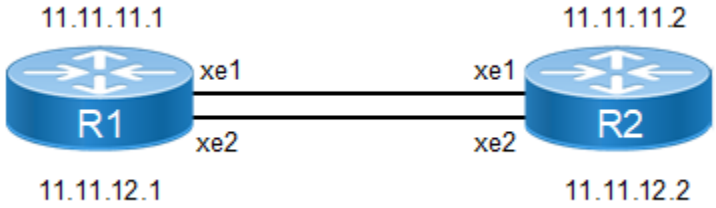

Figure 1-67: IPv4 VRF IBGP Peering

R1

`#Configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrfA`	Create a VRF, vrfA on the router.
`(config-vrf)#rd 1:1`	Assign a route distinguisher to VRF.
`(config-if)#exit`	Exit VRF mode and return to Configure mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ip add 11.11.12.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#address-family ipv4 vrf vrfA`	Enter IPv4 VRF Address Family.
`(config-router)#neighbor IPV4_IBGP_PEER peer-group range 11.11.0.0/16`	Create a dynamic peer-group, IPV4_IBGP_PEER with a dynamic range 11.11.0.0/16.
`(config-router)#neighbor IPV4_IBGP_PEER remote-as 100`	Assign a remote AS for the peer-group, IPV4_IBGP_PEER.
`(config-router)#network 33.33.33.33/32`	Advertise the loopback network into BGP
`(config-router)#end`	Exit from Router BGP mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrfA`	Create a VRF, vrfA on router.
`(config-vrf)#rd 2:1`	Assign a route distinguisher to VRF.
`(config-if)#exit`	Exit VRF mode and return to Configure mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ip address 11.11.11.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)# ip vrf forwarding vrfA`	Assign IP address to VRF.
`(config-if)#ip add 11.11.12.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 2.2.2.2`	Assign a BGP router ID.
`(config-router)#address-family ipv4 vrf vrfA`	Enter IPv4 VRF Address Family.
`(config-router)#neighbor 11.11.11.1 remote-as 100`	Create a static BGP neighbor 11.11.11.1 in remote AS 100.
`(config-router)#neighbor 11.11.12.1 remote-as 100`	Create a static BGP neighbor 11.11.12.1 in remote AS 100
`(config-router)#network 22.22.22.22/32`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

IPv4 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11.11.11.0/24 and 11.11.12.0/24. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 1-68: IPv4 EBGP Peering

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 33.33.33.33/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.1/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor 11.11.11.2 remote-as 200`	Create a static neighbor 11.11.11.2 with remote AS 200.

`#configure terminal`	Enter configure mode.
`(config-router)#network 33.33.33.33/32`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 22.22.22.22/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ip address 11.11.11.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip add 11.11.12.2/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Enter Router BGP mode.
`(config-router)#bgp router-id 2.2.2.2`	Assign a BGP router ID.
`(config-router)#neighbor IPV4_EBGP_PEER peer-group range 11.11.0.0/16`	Create a dynamic peer-group, IPV4_EBGP_PEER.
`(config-router)#neighbor IPV4_EBGP_PEER remote-as 100`	Assign remote AS with the peer-group IPV4_EBGP_PEER.
`(config-router)#neighbor IPV4_EBGP_PEER optional-as 300`	Assign optional AS with the peer-group IPV4_EBGP_PEER
`(config-router)#network 22.22.22.22/32`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 44.44.44.44/32 secondary`	Assign a secondary IP address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ip add 11.11.12.3/24`	Assign IP address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 300`	Enter Router BGP mode.
`(config-router)#bgp router-id 3.3.3.3`	Assign a BGP router ID.
`(config-router)#neighbor 11.11.12.2 remote-as 200`	Create a static BGP neighbor 11.11.12.2 with remote AS 200.

#configure terminal	Enter configure mode.
(config-router)#network 44.44.44.44/32	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

IPv6 IBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1/64 and 11:11:12::1/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

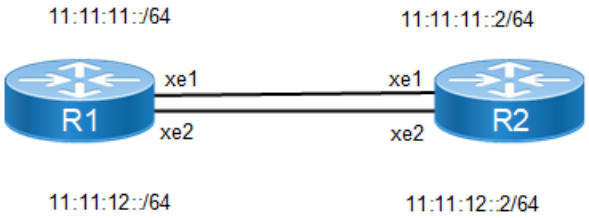

Figure 1-69: IPv6 IBGP Peering

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 33::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ipv6 address 11:11:11::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ipv6 address 11:11:12::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor IPV6_IBGP_PEER peer-group range 11:11::/16`	Create a dynamic peer-group, IPV6_IBGP_PEER with a dynamic range 11:11::/16
`(config-router)#neighbor IPV6_IBGP_PEER remote-as 100`	Configure a remote AS with the peer group, IPV6_IBGP_PEER.
`(config-router)#neighbor IPV6_IBGP_PEER limit 1`	Set peer group neighbors limit to 1. Only one BGP session will be up.
`(config-router)#address-family ipv6 unicast`	Enter the IPv6 Unicast Address Family.
`(config-router-af)#neighbor IPV6_IBGP_PEER activate`	Activate the peer group, IPV6_IBGP_PEER in the IPv6 address family.
`(config-router-af)#network 33::1/128`	Advertise the loopback network into the BGP IPv6 address family.
`(config-router-af)#end`	Exit from Router BGP address family mode.

R2

`#Configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 22::2/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.

(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#bgp router-id 2.2.2.2	Assign a BGP router ID.
(config-router)#neighbor 11:11:11::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#neighbor 11:11:12::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#network 22::2/128	Advertise the loopback network into BGP.
(config-router-af)#neighbor 11:11:12::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#neighbor 11:11:11::1 activate	Activate the neighbor in the IPv6 address family.
(config-router-af)#end	Exit from Router BGP address family mode.

IPV6 IBGP VRF Configuration

Below figure displays the minimum configuration required to enable BGP on an interface with VRF enabled on the device and interface being part of VRF. R1 and R2 are two routers belonging to the same AS, AS100, connecting to network 11:11:11::1 and 11:11:12::1. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

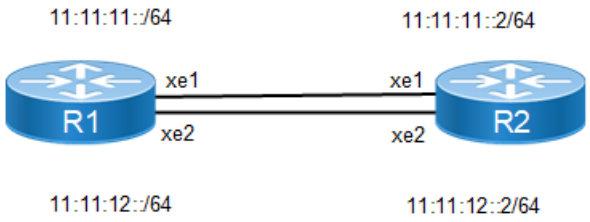

Figure 1-70: IPv6 VRF IBGP peering

R1

`#Configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrfA`	Configure a VRF, vrfA.
`(config-vrf)#rd 1:1`	Configure a route distinguisher to VRF.
`(config-vrf)#router-id 7.7.7.7`	Configure a router ID.
`(config-vrf)#exit`	Exit from VRF mode and return to Configuration mode.

(config)#interface xe1	Enter interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:11::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:12::1/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode.
(config-router)#address-family ipv6 vrf vrfA	Enter IPv6 VRF Address Family.
(config-router-af)#neighbor IPV6_VRF_IBGP_PEER peer-group range 11:11::1/16	Configure a dynamic peer group, IPV6_IBGP_PEER with a dynamic range value.
(config-router-af)#neighbor IPV6_VRF_IBGP_PEER remote-as 100	Configure a remote AS with the peer group, IPV6_IBGP_PEER.
(config-router)#end	Exit from Router BGP mode.

R2

#configure terminal	Enter configure mode.
(config)#ip vrf vrfA	Configure a VRF, vrfA.
(config-vrf)#rd 2:1	Configure a route distinguisher to VRF.
(config-vrf)#router-id 1.1.1.1	Configure a router ID.
(config-vrf)#exit	Exit from VRF mode and return to Configuration mode.
(config)#interface xe1	Enter interface mode for xe1.
(config-if)# ip vrf forwarding vrfA	Assign IP address to VRF.
(config-if)#ipv6 address 11:11:11::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#interface xe2	Enter interface mode for xe2.
(config-if)# ip vrf forwarding vrfA	Assign IP address to vrf.
(config-if)#ipv6 address 11:11:12::2/64	Assign an IPv6 address to the interface.
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)#address-family ipv6 vrf vrfA	Enter IPv6 VRF Address Family.
(config-router-af)#neighbor 11:11:12::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router-af)#neighbor 11:11:11::1 remote-as 100	Configure BGP neighbor by specifying the neighbor IP address.
(config-router)#end	Exit from Router BGP mode.

IPv6 EBGP Configuration

Below figure displays the minimum configuration required to enable BGP on an interface. R1, R2 and R3 are three routers belonging to the different AS, AS100 AS200 and AS300, connecting to network 11:11:11::/64 and 11:11:12::/64. First, define the routing process and the AS number to which the routers belong. Then, define BGP neighbors to start exchanging routing updates.

Topology

Figure 1-71: IPv6 EBGP peering

R1

`#configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 33::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1.
`(config-if)#ipv6 address 11:11:11::1/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Enter Router BGP mode.
`(config-router)#bgp router-id 1.1.1.1`	Assign a BGP router ID.
`(config-router)#neighbor 11:11:11::2 remote-as 200`	Configure BGP neighbor by specifying the neighbor IP address.
`(config-router)#address-family ipv6 unicast`	Enter the IPv6 Unicast Address Family.

`(config-router-af)#neighbor 11:11:11::2 activate`	Activate the neighbor in the address family.
`(config-router-af)#network 33::1/128`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 22::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe1`	Enter interface mode for xe1
`(config-if)#ipv6 address 11:11:11::2/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2.
`(config-if)#ipv6 address 11:11:12::2/64`	Assign an IPv6 address to the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Enter Router BGP mode.
`(config-router)#bgp router-id 2.2.2.2`	Assign a BGP router ID.
`(config-router)#neighbor IPV6_EBGP_PEER peer-group range 11::1/16`	Configure a dynamic peer group, IPV6_EBGP_PEER.
`(config-router)#neighbor IPV6_EBGP_PEER remote-as 100`	Configure remote AS with peer group, IPV6_EBGP_PEER.
`(config-router)#neighbor IPV6_EBGP_PEER optional-as 300`	Configure optional AS with peer group, IPV6_EBGP_PEER.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Unicast Address Family.
`(config-router-af)#neighbor IPV6_EBGP_PEER activate`	Activate peer group in the address family.
`(config-router-af)#network 22::1/128`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from Router BGP mode.

R3

`#Configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ipv6 address 44::1/128`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#interface xe2`	Enter interface mode for xe2
`(config-if)#ipv6 address 11:11:12::3/64`	Assign an IPv6 address.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 300`	Enter Router BGP mode.
`(config-router)#bgp router-id 3.3.3.3`	Assign a BGP router ID.
`(config-router)#neighbor 11:11:12::2 remote-as 200`	Configure the BGP neighbor by specifying the neighbor IP address.

(config-router)#address-family ipv6 unicast	Enter the IPv6 Unicast Address Family.
(config-router-af)#neighbor 11:11:12::2 activate	Activate the neighbor in address family.
(config-router-af)#network 44::1/128	Advertise the loopback network into BGP.
(config-router)#end	Exit from Router BGP mode.

VPNV4 Configuration

Below mentioned topology displays bgp vpnv4 configuration on PE nodes, R1 and R3. IBGP peering will be formed on the loopback interface of R1 and R3; also IGP is running between all the routers.

Topology

Figure 1-72: IPv4 IBGP VPNv4 Configuration

R1

`#Configure terminal`	Enter Configuration mode.
`(config)#ip vrf vrf1`	Create a VRF, vrf1.
`(config-vrf)#rd 100:1`	Configure a route distinguisher value.
`(config-vrf)#route-target export 100:1`	Configure a route target export value to VRF.
`(config-vrf)#route-target import 200:1`	Configure a route target import value to VRF.
`(config-vrf)#exit`	Exit from VRF configuration mode.
`(config)#router ldp`	Enter Router LDP mode.
`(config-router)#router-id 3.3.3.3`	Configure an LDP router ID.
`(config-router)#exit`	Exit from Router LDP mode.
`(config)#interface xe5`	Enter Interface configuration mode.
`(config-if)#ip vrf forwarding vrf1`	Configure the interface to a VRF.
`(config-if)#ip address 1.1.1.1/24`	Assign an IP address to the interface.
`(config-if)#exit`	Exit from Interface configuration mode.
`(config-if)#interface xe1`	Enter another interface.
`(config-if)#ip address 11.11.11.1/24`	Assign an IP address to the interface.
`(config-if)#label-switching`	Enable label switching on interface.
`(config-if)#enable-ldp ipv4`	Enable IPv4 LDP configuration on interface.
`(config-if)#exit`	Exit from Interface configuration mode.

(config-if)#interface lo	Enter the loopback interface.
(config-if)#ip address 20.20.20.20/32 secondary	Assign a secondary IP address to the interface.
(config-if)#exit	Exit from Interface Configuration mode.
(config)#router ospf 100	Enter Router OSPF mode.
(config-router)#network 11.11.11.0/24 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#network 20.20.20.20/32 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#exit	Exit from Router OSPF mode.
(config)#router ospf 200 vrf1	Create an OSPF process on VRF.
(config-router)#network 1.1.1.1/24 area 0	Configure the interface on which OSPF runs, and associate the area ID.
(config-router)#redistribute bgp	Redistribute BGP into OSPF.
(config-router)#exit	Exit from Router OSPF mode.
(config)#router bgp 100	Create a BGP process.
(config-router)#neighbor lo_peer peer-group range 30.30.30.30/32	Configure a dynamic peer group with the range command.
(config-router)#neighbor lo_peer remote-as 100	Configure remote AS to the peer group.
(config-router)#neighbor lo_peer update-source lo	Configure BGP neighbors to update the source routes.
(config-router)#address-family vpnv4 unicast	Enter the VPNv4 Address Family.
(config-router-af)#neighbor lo_peer activate	Activate the peer group in VPNv4 address family.
(config-router-af)#exit-address-family	Exit from VPNv4 address family.
(config-router)#address-family ipv4 vrf vrf1	Enter IPv4 VRF address family.
(config-router-af)#redistribute ospf 200	Redistribute OSPF into the IPv4 VRF address family.
(config-router)#end	Exit from the Router BGP mode.

R2

#Configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 4.4.4.4	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config-if)#interface xe2	Enter Interface Configuration mode.
(config-if)#ip address 12.12.12.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface xe1	Enter another Interface.
(config-if)#ip address 11.11.11.2/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on the interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.

(config-if)#exit	Exit from Interface mode.
(config)#router ospf 100	Create an OSPF process.
(config-router)#network 11.11.11.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#network 12.12.12.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#end	Exit from Router BGP mode.

R3

#Configure terminal	Enter Configuration mode.
(config)#router ldp	Enter Router LDP mode.
(config-router)#router-id 5.5.5.5	Configure an LDP router ID.
(config-router)#exit	Exit from Router LDP mode.
(config)#ip vrf vrf2	Create a VRF, vrf2.
(config-vrf)#rd 200:1	Configure a route distinguisher value.
(config-vrf)#route-target export 200:1	Configure a route target export value to VRF.
(config-vrf)#route-target import 100:1	Configure a route target import value to VRF.
(config-vrf)#exit	Exit from VRF configuration mode.
(config)#interface xe1	Enter Interface configuration mode.
(config-if)#ip vrf forwarding vrf2	Configure an interface to a VRF.
(config-if)#ip address 2.2.2.3/24	Assign an IP address to the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface xe2	Enter another interface.
(config-if)#ip address 12.12.12.3/24	Assign an IP address to the interface.
(config-if)#label-switching	Enable label switching on interface.
(config-if)#enable-ldp ipv4	Enable IPv4 LDP configuration on the interface.
(config-if)#exit	Exit from Interface configuration mode.
(config-if)#interface lo	Enter loopback interface.
(config-if)#ip address 30.30.30.30/32 se	Assign a secondary IP address to the interface.
(config-if)#exit	Exit from Interface mode.
(config)#router ospf 100	Enter Router OSPF mode.
(config-router)#network 12.12.12.0/24 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#network 30.30.30.30/32 area 0	Define the interface on which OSPF runs, and associate the area ID
(config-router)#exit	Exit from Router OSPF mode.
(config)#router ospf 200 vrf2	Create an OSPF process on VRF.
(config-router)#network 2.2.2.3/24 area 0	Define the interface on which OSPF runs, and associate the area ID.
(config-router)#redistribute bgp	Redistribute BGP into OSPF.
(config-router)#exit	Exit from Router OSPF mode.
(config)#router bgp 100	Create a BGP process.

(config-router)#neighbor 20.20.20.20 remote-as 100	Configure BGP neighbor by specifying a neighbor IP address.
(config-router)#neighbor 20.20.20.20 update-slo	Define the BGP neighbors to update the source routes.
(config-router)#address-family vpnv4 unicast	Enter VPNv4 Address Family.
(config-router-af)#neighbor 20.20.20.20 act	Activate the neighbor in VPNv4 address family.
(config-router-af)#exit-address-family	Exit from VPNv4 address family.
(config-router)#address-family ipv4 vrf vrf2	Enter IPv4 VRF address family.
(config-router-af)#redistribute ospf 200	Redistribute OSPF into the IPv4 address family.
(config-router)#end	Exit from Router BGP mode.

Enable eBGP Multihop

This example shows the minimum configuration required for enabling eBGP multihop on peers speaking BGP. eBGP multihop is used for routers that are not directly connected to each other. Typically, eBGP peers are directly connected, but if there is a requirement that necessitates this scenario, this configuration can be used.

Note: The IP addresses used in the configuration should be accessible through an IGP or static routing.

Topology

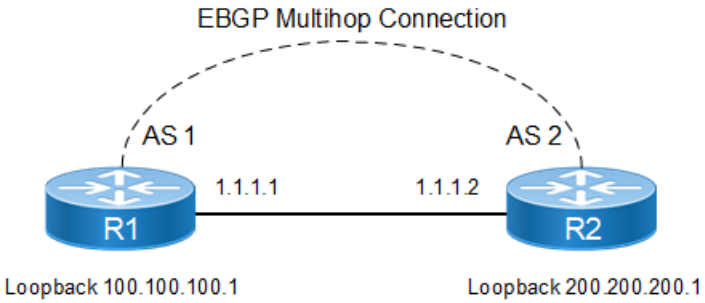

Figure 1-73: eBGP Multihop Connection

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 100.100.100.1/24 secondary`	Specify IP address to the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#ip route 200.200.200.0/24 1.1.1.2`	Specify route IP address.
`(config)#router bgp 1`	Define the routing process. The number 1 specifies the AS number of R1.
`(config-router)#neighbor 200.200.200.1 remote-as 2`	Define BGP neighbors, and establish a TCP session. 200.200.200.1 is the IP address of the neighbor (R2), and 2 is the neighbor's AS number.
`(config-router)#neighbor 200.200.200.1 update-source lo`	Define BGP neighbors, to update the source routes.
`(config-router)#neighbor 200.200.200.1 ebgp-multihop`	Define the neighbor `200.200.200.1` for eBGP multihops.
`(config-router)#end`	Exit BGP router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 200.200.200.1/24 secondary`	Specify IP address to the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#ip route 100.100.100.0/24 1.1.1.1`	Specify route IP address.
`(config)#router bgp 2`	Define the routing process. The number 2 specifies the AS number of R1.
`(config-router)#redistribute static`	Redistribute static route
`(config-router)#neighbor 100.100.100.1 remote-as 1`	Define BGP neighbors, and establish a TCP session. 100.100.100.1 is the IP address of the neighbor (R2), and 1 is the neighbor's AS number.

`(config-router)#neighbor 100.100.100.1 update-source lo`	Define BGP neighbors, to update the source routes.
`(config-router)#neighbor 100.100.100.1 ebgp-multihop`	Define the neighbor `100.100.100.1` for eBGP multihops.
`(config-router)#end`	Exit BGP router mode.

Enable Peer Groups

A BGP speaker might have the same update policies for a set of its peers. This is very useful if you have to change the update policies for all of the peers: Changing individual routers for separate policies can be very time-consuming, thus, peer groups play an important role in creating and assigning policies to a group of routers.

BGP Peer Groups for Address-Family IPv4 Unicast

In the following scenario, R1, R2, and R3 belong to the same peer group ABC. R1, R2 and R3 are in AS 200 and R1 is the route reflector.R4 and R1 are eBGP peers .R4 is in AS 100.

Topology

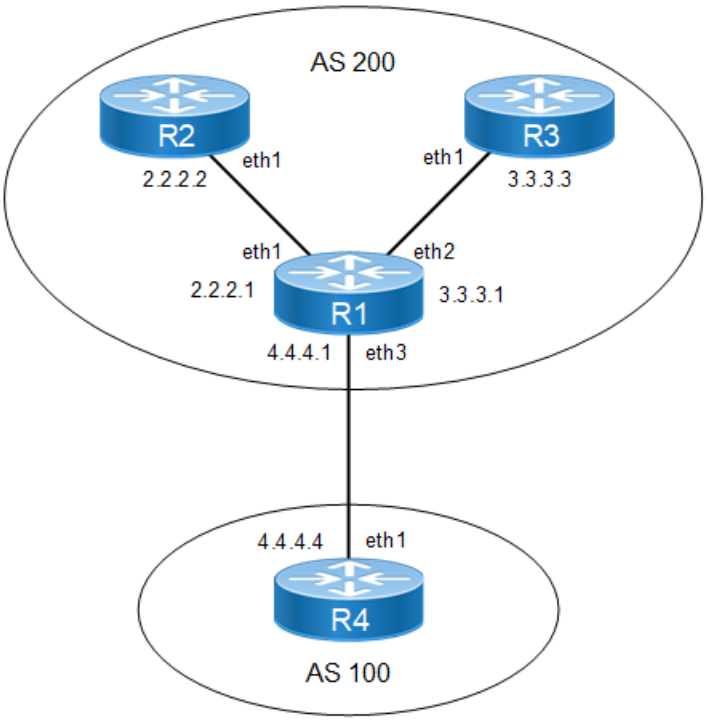

Figure 1-74: BGP Peer Groups with IPv4 Unicast Members

R1

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure IP address for Loopback interface
`(config-if)#ip address 11.11.11.11/32 secondary`	Configure IP address for Loopback interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R1.
`(config-router)#neighbor ABC peer-group`	Create a peer group named ABC.
`(config-router)#neighbor ABC remote-as 200`	Assign options to the peer group named ABC.
`(config-router)#neighbor ABC route-reflector-client`	Configure the peer-group ABC to be route-reflector-client
`(config-router)#neighbor 2.2.2.2 peer-group`	
ABC	Define neighbor 2.2.2.2 (R2) as a peer group member.
`(config-router)#neighbor 3.3.3.3 peer-group`	
ABC	Define neighbor 3.3.3.3 (R3) as a peer group member.
`(config-router)#neighbor 4.4.4.4 remote-as`	
`100`	Define neighbor 4.4.4.4 (R4) is the IP address of R4 and 100 is the AS number.

`(config-router)#network 1.1.1.1/32`	Advertise the network 1.1.1.1/32
`(config-router)#network 11.11.11.11/32`	Advertise the network 11.11.11.11/32

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R2.
`(config-router)#neighbor 2.2.2.1 remote-as 200`	Create a TCP connection with neighbor `2.2.2.1` of AS `200`.

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R3.
`(config-router)#neighbor 3.3.3.1 remote-as 200`	Create a TCP connection with neighbor `3.3.3.1` of AS `200`.

R4

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Define the routing process. The number `100` specifies the AS number of R4.
`(config-router)#neighbor 4.4.4.1 remote-as 200`	Create a TCP connection with neighbor 4.4.4.1 of AS 200.

Peer-group-members cannot be configured with Outbound Policies.

Validation

The above configuration fails with an appropriate error:

```
    R1(config)#router bgp 200
    R1(config-router)#neighbor 2.2.2.2 route-map permit-only-11 out
    %% Invalid command for a peer-group member
```

Peer-group-members inherit the properties of Inbound Policies configured for Peer-group.

R2

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.1/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.1/24`	Configure IP address for interface eth3
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter router bgp mode
`(config-router)#network 22.1.1.0/24`	Advertise the network of eth3 in BGP
`(config-router)#network 100.1.1.0/24`	Advertise the network of Loopback in BGP
`(config-router)#exit`	Exit router bgp mode

R3

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.2/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.2/24`	Configure IP address for interface eth3

(config-if)#exit	Exit interface mode
(config)#router bgp 200	Enter router bgp mode

BGP Peer Groups for Address-Family IPv4 Labeled Unicast

Topology

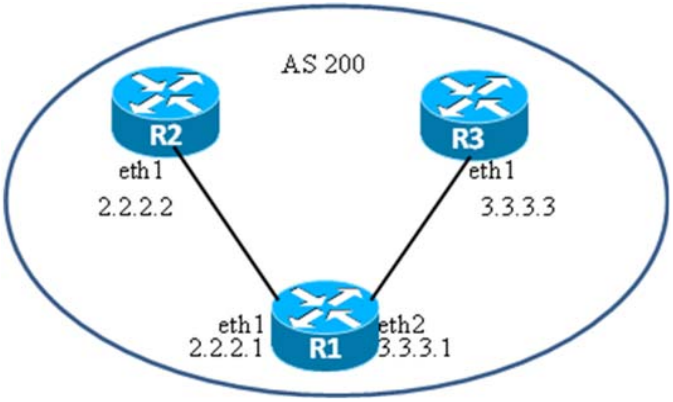

Figure 1-75: BGP Peer-Groups with IPv4 Labeled-Unicast Members

R1

`(config)# interface lo`	Enter interface mode for Loopback
`(config-if)#ip address 1.1.1.1/32 secondary`	Configure ip address for Loopback interface
`(config-if)#ip address 11.11.11.11/32 secondary`	Configure ip address for Loopback interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R1.
`(config-router)#neighbor ABC peer-group`	Create a peer group named ABC.
`(config-router)#neighbor ABC remote-as 200`	Assign options to the peer group named ABC.
`(config-router)#neighbor 2.2.2.2 peer-group ABC`	Define neighbor 2.2.2.2 (R2) as a peer group member.
`(config-router)#neighbor 3.3.3.3 peer-group ABC`	Define neighbor 3.3.3.3 (R3) as a peer group member.
`(config-router)#address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast mode
`(config-router-af)#neighbor ABC activate`	Activate the peer-group ABC for address-family ipv4 labeled-unicast
`(config-router-af)#neighbor ABC route-reflector-client`	Configure the peer-group ABC to be route-reflector-client
`(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast mode
`(config-router)#network 1.1.1.1/32`	Advertise the network 1.1.1.1/32
`(config-router)#network 11.11.11.11/32`	Advertise the network 11.11.11.11/32
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#exit`	

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R2.
`(config-router)#neighbor 2.2.2.1 remote-as 200`	Create a TCP connection with neighbor 2.2.2.1 of AS 200.
`(config-router)#address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast mode
`(config-router-af)#neighbor 2.2.2.1 activate`	Activate the neighbor R1 for address-family ipv4 labeled-unicast
`(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast mode
`(config-router)# exit`	Exit router bgp mode

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process. The number 200 specifies the AS number of R3.
`(config-router)#neighbor 3.3.3.1 remote-as 200`	Create a TCP connection with neighbor 3.3.3.1 of AS 200.
`(config-router)#address-family ipv4 labeled-unicast`	Enter address-family ipv4 labeled-unicast mode
`(config-router-af)#neighbor 3.3.3.1 activate`	Activate the neighbor R1 for address-family ipv4 labeled-unicast
`(config-router-af)# exit-address-family`	Exit address-family ipv4 labeled-unicast mode
`(config-router)# exit`	Exit router bgp mode

Validation

Peer-group-members inherit the properties of Inbound Policies configured for Peer-group under Address-family ipv4 Labeled-Unicast

Follow the configuration of R1,R2,R3 in the previous section with the following configuration

R2

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.1/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.1/24`	Configure IP address for interface eth3
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter router bgp mode
`(config-router)#network 22.1.1.0/24`	Advertise the network of eth3 in BGP
`(config-router)#network 100.1.1.0/24`	Advertise the network of Loopback in BGP
`(config-router)#allocate-label all`	Allocate labels for all IPv4 prefixes advertised
`(config-router)#exit`	Exit router bgp mode

R3

`#configure terminal`	Enter configure mode.
`(config)# interface lo`	Enter interface mode for Loopback interface
`(config-if)#ip address 100.1.1.2/24 secondary`	Configure IP address for Loopback interaface
`(config-if)#interface eth3`	Enter interface mode for interface eth3
`(config-if)#ip address 22.1.1.2/24`	Configure IP address for interface eth3
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Enter router bgp mode
`(config-router)#network 22.1.1.0/24`	Advertise the network of eth3 in BGP
`(config-router)#network 100.1.1.0/24`	Advertise the network of Loopback in BGP

(config-router)#allocate-label all	Allocate labels for all IPv4 prefixes advertised
(config-router)#exit	Exit router bgp mode

R1

#configure terminal	Enter configure mode.
(config)#ip access-list permit-22	Configure access-list to permit 22.1.1.0/24
(config-ip-acl)# permit any 22.1.1.0/24 any	Configure a permit statement to permit 22.1.1.0/24
(config-ip-acl)#exit	Exit ip access-list mode
(config)#route-map permit-only-22	Configure route-map
(config-route-map)#match ip address permit-22	Configure match statement in route-map to match the access-list permit-22
(config-route-map)#exit	Exit route-map mode
(config)#router bgp 200	Enter BGP router mode
(config-router)#address-family ipv4 labeled-unicast	Enter the address-family ipv4 labeled-unicast mode
(config-router-af)#neighbor ABC route-map permit-only-22 in	Configure the peer-group ABC with route-map in the inbound direction under address-family ipv4 labeled-unicast
(config-router-af)#exit-address-family	Exit address-family ipv4 labeled-unicast mode
(config-router)#exit	Exit router bgp mode
(config)# exit	Exit configure terminal mode
#clear ip bgp peer-group ABC ipv4 labeled-unicast soft in	Do inbound soft reset for the peer-group ABC for the policy to take affect for the labelled-unicast peer-group members

Validation

R1

```
R1#show ip bgp labeled-unicast

R1#
```

Route Redistribution in BGP

If there are routers that run both OSPF and BGP, certain OSPF routes might have to be sent to other eBGP peers. This can be achieved using the redistribution feature. Consider the following topology, in which R1 and R2 are eBGP peers, and R2 and R3 are OSPF peers. R2 is redistributing OSPF routes into BGP. The OSPF routes are sent to the R1 BGP routing table. This configuration assumes that all OSPF and eBGP sessions are up and running, and that only the redistribution must be configured.

Topology

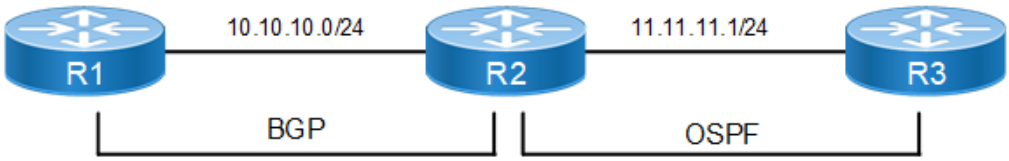

Figure 1-76: Redistribute with OSPF

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Define the routing process. The number `100` specifies the AS number of R2.
`(config-router)#redistribute ospf`	Redistribute OSPF routes in the R2 routing table into the R1 BGP routing table.
`(config-router)#exit`	Exit Router-BGP mode.

Validation

```

Add Multiple Instances of the Same Autonomous System

BGP supports adding the same AS number multiple times to influence the route selection process. This can be done using route maps, as described below.

Under normal circumstances, any route advertised by R1 is sent to R4 via two different routes, and then R4 selects the path from R2. This decision can be influenced by adding multiple instances of AS number 200 at R2.

Topology

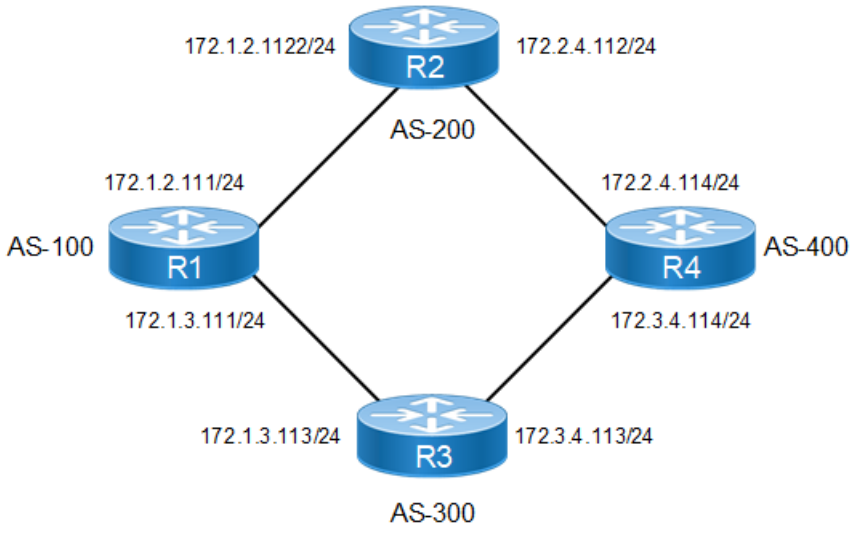

Figure 1-77: Multiple Instances of Same AS

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 44.44.44.1/24 secondary`	Specify the IP address for the interface.

`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 172.1.2.112 remote-as 200`	Define neighbor R2. `172.1.2.112` is the IP address of R2, and `200` is the AS number.
`(config-router)#neighbor 172.1.3.113 remote-as 300`	Define neighbor R3. `172.1.3.113` is the IP address of R2, and `300` is the AS number.
`(config-router)#network 44.44.44.0/24`	Advertise network `44.44.44.0/24` through BGP. This route reaches R4 via R2 and R3.

R2

`#configure terminal`	Enter configure mode.
`(config)#route-map mul_inst permit 10`	Define the route-map multiple instance with permit definition sequence number `10`.
`(config-route-map)#set as-path prepend 200 200`	Prepend AS number `200` two times to the AS_PATH attribute in the BGP Update message.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 172.1.2.111 remote-as 100`	Define neighbor R1. `172.1.2.111` is the IP address of R1, and `100` is the AS number.
`(config-router)#neighbor 172.2.4.114 remote-as 400`	Define neighbor R4. `172.2.4.114` is the IP address of R2, and `400` is the AS number.
`(config-router)#neighbor 172.2.4.114 route-map mul_inst out`	Apply route-map `multi_inst` to all outbound routes to R4.

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 300`	Define the routing process with AS number `300`.
`(config-router)#neighbor 172.1.3.111 remote-as 100`	Define neighbor R1. `172.1.3.111` is the IP address of R1, and `100` is the AS number.
`(config-router)#neighbor 172.3.4.114 remote-as 400`	Define neighbor R4. `172.3.4.114` is the IP address of R4, and `400` is the AS number.

R4

`#configure terminal`	Enter configure mode.
`(config)#router bgp 400`	Define the routing process with AS number `400`.
`(config-router)#neighbor 172.2.4.112 remote-as 200`	Define neighbor R2. `172.2.4.112` is the IP address of R2, and `200` is the AS number.
`(config-router)#neighbor 172.3.4.113 remote-as 300`	Define neighbor R3. `172.3.4.113` is the IP address of R3, and `300` is the AS number.

Validation

Remove the Multi-Exit Disc Attribute from Update Messages

You can remove the Multi-Exit Disc (MED) attribute values from received update messages.

Topology

Figure 1-78: Remove MED Attribute

R1

`#configure terminal`	Enter configure mode.
`(config)#route-map med permit 1`	Define the route-map MED with permit definition sequence number `1`.
`(config-route-map)#set metric 400`	Set the metric value.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 100`	Define the routing process with AS number `100`.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Define neighbor R2. `1.1.1.2` is the IP address of R2, and `200` is the AS number.
`(config-router)#neighbor 1.1.1.2 route-map med out`	Apply the route-map MED to all outbound routes to R2.
`(config)#interface xe2`	Enter interface mode
`(config-if)#ip ad 10.10.10.1/24`	Assign IP address
`(config-if)#no shutdown`	Make interface administratively up
`(config-if)#exit`	Exit interface mode
`(config)#ip route 100.0.0.0/8 10.10.10.2`	Configure the static route with the nexthop address.

R3

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 2.2.2.1 remote-as 200`	Define neighbor R2. `2.2.2.1` is the IP address of R2, and `200` is the AS number.

Removing Sent and Received MED values

The following describes how to remove the received and sent MED values, respectively.

R2 - Remove Received MED Value

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Define neighbor R1. `1.1.1.1` is the IP address of R1, and `100` is the AS number.
`(config-router)#neighbor 2.2.2.2 remote-as 200`	Define neighbor R3. `2.2.2.2` is the IP address of R3, and `200` is the AS number.
`(config-router)#bgp bestpath med remove-recv-med`	Enable the remove received MED value option.

R1 - Add Static Route

`(config)#router bgp 100`	Enter to router bgp mode
`(config-router)#redistribute static`	Redistribute the static routes

R2 - Remove Send MED Value

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Define the routing process with AS number `200`.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Define neighbor R1. `1.1.1.1` is the IP address of R1, and `100` is the AS number.
`(config-router)#neighbor 2.2.2.2 remote-as 200`	Define neighbor R3. `2.2.2.2` is the IP address of R3, and `200` is the AS number.
`(config-router)#bgp bestpath med remove-send-med`	Enable the remove sent MED value option.

```

BGP Four-Byte Autonomous System

Extended AS numbers can be mapped to 2-byte AS numbers if the value is less than, or equal to, 65535. If the AS number is higher than 65535, it cannot be mapped to a 2-byte AS number. Therefore, if a BGP speaker is configured with a non-mappable AS number, it must enable the BGP extended ASN capability in OcNOS.

Note: Autonomous System number 23456 is a reserved IANA number for AS transition; thus, it is recommended that no system be configured with 23456 as its AS number.

The extended ASN capability is disabled by default. However, when it is enabled, it is able to interoperate with a 2-byte AS-numbered speaker, in compliance with RFC 4893.

If a 4-byte AS number is configured in the provider's network using BGP MPLS VPN or standard IPv4/IPv6 BGP, it is recommended that the PE routers be 4-byte AS-enabled before connecting to 4-byte AS-enabled customer networks. For implications related to AS number transition issues, refer to RFC 4893.

You can also set up 4-byte AS-specific extended communities and route distinguishers (RDs) with limited capabilities. However, it is recommended that 2-byte AS-specific RDs and extended communities be used for regular deployment.

BGP encodes an ASN into four octets, so that more autonomous systems can be supported. Extended ASN capability is advertised in the Open message capabilities when the 4-octet ASN capability is enabled. When the 4-octet ASN capability is enabled, the valid ASN value range is <1-4294967295>, with the exception discussed in the first Note, above.

Note: Four-octet capability is disabled by default.

4-Octet ASN Capability Enabled on R1 and R2

In this example, 4-Octet ASN capability is enabled on BGP speakers R1 and R2.

Topology

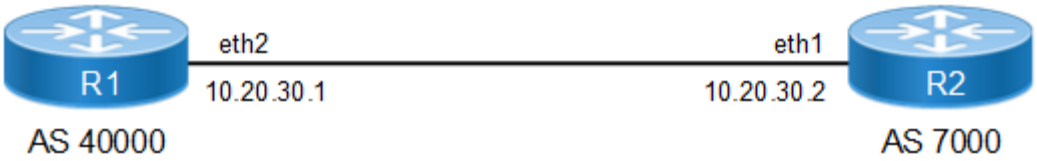

Figure 1-79: 4-Octet ASN on Both Routers

R1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 400000`	Assign the ASN value (`400000`) to the router.
`(config-router)#neighbor 10.20.30.2 remote-as 7000`	Specify the neighbor's IP address (`10.20.30.2`) and the ASN value of the neighbor (`7000`).

R2

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 7000`	Assign the ASN value (`7000`) to the router.
`(config-router)#neighbor 10.20.30.1 remote-as 400000`	Specify the neighbor's IP address (`10.20.30.1`) and the ASN value of the neighbor (`400000`).

4-Octet ASN Capability Enabled on R1 and Disabled on R2

In the following two examples, 4-Octet ASN capability is enabled on BGP speaker R1 and disabled on R2.

Topology

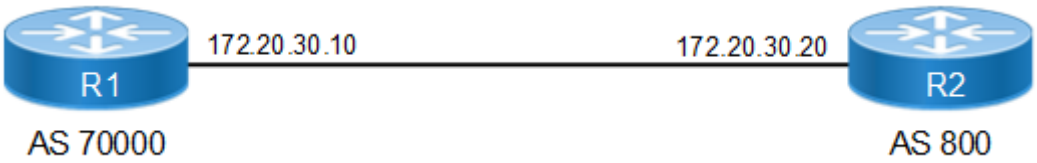

Figure 1-80: 4-Octet ASN on One Router

R1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 70000`	Assign the ASN value (`70000`) to the router.
`(config-router)#neighbor 172.20.30.20 remote-as 800`	Specify the neighbor's IP address (`172.20.30.20`) and the ASN value of the neighbor (`800`).

R2

`#configure terminal`	Enter configure mode.
`(config)#no bgp extended-asn-cap`	Disable 4-octet ASN capability.
`(config)#router bgp 800`	Assign the ASN value (`800`) to the router.
`(config-router)#neighbor 172.20.30.10 remote-as 70000`	Specify the neighbor's IP address (`172.20.30.10`) and the ASN value of the neighbor (`70000`).

Topology

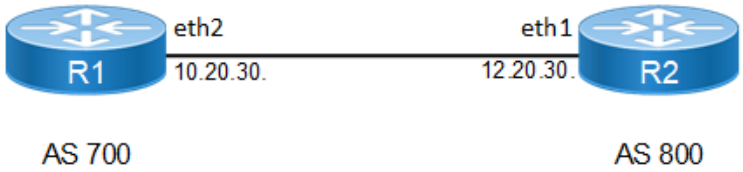

Figure 1-81: 4-Octet ASN

R1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 700`	Assign the ASN value (`700`) to the router.
`(config-router)#neighbor 172.20.30.20 remote-as 800`	Specify the neighbor's IP address (`172.20.30.20`) and the ASN value of the neighbor (`800`).

R2

`#configure terminal`	Enter configure mode.
`(config)#no bgp extended-asn-cap`	Disable 4-octet ASN capability.
`(config)#router bgp 800`	Assign the ASN value (`800`) to the router.
`(config-router)#neighbor 172.20.30.10 remote-as 700`	Specify the neighbor's IP address (`172.20.30.10`) and the ASN value of the neighbor (`700`).

BGP Extended Community Attribute

The Extended Community Attribute provides a mechanism for labeling information carried in BGP.

Extended Community with a 2-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 are 2-byte-ASN capable, and do not support 4-byte-ASN capability.

Topology

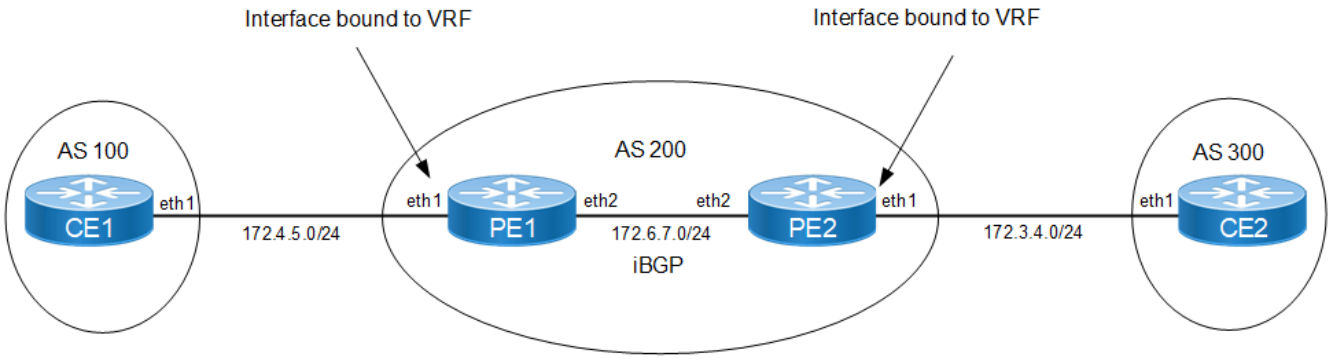

Figure 1-82: Extended Communities — 2-Byte ASN

CE1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.4.5.116 remote-as 200`	Specify the neighbor's IP address (`172.4.5.116`) and the ASN value of the neighbor (`200`).

CE2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.3.4.114/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 300`	Assign the ASN value (`300`) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 172.3.4.117 remote-as 200`	Specify the neighbor's IP address (`172.3.4.117`) and the ASN value of the neighbor (`200`).

PE1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 100:10`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:10`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).
`(config-if)#ip address 172.4.5.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 75.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 172.6.7.117 remote-as 200`	Specify the neighbor's (PE2) IP address (`172.6.7.117`) and the ASN value of the neighbor (`200`). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.117 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.4.5.115 remote-as 100`	Specify the neighbor's (CE1) IP address and ASN value.
`(config-router-af)#neighbor 172.4.5.115 send-community both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)#end`	Exit Address-Family mode

PE2

`#configure terminal`	Enter configure mode.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 100:10`	Assign a route distinguisher (RD) for the VRF.
`(config-vrf)#route-target both 100:10`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).
`(config-if)#ip address 172.3.4.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 100.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 172.6.7.116 remote-as 200`	Specify the neighbor's (PE1) IP address (`172.6.7.116`) and the ASN value of the neighbor (`200`). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.116 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.3.4.114 remote-as 300`	Specify the neighbor's (CE2) IP address and ASN value.
`(config-router-af)#neighbor 172.3.4.114 send-community both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)#end`	Exit Address-Family mode

Extended Community with a 4-Byte ASN

In the following example, CE1, PE1, PE2, and CE2 support 4-byte ASN capability.

Note: PE1 and PE2 should both either be 4-byte-ASN capable or 2-byte-ASN capable. Support for the combination of one 4-byte-ASN capable PE with one 2-byte-ASN-capable PE is currently unavailable.

Topology

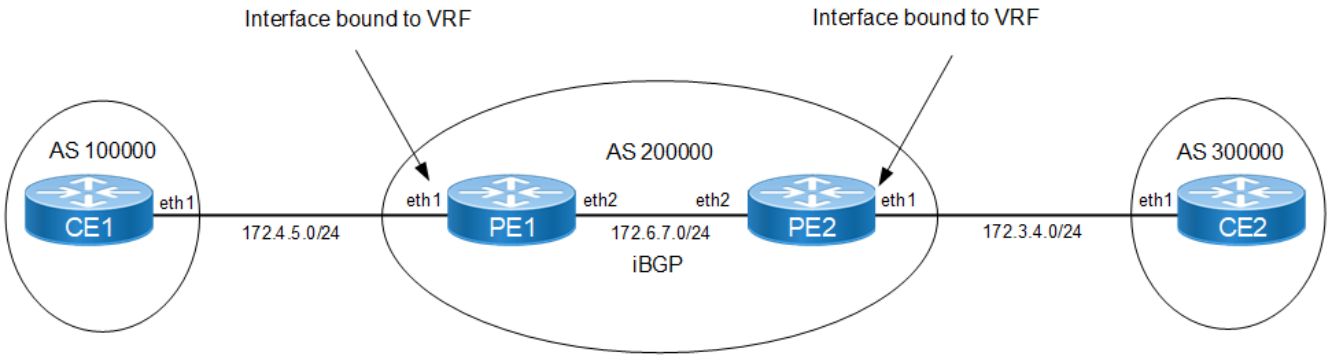

Figure 1-83: Extended Communities — 4-Byte ASN

CE1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.4.5.115/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 100000`	Assign the ASN value (`100000`) to the router. The ASN range is <1-4294967295>.
`(config-router)#neighbor 172.4.5.116 remote-as 200000`	Specify the neighbor's IP address (`172.4.5.116`) and the ASN value of the neighbor (`200000`).

PE1

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability. Dynamic change from 2-byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 1.1.1.1:200`	Assign a 4-byte route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in A.B.C.D:NN format.
`(config-vrf)#route-target both 1.1.1.1:200`	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).
`(config-if)#ip address 172.4.5.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 50.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.116/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200000`	Assign the ASN value (`200000`) to the router.
`(config-router)#neighbor 172.6.7.117 remote-as 200000`	Specify the neighbor's (PE2) IP address (`172.6.7.117`) and the ASN value of the neighbor (`200000`). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.117 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.4.5.115 remote-as 100000`	Specify the neighbor's (CE1) IP address and ASN value.
`(config-router-af)#neighbor 172.4.5.115 send-community both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)#end`	Exit Address-Family mode

PE2

`#configure terminal`	Enter configure mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability. Dynamic change from 2-byte to 4-byte capability, or vice versa, is not allowed, unless the VRF is removed.
`(config)#ip vrf VRF1`	Specify the name of the VRF (`VRF1`) to be created.
`(config-vrf)#rd 1.1.1.1:200`	Assign a 4-byte route distinguisher (RD) for the VRF.
`(config-vrf)#route-target both 1.1.1.1:200`	Specify the 4-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding VRF1`	Bind the interface (eth1) to the VRF (`VRF1`).
`(config-if)#ip address 172.3.4.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#ip route vrf VRF1 200.1.1.0/24 eth1`	Create a VRF static route.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 172.6.7.117/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200000`	Assign the ASN value (`200000`) to the router.
`(config-router)#neighbor 172.6.7.116 remote-as 200000`	Specify the neighbor's (PE2) IP address (`172.6.7.116`) and the ASN value of the neighbor (`200000`). In this case, it is an iBGP connection, so both PE1 and PE2 are in the same AS.
`(config-router)#address-family vpnv4 unicast`	Enable the exchange of VPNv4 routing information among ISP PE-routers, and enter Address-Family-VPNv4 mode.
`(config-router-af)#neighbor 172.6.7.116 activate`	Enable the exchange of routing information with a peer router.
`(config-router-af)#exit`	Exit Address-Family-VPNv4 mode.
`(config-router)#address-family ipv4 vrf VRF1`	Enable the exchange of VRF routing information among ISP PE-routers, and enter Address-Family-VRF mode.
`(config-router-af)#neighbor 172.3.4.114 remote-as 300000`	Specify the neighbor's (CE1) IP address and ASN value.
`(config-router-af)#neighbor 172.3.4.114 send-community both`	Enable extended community attribute for the neighbor.
`(config-router-af)#redistribute static`	Configure static redistribution.
`(config-router-af)#end`	Exit Address-Family mode

CE2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 172.3.4.114/24`	Configure the IP address on this interface
`(config-if)#exit`	Exit interface mode.
`(config)#bgp extended-asn-cap`	Enable 4-octet ASN capability.
`(config)#router bgp 300000`	Assign the ASN value (`300000`) to the router.
`(config-router)#neighbor 172.3.4.117 remote-as 200000`	Specify the neighbor's IP address (`172.3.4.117`) and the ASN value of the neighbor (`200000`).

Nexthop Tracking

Nexthop tracking is used to notify the BGP process asynchronously whenever there is any change in the IGP routes. It reduces the convergence time of BGP routes when IGP routes are changed.

Topology

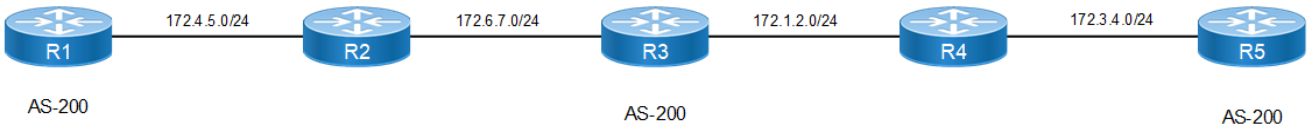

Figure 1-84: BGP Nexthop Tracking

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (200.200.200.200) and the ASN value of the neighbor (200).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if) #ip address 150.150.150.150/32 secondary`	Configure the IP address on this interface.
`(config-if)#ip address 200.200.200.200/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 100.100.100.100 remote-as 200`	Specify the neighbor's IP address (`100.100.100.100`) and the ASN value of the neighbor (`200`).
`(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200`	Specify the routing update source.
`(config-router)#neighbor 220.220.220.220 remote-as 200`	Specify the neighbor's IP address (`220.220.220.220`) and the ASN value of the neighbor (`200`).
`(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#bgp nexthop-trigger enable`	Enable Nexthop tracking.
`(config)#bgp nexthop-trigger delay 20`	Configure the nexthop trigger-delay time interval.

R4

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (`1`).
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area `0`.
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area `0`.

R5

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 220.220.220.220/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 150.150.150.150 remote-as 200`	Specify the neighbor's IP address (150.150.150.150) and the ASN value of the neighbor (`200`).

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 220.220.220.220/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config-router)#neighbor 150.150.150.150 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.

Nexthop Tracking Delay Timer

The delay interval between routing table walks can be configured for nexthop delay tracking. This time determines how long BGP waits before it starts walking the full BGP routing table after receiving notification from NSM about a next-hop change.

Topology

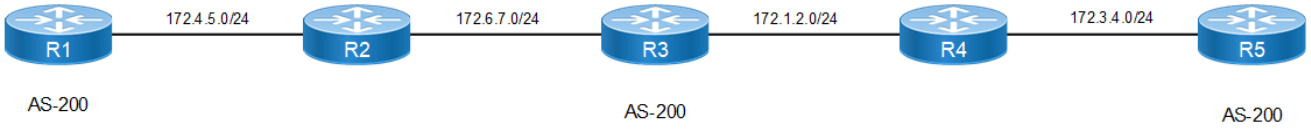

Figure 1-85: Topology for Nexthop Tracking Delay Timer

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 150.150.150.150/32 secondary`	Configure the IP address on this interface.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router. The ASN range is <1-65535>.
`(config-router)#neighbor 200.200.200.200 remote-as 200`	Specify the neighbor's IP address (200.200.200.200) and the ASN value of the neighbor (200).
`(config-router)#neighbor 200.200.200.200 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 150.150.150.150/32 secondary`	Configure the IP address on this interface.
`(config-if)#ip address 100.100.100.100/32 secondary`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.4.5.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 200.200.200.200/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router.
`(config-router)#neighbor 100.100.100.100 remote-as 200`	Specify the neighbor's IP address (100.100.100.100) and the ASN value of the neighbor (200).
`(config-router)#neighbor 100.100.100.100 update-source 200.200.200.200`	Specify the routing update source.
`(config-router)#neighbor 220.220.220.220 remote-as 200`	Specify the neighbor's IP address (220.220.220.220) and the ASN value of the neighbor (200).
`(config-router)#neighbor 220.220.220.220 update-source 150.150.150.150`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.6.7.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#bgp nexthop-trigger enable`	Enable nexthop tracking.
`(config)#bgp nexthop-trigger delay 20`	Configure the nexthop trigger-delay time interval.

R4

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.1.2.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area 0.

R5

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the loopback interface, and enter Interface mode.
`(config-if)#ip address 220.220.220.220/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router bgp 200`	Assign the ASN value (200) to the router.
`(config-router)#neighbor 150.150.150.150 remote-as 200`	Specify the neighbor's IP address (150.150.150.150) and the ASN value of the neighbor (200).
`(config-router)#neighbor 150.150.150.150 update-source lo`	Specify the routing update source.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 1`	Configure the OSPF process (1).
`(config-router)#network 172.3.4.0/24 area 0`	Advertise the network in Area 0.
`(config-router)#redistribute connected`	Redistribute the connected routes.

BGP Distance

Administrative distance in BGP can be configured for a specific address family.

Topology

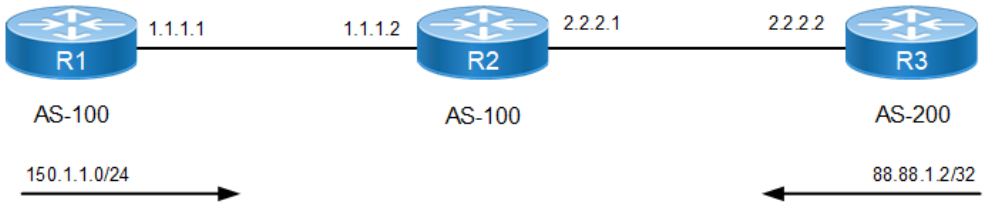

Figure 1-86: Administrative Distance for IPv4 BGP

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter loopback interface mode.
`(config-if)#ip address 150.1.1.1/24 secondary`	Specify IP address for the interface.
`(config-if)#exit`	Exit loopback interface mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#network 150.1.1.0/24`	Specify the network to be advertised by the BGP routing process.
`(config-router)#neighbor 1.1.1.2 remote-as 100`	Specify the neighbor's IP address and ASN value.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 2.2.2.2 remote-as 200`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address and the ASN value of another neighbor.

(config-router)#distance bgp 12 13 120	Configure the administrative distance for external, internal, and local routes received.
(config-router)#aggregate-address 150.1.0.0/16 summary-only	Configure a non-AS-set aggregate route on R2. The local distance is applied to this route.

R3

#configure terminal	Enter configure mode.
(config)#interface lo	Enter loopback interface mode.
(config-if)#ip address 88.88.1.2/32 secondary	Specify IP address for the interface.
(config-if)#exit	Exit loopback interface mode.
(config)#router bgp 200	Assign the ASN value (200) to the router.
(config-router)#network 88.88.1.2/32	Specify the network to be advertised by the BGP routing process.
(config-router)#neighbor 2.2.2.1 remote-as 100	Specify the neighbor's IP address and ASN value.

Validation

BGP Weight per Peer

A different weight can be assigned per address family of a peer. For example, a system can be configured to prefer VPN4 routes from peer A and IPv4 routes from peer B.

If the neighbor weight command is given under a specific address-family mode, the peer weight is set for that specific address family. If the address family is not specifically set, the weight is updated for the default address-family.

Topology

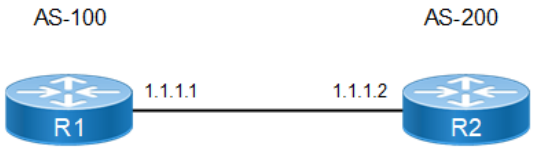

Figure 1-87: BGP Weight Per Peer

R1

`#configure terminal`	Enter configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 1.1.1.2 remote-as 200`	Specify the neighbor's IP address and ASN value.

R2

`#configure terminal`	Enter configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#neighbor 1.1.1.1 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 1.1.1.1 weight 500`	Add a weight of `500` to all the routes coming from the neighbor, `1.1.1.1` (only IPv4 routes).

OSPF as PE-CE Protocol for VPNs

In an MPLS VPN environment, customer networks are connected to an MPLS VPN-enabled provider backbone. As shown in Figure 1-88, Customer A areas, Areas 0 and 1, are connected to an MPLS VPN–enabled provider network. Area 0 and Area 1 have routers CE1 and CE2 running OSPF. MP-iBGP is used between PE1 and PE2 to propagate routes between Site 1 (Area 0) and Site 2 (Area 1). Traditional OSPF-BGP redistribution is performed at PE routers, PE1 and PE2. In this case, routes distributed by CE1 into the MP-iBGP cloud are sent to CE2 as external routes, even though both CE1 and CE2 belong to the same customer.

This behavior can be changed with the additional domain ID configuration. Each VRF should be configured a domain ID on the PE routers. If a PE router gets a route through the MP-iBGP cloud and has to send to any customer site, it checks the domain ID value against the list of stored domain ID values. If the incoming domain ID matches any of the stored IDs, that route is inserted into the customer site with the same type, as it was inserted into the MP-BGP cloud; otherwise, it is inserted as external route.

Topology

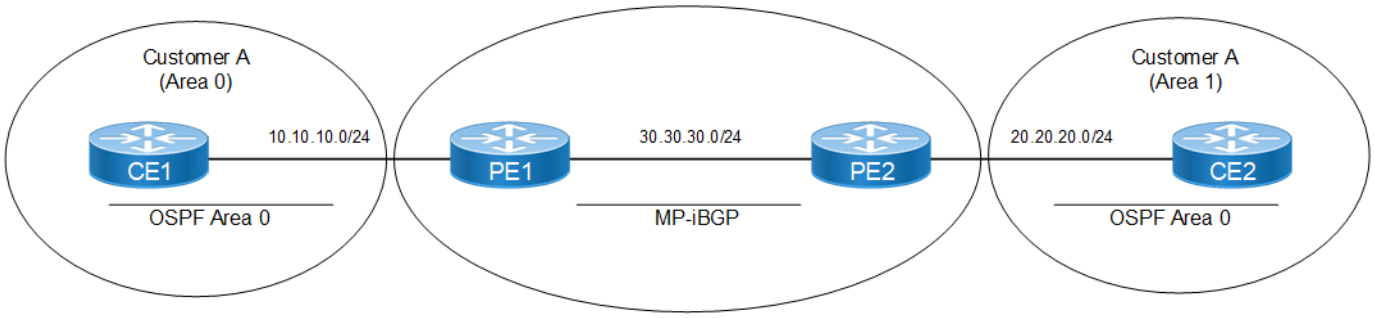

Figure 1-88: OSPF as PE-CE Protocol

CE1

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 60.1.1.1/24 secondary`	Specify IP address for the interface
`(config-if)#exit`	Exit loopback interface mode
`(config)#router ospf 1`	Configure the routing process and specify the Process ID (1).
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the network in OSPF
`(config-router)#network 60.1.1.0/24 area 0`	Advertise the loopback IP address in area 0 of router OSPF 1.

PE1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf ABC`	Specify the name of the VRF (ABC) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 10:100`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
`(config-vrf)#exit`	Exit VRF mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding ABC`	Associate interface eth1 to vrf ABC.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1 ABC`	Configure OSPF for VRF.
`(config-router)#network 10.10.10.0/24 area 0`	Advertise the network for OSPF adjacency with CE1.
`(config-router)#domain-id 1.1.1.1`	Configure the primary domain ID.
`(config-router)#domain-id 2.2.2.2 secondary`	Configure a secondary domain ID.
`(config-router)#domain-id 3.3.3.3 secondary`	Configure a secondary domain ID.
`(config-router)#exit`	Exit Router mode and return to Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the BGP router.

(config-router)#neighbor 30.30.30.2 remote-as 100	Configure neighbor 30.30.30.2 for iBGP.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 30.30.30.2 activate	Activate neighbor 30.30.30.2.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf ABC	Enter Address-Family-VRF mode.
(config-router)#redistribute ospf	Specify redistributing routes from OSPF into BGP.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.

PE2

#configure terminal	Enter configure mode.
(config)#ip vrf ABC	Specify the name of the VRF (ABC) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 10:100	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip vrf forwarding ABC	Associate interface eth1 to vrf ABC.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1 ABC	Configure OSPF for VRF.
(config-router)#network 20.20.20.0/24 area 0	Advertise the network for OSPF adjacency with CE1.
(config-router)#domain-id 1.1.1.1	Configure the primary domain ID.
(config-router)#domain-id 2.2.2.2 secondary	Configure a secondary domain ID.
(config-router)#domain-id 3.3.3.3 secondary	Configure a secondary domain ID.
(config-router)#exit	Exit Router mode and return to Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 30.30.30.1 remote-as 100	Configure neighbor 30.30.30.1 for iBGP.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 30.30.30.1 activate	Activate neighbor 30.30.30.1.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf ABC	Enter Address-Family-VRF mode.
(config-router)#redistribute ospf	Specify redistributing routes from OSPF into BGP.
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.

CE2

#configure terminal	Enter configure mode.

`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1).
`(config-router)#network 20.20.20.0/24 area 0`	Advertise the network in OSPF.

BGP Multipath for IPv4

BGP supports multipath for IPv4 prefixes. BGP Multipath allows load-balancing traffic among multiple BGP routes. It supports both iBGP and eBGP routes. In case of eBGP, the routes should arrive from same AS number.

Topology

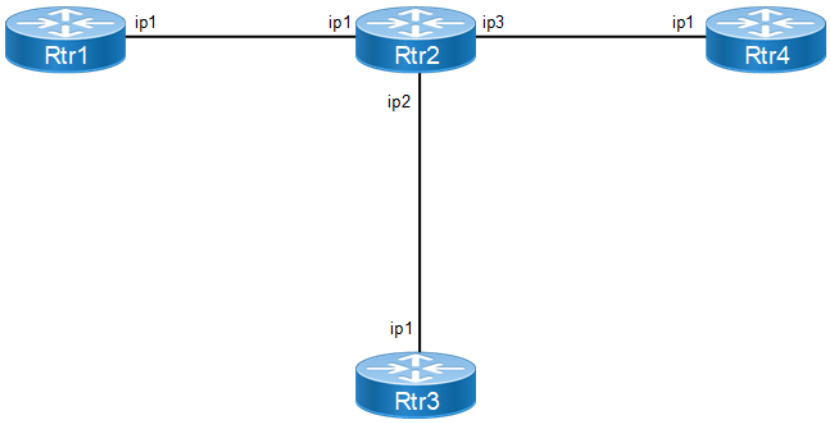

Figure 1-89: Multipath iBGP for IPv4

Rtr1

`#configure terminal`	Enter the Configure mode.
`(config)#router bgp 100`	Assign the ASN value (100) to the BGP router.
`(config-router)#bgp router-id 2.2.2.2`	Configure a fixed Router ID (2.2.2.2).
`(config-router)#redistribute static`	Redistribute the static routes.

(config-router)#neighbor 30.30.30.9 remote-as 100	Configure neighbor 30.30.30.9 for iBGP.
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.

Rtr3

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#bgp router-id 4.4.4.4	Configure a fixed Router ID (4.4.4.4).
(config-router)#redistribute static	Redistribute the static routes.
(config-router)#neighbor 40.40.40.9 remote-as 100	Configure neighbor 40.40.40.9 for iBGP.
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.

Rtr4

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#bgp router-id 6.6.6.6	Configure a fixed Router ID (6.6.6.6).
(config-router)#redistribute static	Redistribute the static routes.
(config-router)#neighbor 50.50.50.9 remote-as 100	Configure neighbor 50.50.50.9 for iBGP.
(config)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip route 88.88.0.0/16 Null	Configure static route.

Rtr2

#configure terminal	Enter the Configure mode.
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#max-paths ibgp 2	Configure iBGP max-paths (2).
(config)#bgp router-id 9.9.9.9	Configure a fixed Router ID (9.9.9.9).
(config-router)#neighbor 30.30.30.2 remote-as 100	Configure neighbor 30.30.30.2 for iBGP.
(config-router)#neighbor 40.40.40.4 remote-as 100	Configure neighbor 40.40.40.4 for iBGP.
(config-router)#neighbor 50.50.50.6 remote-as 100	Configure neighbor 50.50.50.6 for iBGP.
(config-router)#exit	Exit the Router mode and return to Configure mode.

```

BGP AS-PATH Multipath-relax

BGP will not load balance across multiple paths by default. We can configure it to do so with the `max-paths ebgp <no-of-multipaths>` command. The criterion of this command is that all attributes must match (Weight, Local preference, AS Path, etc). This is acceptable if we are multi-homed to a single AS, but what if we are multi-homed to different AS.

BGP AS PATH multipath relax effectively allows for ECMP to be done across different neighboring ASN's.

Topology

Below topology explains about BGP AS PATH multipath relax functionality.

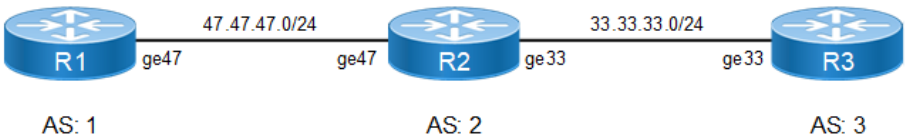

Figure 1-91: BGP AS-PATH Multipath-relax Topology

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter Interface loopback
`(config-if)#ip address 100.1.1.1/24 secondary`	Configure IP address for interface
`(config-if)#exit`	Exit interface mode
`(config)#interface ge47`	Enter Interface loopback
`(config-if)#ip address 47.47.47.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter the Configure mode
`(config)#router bgp 1`	Assign the ASN value (1) to the BGP router
`(config-router)#neighbor 47.47.47.2 remote-as 2`	Configure eBGP neighbor.
`(config-router)#network 100.1.1.0/24`	Advertise the loopback network into BGP.
`(config-router)#end`	Exit from BGP router config mode

R2

`#configure terminal`	Enter the Configure mode.
`(config)#interface ge33`	Enter interface mode
`(config-if)#ip address 33.33.33.2/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter the Configure mode
`(config)#interface ge47`	Enter interface mode
`(config-if)#ip address 47.47.47.2/24`	Configure IP address for interface.
`(config-if)#exit`	Exit from interface mode and enter the Configure mode
`(config)#router bgp 2`	Assign the ASN value (2) to the BGP router.
`(config-router)#neighbor 33.33.33.3 remote-as 3`	Configure eBGP neighbor.
`(config-router)#neighbor 47.47.47.1 remote-as 1`	Configure eBGP neighbor.
`(config-router)#max-paths ebgp 8`	Configure eBGP Multipath.
`(config-router)#bgp bestpath as-path multipath-relax`	Configure BGP AS PATH Multipath relax.
`(config-router)#end`	Exit from BGP router config mode.

R3

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter Interface loopback.
`(config-if)#ip address 100.1.1.1/24 secondary`	Configure IP address for interface.
`(config-if)#exit`	Exit from interface mode and enter the Configure mode.
`(config)#interface ge33`	Enter Interface loopback.
`(config-if)#ip address 33.33.33.3/24`	Configure IP address for interface.

(config-if)#exit	Exit from interface mode and enter the Configure mode.
(config)#router bgp 3	Assign the ASN value (3) to the BGP router.
(config-router)#neighbor 33.33.33.2 remote-as 2	Configure eBGP neighbor.
(config-router)#network 100.1.1.0/24	Advertise the loopback network into BGP.
(config-router)#end	Exit from BGP router config mode.

BGP FIB Install (Selective Route Download)

The BGP—Selective Route Download feature allows a network administrator to selectively download some or none of the BGP routes into the Routing Information Base (RIB). The primary application for this feature is to suppress the unnecessary downloading of certain BGP routes to the RIB or Forwarding Information Base (FIB) on a dedicated route reflector, which propagates BGP updates without carrying transit traffic. The feature thereby helps to maximize resources available and to improve routing scalability and convergence on the dedicated route reflector.

With RFC 4456, the concept of route reflection was defined; this would allow configuring designated one or more BGP routers in iBGP network as route reflectors. BGP relaxes the re-advertising restriction on these route reflectors, allowing them to accept and propagate IBGP routes to their clients.

The role of a dedicated route reflector (RR) is to propagate BGP updates without participating in the actual forwarding of transit traffic. That means the RR does not need to have all BGP routes downloaded into its RIB or FIB. It is beneficial for the RR to preserve its resources by not processing and storing those routes.

By default, BGP routes are downloaded to the RIB. To save resources on a dedicated route reflector, such downloading can be reduced or prevented by configuring a table map. A table map is so named because it controls what is put into the BGP routing table.

By reducing the route installation in the dedicated route reflectors, we can maximize availability of resources and improve routing scalability and convergence.

A new command ‘table map’ is being introduced to achieve this. A table map controls what is put into the BGP routing table. When configured it would reduce or prevent downloading routes to RIB.

Table map command references ‘route map’ rules available in BGP to control the routes going into the BGP routing table.

Table-map command can be used in two ways:

- When a simple table-map command is given (without filter option), the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option ‘filter’ is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Topology

Below topology explains about BGP FIB Install functionality

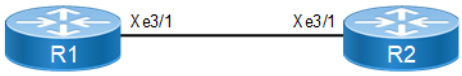

Figure 1-92: BFP FIB Install Topology

R1

#configure terminal	Enter the Configure mode.
(config)#interface xe3/1	Enter interface mode.
(config-if)#ip address 20.1.1.1/24	Configure IP address for interface
(config-if)#exit	Exit interface mode
(config)# router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#neighbor 20.1.1.2 remote-as 100	Configure neighbor in IBGP
(config-router)#redistribute static	Redistribute static routes to advertise to its neighbor
(config-router)#exit	Exit Router mode and enter Configure mode
(config)#ip route 1.1.1.0/24 xe3/1	Configure static route.
(config)#ip route 2.2.2.0/24 xe3/1	Configure static route.
(config)#ip route 3.3.3.0/24 xe3/1	Configure static route.
(config)#ip route 4.4.4.0/24 xe3/1	Configure static route.
(config)#ip route 5.5.5.0/24 xe3/1	Configure static route.
(config)#ip route 6.6.6.0/24 xe3/1	Configure static route.

R2

#configure terminal	Enter the Configure mode.
(config)#interface xe3/1	Configure IP address for interface
(config-if)#ip address 20.1.1.2/24	Configure IP address for interface
(config-if)#exit	Exit from interface mode and enter into Configure mode
(config)#router bgp 100	Assign the ASN value (100) to the BGP router.
(config-router)#redistribute static	Redistribute the static routes.
(config-router)#neighbor 20.1.1.1 remote-as 100	Configure neighbor iBGP.
(config-router)#exit	Exit the BGP Router mode and return to the Configure mode.
(config)#ip access-list 1	Login to Configure access-list parameters
(config-ip-acl)#permit ipip 2.2.2.0 0.0.0.225 any	Configure access-list by allowing only one route to install in FIB table.
(config-ip-acl)#exit	Exit assess list mode
(config)# route-map test permit 1	Configure route-map to match access-list
(config-route-map)# match ip address 1	Match the above configured access-list 1
(config-route-map)#exit	Exit from route-map Configure mode and enter into Configure mode
(config)#router bgp 100	Enter into BGP router mode

(config-router)# table-map test filter	Apply table-map with route-map created and with filter option
(config-router)#end	Exit from router and Configure mode

Validation

Table-map with Filter Option

Verify BGP neighborship is up between R1 and R2. Before applying table-map in R2, all routes will be installed in FIB table, as in below output.

R1

C     20.1.1.0/24 is directly connected, eth1, 00:31:16
C     127.0.0.0/8 is directly connected, lo, 00:42:30
C     192.168.52.0/24 is directly connected, eth0, 00:42:27

Gateway of last resort is not set
#
```

Note: Same can be tried with IPV6 VRF–v4 and VRF–v6 address-families and this feature is not supported for VPNV4 address-family

Route Target Constraint

BGP/MPLS IP VPNs use PE routers to Route Target (RT) extended communities and control the distribution of routes into the VRFs. Within a given iBGP mesh, PE routers hold routes marked with RouteTargets pertaining to VRFs that have local CE attachments.

BGP RT Constrained Route Distribution is a feature that can be used by service providers in Multiprotocol Label Switching (MPLS) Layer 3 VPNs to reduce the number of unnecessary routing updates that route reflectors (RRs) send to Provider Edge (PE) routers. The reduction in “routing updates” saves resources by allowing RRs, Autonomous System Boundary Routers (ASBRs), and PEs to carry fewer routes. Route targets are used to constrain routing updates.

With (MPLS)VPNs, the (iBGP) peers or Route Reflectors send all VPN4 and/or VPN6 prefixes to the PE routers. The PE routers drop the VPN4/6 prefixes for which there is no importing VPN route forwarding (VRF).

Topology

The topology below shows Route-target filtering in an L3VPN—with Route Target Constraint (RTC), the RR sends only wanted VPN4/6 prefixes to the PE; wanted” means that the PEs have the VRFs importing the specific prefixes.

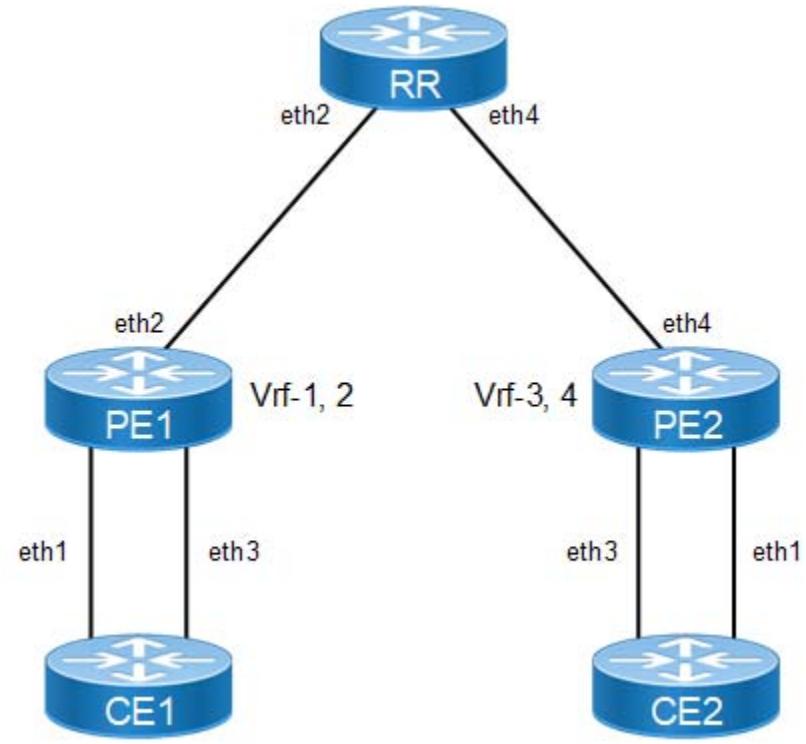

Figure 1-93: Route-target Filter Topology

CE1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 80.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter into Configure mode
`(config)#interface eth3`	Enter interface mode
`(config-if)#ip address 90.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter into Configure mode
`(config)# router bgp 200`	Assign the ASN value (100) to the BGP router
`(config-router)#neighbor 80.1.1.2 remote-as 100` `(config-router)#neighbor 90.1.1.2 remote-as 100`	Configure neighbor (RR) in IBGP
`(config-router)#redistribute static`	Redistribute static routes into BGP
`(config-router)#exit`	Exit from router mode and enter configure mode
`(config)#ip route 1 1.1.1.0/24 eth1`	Configure static route with VRF 1 instance
`(config)#ip route 2 3.3.3.0/24 eth3`	Configure static route with VRF 2 instance
`(config)#ip route 2 4.4.4.0/24 eth3`	Configure static route with VRF 2 instance

CE2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 101.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter into Configure mode
`(config)#interface eth3`	Enter interface mode
`(config-if)#ip address 100.1.1.1/24`	Configure IP address for interface
`(config-if)#exit`	Exit from interface mode and enter into Configure mode
`(config)# router bgp 200`	Assign the ASN value (100) to the BGP router
`(config-router)#neighbor 100.1.1.2 remote-as 100` `(config-router)#neighbor 101.1.1.2 remote-as 100`	Configure neighbor (RR) in IBGP
`(config-router)#end`	Exit from router and configure mode

PE1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf 1`	Create a VRF instance 1
`(config-vrf)#rd 1:100`	Configure unique RD value for VRF to identify VRF instance
`(config-vrf)#route-target export 1:200`	Configure route-target (rt) value for exporting routes into other VRFs (for other PE's)
`(config-vrf)#exit`	Exit VRF mode and enter Configure mode
`(config)#ip vrf 2`	Create a VRF instance 2
`(config-vrf)#rd 1:300`	Configure unique RD value for VRF to identify VRF instance
`(config-vrf)#route-target both 1:400`	Configure route-target (rt) value for exporting routes into other VRFs (for other PE's)
`(config-vrf)#exit`	Exit VRF mode and enter Configure mode
`(config)#router ldp`	Enable LDP.
`(config-router)#exit`	Exit router LDP mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 11.11.11.11/32 secondary`	Configure IP address for loopback interface
`(config-if)# enable-ldp ipv4`	Enable LDP on loopback interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip vrf forwarding 1`	Bind interface to VRF 1
`(config-if)#ip address 80.1.1.2/24`	Configure IP address for VRF binded interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode

(config-if)#ip address 40.1.1.1/24	Configure an IP address for interface
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP on connected interface between PE1 and RR
(config-if)#exit	Exit interface mode
(config)#interface eth3	Enter interface mode
(config-if)#ip vrf forwarding 2	Bind interface to VRF 1
(config-if)#ip address 90.1.1.2/24	Configure IP address for VRF binded interface
(config-if)#exit	Exit interface mode
(config)#router ospf	Enable OSPF process between PE1 and RR
(config-router)#network 11.11.11.11/32 area 0.0.0.0 (config-router)#network 40.1.1.0/24 area 0.0.0.0	Advertise loopback network in OSPF area 0
(config-router)#exit	Exit router OSPF mode
(config)# router bgp 100	Assign the ASN value (100) to the BGP router
(config-router)#neighbor 22.22.22.22 remote-as 100	Configure neighbor (RR) in IBGP
(config-router)#neighbor 22.22.22.22 update-source lo	Enable neighbor with loopback interface.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 22.22.22.22 activate	Activate RR neighbor
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family rtfilter unicast	Enable RT filter address-family mode
(config-router-af)#neighbor 22.22.22.22 activate	Activate neighbor
(config-router-af)#exit-address-family	Exit RTfilter Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 1	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 80.1.1.1 remote-as 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 80.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 2	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 90.1.1.1 remote-as 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 90.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#end	Exit from router mode and configure mode

RR

(config)#router ldp	Enable LDP
(config-router)#exit	Exit router LDP mode

(config)#interface lo	Enter loopback interface
(config-if)#ip address 22.22.22.22/32 secondary (config-if)#ip address 44.44.44.44/32 secondary	Configure IP address for loopback interface
(config-if)# enable-ldp ipv4	Enable LDP on loopback interface
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 40.1.1.2/24	Configure IP address for interface connecting to PE2
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP on connected interface between PE1 and RR
(config-if)#exit	Exit interface mode
(config)#interface eth4	Enter into interface mode
(config-if)#ip address 50.1.1.1/24	Configure an IP address for interface connecting to PE1
(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP on connected interface between PE1 and RR
(config-if)#exit	Exit interface mode
(config)#router ospf	Enable OSPF process between PE1 and RR
(config-router)#network 22.22.22.22/32 area 0.0.0.0	Advertise loopback network in OSPF area 0
(config-router)#network 40.1.1.0/24 area 0 (config-router)#network 44.44.44.44/32 area 0.0.0.0 (config-router)#network 50.1.1.0/24 area 0.0.0.0	Advertise PE1 to RR connected network in OSPF
(config-router)#exit	Exit from router OSPF mode
(config)# router bgp 100	Assign the ASN value (100) to the BGP router
(config-router)#neighbor 11.11.11.11 remote-as 100	Configure neighbor (PE1) in IBGP
(config-router)#neighbor 11.11.11.11 update-source 22.22.22.22	Enable neighbor with loopback interface
(config-router)#neighbor 33.33.33.33 remote-as 100	Configure neighbor (PE2) in IBGP
(config-router)#neighbor 33.33.33.33 update-source 44.44.44.44	Enable neighbor with loopback interface
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 11.11.11.11 activate	Activate PE1 neighbor
(config-router-af)#neighbor 33.33.33.33 activate	Activate PE2 neighbor
(config-router-af)#neighbor 11.11.11.11 route-reflector-client	Configure PE1 as Route Reflector client
(config-router-af)#neighbor 33.33.33.33 route-reflector-client	Configure PE2 as Route Reflector client
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.

(config-router)#address-family rtfilter unicast	Enable RT filter address-family mode
(config-router-af)#neighbor 11.11.11.11 activate	Activate PE1 neighbor in RTfilter family
(config-router-af)#neighbor 33.33.33.33 activate	Activate PE2 neighbor in RTfilter family
(config-router-af)#neighbor 33.33.33.33 route-reflector-client	Configure PE2 as Route Reflector client
(config-router-af)#neighbor 11.11.11.11 route-reflector-client	Configure PE1 as Route Reflector client
(config-router-af)#exit-address-family	Exit RTfilter Address-Family mode
(config-router)#end	Exit from Address-Family, Router and Configure mode.

PE2

#configure terminal	Enter configure mode.
(config)#ip vrf 3	Create a VRF instance 3
(config-vrf)#rd 1:600	Configure unique RD value for VRF to identify VRF instance
(config-vrf)#route-target export 1:200	Configure route-target (rt) value for exporting routes into other VRFs (for other PE's)
(config-vrf)#exit	Exit VRF mode and enter Configure mode
(config)#ip vrf 4	Create a VRF instance 4
(config-vrf)#rd 1:900	Configure unique RD value for VRF to identify VRF instance
(config-vrf)#route-target both 1:400	Configure route-target (rt) value for exporting routes into other VRFs (for other PE's)
(config-vrf)#exit	Exit VRF mode and enter Configure mode
(config)#router ldp	Enable LDP.
(config-router)#exit	Exit router LDP mode
(config)#interface lo	Enter loopback interface mode
(config-if)#ip address 33.33.33.33/32 secondary	Configure IP address for loopback interface
(config-if)# enable-ldp ipv4	Enable LDP on loopback interface
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding 3	Bind interface to VRF 3
(config-if)#ip address 101.1.1.2/24	Configure IP address for VRF binded interface
(config-if)#exit	Exit interface mode
(config)#interface eth3	Enter interface mode
(config-if)#ip vrf forwarding 4	Bind interface to VRF 3
(config-if)#ip address 100.1.1.2/24	Configure IP address for VRF binded interface
(config-if)#exit	Exit interface mode
(config)#interface eth4	Enter interface mode
(config-if)#ip address 50.1.1.2/24	Configure an IP address for interface

(config-if)#label-switching	Enable label-switching on interface
(config-if)# enable-ldp ipv4	Enable LDP on connected interface between PE2 and RR
(config-if)#exit	Exit interface mode
(config)#router ospf	Enable OSPF process between PE2 and RR
(config-router)#network 33.33.33.33/32 area 0.0.0.0	Advertise loopback network in OSPF area 0
(config-router)#network 50.1.1.0/24 area 0	Advertise PE2 to RR connected network in OSPF
(config-router)#exit	Exit router OSPF mode
(config)# router bgp 100	Assign the ASN value (100) to the BGP router
(config-router)#neighbor 44.44.44.44 remote-as 100	Configure neighbor (RR) in IBGP
(config-router)#neighbor 44.44.44.44 update-source 33.33.33.33	Enable neighbor with loopback interface.
(config-router)#address-family vpnv4 unicast	Enter Address-Family-VPNv4 mode.
(config-router-af)#neighbor 44.44.44.44 activate	Activate RR neighbor
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family rtfilter unicast	Enable RT filter address-family mode
(config-router-af)#neighbor 44.44.44.44 activate	Activate neighbor
(config-router-af)#exit-address-family	Exit RTfilter Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 3	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 101.1.1.1 remote-as 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 101.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#address-family ipv4 vrf 4	Enter Address-Family-VRF mode.
(config-router-af)#neighbor 100.1.1.1 remote-as 200	Configure CE neighbor in VRF mode
(config-router-af)#neighbor 100.1.1.1 activate	Activate neighbor in VRF
(config-router-af)#exit-address-family	Exit Address Family mode and return to Router mode.
(config-router)#end	Exit router and configure mode

Validation

Through RTfilter address-family RT values will be exchanged between RR and PE’s. Neighbors are activated under this address-family and configured clients as well in this. RR will learn routes from PE’s and send to other PE’s if it has any peer requesting for that particular routes based on their RT import values

Below outputs shows the routes sent and learned in PE’s and installed in VRF’s and display’s RT filter values exchanged between them.

BGP Labeled Unicast

As well as distributing routes, BGP with Multiprotocol Extensions (MP-BGP) can advertise MPLS label mappings that are mapped to routes. BGP Labeled Unicast (BGP-LU) attaches an MPLS label to an advertised IGP prefix and distributes the MPLS label mapped to the prefix to its peers.

With BGP-LU, a network can be divided into multiple regions to limit the total number of LSPs and enable failures to be contained and restored in a single region These regions operate separate instances of the IGP and use BGP-LU to advertise route information between inter-region routers.

A configuration for BGP-LU uses these type of nodes:

- Provider Edge (PE) nodes advertise label bindings to remote PEs in other regions. These advertisements only affect the PE routers and the ABRs and not provider routers (“P”) in the core network.
- Area Border Router (ABR) nodes advertise the label bindings to remote PEs in other regions.

BGP Labeled Unicast with LU as transport

Topology

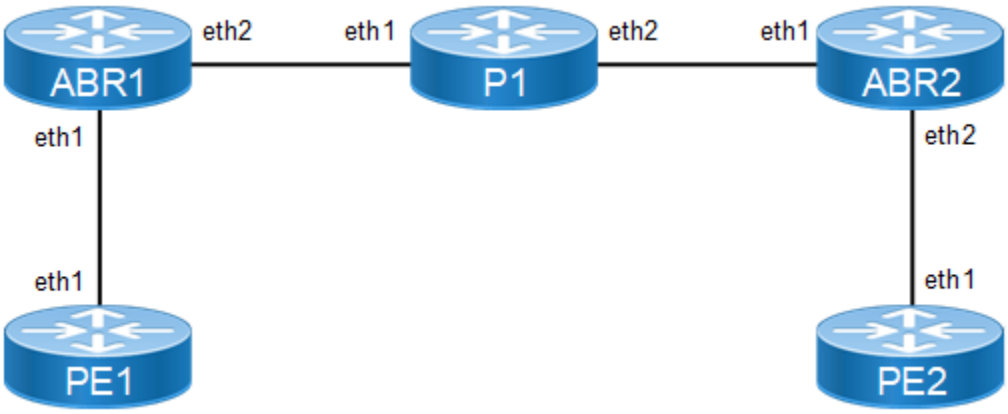

Figure 1-94: BGP labeled unicast

Configuration

PE1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 11.11.11.55/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 172.4.5.55/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process OSPF with process Id 1
`(config-router)#network 172.4.5.0/24 area 0`	Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 11.11.11.55/32 area 0`	Define the interface (11.11.11.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 21.21.21.56 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 21.21.21.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 172.4.5.52 remote-as 100`	Add neighbor with neighbor AS
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 172.4.5.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family  vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 21.21.21.56 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#network 11.11.11.55/32`	Advertise the loopback of RTR1 in BGP
`(config-router)#exit`	Exit from router BGP mode
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.
`(config-vrf)#rd 10:100`	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
`(config-vrf)#route-target both 100:300`	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.

(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 172.10.20.55/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router)# redistribute connected	Redistribute connected routes
(config-router)#end	Exit from router mode into privilege mode

ABR1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 22.22.22.52/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 172.4.5.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 172.6.7.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process OSPF with process Id 1
(config-router)#network 172.4.5.0/24 area 0	Define the interface (172.4.5.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 172.6.7.0/24 area 0	Define the interface (172.6.7.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 172.4.5.55 remote-as 100	Add neighbor with neighbor AS
(config-router)#neighbor 172.6.7.54 remote-as 100	Add neighbor with neighbor AS
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 172.6.7.54 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 172.4.5.55 activate	Activate the neighbor inside labeled-unicast address family

(config-router-af)# neighbor 172.4.5.55 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.6.7.54 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.4.5.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 172.6.7.54 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router)#exit	Exit from router BGP mode
(config)#end	Exit from config mode

P1

#configure terminal	Enter the Configure mode.

Topology

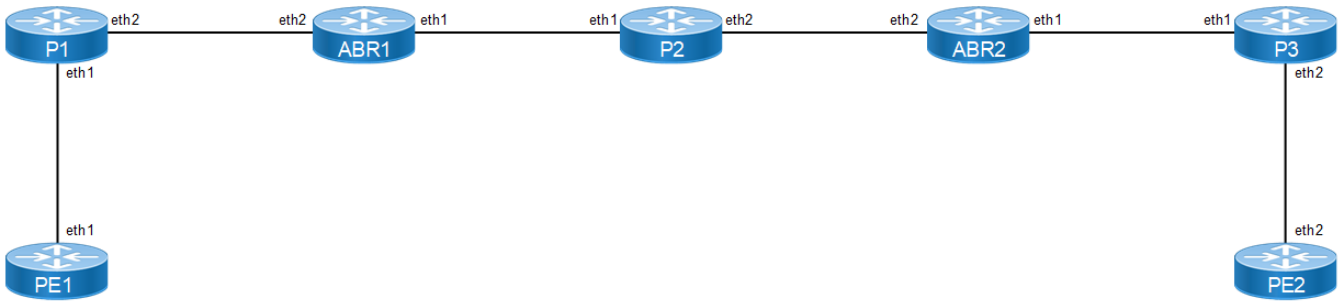

Figure 1-95: BGP_LU with MPLS

Configuration

PE1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode

(config-if)#ip address 1.1.1.54/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.54/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 10
(config-router)#network 1.1.1.54/32 area 0	Define the interface (1.1.1.54/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.1.0/24 area 0	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 7.7.7.55 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 7.7.7.55 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 3.3.3.52 remote-as 100	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#neighbor 3.3.3.52 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 3.3.3.52 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 7.7.7.55 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#network 1.1.1.54/32	Advertise the loopback of RTR1 in BGP
(config-router)#exit	Exit from router BGP mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 1.1.1.54 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip vrf vrf1	Specify the name of the VRF (vrf1) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.

(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 61.1.1.54/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router)# redistribute connected	Redistribute connected routes
(config-router)#end	Exit from router mode into privilege mode

P1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.23/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.23/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.23/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 10
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24)) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.1.0/24 area 0	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 2.2.2.23/32 area 0	Define the interface (2.2.2.23/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 2.2.2.23 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 7.7.7.55/32 20.1.1.52	Specify the destination prefix and mask for the network and a gateway.
(config)# end	Exit from config mode

ABR1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 3.3.3.52/32`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 30.1.1.52/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 20.1.1.52/24`	Configure the IP address of the interface eth2
`(config-if)#label-switching`	Enable label-switching on interface eth2
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth2 interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 20`	Configure the routing process OSPF with process id 20
`(config-router)#network 3.3.3.52/32 area 0`	Define the interface (3.3.3.52/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 3.3.3.52 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 1.1.1.54 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.54 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 5.5.5.56 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 5.5.5.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 1.1.1.54 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#neighbor 5.5.5.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)# neighbor 1.1.1.54 route-reflector-client`	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast

(config-router-af)# neighbor 5.5.5.56 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 1.1.1.54 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 5.5.5.56 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family labeled-unicast
(config-router)#exit	Exit from router BGP mode

P2

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 4.4.4.53/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 30.1.1.53/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 40.1.1.53/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode
(config)#router ospf 20	Configure the routing process OSPF with process id 20
(config-router)#network 30.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 40.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 4.4.4.53/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 4.4.4.53 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode

ABR2

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode

(config-if)#ip address 5.5.5.56/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.56/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 40.1.1.56/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 5.5.5.56/32 area 0	Define the interface 5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 50.1.1.0/24 area 0	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#router ospf 20	Configure the routing process OSPF with process id 20
(config-router)#network 5.5.5.56/32 area 0	Define the interface 5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 40.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 3.3.3.52 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 3.3.3.52 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 3.3.3.52 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 7.7.7.55 remote-as 100	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#neighbor 7.7.7.55 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 3.3.3.52 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 7.7.7.55 activate	Activate the neighbor inside labeled-unicast address family

(config-router-af)# neighbor 3.3.3.52 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 7.7.7.55 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 3.3.3.52 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 7.7.7.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family labeled-unicast
(config-router)#exit	Exit from router BGP mode

P3

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 6.6.6.22/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.22/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.22/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 50.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 6.6.6.22/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 6.6.6.22 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 1.1.1.54/32 50.1.1.56	Specify the destination prefix and mask for the network and a gateway.
(config)#exit	Exit from config mode

PE2

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 7.7.7.55/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 60.1.1.55/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 30`	Configure the routing process OSPF with process id 10
`(config-router)#network 7.7.7.55/32 area 0`	Define the interface (7.7.7.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 60.1.1.0/24 area 0`	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 1.1.1.54 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 1.1.1.54 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 5.5.5.56 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 5.5.5.56 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 5.5.5.56 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family  vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 1.1.1.54 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#network 7.7.7.55/32`	Advertise the loopback of RTR1 in BGP
`(config-router)#exit`	Exit from router BGP mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 7.7.7.55 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode
`(config)# ip vrf vrf1`	Specify the name of the VRF (vrf1) to be created.

(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 62.1.1.55/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router)# redistribute connected	Redistribute connected routes
(config-router)#end	Exit from router mode into privilege mode

BGP Labeled Unicast with Inter-AS

Topology

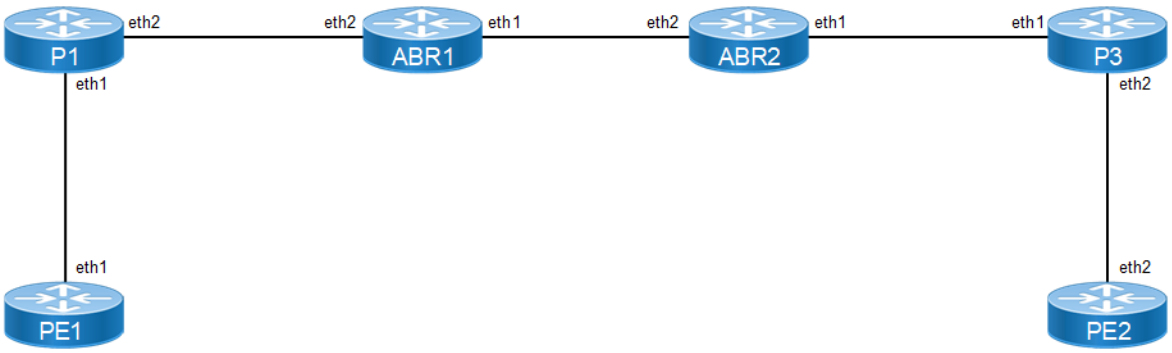

Figure 1-96: BGP Labeled unicast with Inter-AS

Configurations

PE1

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter interface mode
`(config-if)#ip address 1.1.1.54/32 secondary`	Configure the IP address of the interface loopback
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.1.1.54/24`	Configure the IP address of the interface eth1
`(config-if)#label-switching`	Enable label-switching on interface eth1
`(config-if)# enable-ldp ipv4`	Enable LDP process on eth1 interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 10`	Configure the routing process OSPF with process id 10
`(config-router)#network 1.1.1.54/32 area 0`	Define the interface (1.1.1.54/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#exit`	Exit from router ospf mode
`(config)#router bgp 100`	Enter Router BGP mode
`(config-router)#neighbor 7.7.7.55 remote-as 100`	Add loopback ip of PE2 as neighbor with neighbor AS
`(config-router)#neighbor 7.7.7.55 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#neighbor 3.3.3.52 remote-as 100`	Add loopback ip of ABR1 as neighbor with neighbor AS
`(config-router)#neighbor 3.3.3.52 update-source lo`	Update the source for that particular neighbor as loopback interface
`(config-router)#address-family ipv4 labeled-unicast`	Enter into labeled-unicast address family
`(config-router-af)#neighbor 3.3.3.52 activate`	Activate the neighbor inside labeled-unicast address family
`(config-router-af)#exit-address-family`	Exit from address family IPv4 labeled unicast
`(config-router)#address-family  vpnv4 unicast`	Enter into vpnv4 unicast address family
`(config-router-af)#neighbor 7.7.7.55 activate`	Activate the neighbor inside vpnv4 address family
`(config-router-af)#exit-address-family`	Exit from address family vpnv4
`(config-router)#network 1.1.1.54/32`	Advertise the loopback of RTR1 in BGP
`(config-router)#exit`	Exit from router BGP mode
`(config)# router ldp`	Configure Router LDP instance
`(config-router)# transport-address ipv4 1.1.1.54 0`	Configure Transport address for LDP with label space value 0
`(config-router)#exit`	Exit from router mode

(config)# ip vrf vrf1	Specify the name of the VRF (vrf1) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 61.1.1.54/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router)# redistribute connected	Redistribute connected routes
(config-router)#end	Exit from router mode into privilege mode

P1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 2.2.2.23/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.1.1.23/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.23/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 10
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24)) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 10.1.1.0/24 area 0	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 2.2.2.23/32 area 0	Define the interface (2.2.2.23/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance

(config-router)# transport-address ipv4 2.2.2.23 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip route 7.7.7.55/32 20.1.1.52	Specify the destination prefix and mask for the network and a gateway.
(config)# end	Exit from config mode

ABR1

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 3.3.3.52/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 52.56.1.52/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.1.1.52/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure the routing process OSPF with process id 20
(config-router)#network 3.3.3.52/32 area 0	Define the interface (3.3.3.52/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 3.3.3.52 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)#router bgp 100	Enter Router BGP mode
(config-router)#neighbor 1.1.1.54 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 1.1.1.54 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 52.56.1.56 remote-as 100	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family

(config-router-af)#neighbor 1.1.1.54 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 52.56.1.56 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)# neighbor 1.1.1.54 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 1.1.1.54 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 52.56.1.56 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)#exit-address-family	Exit from address family labeled-unicast
(config-router)#exit	Exit from router BGP mode

ABR2

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 5.5.5.56/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.56/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 52.56.1.56/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)#exit	Exit interface mode.
(config)#router ospf 30	Configure the routing process OSPF with process Id 1
(config-router)#network 5.5.5.56/32 area 0	Define the interface (5.5.5.56/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 50.1.1.0/24 area 0	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 5.5.5.56 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)#router bgp 200	Enter Router BGP mode
(config-router)#neighbor 52.56.1.52 remote-as 100	Add neighbor peer ip and neighbor AS
(config-router)#neighbor 7.7.7.55 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 7.7.7.55 update-source lo	Update the source for that particular neighbor as loopback interface

(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 52.56.1.52 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#neighbor 7.7.7.55 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)# neighbor 7.7.7.55 route-reflector-client	Enable Route reflector client for the neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 52.56.1.52 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router-af)# neighbor 7.7.7.55 next-hop-self	Enable next hop self for the particular neighbor inside address family IPv4 labeled unicast
(config-router)#exit	Exit from router BGP mode
(config)#end	Exit from config mode

P2

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 6.6.6.22/32	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth1	Enter interface mode
(config-if)#ip address 50.1.1.22/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.22/24	Configure the IP address of the interface eth2
(config-if)#label-switching	Enable label-switching on interface eth2
(config-if)# enable-ldp ipv4	Enable LDP process on eth2 interface
(config-if)#exit	Exit interface mode
(config)#router ospf 30	Configure the routing process OSPF with process id 20
(config-router)#network 50.1.1.0/24 area 0	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 6.6.6.22/32 area 0	Define the interface (4.4.4.53/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 6.6.6.22 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode

(config)# ip route 1.1.1.54/32 50.1.1.56	Specify the destination prefix and mask for the network and a gateway.
(config)#exit	Exit from Cofig mode

PE2

#configure terminal	Enter the Configure mode.
(config)#interface lo	Enter interface mode
(config-if)#ip address 7.7.7.55/32 secondary	Configure the IP address of the interface loopback
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 60.1.1.55/24	Configure the IP address of the interface eth1
(config-if)#label-switching	Enable label-switching on interface eth1
(config-if)# enable-ldp ipv4	Enable LDP process on eth1 interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 30	Configure the routing process OSPF with process id 10
(config-router)#network 7.7.7.55/32 area 0	Define the interface (7.7.7.55/32) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 60.1.1.0/24 area 0	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#exit	Exit from router ospf mode
(config)#router bgp 200	Enter Router BGP mode
(config-router)#neighbor 1.1.1.54 remote-as 100	Add loopback ip of PE2 as neighbor with neighbor AS
(config-router)#neighbor 1.1.1.54 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#neighbor 1.1.1.54 ebgp-multihop	Enable neighbor connection between two eBGP
(config-router)#neighbor 5.5.5.56 remote-as 200	Add loopback ip of ABR1 as neighbor with neighbor AS
(config-router)#neighbor 5.5.5.56 update-source lo	Update the source for that particular neighbor as loopback interface
(config-router)#address-family ipv4 labeled-unicast	Enter into labeled-unicast address family
(config-router-af)#neighbor 5.5.5.56 activate	Activate the neighbor inside vpnv4 address family
(config-router-af)#exit-address-family	Exit from address family IPv4 labeled unicast
(config-router)#address-family vpnv4 unicast	Enter into vpnv4 unicast address family
(config-router-af)#neighbor 1.1.1.54 allow-ebgp-vpn	Allow eBGP neighbor to be a vpn peer.
(config-router-af)#neighbor 1.1.1.54 activate	Activate the neighbor inside labeled-unicast address family
(config-router-af)#exit-address-family	Exit from address family vpnv4
(config-router)#network 7.7.7.55/32	Advertise the loopback of RTR1 in BGP

(config-router)#exit	Exit from router BGP mode
(config)# router ldp	Configure Router LDP instance
(config-router)# transport-address ipv4 7.7.7.55 0	Configure Transport address for LDP with label space value 0
(config-router)#exit	Exit from router mode
(config)# ip vrf vrf1	Specify the name of the VRF (vrf1) to be created.
(config-vrf)#rd 10:100	Assign a route distinguisher (RD) for the VRF, which is a unique value on the router. The RD value can be in ASN:NN or A.B.C.D:NN format.
(config-vrf)#route-target both 100:300	Specify the 2-Octet AS specific or IPv4 specific Transitive Route-Target extended community attribute.
(config-vrf)#exit	Exit VRF mode, and return to Configure mode.
(config)#interface eth2	Enter interface mode
(config-if)# ip vrf forwarding vrf1	Bind the interface (eth2) to the VRF vrf1
(config-if)# ip address 62.1.1.55/24	Configure the IP address of the interface eth2
(config-if)#exit	Exit interface mode.
(config)#router bgp 100	Enter Router BGP mode
(config-router)# address-family ipv4 vrf vrf1	Enter address family ipv4 vrf mode
(config-router)# redistribute connected	Redistribute connected routes
(config-router)#end	Exit from router mode into privilege mode

BGP Best Path Selection Process

BGP assigns the first valid path as the current best path. BGP then compares the best path with the next path in the list, until BGP reaches the end of the list of valid paths. Below steps provides the rules that are used to determine the best path:

1. Prefer the path with the highest WEIGHT.
2. Prefer the path with the highest LOCAL_PREF.
3. Prefer the path that was locally originated via a network or aggregate BGP subcommand or through redistribution from an IGP.
4. Prefer the path with the shortest AS_PATH.

Note: Beware of these items:

- This step is skipped if user has configured the `bgp bestpath as-path ignore` command.
- If `bgp bestpath compare-confed-aspath` is configured then Prefer the path with the shortest AS_CONFED path.

5. Prefer the path with the lowest ORIGIN type.

Note: Beware of below listed items:

- IGP is lower than Exterior Gateway Protocol (EGP), and EGP is lower than INCOMPLETE.

6. Prefer the path with the lowest multi-exit discriminator (MED).

Note: Beware of these items:

- By default, MED is compared in these cases:
  - MEDs are compared only if the first AS in the AS_SEQUENCE is the same for multiple paths
  - If both the paths are internal as routes
  - If paths have confederation as-path then MEDs are compared only if the first AS in the BGP_AS_CONFED_SEQUENCE is the same for multiple paths
  - To override all above checks, user can configure `bgp always-compare-med` command

7. Prefer eBGP over iBGP paths.

Note: Beware of below listed item:

- EBGP is preferred over IGBP or EBGP is preferred over CONFED.

8. Path learned from LU Address-family is preferred over IPv4 Unicast Address-family.

Note: Beware of these items:

- This is Exception Rule for IPv4 Labeled-Unicast Address-family.
- This rule applicable only for IPv4 Labeled-Unicast/Unicast routes over default VRF.

9. Prefer the path with the lowest IGP metric to the BGP next hop.
10. Determine if multiple paths require installation in the routing table for BGP Multipath and mark the ECMP candidate.
11. When both paths are external, prefer the path that was received first (the oldest one). This step minimizes route-flap, since a newer path won't displace an older one, even if it was the preferred route based on the additional decision criteria below. This has to be enabled by BGP command `bestpath tie-break-on-age`

Note: Beware of these items:

- Skip this step if any of these items are true:
  - If `bgp bestpath compare-routerid` is configured in addition to `bestpath tie-break-on-age`, then this step will be skipped.
  - If the router ID is same for multiple paths, because the routes were received from the same router, then this step will be skipped.

12. Router ID and Originator Id:
    - If `bgp bestpath compare-routerid` is configured, then prefer the route that comes from the BGP router with the lowest Router ID.
    - If `bgp bestpath dont-compare-originator-id` is not configured, prefer the route that comes from the BGP router with the lowest Router ID.

Note: Beware of the below listed item:

- If a path contains Route Reflector (RR) attributes, the Originator ID is substituted for the Router ID in the path selection process.
- If `bgp bestpath dont-compare-originator-id` is configured, prefer the route that comes from the BGP router with the lowest router ID. In this case, Originator ID is not compared even if the RR attribute is present.

13. If the originator or Router ID is the same for multiple paths, prefer the path with the minimum cluster list length.

Prefer the path that comes from the lowest neighbor address.

BGP Dampening

BGP supports route dampening for IPv4 and IPv6 prefixes. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the suppress limit, the advertisement of the route is suppressed. This penalty is decayed according to the configured half time value. Once the penalty is lower than the reuse limit, the route advertisement is unsuppressed. The dampening information is purged from the router once the penalty becomes less than half of the reuse limit.

Topology

In this example, a successful TCP connection is being established between the routers.

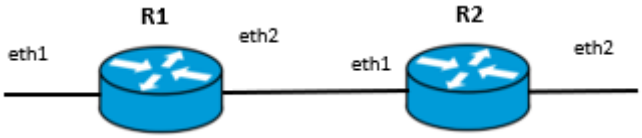

Figure 1-97: BGP dampening

IPv4 Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 1.1.1.1 secondary`	Configure the secondary loopback address
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 101.1.0.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 100`	Configure BGP with the AS number 100
`(config-router)#neighbor 10.1.1.2 remote-as 200`	Define the BGP neighbor, and establish a TCP session. 10.1.1.2 is the IP address of one of the neighbors (R2), and 200 is the neighbor's AS number.
`(config-router)#neighbor 100.1.0.2 remote-as 300`	Define the BGP neighbor, and establish a TCP session. 100.1.0.2 is the IP address of one of the neighbors on interface eth1, and 300 is the neighbor's AS number.
`(config-router)#redistribute connected`	Enable redistribute connected
`(config-router)#exit`	Exit router configure mode

R2

`#configure terminal`	Enter configure mode
`(config)#interface lo`	Enter loopback interface mode
`(config-if)#ip address 2.2.2.2 secondary`	Configure the secondary loopback address
`(config-if)#exit`	Exit interface mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 10.1.1.2/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 101.1.0.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Configure BGP with the AS number 100

`(config-router)#redistribute connected`	Enable redistribute connected
`(config-router)#bgp dampening`	Enable BGP dampening with default values: • Reachability half-life is 15 minutes • Reuse limit is 750: • Suppress limit is 2000 • Max-suppress value is 60 minutes • Un-reachability half-life is 15 minutes
`(config-router)#neighbor 10.1.1.1 remote-as 100`	Define the BGP neighbor, and establish a TCP session. 10.1.1.1 is the IP address of one of the neighbors (R1), and 100 is the neighbor's AS number.
`(config-router)#neighbor 101.1.0.2 remote-as 400`	Define the BGP neighbor, and establish a TCP session. 101.1.0.2 is the IP address of one of the neighbors on eth2 interface, and 400 is the neighbor's AS number.
`(config-router)#neighbor 100.1.0.2 remote-as 300`	Define the BGP neighbor, and establish a TCP session. 100.1.0.2 is the IP address of one of the neighbors of router R1 on eth1 interface, and 300 is the neighbor's AS number.
`(config-router)#neighbor 100.1.0.2 ebgp-multihop 2`	Increase BGP neighbors with ebgp-multihop value

Validation

IPv6 Configuration

R1

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 address 2000:0:0:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 2000:0:2:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 100`	Configure BGP with the AS number 100
`(config-router)#neighbor 2000:0:0:1::2 remote-as 300`	Define the BGP neighbor, and establish a TCP session. 2000:0:0:1::2 is the IP address of one of the neighbors on interface eth1, and 300 is the neighbor's AS number.
`(config-router)#neighbor 2000:0:2:1::2 remote-as 200`	Define the BGP neighbor, and establish a TCP session. 2000:0:2:1::2 is the IP address of one of the neighbors (R2), and 200 is the neighbor's AS number.
`(config-router)#redistribute connected`	Enable redistribute connected
`(config-router)#address-family ipv6 unicast`	Enter IPv6 address family
`(config-router-af)neighbor 2000:0:0:1::2 activate`	Activate BGP neighbor
`(config-router-af)neighbor 2000:0:2:1::2 activate`	Activate BGP neighbor

R2

`#configure terminal`	Enter configure mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 2000:0:2:1::2/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip address 2000:0:1:1::1/64`	Configure the IPv6 address of the interface
`(config-if)#exit`	Exit interface mode
`(config)#router bgp 200`	Configure BGP with the AS number 200
`(config-router)#redistribute connected`	Enable redistribute connected
`(config-router)#neighbor 2000:0:1:1::2 remote-as 400`	Define the BGP neighbor, and establish a TCP session. 2000:0:1:1::2 is the IP address of one of the neighbors on interface eth2, and 400 is the neighbor's AS number.
`(config-router)#neighbor 2000:0:2:1::1 remote-as 100`	Define the BGP neighbor, and establish a TCP session. 2000:0:2:1::1 is the IP address of one of the neighbors (R1), and 100 is the neighbor's AS number.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 address-family
`(config-router-af)#bgp dampening`	Enable BGP dampening with default values: • Reachability half-life is 15 minutes • Reuse limit is 750 • Suppress limit is 2000 • Max-suppress value is 60 minutes • Un-reachability half-life is 15 minutes
`(config-router-af)#neighbor 2000:0:1:1::2 activate`	Activate BGP neighbor
`(config-router-af)#neighbor 2000:0:2:1::1 activate`	Activate BGP neighbor

Validation

CHAPTER 2 BGP4+

This chapter contains basic BGP4+ configuration examples.

For details about the commands used in these examples, see the *Border Gateway Protocol Command Reference*.

Enable iBGP Peering Using a Global Address

This example shows the minimum configuration required to enable BGP on an interface. R1 and R2 are two routers belonging to the same Autonomous System (AS), AS200, connecting to network 3ffe:10::/48. First, specify the IPv6 global address, then define the routing process and AS number to which the routers belong. Configure a fixed Router ID, then, define BGP neighbors to start exchanging routing updates.

Topology

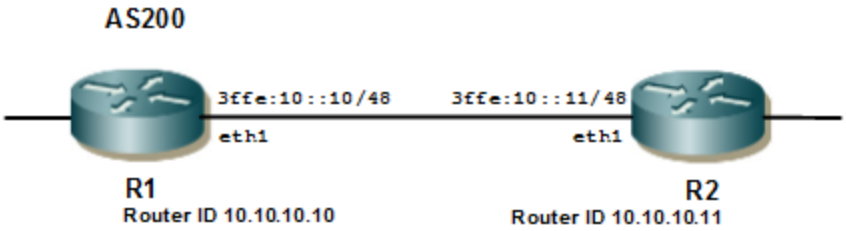

Figure 2-98: iBGP Peering

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure.
`(config-if)#ipv6 address 3ffe:10::10/48`	Specify the IPv6 global address.
`(config-if)#exit`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R1`.
`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::11 remote-as 200`	Define BGP neighbor `R2`, and establish a TCP session by specifying the global IPv6 address (`3ffe:10::11`) and the AS number (`200`) of neighbor R2.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::11 activate`	Activate the neighbor `R2(3ffe:10::11)`, and enable exchange of IPv6 address prefix types with this neighbor.

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface `(eth1)` to configure.
`(config-if)#ipv6 address 3ffe:10::11/48`	Specify the IPv6 global address.
`(config-if)#exit`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R2.
`(config-router)#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remote-as 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the global IPv6 address (`3ffe:10::10`)and the AS number`(200)`of neighbor `R1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor `R1(3ffe:10::10)`, and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Enable iBGP Peering Using Link-local Address

This example shows the minimum configuration required to enable iBGP on an interface. R1 and R2 are two routers belonging to the same AS, AS200, connecting to network fe80::/10. First, define the routing process and AS number to which the routers belong. Configure a fixed Router ID for the BGP4+ routing process, then, define BGP neighbors to start exchanging routing updates.

Topology

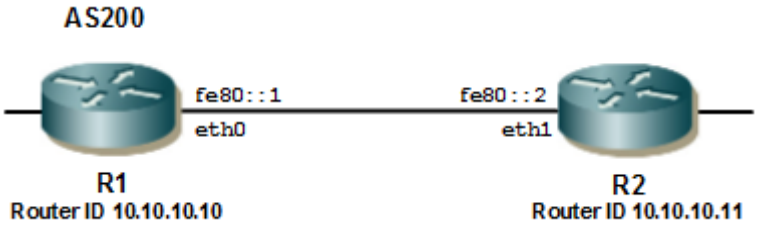

Figure 2-99: iBGP Peering Link-Local Address

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R1`.
`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor fe80::2 remote-as 200`	Define BGP neighbor (R2), and establish a TCP session by specifying the link-local address (`fe80::2`) and the AS number (`200`) of neighbor `R2`.
`(config-router)#neighbor fe80::2 interface eth0`	To specify a link-local neighbor, configure the interface name of the neighbor `fe80::2`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor fe80::2 activate`	Activate the neighbor `R2(fe80::2)`, and enable exchange of IPv6 address prefix types with this neighbor.

R2

`(config)#router bgp 200`	Define the routing process. The number `200` specifies the AS number of `R2`.
`(config-router)#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor fe80::1 remote-as 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the link-local address `R1(fe80::1)` and the AS number (`200`) of neighbor `R1`.
`(config-router)#neighbor fe80::1 interface eth1`	To specify a link-local neighbor, configure the interface name of the neighbor `fe80::1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor fe80::1 activate`	Activate the neighbor `R1(fe80:1)`, and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6, show bgp ipv6 neighbors

Enable eBGP Peering Between Different Autonomous Systems

This example shows the minimum configuration required to enable eBGP on an interface, when the routers belong to different ASs. R1 and R2 are two routers in different ASs, AS200 and AS300 connecting to network 3ffe:10::/64.

Topology

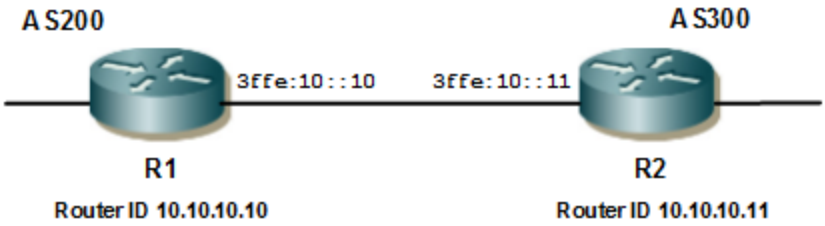

Figure 2-100: BGP Peering - Different AS

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)``#router bgp 200`	Define the routing process. The number `200` specifies the AS number of R1.
`(config-router)``#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)``#neighbor 3ffe:10::11 remote-as 300`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::11`) and the AS number (`300`) of neighbor R2.
`(config-router)``#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)``#neighbor 3ffe:10::11 activate`	Activate the neighbor R2 (`3ffe:10::11`), and enable exchange of IPv6 address prefix types with this neighbor.

R2

`(config)``#router bgp 300`	Define the routing process. The number `300` specifies the AS number of R2.
`(config-router)``#bgp router-id 10.10.10.11`	Configure a fixed Router ID (`10.10.10.11`) for the BGP4+ routing process.
`(config-router)``#neighbor 3ffe:10::10 remote-as 200`	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (`3ffe:10::10`) and the AS number (`200`) of neighbor R1.
`(config-router)``#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)``#neighbor 3ffe:10::10 activate`	Activate the neighbor R1 (`3ffe:10::10`) and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Route-Map

Use route-maps to filter incoming updates from a BGP peer. In this example, a prefix list named `myPrefixList` on R1 is configured to deny entry of any routes with the IP address 3ffe:12::/32. To test the filter, R2 is configured to generate network prefixes 3ffe:11::/48 and 3ffe:12::/48. To verify, use the `show bgp ipv6` command on R1; it displays R1 receiving only the 3ffe:11::/48 network prefix.

Topology

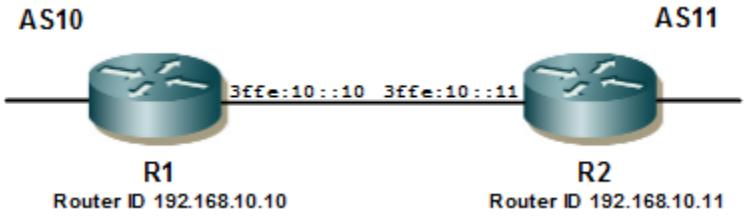

Figure 2-101: Route-Map

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#ipv6 prefix-list myPrefixList seq 5 deny 3ffe:12::/32 ge 48 le 64`	Create an entry in the prefix-list. `myPrefixList` is the name of the map that is created. `5` and `10` specify the sequence number or position of this specific route map. `deny` specifies the packets are to be rejected. `permit` specifies the packets are to be allowed. `48` and `64` are the minimum and maximum prefix lengths, respectively, to be matched.
`(config)#ipv6 prefix-list myPrefixList seq 10 permit any`	Create another entry in the `myPrefixList` map. `10` specifies the sequence number or position of this specific route map. `permit any` specifies accept all packets of any length.
`(config)#route-map myPrefixList permit 1`	Enter Route-map mode.
`(config-route-map)#match ipv6 address prefix-list myPrefixList`	Set the match criteria. In this case, if the route-map name matches `myPrefixList`, the packets from the first sequence will be denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config)#router bgp 10`	Define the routing process. The number `10` specifies the AS number of R1.
`(config-router)#bgp router-id 192.168.10.10`	Configure a fixed Router ID (`192.168.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10:11 remote-as 11`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::11`) and the AS number (`11`) of neighbor R2.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.

`#configure terminal`	Enter Configure mode.
`(config)#ipv6 prefix-list myPrefixList seq 5 deny 3ffe:12::/32 ge 48 le 64`	Create an entry in the prefix-list. `myPrefixList` is the name of the map that is created. `5` and `10` specify the sequence number or position of this specific route map. `deny` specifies the packets are to be rejected. `permit` specifies the packets are to be allowed. `48` and `64` are the minimum and maximum prefix lengths, respectively, to be matched.
`(config)#ipv6 prefix-list myPrefixList seq 10 permit any`	Create another entry in the `myPrefixList` map. `10` specifies the sequence number or position of this specific route map. `permit any` specifies accept all packets of any length.
`(config)#route-map myPrefixList permit 1`	Enter Route-map mode.
`(config-route-map)#match ipv6 address prefix-list myPrefixList`	Set the match criteria. In this case, if the route-map name matches `myPrefixList`, the packets from the first sequence will be denied.
`(config-route-map)#exit`	Exit Route-map mode, and return to Configure mode.
`(config-router-af)#neighbor 3ffe:10::11 activate`	Activate the neighbor `R2(3ffe:10::11)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:10::11 route-map myPrefixList in`	Apply the route-map `myPrefixList` to all incoming routes.
`(config-router-af)#exit-address-family`	Exit Address Family mode, and return to Router mode.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`(config)#router bgp 11`	Define the routing process. The number `11` specifies the AS number of `R2`.
`(config-router)#bgp router-id 192.168.10.11`	Configure a fixed Router ID (`192.168.10.11`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remote-as 10`	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (`3ffe:10::10`) and the AS number (`10`) of neighbor `R1`.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#network 3ffe:11::/48`	Announce the IPv6 network prefix (`3ffe:11::/48`).
`(config-router-af)#network 3ffe:12::/48`	Announce the IPv6 network prefix (`3ffe:12::/48`).
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor `R1(3ffe:10::10)`, and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#exit-address-family`	Exit Address Family mode, and return to `Router` mode.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors, show bgp ipv6, show bgp ipv6 prefix-list

Route Reflector

Use Route Reflectors to reduce the iBGP mesh inside an AS. In this example, R2, R5, and R4 would have to maintain a full mesh among themselves, but by making R5 the Route Reflector, R2 (Client1) has an iBGP session with RR only, and not with R4 (Client 2). The routes learned from R2 are advertised to the other clients, and to iBGP peers outside the cluster; the iBGP routes learned from iBGP peers outside the cluster are advertised to the R2. This reduces the iBGP peer connections in AS1.

Topology

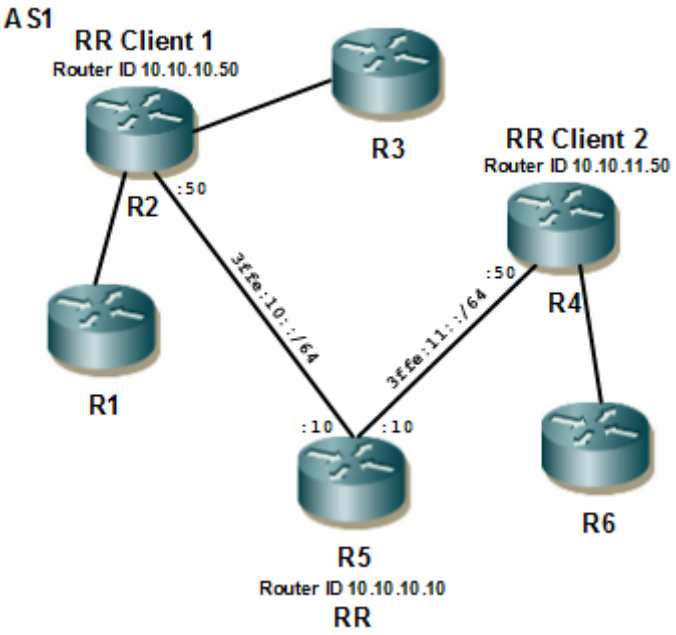

Figure 2-102: BGP4+ Route Reflector

Configuration

RR (R5)

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1`	Define the routing process. The number 1 specifies the AS number of R5 (RR).
`(config-router)#bgp router-id 10.10.10.10`	Configure a fixed Router ID (`10.10.10.10`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::50 remote-as 1`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::50`) and the AS number (`1`) of neighbor R2.

`(config-router)#neighbor 3ffe:11::50 remote-as 1`	Define the BGP neighbor (R4), and establish a TCP session by specifying the IPv6 address (`3ffe:11::50`)and the AS number(`1`) of neighbor R4.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::50 activate`	Activate the neighbor R2(`3ffe:10::50`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:10::50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R2 as its client.
`(config-router-af)#neighbor 3ffe:11::50 activate`	Activate the neighbor R4(`3ffe:11::50`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:11::50 route-reflector-client`	Configure R5 as the Route-Reflector (RR) and neighbor R4 as its client.

RR Client 1 (R2)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of R2 (RR Client 1).
`(config-router)#bgp router-id 10.10.10.50`	Configure a fixed Router ID (`10.10.10.50`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:10::10 remote-as 1`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:10::10`) and the AS number(`1`) of neighbor R5.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::10 activate`	Activate the neighbor (`3ffe:10::10`), and enable exchange of IPv6 address prefix types with this neighbor.

RR Client 2 (R4)

`(config)#router bgp 1`	Define the routing process. The number `1` specifies the AS number of R4 (RR Client 2).
`(config-router)#bgp router-id 10.10.11.50`	Configure a fixed Router ID (`10.10.11.50`) for the BGP4+ routing process.
`(config-router)#neighbor 3ffe:11::10 remote-as 1`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:11::10`) and the AS number(`1`) of the neighbor.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:11::10 activate`	Activate the neighbor (`3ffe:11::10`), and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

Confederations

In this example, AS1 contains three Confederated Autonomous Systems--AS 1000, AS 1001 and AS 1002. To any outside AS, the overall Confederation is a single AS, AS1. Confederation eBGP is run between R2 and R5, and between R5 and R7. R2 is configured so that its local AS is 1000. Its peer connection to R5 is set up like any other eBGP session. The `bgp confederation identifier` command informs the router that it is a member of a Confederation and passes the Confederation ID. The `bgp confederation peers` command lists the member AS to which R2 is connected. The same command tells the BGP process that the eBGP connection is a Confederation eBGP, rather than a normal eBGP.

Topology

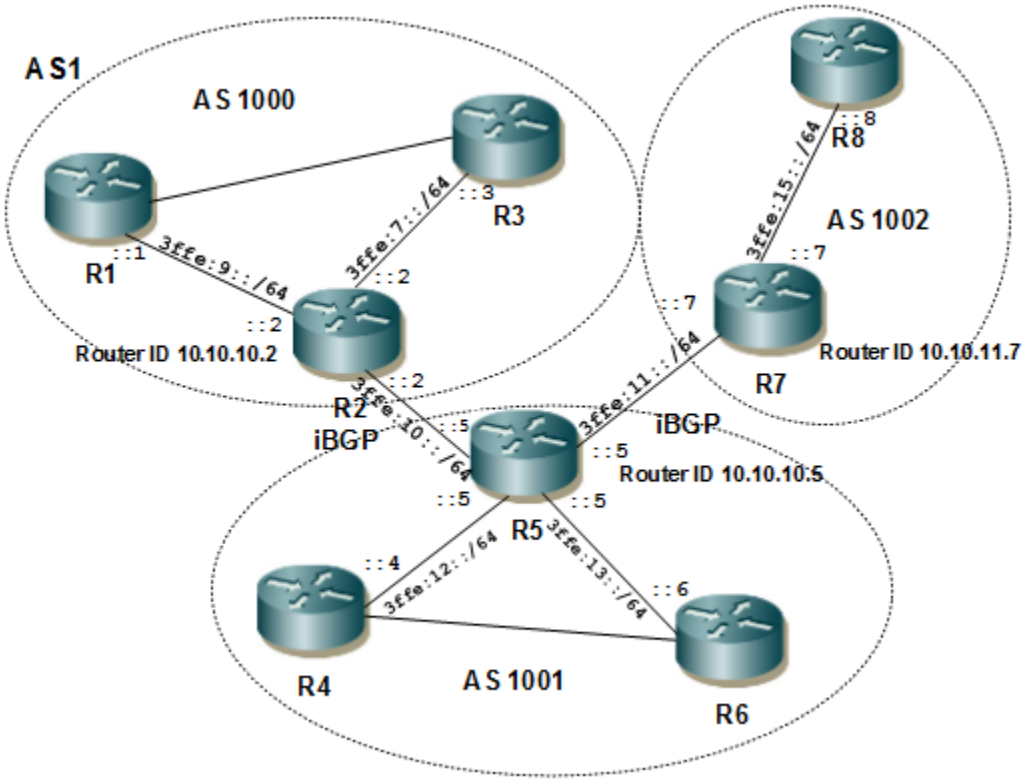

Figure 2-103: BGP4+ Confederations

Configuration

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 1000`	Define the routing process. The number `1000` specifies the AS number of R2.
`(config-router)#bgp router-id 10.10.10.2`	Configure a fixed Router ID (`10.10.10.2`) for the BGP4+ routing process.

`(config-router)#bgp confederation identifier 1`	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
`(config-router)#bgp confederation peers 1001 1002`	Specify ASs `1001` and `1002` as confederation peers, making them members of the Confederation.
`(config-router)#neighbor 3ffe:10::5 remote-as 1001`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:10::5`) and the AS number (`1001`) of neighbor R5.
`(config-router)#neighbor 3ffe:9::1 remote-as 1000`	Define the BGP neighbor (R1), and establish a TCP session by specifying the IPv6 address (`3ffe:9::1`) and the AS number (`1000`) of neighbor R1.
`(config-router)#neighbor 3ffe:7::3 remote-as 1000`	Define the BGP neighbor (R3), and establish a TCP session by specifying the IPv6 address (`3ffe:7::3`) and the AS number (`1000`) of neighbor R3.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:10::5 activate`	Activate neighbor R5 (`3ffe:10::5`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:9::1 activate`	Activate neighbor R1 (`3ffe:9::1`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:7::3 activate`	Activate neighbor R3 (`3ffe:7::3`), and enable exchange of IPv6 address prefix types with this neighbor.

R5

`(config)#router bgp 1001`	Define the routing process. The number `1001` specifies the AS number of R5.
`(config-router)#bgp router-id 10.10.10.5`	Configure a fixed Router ID (`10.10.10.5`) for the BGP4+ routing process.
`(config-router)#bgp confederation identifier 1`	Specify the BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
`(config-router)#bgp confederation peers 1000 1002`	Specify ASs `1001` and `1002` as confederation peers, making them members of the Confederation.
`(config-router)#neighbor 3ffe:10::2 remote-as 1000`	Define the BGP neighbor (R2), and establish a TCP session by specifying the IPv6 address (`3ffe:10::2`) and the AS number (`1000`) of neighbor R2.
`(config-router)#neighbor 3ffe:11::7 remote-as 1002`	Define the BGP neighbor (R7), and establish a TCP session by specifying the IPv6 address (`3ffe:11::7`) and the AS number (`1002`) of neighbor R7.
`(config-router)#neighbor 3ffe:12::4 remote-as 1001`	Define the BGP neighbor (R4), and establish a TCP session by specifying the IPv6 address (`3ffe:12::4`) and the AS number (`1001`) of neighbor R4.
`(config-router)#neighbor 3ffe:13::6 remote-as 1001`	Define the BGP neighbor (R6), and establish a TCP session by specifying the IPv6 address (`3ffe:13::6`) and the AS number (`1001`) of neighbor R6.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.

`(config-router-af)#neighbor 3ffe:10::2 activate`	Activate the neighbor R2(`3ffe:10::2`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:11::7 activate`	Activate the neighbor R7(`3ffe:11::7`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:12::4 activate`	Activate the neighbor R4(`3ffe:12::4`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:13::6 activate`	Activate the neighbor R6(`3ffe:13::6`), and enable exchange of IPv6 address prefix types with this neighbor.

R7

`(config)#router bgp 1002`	Define the routing process. The number `1002` specifies the AS number of R7.
`(config-router)#bgp router-id 10.10.11.7`	Configure a fixed Router ID (`10.10.11.7`) for the BGP4+ routing process.
`(config-router)#bgp confederation identifier 1`	Specify BGP Confederation Identifier (1). To others, the group will appear as a single AS, and the identifier as its AS number.
`(config-router)#bgp confederation peers 1000 1001`	Specify ASs `1000` and `1001` as confederation peers, making them members of the Confederation.
`(config-router)#neighbor 3ffe:11::5 remote-as 1001`	Define the BGP neighbor (R5), and establish a TCP session by specifying the IPv6 address (`3ffe:11::5`)and the AS number(`1001`)of neighbor R5.
`(config-router)#neighbor 3ffe:15::8 remote-as 1002`	Define the BGP neighbor (R8), and establish a TCP session by specifying the IPv6 address (`3ffe:15::8`)and the AS number(`1002`)of neighbor R8.
`(config-router)#address-family ipv6`	Enter Address Family mode for configuring routing sessions that use IPv6 address prefixes.
`(config-router-af)#neighbor 3ffe:11::5 activate`	Activate the neighbor R5(`3ffe:11::5`), and enable exchange of IPv6 address prefix types with this neighbor.
`(config-router-af)#neighbor 3ffe:15::8 activate`	Activate the neighbor R8(`3ffe:15::8`), and enable exchange of IPv6 address prefix types with this neighbor.

Validation

show bgp ipv6 summary, show bgp ipv6 neighbors

BGP4+ Graceful Restart

Using BGP+ graceful restart, the data-forwarding plane of a router can continue to process and forward packets, even if the control plane (which is responsible for determining best paths) fails.

Topology

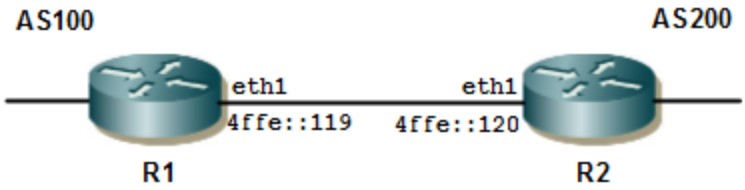

Figure 2-104: BGP4+ Graceful Restart

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#neighbor 4ffe::120 remote-as 200`	Specify the neighbor's IP address (`4ffe::120`) and the ASN value of the neighbor (`200`).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::120 activate`	Specify the neighbor's IPv6 address (`4ffe::120`), and activate the neighbor.
`(config-router-af)#neighbor 4ffe::120 capability graceful-restart`	Specify the neighbor's IPv6 address (`4ffe::120`) for which the graceful restart capability is supported.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#bgp graceful-restart restart-time 120`	Configure the maximum time (`120`) required for neighbor(s) to restart.
`(config-router)#bgp graceful-restart stalepath-time 120`	Configure the maximum time (`120`) to retain stale paths from the restarting neighbor(s).
`(config-router)#neighbor 4ffe::119 remote-as 100`	Specify the neighbor's IP address (`4ffe::119`) and the ASN value of the neighbor (`100`).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::119 activate`	Specify the neighbor's IPv6 address (`4ffe::119`), and activate the neighbor.
`(config-router-af)#neighbor 4ffe::119 capability graceful-restart`	Specify the neighbor's IPv6 address (`4ffe::119`) for which the graceful restart capability is supported.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show bgp ipv6, show ipv6 route database bgp, show ipv6 route database, show ipv6 route

Configure BGP4+ Distance

Administrative distance in BGP+ can be configured for a specific address family.

This example shows configuring the BGP administrative distance for the IPv6 address family.

Topology

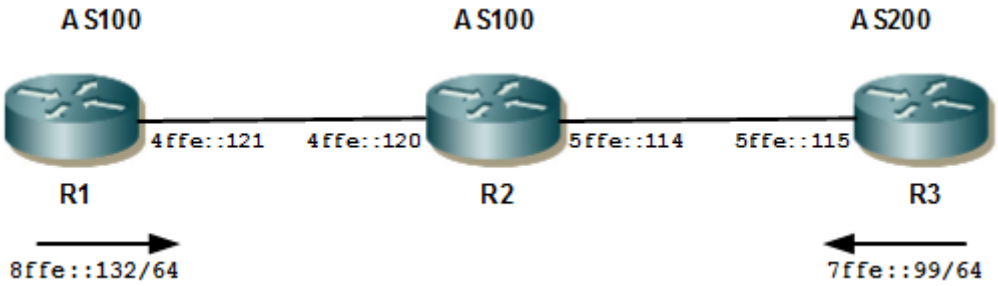

Figure 2-105: BGP4+ Distance

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#network 8ffe::132/64`	Specify the network to be advertised by the BGP routing process.
`(config-router)#neighbor 4ffe::120 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#neighbor 4ffe::120 activate`	Activate the IPv6 neighbor.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#neighbor 4ffe::121 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#neighbor 5ffe::115 remote-as 200`	Specify the neighbor's IP address and the ASN value of another neighbor.

`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#aggregate-address 2ffe::102/64 summary-only`	Configure an IPv6 non-AS-set aggregate route on R2. The local distance will be applied to this route.
`(config-router-af)#neighbor 4ffe::121 activate`	Activate the IPv6 neighbor.
`(config-router-af)#neighbor 5ffe::115 activate`	Activate the IPv6 neighbor.
`(config-router-af)#distance 12 13 11`	Configure the administrative distance for external, internal, and local routes received in IPv6 Address-Family mode.

R3

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#network 7ffe::99/64`	Specify the network to be advertised by the BGP routing process.
`(config-router)#neighbor 5ffe::114 remote-as 100`	Specify the neighbor's IP address and ASN value.
`(config-router)#address-family ipv6 unicast`	Enter IPv6 Address-Family mode.
`(config-router-af)#neighbor 5ffe::114 activate`	Activate the IPv6 neighbor.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show ipv6 route database bgp, show ipv6 route database, show ipv6 route, show bgp ipv6

BGP4+ Graceful Reset

The graceful restart mechanism for BGP+ session reset (the BGP+ daemon is not restarted) is used so that any changes in network configuration do not affect packet forwarding. The `bgp graceful-restart graceful-reset` CLI invokes graceful restart when a configuration change forces a peer reset. Graceful restart is invoked only when these CLI configuration changes force a peer reset.

Topology

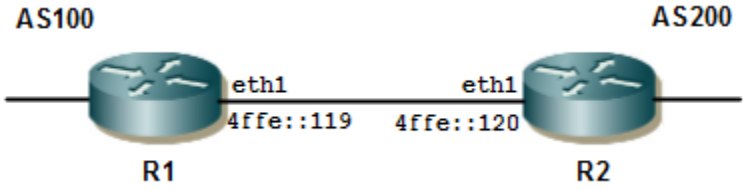

Figure 2-106: BGP4+ Graceful Reset

Configuration

R1

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 100`	Assign the ASN value (`100`) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`(config-router)#neighbor 4ffe::120 remote-as 200`	Specify the neighbor's IP address (`4ffe::120`) and the ASN value of the neighbor (`200`).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::120 activate`	Specify the neighbor's IPv6 address(`4ffe::120`), and activate the neighbor.
`(config-router-af)#neighbor 4ffe::120 capability graceful-restart`	Specify the neighbor's IPv6 address (`4ffe::120`) for which the graceful restart capability is supported.

R2

`#configure terminal`	Enter Configure mode.
`(config)#router bgp 200`	Assign the ASN value (`200`) to the router.
`(config-router)#bgp graceful-restart`	Enable BGP graceful restart support.
`(config-router)#bgp graceful-restart graceful-reset`	Configure to invoke graceful restart when a configuration change forces a peer reset.
`(config-router)#neighbor 4ffe::119 remote-as 100`	Specify the neighbor's IP address (`4ffe::119`) and the ASN value of the neighbor (`100`).
`(config-router)#address-family ipv6 unicast`	Exchange the IPv6 capabilities, and switch the mode to the IPv6 address family.
`(config-router-af)#neighbor 4ffe::119 activate`	Specify the neighbor's IPv6 address(`4ffe::119`), and activate the neighbor.
`(config-router-af)#neighbor 4ffe::119 capability graceful-restart`	Specify the neighbor's IPv6 address (`4ffe::119`) for which the graceful restart capability is supported.

Validation

show bgp ipv6 summary, show ip bgp neighbors, show bgp ipv6, show ipv6 route database bgp, show ipv6 route database, show ipv6 route

CHAPTER 3 BGP Graceful Restart Configuration

During a BGP restart, all BGP peers detect that a session had gone down and come back up. OcNOS invalidates the associated portion of the IP forwarding cache, does a BGP route re-computation, and generates BGP routing updates. The forwarding tables become corrupted and unstable.

Graceful restart helps minimize these negative effects on routing caused by a BGP restart by allowing the restarting BGP router to temporarily retain routing information and continue forwarding packets while BGP restarts. In this way, even while a router rebuilds routing and forwarding tables, the router continues to operate across the TCP connection.

Graceful restart allows a restarting router, and its neighbors, to continue forwarding packets, without disrupting network performance. Because neighboring routers assist in the restart, the restarting router can quickly resume full operation.

The graceful restart capability extends to the case when a configuration change forces a peer reset.

Graceful reset is a refinement of graceful restart to help ensure smooth restarts when a configuration change forces BGP peer reset.

In addition, graceful restart is available for BGP with MPLS, when BGP is used to distribute MPLS-VPN labels. Without the graceful restart capability, when BGP distributes MPLS-VPN labels, a BGP route withdrawal accompanies the associated label withdrawal. This causes a routing flap and a BGP route re-computation, generating BGP routing updates, and unnecessary disruption in the forwarding tables. Also, when BGP goes down, label-switched routers (LSRs) clear FEC label bindings (for VPN routes) learned from the restarting LSR. As a result, MPLS forwarding is impacted across the restart.

The graceful restart and graceful reset capabilities provide a way to save MPLS forwarding states in NSM. These capabilities also synchronize with the VRF table when BGP goes down in the control plane. This feature is supported for the VPNv4 address family.

Topology

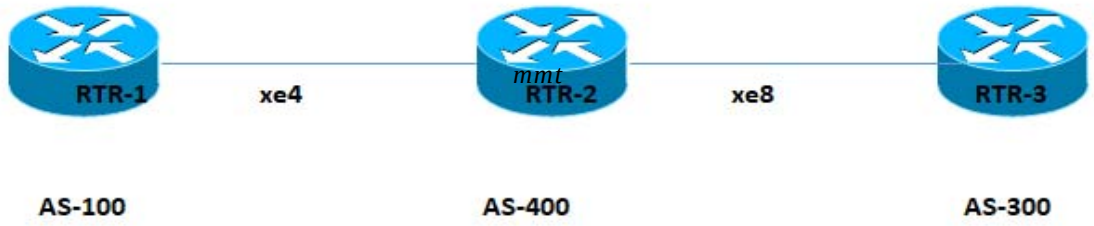

Figure 3: Device topology for BGP in VR/VRF

RTR1

`#configure terminal`	Enter Configuration mode.
`(config)#interface lo`	Enter interface mode for loopback.
`(config-if)#ip address 1.1.1.11.1.1.1/32 secondary`	Configure ip address on loopback.

(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode for eth2.
(config-if)#ip address 10.10.10.1/24	Configure ip address on eth2.
(config-if)#exit	Exit interface mode for eth2.
(config)# router bgp 100	Enter router bgp mode.
(config-router)# bgp router-id 1.1.1.11.1.1.1	Configure bgp router-id same as loopback ip address.
(config-router)# bgp graceful-restart	Configure Graceful Restart for BGP.
(config-router)#redistribute connected	Redistributing connected Routes inside BGP.
(config-router)# neighbor 10.10.10.2 remote-as 400	Configure Neighbor for AS-400.
(config-router)# neighbor 10.10.10.2 capability graceful-restart	Configure GR capability inside router bgp.
(config-router)#end	Exit router BGP mode.

RTR2

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ip address 2.2.2.22.2.2.2/32 second-ary	Configure ip address on loopback.
(config-if)#exit	Exit interface mode.
(config)#interface xe4	Enter interface mode for eth1.
(config-if)#ip address 10.10.10.2/24	Configure ip address on eth1.
(config-if)#exit	Exit interface mode for eth1.
(config)#interface xe8	Enter interface mode for eth2.
(config-if)#ip address 20.20.20.1/24	Configure ip address on eth2.
(config-if)#exit	Exit interface mode for eth2.
(config)#router bgp 400	Enter router BGP mode.
(config-router)# bgp router-id 2.2.2.22.2.2.2	Configure bgp router-id same as loopback ip address.
(config-router)# bgp graceful-restart	Configure Graceful Restart for BGP.
(config-router)#redistribute connected	Redistributing connected Routes inside BGP.
(config-router)# neighbor 10.10.10.1 remote-as 100	Configure Neighbor for AS-100.
(config-router)# neighbor 10.10.10.1 capability graceful-restart	Configure GR capability inside router bgp.
(config-router)# neighbor 20.20.20.2 remote-as 300	Configure Neighbor for AS-300.
(config-router)# neighbor 20.20.20.2 capability graceful-restart	Configure GR capability inside router bgp
(config-router)#end	Exit router ospf mode.

RTR3

#configure terminal	Enter Configuration mode.
(config)#interface lo	Enter interface mode for loopback.
(config-if)#ip address 3.3.3.33.3.3.3/32 secondary	Configure ip address on loopback.
(config-if)#exit	Exit interface mode.
(config)#interface xe8	Enter interface mode for eth2.
(config-if)#ip address 20.20.20.2/24	Configure ip address on eth2.
(config-if)#exit	Exit interface mode for eth2.
(config)# router bgp 300	Enter router BGP mode.
(config-router)# bgp router-id 3.3.3.33.3.3.3	Configure bgp router-id same as loopback ip address.
(config-router)# bgp graceful-restart	Configure Graceful Restart for BGP.
(config-router)#redistribute connected	Redistributing connected Routes inside BGP.
(config-router)# neighbor 20.20.20.1 remote-as 400	Configure Neighbor for AS-400.
(config-router)# neighbor 20.20.20.1 capability graceful-restart	Configure GR capability inside router bgp.
(config-router)#end	Exit router BGP mode.

CHAPTER 4 OSPFv2

This chapter contains basic OSPFv2 (Open Shortest Path First) configuration examples.

Enable OSPF on an Interface

The diagram shows the minimum configuration required to enable OSPF on an interface. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

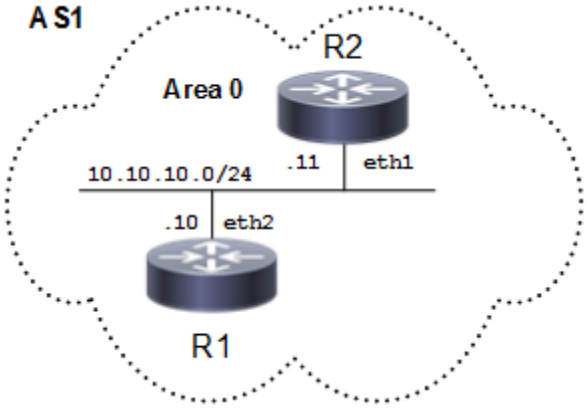

Figure 4-1: Basic OSPF Topology

R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 200`	Configure the routing process, and specify the Process ID (`200`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

Validation

R1

```
#show ip ospf
 Routing Process "ospf 100" with ID 10.12.26.88
 Process uptime is 1 minute
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 0 secs 0 msecs
 Minimum hold time for LSA throttle 5 secs 0 msecs
 Maximum wait time for LSA throttle 5 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1
    Area 0.0.0.0 (BACKBONE)

C  10.10.10.0/24 [1] is directly connected, eth1, Area 0.0.0.0
```

Set Priority

This example shows how to set the priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured to have a priority of 10, which is higher than the default priority (1) of R1 and R2; making it the DR.

Topology

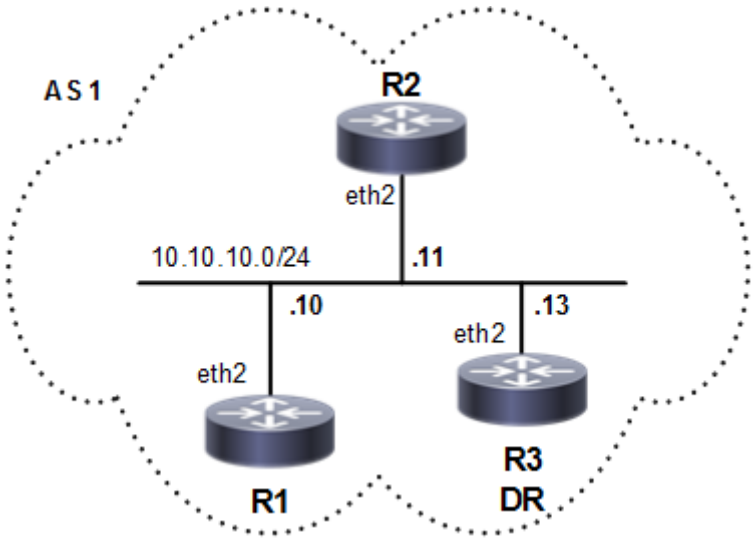

Figure 4-2: Set OSPF Priority

R3

`#configure terminal`	Enter configure mode
`(config)``#interface eth2`	Enter interface mode.
`(config-if)``#ip ospf priority 10`	Specify the router priority to a higher priority (10) to make R3 the Designated Router (DR).
`(config-if)``#exit`	Exit interface mode.
`(config)``#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)``#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

R1

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 200`	Configure the routing process, and specify the Process ID (`200`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, Interface eth0 is in Area 0, and Interface eth1 is in Area 1.

Topology

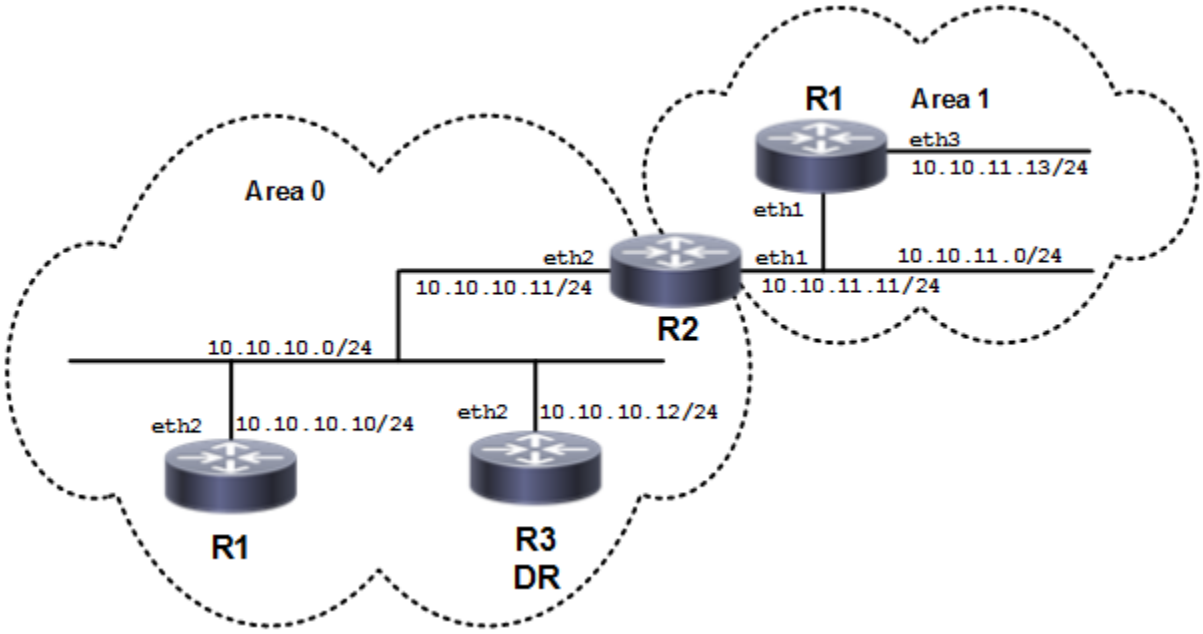

Figure 4-3: OSPF ABR Topology

Configuration

R2

`#configure terminal`	Enter configure mode
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.
`(config-router)#network 10.10.11.0/24 area 1`	Define the other interface `(10.10.11.0/24)` on which OSPF runs, and associate the area ID `(1)` with the interface.

Redistribute Routes into OSPF

In this example, the configuration causes BGP routes to be imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

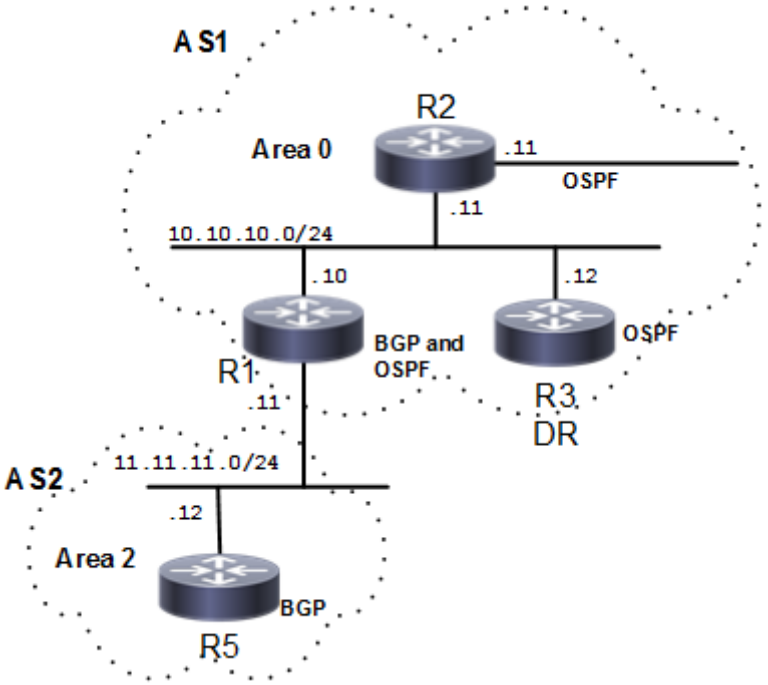

Figure 4-4: Redistribute Routes

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#redistribute bgp`	Specify redistributing routes from other routing protocol (BGP) into OSPF.

Validation

```
#show ip ospf route

OSPF process 100:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

C  10.10.9.0/24 [1] is directly connected, eth2, Area 0.0.0.0
C  10.10.10.0/24 [1] is directly connected, eth3, Area 0.0.0.0
O  10.10.11.0/24 [101] via 10.10.10.11, eth3, Area 0.0.0.0
C  10.10.12.0/24 [1] is directly connected, eth1, Area 0.0.0.0
O  10.10.13.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
O  10.10.14.0/24 [102] via 10.10.10.11, eth3, Area 0.0.0.0
```

Cost

A route can be made the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 1. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 1+100 = 101

R3: 1+150 = 151

Therefore, R1 chooses R2 as its next hop to destination 10.10.14.0/24 because it has the lower cost.

Topology

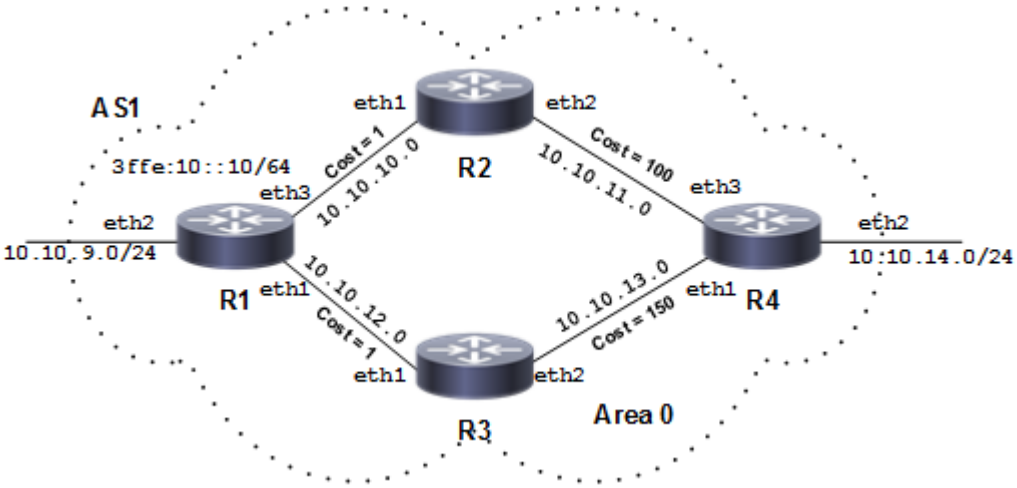

Figure 4-5: Configure Cost Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.9.0/24 area 0`
`(config-router)#network 10.10.10.0/24 area 0`
`(config-router)#network 10.10.12.0/24 area 0`
	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID `0` specifies the backbone area).

R2

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf cost 100`	Set the OSPF cost of this link to `100`.
`(config-if)#exit`	Exit interface mode.

`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

R3

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf cost 150`	Set the OSPF cost of this link to `100`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.12.0/24 area 0` `(config-router)#network 10.10.13.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

R4

`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.11.0/24 area 0`
`(config-router)#network 10.10.13.0/24 area 0`
`(config-router)#network 10.10.14.0/24 area 0`
	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface.

Validation

Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn, disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

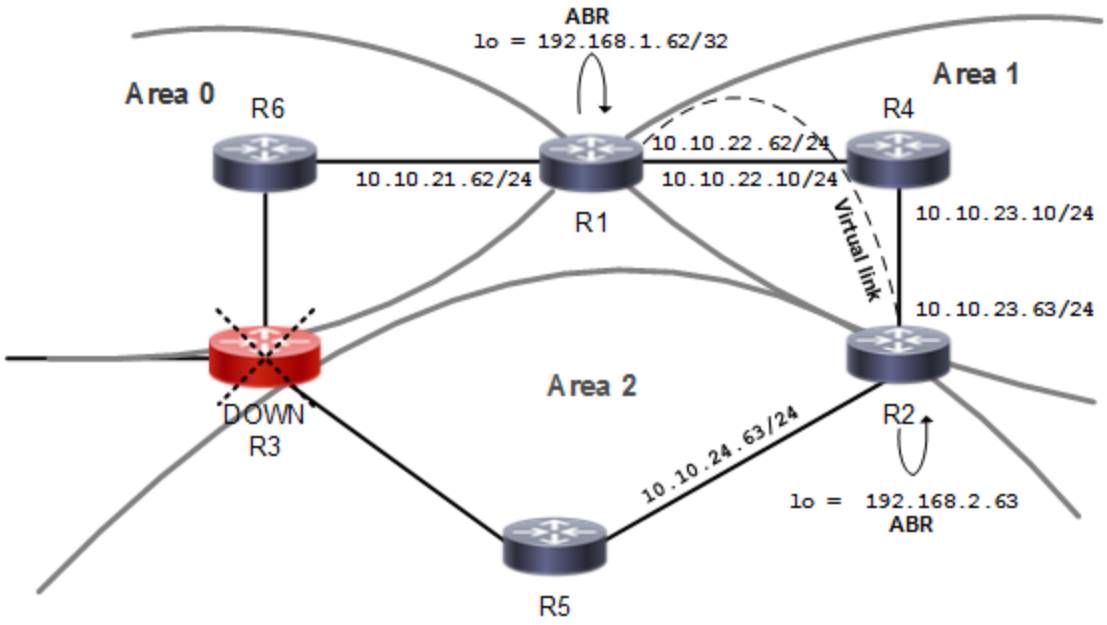

Figure 4-6: Virtual Links Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.1.62/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#ospf router-id 192.168.1.62`	Configure the OSPF Router ID (`192.168.1.62`) for this router.
`(config-router)#network 10.10.21.0/24 area 0` `(config-router)#network 10.10.22.0/24 area 1`	Define interfaces on which OSPF runs, and associate the area IDs (`0 and 1`) with the interface.
`(config-router)#area 1 virtual-link 192.168.2.63`	Configure a virtual link between this router R1 and R2 (Router ID `192.168.2.63`) through transit area 1.

R2

`(config)#interface lo`	Specify loopback as the interface you want to configure.
`(config-if)#ip address 192.168.2.63/32`	Configure the IP address on this interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#ospf router-id 192.168.2.63`	Configure the OSPF Router ID (`192.168.1.63`) for this router.

`(config-router)#network 10.10.23.0/24 area 1`
`(config-router)#network 10.10.24.0/24 area 2`
`(config-router)#network 192.168.2.63/32 area 2`
	Define interfaces on which OSPF runs, and associate the area IDs (`1` and `2`) with the interface.

`(config-router)#area 1 virtual-link 192.168.1.62`	Configure a virtual link between this router R2 and R1 (Router ID `192.168.2.62`) through transit area `1`.

OSPF Authentication

There are three types of OSPF authentications--Null (Type 0), Simple Text (Type 1), and MD5 (Type 2). With Null authentication, routing exchanges over the network are not authenticated. In Simple Text authentication, the authentication type is the same for all routers that communicate using OSPF in a network. For MD5 authentication, configure a key and a key ID on each router. The router generates a message digest on the basis of the key, key ID, and OSPF packet, and adds it to the OSPF packet.

The authentication type can be configured on a per-interface basis or a per-area basis. Additionally, Interface and Area authentication can be used together. Area authentication is used for an area, and interface authentication is used for a specific interface in the area. If the Interface authentication type is different from the Area authentication type, the Interface authentication type overrides the Area authentication type. If the Authentication type is not specified for an interface, the Authentication type for the area is used. The authentication command descriptions contain details of each type of authentication.

In the example below, R1 and R2 are configured for both the interface and area authentications. The authentication type of interface eth1 on R1 and interface eth0 on R2 is MD5 mode, and is defined by the area authentication command; however, the authentication type of interface eth2 on R1 and interface eth1 on R2 is plain text mode, and is defined by the `ip ospf authentication` command. This interface command overrides the `area authentication` command.

Topology

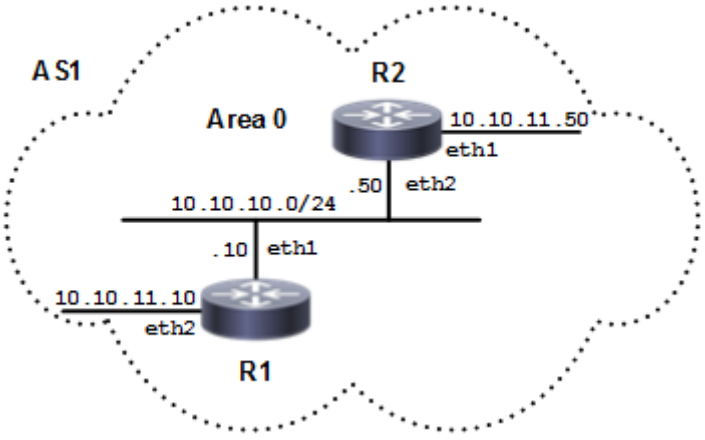

Figure 4-7: OSPF Authentication Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip ospf message-digest-key 1 md5 0 test`	Register the MD5 key test for OSPF authentication. The key ID is 1.
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf authentication`	Enable the OSPF packet to use text authentication on the current interface (`eth2`).
`(config-if)#ip ospf authentication-key 0 test`	Specify an OSPF authentication password (`test`) for the neighboring routers.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 100`	Configure the routing process, and specify the Process ID (`100`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0` `(config-router)#network 10.10.11.0/24 area 0`	Define interfaces on which OSPF runs, and associate the area ID `(0)` with the interface (area ID 0 specifies the backbone area).
`(config-router)#area 0 authentication message-digest`	Enable MD5 authentication on area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip ospf message-digest-key 1 md5 0 test`	Register MD5 key test for OSPF authentication. The key ID is 1.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip ospf authentication`	Enable the OSPF packet to use text authentication on the current interface (`eth1`).
`(config-if)#ip ospf authentication-key 0 test`	Specify an OSPF authentication password `test` for the neighboring routers.

Multiple OSPF Instances

By using multiple OSPF instances, OSPF routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

To configure multiple OSPF instances, perform the following procedures referring to the topology diagram below:

1. Enable OSPF on an interface.
2. Enable multiple instances.
3. Configure redistribution among multiple instances.

   Note: Optionally, redistribution can be configured with the metric, type or route-map options.

Topology

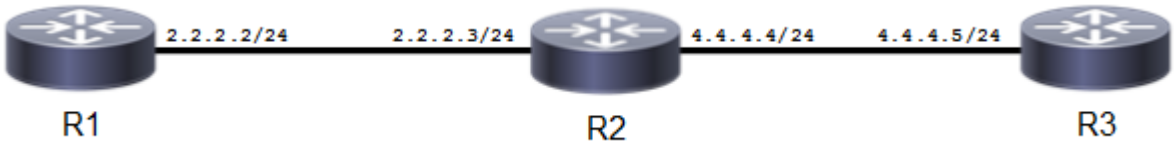

Figure 4-8: Multiple OSPF Instances

Enable Multiple OSPF Instances on a Router

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPF.

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ip address 2.2.2.2/24`	Specify the IP address of the interface.
`(config-if)#no shutdown`	Activate the interface.

(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure an OSPF instance with an instance ID of 10.
(config-router)#router-id 5.5.5.5	Configure the router ID to use on this instance.
(config-router)#network 2.2.2.0/24 area 0	Advertise the network with the area ID.

R2

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ip address 2.2.2.3/24	Specify the IP address of the interface.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 10	Configure an OSPF instance with an instance ID of 10.
(config-router)#router-id 6.6.6.6	Configure the router ID to use on this instance.
(config-router)#network 2.2.2.0/24 area 0	Advertise the network with the area ID.
(config-router)#exit	Exit router mode.
(config)#interface eth2	Enter interface mode for eth2.
(config-if)#ip address 4.4.4.4/24	Configure the IP address.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 15	Configure an OSPF instance with an instance ID of 15.
(config-router)#router-id 8.8.8.8	Configure the router ID to use on this instance.
(config-router)#network 4.4.4.0/24 area 0	Advertise the network with the area ID.

R3

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ip address 4.4.4.5/24	Configure the IP address.
(config-if)#no shutdown	Activate the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 15	Configure an OSPF instance with an instance ID of 15.
(config-router)#router-id 7.7.7.7	Configure the router ID to use on this instance.
(config-router)#network 4.4.4.0/24 area 0	Advertise the network with the area ID.

R3#sh ip ospf neighbor

Total number of full neighbors: 1
OSPF process 15 VRF(default):
Neighbor ID     Pri   State           Dead Time   Address         Interface
Instance ID
8.8.8.8           1   Full/DR         00:00:30    4.4.4.4         eth1
0
```

Redistribute among Multiple Instances

In this example, routes of one instance are redistributed to another instance to enable ping from R1 to R3 or vice versa; and R2 redistributes routes from one instance to another.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID `15`.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10`	Redistribute instance `10` routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID `10`.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15`	Redistribute instance `15` routes.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `10`.

Redistribute with the Metric Option

In this example, on R3, R1 and R2 have each other's routes with a metric of 100.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID `15`.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10 metric 100`	Redistribute instance `10` routes with metric `100`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID `10`.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric 100`	Redistribute instance `15` routes with metric `100`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `10`.

Redistribute with the Type Option

In this example, on R3, R1 has R3 routes as type 2, and R2 has R1 routes as type 1.

R2

`(config)#router ospf 15`	Configure an OSPF instance with instance ID `15`.
`(config-router)#router-id 8.8.8.8`	Configure the router ID.
`(config-router)#redistribute ospf 10 metric-type 1`	Redistribute instance `10` routes with metric-type `1`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `15`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 10`	Configure an OSPF instance with instance ID `10`.
`(config-router)#router-id 6.6.6.6`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric-type 2`	Redistribute instance `15` routes with type `2`.
`(config-router)#redistribute connected`	Redistribute connected routes to instance `10`.

Redistribute with the Route-Map Option

R2

`(config)#route-map 1 permit 10`	Enter route-map mode, specifying route-map ID.
`(config-route-map)#set metric 100`	Set metric value.
`(config-route-map)#set metric-type type-2`	Set metric-type.
`(config-route-map)#exit`	Exit route-map mode.

(config)#route-map 2 permit 10	Enter route-map mode, specifying route-map ID.
(config-route-map)#set metric 200	Set metric value.
(config-route-map)#set metric-type type-1	Set metric-type.
(config-route-map)#exit	Exit route-map mode.
(config)#router ospf 15	Configure an OSPF instance with instance ID 15.
(config-router)#router-id 8.8.8.8	Configure the router ID.
(config-router)#redistribute ospf 10 route-map 1	Redistribute instance 10 routes with route map 1.
(config-router)#redistribute connected	Redistribute connected routes to instance 15.
(config-router)#exit	Exit Router mode, and return to Configure mode.
(config)#router ospf 10	Configure an OSPF instance with instance ID 10.
(config-router)#router-id 6.6.6.6	Configure the router ID.
(config-router)#redistribute ospf 15 route-map 2	Redistribute instance 15 routes with route map 2.
(config-router)#redistribute connected	Redistribute connected routes to instance 10.

Multiple OSPF Instances on Same Subnet

Multiple OSPF instances can be configured on the same subnet. The OSPF instance ID supports separate OSPFv2 protocol instances. With this feature, an adjacency is formed only if the received packet's instance ID is the same as the instance ID configured for that interface.

Topology

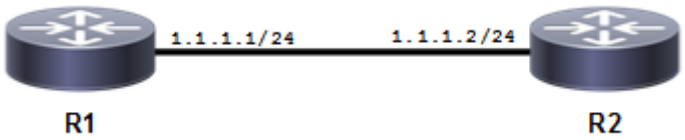

Figure 4-9: Multiple Instances on the Same Subnet

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#enable ext-ospf-multi-inst`	Enable multiple-instance capability.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 1`	Advertise the network in Area 0 with an instance ID of 1.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 2`	Configure an OSPF instance with an instance ID of 2.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 2`	Advertise the network in Area 0 with an instance ID of 2.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#enable ext-ospf-multi-inst`	Enable multiple-instance capability.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 1`	Advertise the network in Area 0 with an instance ID of 1.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#router ospf 2`	Configure an OSPF instance with an instance ID of 2.
`(config-router)#network 1.1.1.0/24 area 0 instance-id 2`	Advertise the network in Area 0 with an instance ID of 2.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

Multi-Area Adjacency Configuration

Multiple OSPF areas for a same subnet can be configured between two routers. In the diagram below, OSPF is enabled between R2 and R3 under area 0 and area 1, though there is only one link available between these two routers. Multi-area adjacency allows establishing adjacency on multiple areas between the Area Border Routers (ABRs). The specified interface of the ABR is associated with multiple areas.

Each multi-area-adjacency internally implements point-to-point functionality, once the adjacency reaches the FULL state. This point-to-point link provides a topological path for that area. Like a virtual link, there is no restriction for multi-area adjacency that the packets always go through the backbone.

Topology

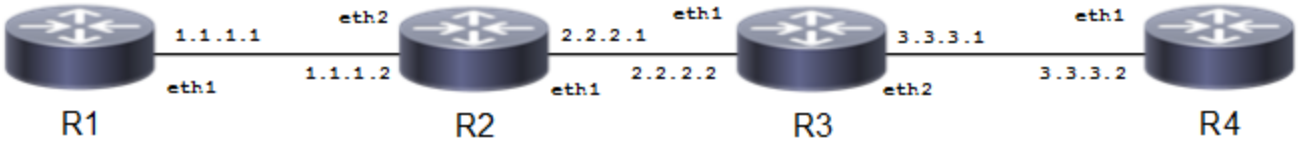

Figure 4-10: One Subnet with Multiple OSPF Areas

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area 1.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of 1.
`(config-router)#network 1.1.1.0/24 area 1`	Configure OSPF between R1 and R2 under area 1.
`(config-router)#network 2.2.2.0/24 area 0`	Configure OSPF between R2 and R3 under area 0.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.1/24`	Configure IP address on the interface.
`(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.2`	Configure multi area adjacency.
`(config-if)#exit`	Exit interface mode.

R3

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of `1`.
`(config-router)#network 2.2.2.0/24 area 0`	Configure OSPF between R2 and R3 under area `0`.
`(config-router)#network 3.3.3.0/24 area 1`	Configure OSPF between R3 and R4 under area `1`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/24`	Configure IP address on the interface.
`(config-if)#ip ospf 1 multi-area 0.0.0.1 neighbor 2.2.2.1`	Configure multi area adjacency.
`(config-if)#exit`	Exit interface mode.

R4

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure an OSPF instance with an instance ID of `1`.
`(config-router)#network 3.3.3.0/24 area 1`	Configure OSPF between R3 and R4 under area `1`.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.

Validation

R2

LSA Throttling

This section contains basic OSPF LSA throttling configuration examples.

The OSPF Link-State Advertisement (LSA) throttling feature provides a mechanism to dynamically slow down link-state advertisement (LSA) updates in OSPF during times of network instability. It also allows faster OSPF convergence by providing LSA rate limiting in milliseconds, when the network is stable.

How OSPF LSA Throttling Works

The `timers throttle lsa all` command controls the generation (sending) of LSAs. The first LSA is always generated immediately upon an OSPF topology change, and the next LSA generated is controlled by the minimum start interval. The subsequent LSAs generated for the same LSA are rate-limited until the maximum interval is reached. The “same LSA” is defined as an LSA instance that contains the same LSA ID number, LSA type, and advertising router ID.

The `timers lsa arrival` command controls the minimum interval for accepting the same LSA. If an instance of the same LSA arrives sooner than the interval that is set, the LSA is dropped. It is recommended that the arrival interval be less than or equal to the hold-time interval of the `timers throttle lsa all` command.

Topology

The diagram shows the minimum configuration required to enable OSPF LSA Throttling Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

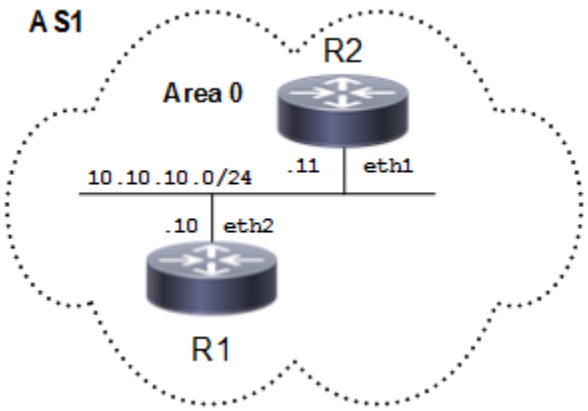

Figure 4-11: Basic OSPF Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32`	Configure the ip address (1.1.1.1) to interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (`1.1.1.1/32`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#timers throttle lsa all 10000 20000 45000`	Configure LSA Throttling timers (Starting interval: <0-600000>, Min Hold Interval: <1-600000> and Max Wait Interval:< 1-600000>) in milliseconds. The Default value for corresponding timers are: Starting interval: 0, Min Hold Interval: 5 sec and Max Wait Interval: 5 sec.
`(config-router)#logging monitor 7`	Enable logging monitor globally.
`(config-router)#logging level ospf 7`	Enable logging level ospf globally.
`(config-router)#end`	Exit router mode

R2

`#configure terminal`	Enter configure mode.

`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface.

Validation

R1

Check the output of `show ip ospf` and verify the initial throttle delay, minimum hold time for LSA throttle and maximum wait time for LSA throttle.

```
#show ip ospf 1
 Routing Process "ospf 1" with ID 1.1.1.1
 Process uptime is 11 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incoming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1
MemPool - struct ospf lsa             : (0-8) | Total (8/100000) blk_size:160

Configure OSPF LSA Arrival Timers

The diagram shows the minimum configuration required to enable OSPF Minimum LSA Arrival Timers feature. R1 and R2 are two routers in Area 0 connecting to network 10.10.10.0/24.

Note: Configure one interface so that it belongs to only one area. It is possible, however, to configure different interfaces on a router to belong to different areas.

Topology

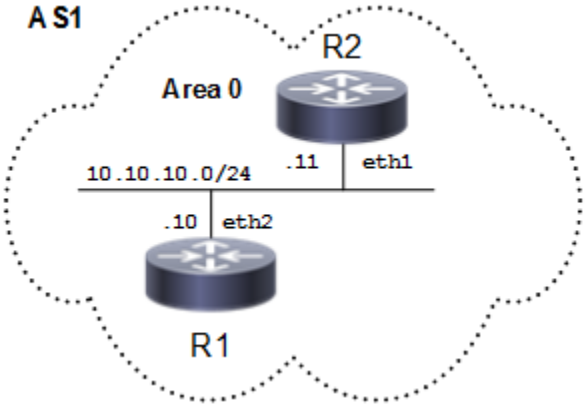

Figure 4-12: Basic OSPF Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface loopback to configure.
`(config-if)#ip address 1.1.1.1/32`	Configure the ip address (1.1.1.1) to interface loopback.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 10.10.10.0/24 area 0`	Define the interface (`10.10.10.0/24`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#network 1.1.1.1/32 area 0`	Define the interface (`1.1.1.1/32`) on which OSPF runs, and associate the area ID (`0`) with the interface (area ID `0` specifies the backbone area).
`(config-router)#end`	Exit router mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (`1`). The Process ID should be a unique positive integer identifying the routing process.

`(config-router)#network 10.10.10.0/24 area 0`	Define the interface `(10.10.10.0/24)` on which OSPF runs, and associate the area ID `(0)` with the interface.
`(config-router)#timers lsa arrival 100000`	Configure Minimum LSA Arrival timers (Minimum LSA arrival Interval:< 0-600000>) in milliseconds. The Default value for Minimum LSA Arrival timer is: 1 sec.

Validation

R1

Check the output of `show ip ospf` and verify that the minimum LSA arrival timer by default is set to 1 sec.

```
#show ip ospf
 Routing Process "ospf 1" with ID 1.1.1.1
 Process uptime is 11 minutes
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 SPF schedule delay initial 0 secs 500 msecs
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incoming current DD exchange neighbors 0/64
 Number of outgoing current DD exchange neighbors 0/64
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 0. Checksum 0x000000
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 0
 External LSA database is unlimited.
 Number of LSA originated 4
 Number of LSA received 4
 Number of areas attached to this router: 1
MemPool - struct ospf lsa             : (0-8) | Total (8/100000) blk_size:160
MemPool - struct rxmt                 : | Total (0/0) blk_size:8
    Area 0.0.0.0 (BACKBONE)
        Number of interfaces in this area is 2(2)
        Number of fully adjacent neighbors in this area is 1
        Area has no authentication
        SPF algorithm last executed 00:10:12.807 ago
        SPF algorithm executed 5 times
        Number of LSA 7. Checksum 0x02c480
 Dste Staus: Disabled

#show ip ospf neighbor

Loop-Free Alternate Fast Reroute

This section contains basic OSPF Loop-Free Alternate Fast Reroute (LFA-FRR) configuration examples.

Overview

The goal of (LFA-FRR) is to reduce failure reaction time to 10s of milliseconds by using a pre-computed alternate next-hop in the event that the currently selected primary next-hop fails, so that the alternate can be rapidly used when the failure is detected. A network with this feature experiences less traffic loss and less micro-looping of packets than a network without LFA-FRR.

After enabling LFA-FRR on routers, routers calculate a backup path for each primary path to reach the destination.The backup path is calculated based on the attributes such as node protecting, link protecting, broadcast-link protecting and secondary path.

OSPF LFA and ISIS LFA along with MPLS is not supported. Do not configure OSPF LFA or ISIS LFA, if MPLS is configured or vice-versa.

Topology

The diagram shows the configuration required to enable the OSPF LFA feature.

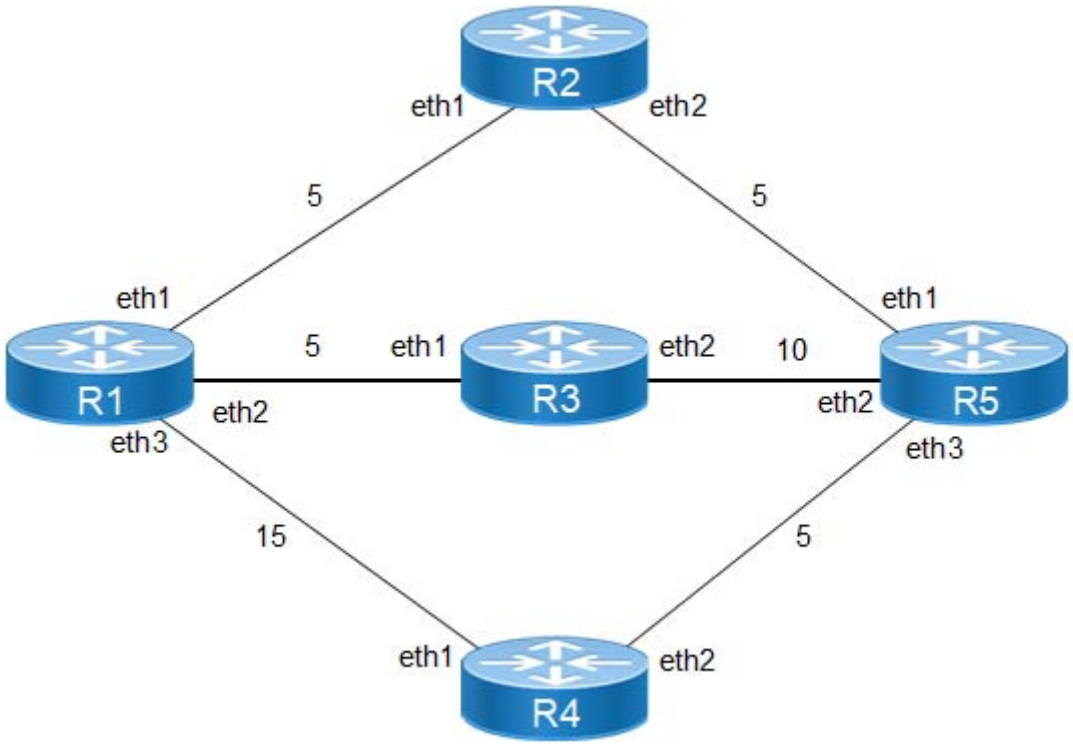

Figure 4-13: Basic OSPF-LFA Topology

R1

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 30.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process and specify the Process ID (1).
`(config-router)#network 10.1.1.0/24 area 0`	Define the interface (10.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 20.1.1.0/24 area 0`	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 30.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).

(config-router)#fast-reroute keep-all- paths	Configure LFA-FRR to calculate the available backup path.
(config-router)#end	Exit router mode.

R2

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 40.1.1.1/24	Configure the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 10.1.1.0/24 area 0	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 40.1.1.0/24 area 0	Define the interface (40.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#end	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 50.1.1.1/24	Configure the IP address of the interface.
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
(config-router)#network 20.1.1.0/24 area 0	Define the interface (20.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#network 50.1.1.0/24 area 0	Define the interface (50.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
(config-router)#end	Exit router mode.

R4

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 30.1.1.2/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 60.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 30.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 60.1.1.0/24 area 0`	Define the interface (60.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#end`	Exit router mode.

R5

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 40.1.1.2/24`	Configure the IP address of the interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 50.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 60.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#network 40.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 50.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#network 60.1.1.0/24 area 0`	Define the interface (30.1.1.0/24) on which OSPF runs, and associate the area ID (0) with the interface (area ID 0 specifies the backbone area).
`(config-router)#end`	Exit router mode.

Validation

R1

Check OSPF neighborship.

```
#show ip ospf neighbor
OSPF Process 100 VRF (default)
Neighbor ID     Pri   State           Dead Time   Address  Interface Intance
ID
2.2.2.2           1   Full/DR         00:00:33    10.1.1.2     eth1  0
3.3.3.3           1   Full/DR         00:00:33    20.1.1.2     eth2  0
4.4.4.4           1   Full/DR         00:00:39    30.1.1.2     eth2  0

```

Note: Now the LFA backup paths have been changed, `eth3` is not used.

LFA Tie-Breaker

Based on the index values configured, if inequalities are satisfied, protections will be provided:

- Lower the index will have the highest priority, the path which provides protection with highest priority will be selected. If there are multiple paths providing the highest priority protection, then we will check which path provides the protection which has 2nd highest priority and so on.
- If all the paths provide same priority, then the LFA route is chosen on the basis of path cost.
- If none of the paths provides the protection with highest priority, then we will see which path provides the 2nd highest priority and so on.

```
config)#router ospf 100
(config-router)#fast-reroute tie-break ?
broadcast-interface-disjoint  Prefer broadcast link protecting backup path

                              *Default value is 70

downstream-path               Prefer backup path from downstream

                              *Default value is 90

interface-disjoint            Prefer link protecting backup path

                              *Default value is 60

node-protecting               Prefer node protecting backup path

                              *Default value is 30

primary-path                  Prefer backup path from ECMP set

                              *Default value is 20

secondary-path                Prefer non-ECMP backup path

                              *Default value is 255
(config-router)#fast-reroute tie-break broadcast-interface-disjoint index 1
(config-router)#fast-reroute tie-break node-protecting index 2
```

Verify show ip route and show ip route fast-reroute for backup path calculated according to attributes configured above.

```

LFA Termination

A router MUST limit the amount of time an alternate next-hop is used after the primary next-hop has become unavailable. This ensures that the router will start using the new primary next-hops.

LFA termination avoids a micro looping in topology, when particular network goes down, LFA backup path will be installed and if termination interval is configured, LFA backup will be still used till the interval and it is used in order to verify new primary path is loop free.

R1

Configure termination interval on R1 in router mode:

`(config)#router ospf 1`	Configure the routing process, and specify the Process ID (1). The Process ID should be a unique positive integer identifying the routing process.
`(config-router)#fast-reroute terminate-hold-on interval 100000`	Configure LFA termination interval
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

If you check “show ip ospf” you can see the configured termination-hold on interval value along with ospf output:

```
#show ip ospf
IPFRR per-prefix tiebreakers:
    Name                              Index
    Primary path                      20
    Node Protecting                   30
    Interface disjoint                60
    Broadcast interface disjoint      70
    Secondary path                    255
 LFA termination hold-on timer : 100 secs 0 msecs

Loop-Free Alternate (LFA) ECMP PATH

This section contains configurations for OSPF LFA ECMP which provides LFA/alternate path from primary ECMP path set or non-primary/non-ECMP path set which improve convergence after a primary path failure occur in network.

Overview

With ECMP, a prefix has multiple primary paths to forward traffic. When a particular primary path fails, the other primary paths are not guaranteed to provide protection against the failure scenario. As part of LFA ECMP, alternate paths are determined for each primary path separately. The selected alternate path can be either one of the primary path from the set of ECMP or a loop-free non-ECMP if available.

In OSPF, by default the LFA algorithm tries to find loop free node protecting alternate from the set of existing primary next-hops. If no loop free node-protecting alternate is available, the LFA algorithm tries to find link-protecting alternate

from the set of existing primary next-hops. If no loop-free node-protecting and link-protecting alternate is available, then the LFA algorithm should select a loop-free link-protecting from the non-ECMP next-hops.

Topology

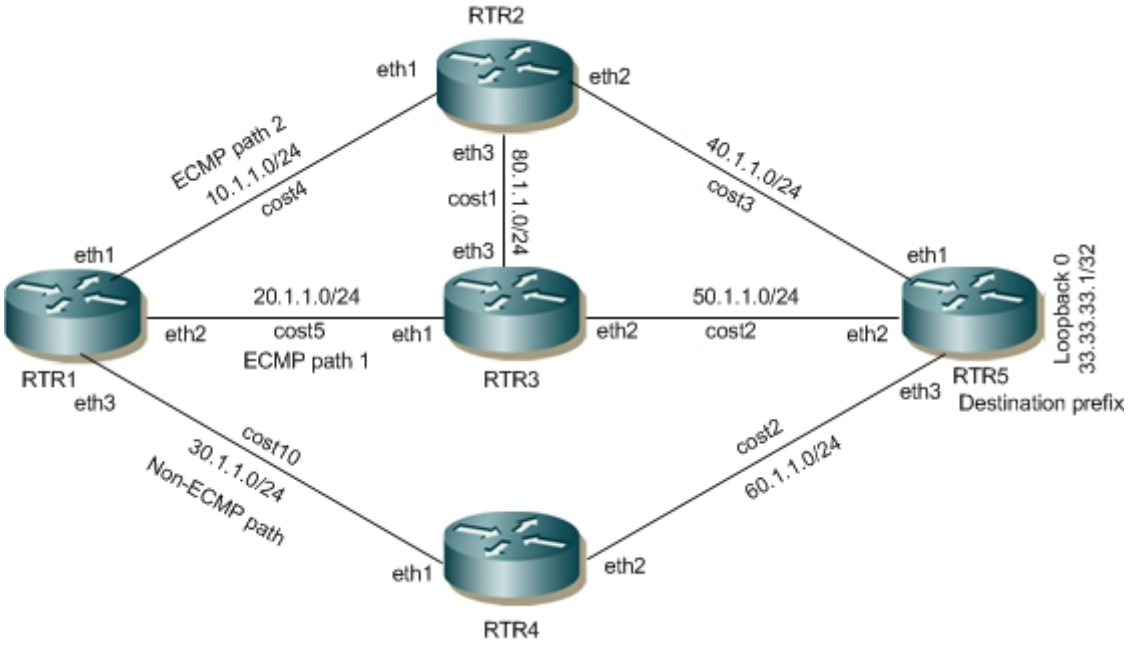

Figure 4-14: OSPF-LFA_ECMP

Configuring OSPF LFA ECMP

Configuration Part 1: with default LFA configuration where primary path priority higher than Secondary-path (non-ECMP) and LFA selection happen within primary ECMP path

RTR1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 10.1.1.1/24`	Configure the IP address of the interface.
`(config-if)#ip ospf cost 4`	Assign cost to interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 20.1.1.1/24`	Assign IP address.
`(config-if)#ip ospf cost 5`	Assign cost to interface
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ip address 30.1.1.1/24`	Assign IP address.
`(config-if)#ip ospf cost 10`	Assign cost to interface
`(config-if)#exit`	Exit interface mode.

(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#ospf router-id 1.1.1.1	Configure router-id as 1.1.1.1
(config-router)#bfd all-interfaces	Enable BFD over ospf for all ospf enabled interfaces
(config-router)#network 10.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 20.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 30.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#fast-reroute keep-all-paths	Configure LFA-FRR to calculate the available backup path.
(config-router)#end	Exit router mode.

RTR2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 10.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 4	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 40.1.1.1/24	Assign IP address.
(config-if)#ip ospf cost 3	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ip address 80.1.1.1/24	Assign IP address.
(config-if)#ip ospf cost 1	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#ospf router-id 2.2.2.2	Configure router-id.
(config-router)#bfd all-interfaces	Enable BFD over ospf for all ospf enabled interfaces
(config-router)#network 10.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 40.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 80.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#end	Exit router mode.

RTR3

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface.

(config-if)#ip ospf cost 5	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 50.1.1.1/24	Assign IP address.
(config-if)#ip ospf cost 2	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ip address 80.1.1.2/24	Assign IP address.
(config-if)#ip ospf cost 1	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#ospf router-id 3.3.3.3	Configure router-id.
(config-router)#bfd all-interfaces	Enable BFD over ospf for all ospf enabled interfaces
(config-router)#network 20.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 50.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 80.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#end	Exit router mode.

RTR4

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 30.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 10	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 60.1.1.1/24	Assign IP address.
(config-if)#ip ospf cost 2	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#ospf router-id 4.4.4.4	Configure router-id.
(config-router)#bfd all-interfaces	Enable BFD over ospf for all ospf enabled interfaces
(config-router)#network 30.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 60.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#end	Exit router mode.

RTR5

#configure terminal	Enter configure mode.
(config)#interface lo	Enter interface mode.
(config-if)#ip address 33.33.33.1/32	Assign IP address.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 40.1.1.2/24	Configure the IP address of the interface.
(config-if)#ip ospf cost 3	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 50.1.1.2/24	Assign IP address.
(config-if)#ip ospf cost 2	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ip address 60.1.1.2/24	Assign IP address.
(config-if)#ip ospf cost 2	Assign cost to interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 1	Configure the routing process and specify the Process ID (1).
(config-router)#ospf router-id 5.5.5.5	Configure router-id.
(config-router)#bfd all-interfaces	Enable BFD over ospf for all ospf enabled interfaces
(config-router)#network 40.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 50.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 60.1.1.0/24 area 0	Configure OSPF network for area 0.
(config-router)#network 33.33.33.1/32 area 0	Configure OSPF network for area 0.
(config-router)#end	Exit router mode.

Validation

Validation Part 1: LFA selected from primary ECMP path set

RTR1

```
#show ip ospf route fast-reroute

OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       OSPF LFA attributes:
       P - Primary, SP - Secondary-Path, ID - Interface Disjoint,
       NP - Node Protecting, BID - Broadcast Interface Disjoint
```

```
O  33.33.33.1/32 [17] via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                            via 20.1.1.2, eth2, Area 0.0.0.0
                           Attributes: Metric: [17] ,P ,NP
                      via 20.1.1.2, eth2, Area 0.0.0.0
                        Backup path:
                            via 10.1.1.2, eth1, Area 0.0.0.0
                           Attributes: Metric: [17] ,P ,ID
O  40.1.1.0/24 [7] via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                          via 30.1.1.2, eth3, Area 0.0.0.0
                         Attributes: Metric: [15] ,SP ,NP
O  50.1.1.0/24 [7] via 20.1.1.2, eth2, Area 0.0.0.0
                        Backup path:
                         via 10.1.1.2, eth1, Area 0.0.0.0
                        Attributes: Metric: [7] ,P ,ID
                    via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                         via 20.1.1.2, eth2, Area 0.0.0.0
                        Attributes: Metric: [7] ,P ,NP
O  60.1.1.0/24 [9] via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                         via 20.1.1.2, eth2, Area 0.0.0.0
                        Attributes: Metric: [9] ,P ,NP
                    via 20.1.1.2, eth2, Area 0.0.0.0
                        Backup path:
                         via 10.1.1.2, eth1, Area 0.0.0.0
                        Attributes: Metric: [9] ,P ,ID
O  80.1.1.0/24 [5] via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                         via 20.1.1.2, eth2, Area 0.0.0.0
                        Attributes: Metric: [6] ,SP ,NP

#show ip route fast-reroute

  * 10.1.1.2, via eth1
```

Configuration Part 2: with non-ECMP tiebreaker configured where secondary-path priority higher than primary (ECMP) path

Configure below configuration with config's shown in Part1:

RTR1

`#configure terminal`	Enter configure mode.
`(config)#router ospf 1`	Enter Router OSPF mode.
`(config-router)#fast-reroute tie-break secondary-path index 5`	Configure LFA tiebreaker for LFA to be calculate from non-ecmp path set if available (this is user defined to decide the priority to select between ecmp/non-ecmp set)
`(config-router)#exit`	Exit Router OSPF mode and return to Configure mode.

Validation Part 2: LFA selected from non-ecmp path for each primary ecmp path

RTR1

```
#show ip ospf route fast-reroute

OSPF process 1:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
```

```
       E1 - OSPF external type 1, E2 - OSPF external type 2
       OSPF LFA attributes:
       P - Primary, SP - Secondary-Path, ID - Interface Disjoint,
       NP - Node Protecting, BID - Broadcast Interface Disjoint

O  33.33.33.1/32 [17] via 10.1.1.2, eth1, Area 0.0.0.0
                        Backup path:
                            via 30.1.1.2, eth3, Area 0.0.0.0
                           Attributes: Metric: [22] ,SP ,NP
                      via 20.1.1.2, eth2, Area 0.0.0.0
                        Backup path:
                            via 30.1.1.2, eth3, Area 0.0.0.0

```

[FRR-NH] via 20.1.1.2, eth2

CHAPTER 5 OSPFv3

This chapter contains basic OSPFv3 configuration examples.

Enable OSPFv3 on an Interface

This example shows the minimum configuration required for enabling OSPFv3 on an interface. R1 and R2 are two routers in Area 0 connecting to the network 3ffe:10::/64. After enabling OSPFv3 on an interface, create a routing instance, and specify the Router ID.

Note: You must explicitly specify a Router ID for the OSPFv3 process to be activated.

Topology

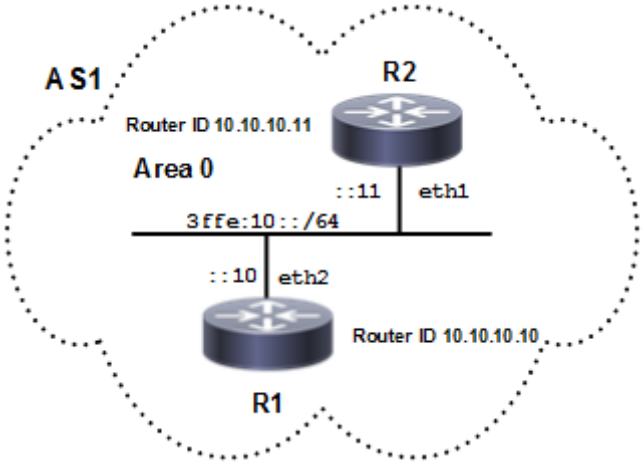

Figure 5-15: Basic OSPFv3 Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `0`.

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.

`(config-router)#router-id 10.10.10.11`	Specify a Router ID (`10.10.10.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).

Validation

R1

```

```

Set Priority

This example shows how to set priority for an interface. Set a high priority for a router to make it the Designated Router (DR). Router R3 is configured with a priority of 10; this is higher than the default priority (default priority is 1) set for R1 and R2. This makes R3 the DR.

Topology

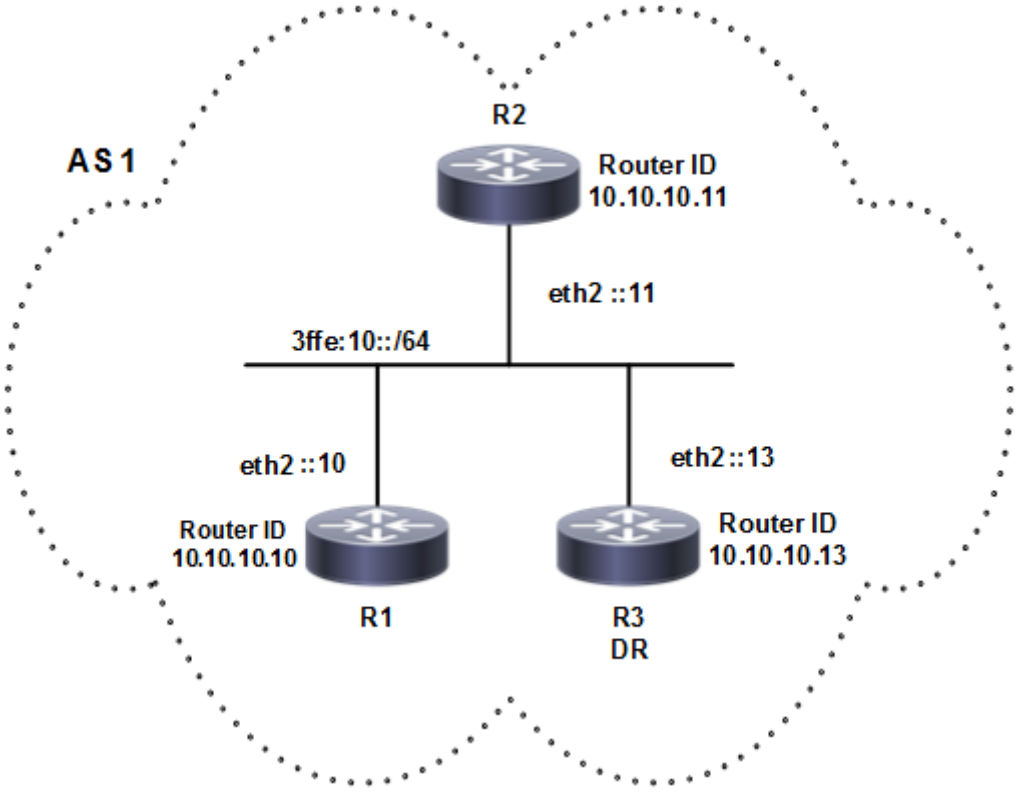

Figure 5-16: OSPFv3 Set Priority

R3

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.13`	Specify a Router ID (`10.10.10.13`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).
`(config-if)#ipv6 ospf priority 10`	Specify the router priority to a higher priority (10) to make R3 the Designated Router (DR).

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID (`10.10.10.10`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).

R2

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.11`	Specify a Router ID (`10.10.10.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).

Area Border Router

This example shows configuration for an Area Border Router. R2 is an Area Border Router (ABR). On R2, interface eth2 is in Area 0, and interface eth1 is in Area 1.

Topology

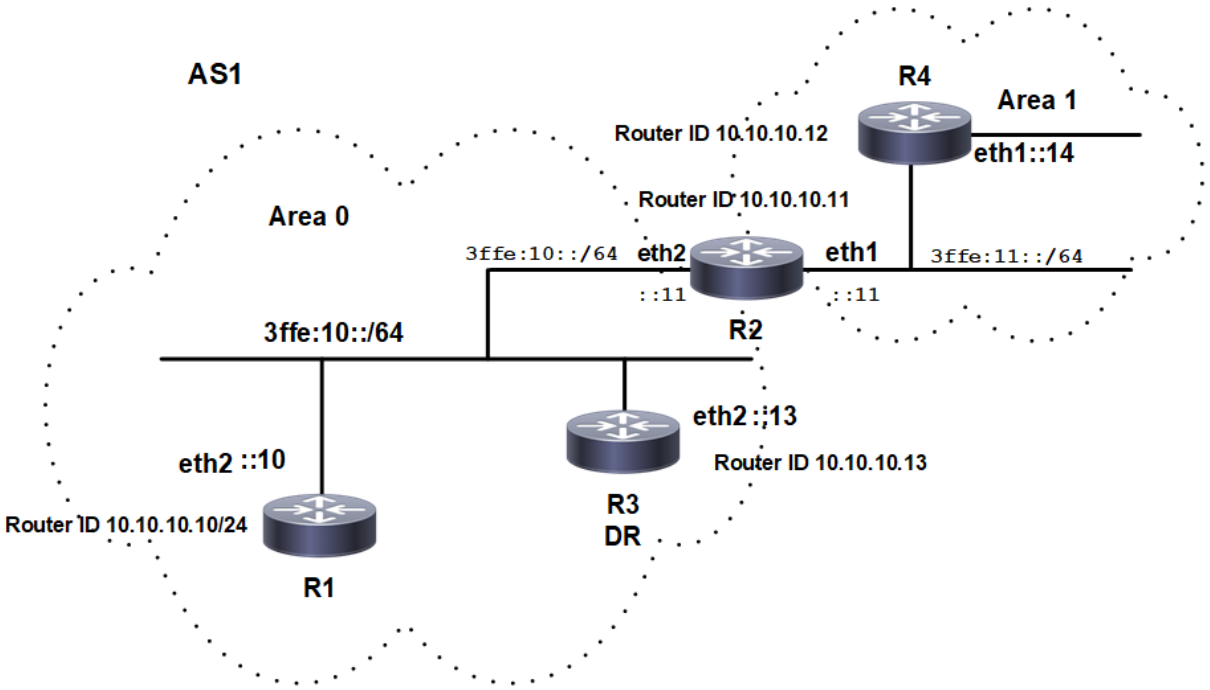

Figure 5-17: OSPFv3 Area Border Router

Configuration

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.11`	Specify a Router ID (`10.10.10.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on the other interface, and assign the other Area ID (`1`).

R4

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.12`	Specify a Router ID (10.10.10.12) for the OSPFv3 routing process.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on the other interface, and assign the other Area ID (1).

Validation

Redistribute Routes into OSPFv3

In this example, the BGP routes are imported into the OSPF routing table, and advertised as Type 5 External LSAs into Area 0.

Topology

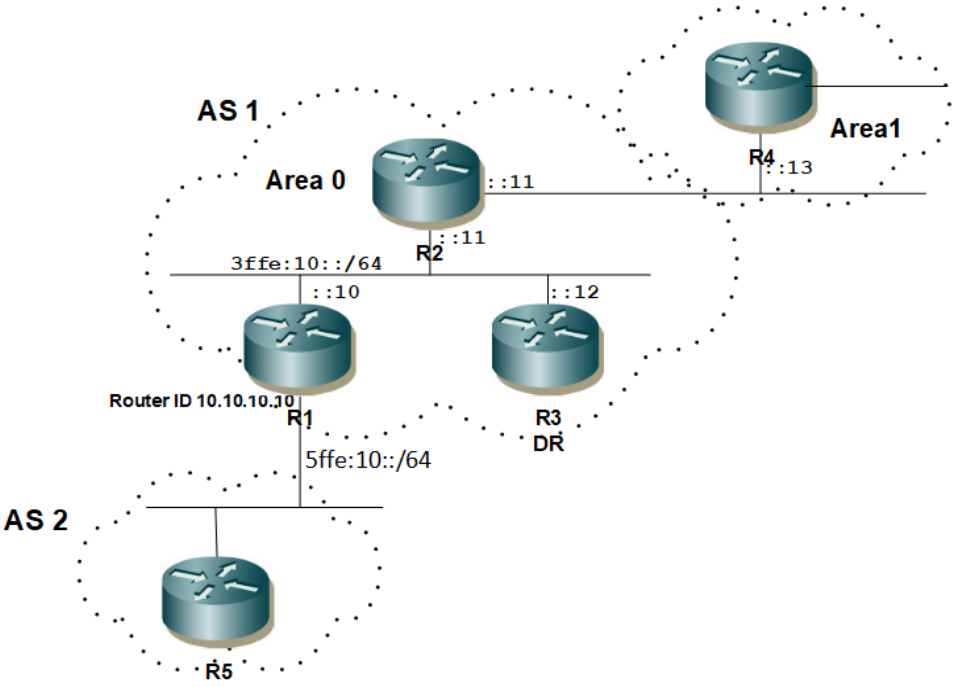

Figure 5-18: OSPFv3 Redistribute Routes

Configuration

R5

(config)#router bgp 2	Configure router bgp instance
(config-router)# neighbor 5ffe:10::10 remote-as 1	Configure R1 as ipv6 BGP neighbor
(config-router)# neighbor 5ffe:10::10 ebgp-multihop 4	Configure the ebgp -multihop for the ebgp neighbor R1
(config-router)# address-family ipv6 unicast	
(config-router-af)# neighbor 5ffe:10::10 activate	Activate the BGP neighbor on R1 for address-family ipv6 unicast to advertise and receive ipv6 routes

R1

#configure terminal	Enter configure mode.
(config)#router bgp 2	Configure router bgp instance
(config-router)# neighbor 5ffe:10::55 remote-as 2	Configure R5 as ipv6 BGP neighbor
(config-router)# neighbor 5ffe:10::55 ebgp-multihop 4	Configure the ebgp -multihop for the ebgp neighbor R5
(config-router)# address-family ipv6 unicast	
(config-router-af)# neighbor 5ffe:10::55 activate	Activate the BGP neighbor on R5 for address-family ipv6 unicast to advertise and receive ipv6 routes
(config-router-af)#exit	Exit address-family ipv6 unicast mode
(config-router)#exit	Exit router bgp mode
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 10.10.10.10	Specify a Router ID (10.10.10.10) for the OSPFv3 routing process.
(config-router)#redistribute bgp	Specify redistributing routes from the other routing protocol (BGP) into OSPFv3.
(config-router)#exit	Exit OSPF router mode.
(config)#interface eth12	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface, and assign the Area ID (0).

Validation

Cost

Make a route the preferred route by changing its cost. In this example, cost has been configured to make R2 the next hop for R1.

The default cost for each interface is 10. Interface eth2 on R2 has a cost of 100, and Interface eth2 on R3 has a cost of 150. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 10+100 = 110

R3: 10+150 = 160

For this reason, R1 chooses R2 as its next hop to destination 10.10.14.0/24, because it has the lower cost.

Topology

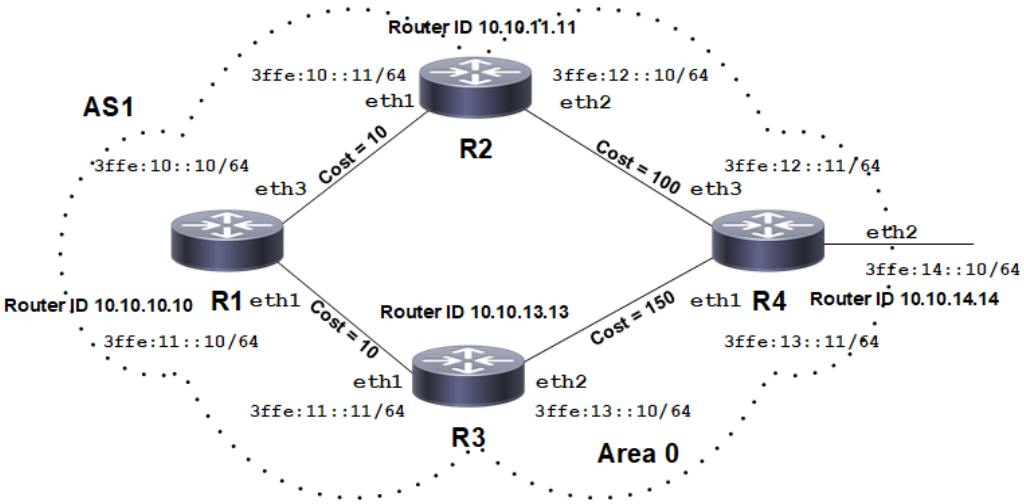

Figure 5-19: Configure Cost OSPFv3

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.10.10`	Specify a Router ID (`10.10.10.10`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.

`#configure terminal`	Enter configure mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.

R2

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.11.11`	Specify a Router ID (`10.10.11.11`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf cost 100`	Set the cost of the link-state metric (on `eth2`) to `100`.

R3

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.13.13`	Specify a Router ID (`10.10.13.13`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID `(0)`.
`(config-if)#ipv6 ospf cost 150`	Set the cost of link-state metric to `150`.

R4

`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 10.10.14.14`	Specify a Router ID (`10.10.14.14`) for the OSPFv3 routing process.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on an interface, and assign the Area ID (`0`).

```

Virtual Links

Virtual links are used to connect a temporarily-disjointed non-backbone area to the backbone area, or to repair a non-contiguous backbone area. In this example, the ABR R3 has temporarily lost connection to Area 0, in turn disconnecting Area 2 from the backbone area. The virtual link between ABR R1 and ABR R2 connects Area 2 to Area 0. Area 1 is used as a transit area.

Topology

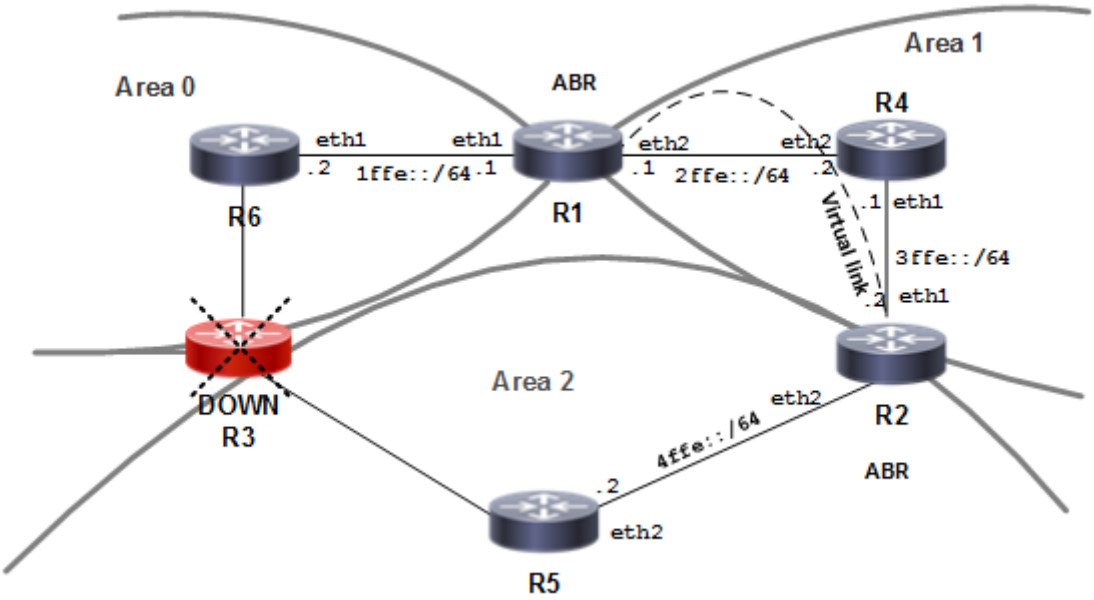

Figure 5-20: OSPFv3 Virtual Links

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Setup loopback interface
`(config-if)#ip address 1.1.1.1/32 secondary`	Specify loopback interface address
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 0`	Enable OSPFv3 routing on this interface, and assign the Area ID `(0)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 1.1.1.1`	Specify a Router ID (`1.1.1.1`) for the OSPFv3 routing process.
`(config-router)#area 1 virtual-link 2.2.2.2`	Configure a virtual link between this router R1 and R2 (Router ID `2.2.2.2`) through transit area 1.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Setup loopback interface
`(config-if)#ip address 2.2.2.2/32 secondary`	Specify loopback interface address
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router ospf area 1`	Enable OSPFv3 routing on this interface, and assign the Area ID `(1)`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router ospf area 2`	Enable OSPFv3 routing on this interface, and assign the Area ID `(2)`.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf`	Create an OSPFv3 routing instance.
`(config-router)#router-id 2.2.2.2`	Specify a Router ID (`2.2.2.2`) for the OSPFv3 routing process.
`(config-router)#area 1 virtual-link 1.1.1.1`	Configure a virtual link between this router R1 and R2 (Router ID `1.1.1.1`) through transit area 1.

R4

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.

(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 1	Enable OSPFv3 routing on this interface, and assign the Area ID (1).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 4.4.4.4	Specify a Router ID (4.4.4.4) for the OSPFv3 routing process.

R5

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 2	Enable OSPFv3 routing on this interface, and assign the Area ID (2).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 5.5.5.5	Specify a Router ID (5.5.5.5) for the OSPFv3 routing process.

R6

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on this interface, and assign the Area ID (0).
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 6.6.6.6	Specify a Router ID (6.6.6.6) for the OSPFv3 routing process.

```

Multiple Instances

By using multiple OSPFv3 instances, OSPFv3 routes can be segregated, based on their instance number. Routes of one instance are stored differently from routes of another instance running in the same router.

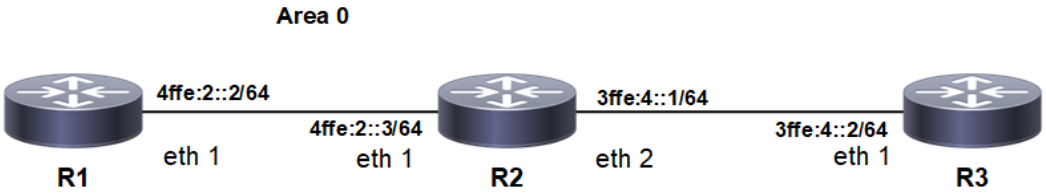
To configure multiple OSPFv3 instances, refer to the topology diagram and follow the procedures below.

1. Enable OSPFv3 on an interface.
2. Enable multiple instances.

3. Configure redistribution among multiple instances.

   Note: Optionally, redistribution can be configured with the metric, type, or route-map options.

Topology



Enable Multiple OSPFv3 Instances on a Router Based on Tags

In this example, routers R1, R2, and R3 are in Area 0, and all run OSPFv3.

R1

`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with an instance ID of 5.
`(config-router)#router-id 5.5.5.5`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Specify the interface on which OSPFv3 is to be enabled.
`(config-if)#ipv6 address 4ffe:2::2/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 5`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.

R2

`(config)#router ipv6 ospf 5`	Configure an OSPFv3 instance with an instance ID of 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth1`	Configure the interface to connect to R1.
`(config-if)#ipv6 address 4ffe:2::3/64`	Configure the IPv6 address.
`(config-if)#ipv6 router ospf area 0 tag 5`	Configure the area number and instance value: match the instance ID with the instance ID created previously.
`(config-if)#no shutdown`	Activate the interface.
`(config-if)#exit`	Exit Interface mode, and return to Configure terminal mode.
`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with an instance ID of 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit Router mode, and return to Interface mode.
`(config)#interface eth2`	Configure the interface to connect to R3.
`(config-if)#ipv6 address 3ffe:4::1/64`	Configure the IPv6 address.

(config-if)#no shutdown	Activate the interface.
(config-if)#ipv6 router ospf area 0 tag 15	Configure the area number and instance value: match the instance ID with the instance ID created previously.

R3

(config)#router ipv6 ospf 15	Configure an OSPFv3 instance with an instance ID of 15.
(config-router)#router-id 152.152.152.152	Configure the router ID to use on this instance.
(config-router)#exit	Exit Router mode, and return to Interface mode.
(config)#interface eth1	Specify the interface on which OSPFv3 is to be enabled.
(config-if)#ipv6 address 3ffe:4::2/64	Configure the IPv6 address.
(config-if)#ipv6 router ospf area 0 tag 15	Configure the area number and instance value: match the instance ID with the instance ID created previously.
(config-if)#no shutdown	Activate the interface.

```

Redistribute among Multiple Instances

In this example, routes of one ospfv3 instance are redistributed to another ospfv3 instance to enable ping from R1 to R3 or vice-versa; and R2 redistributes routes from one instance to another.

R2

(config)#router ipv6 ospf 15	Configure an OSPFv3 instance with instance ID 15.
(config-router)#router-id 159.159.159.159	Configure the router ID.
(config-router)#redistribute ospf 5	Redistribute instance 5 routes.
(config-router)#exit	Exit OSPF router mode.
(config)#router ipv6 ospf 5	Configure an OSPFv3 instance with instance ID 5.
(config-router)#router-id 149.149.149.149	Configure the router ID.
(config-router)#redistribute ospf 15	Redistribute instance 15 routes.

```

Redistribute with Metric Option

In this example, on R3, routes of instance 15 are redistributed into instance and vice-versa with metric of 100 so that R1 and R2 have each other's routes with a metric of 100.

R2

`(config)#router ipv6 ospf 15`	Configure an OSPFv3 instance with instance ID 15.
`(config-router)#router-id 159.159.159.159`	Configure the router ID.
`(config-router)#redistribute ospf 5 metric 100`	Redistribute instance 5 routes with metric 100.
`(config-router)#exit`	Exit OSPF router mode.
`(config)#router ipv6 ospf 5`	Redistribute routes into instance 5.
`(config-router)#router-id 149.149.149.149`	Configure the router ID.
`(config-router)#redistribute ospf 15 metric 100`	Redistribute instance 15 routes with metric 100.
