Not-So-Stubby Area

This section contains OSPFv3 NSSA (Not-So-Stubby Area) configuration examples.

An NSSA allows external routes to be advertised into the OSPF autonomous system while retaining the characteristics of a stub area to the rest of the autonomous system. To do this, the ASBR in an NSSA will originate type 7 LSAs to advertise the external destinations. These NSSA external LSAs are flooded throughout the NSSA but are blocked at the ABR.

The NSSA external LSA has a flag in its header known as the P-bit. The NSSA ASBR has the option of setting or clearing the P-bit. If an NSSA's ABR receives a type 7 LSA with the P-bit set to one, it translates the type 7 LSA into a type 5 LSA and floods it throughout the other areas. If the P-bit is set to zero, no translation takes place and the destination in the type 7 LSA is not advertised outside of the NSSA.

Topology

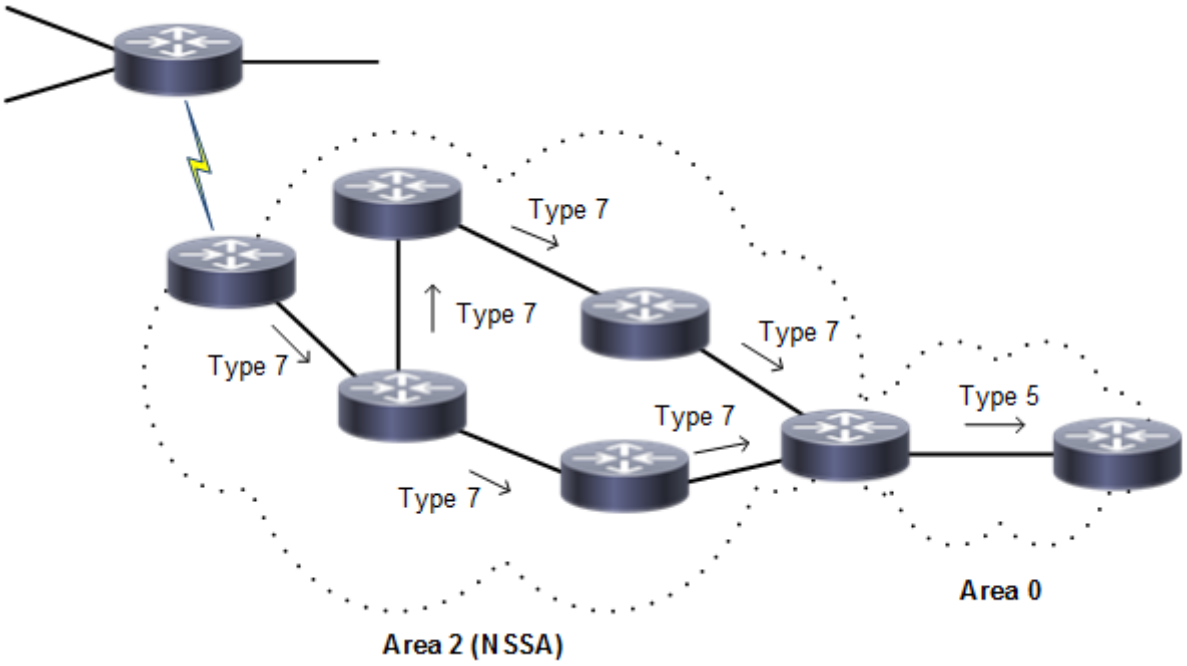

Figure 5-21: Translating Type 7 LSAs into Type 5 LSAs

NSSA with Route Option

This example shows the configuration to enable NSSA and to configure different route options for NSSA. There are three `area nssa` command options for originating default Type-3 LSA and default Type-7 LSA, and for blocking redistribution of Type-7 LSA into an NSSA:

- `no-summary`: The NSSA ABR blocks all type-3 and type-4 LSAs into the NSSA area and sends a single type-3 LSA into the area to advertise a default route
- `default-information-originate`: The NSSA ABR advertises a default route into the NSSA as a type-7 LSA.
- `no-redistribution`: The NSSA ABR bocks type-7 LSA from being redistributed into the NSSA area.

In Figure 5-22, R2 is an NSSA ABR as well as an NSSA ASBR that maps the router interfaces to two different areas and redistributes the connected routes of the loopback interface. Also, this example sets the `no-summary`, `no-redistribution`, and `default-information-originate` options on R2 to originate default Type-3 LSAs and default Type-7 LSAs into the NSSA and to block Type-7 LSAs.

Topology

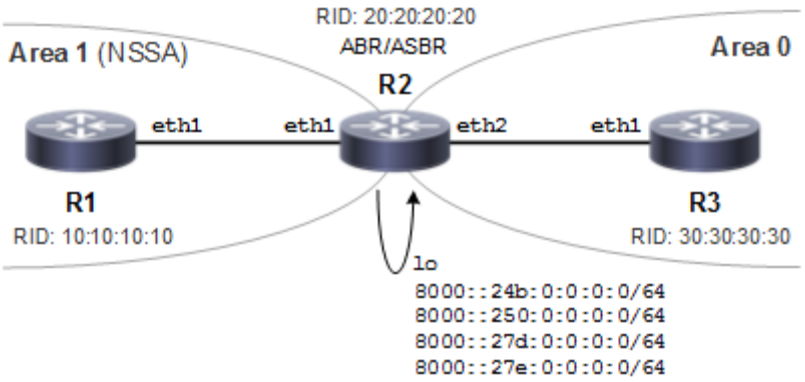

Figure 5-22: NSSA with Route Options

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure area as NSSA
`(config-router)#exit`	Exit interface mode

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone
`(config-if)#interface lo`	Enter interface mode for Loopback
`(config-if)#ipv6 address 8000::24b:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::250:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27d:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27e:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance (100)
`(config-router)#redistribute connected`	Redistribute the configured loopback network into the NSSA

`(config-router)#area 1 nssa no-redistribution default-information-originate no-summary`	Configure the Router to originate default Type-3 LSAs and default Type-7 LSAs, and to block Type-7 LSAs into the NSSA
`(config-router)#exit`	Exit interface mode

R3

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 30.30.30.30`	Configure the router ID to use on this instance (100)
`(config-router)#exit`	Exit interface mode

Validation 1

In the output of `show ipv6 ospf neighbor` below, verify that OSPFv3 adjacency is in state “full” for both R1 and R2 under the process identifier 100.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1   Full/DR         00:00:34    eth1       0

R2#show ipv6 ospf neighbor

Total number of full neighbors: 2
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
10.10.10.10       1   Full/DR         00:00:36    eth1       0
30.30.30.30       1   Full/Backup     00:00:39    eth2       0
R2#
```

Validation 2

The output below shows originating default Type-3 LSAs into the NSSA with the no-summary option. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and the LS-Type is Inter-Area-Prefix-LSA for the default Type-3 LSA route into the NSSA.

```
R1#sh ipv6 ospf database inter-prefix

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                Inter-Area-Prefix-LSA (Area 0.0.0.1)

  LS age: 1234
  LS Type: Inter-Area-Prefix-LSA
  Link State ID: 0.0.0.6
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000001
  Checksum: 0x17D0
  Length: 28
```

```
        Metric: 1
        Prefix: ::/0
        Prefix Options: 0
```

Validation 3

The output below shows originating default type-7 LSAs alone after setting the no-redistribution and default-information originate options. The advertising router identifier is for R2 (20.20.20.20, the NSSA-ABR). Also, the prefix is ::/0 and LS-Type is NSSA-external-LSA for the default Type-7 LSA route into the NSSA

```
    R1#sh ipv6 ospf database nssa-external

                OSPFv3 Router with ID (10.10.10.10) (Process 100)

                    NSSA-external-LSA (Area 0.0.0.1)

      LS age: 1758
      LS Type: NSSA-external-LSA
      Link State ID: 0.0.0.20
      Advertising Router: 20.20.20.20
      LS Seq Number: 0x80000002
      Checksum: 0x6468
      Length: 32
        Metric Type: 2 (Larger than any link state path)
        Metric: 1
        Prefix: ::/0
        Prefix Options: 0 (-|-|-|-)
        External Route Tag: 0
```

NSSA with the Summary Address Option

Figure 5-23 shows the configuration to originate external LSAs (Type-7) and translate them into external LSAs (Type-5):

- R1 is an NSSA-ASBR configured with loopback IPv6 addresses that are redistributed into OSPFv3
- R2 is an NSSA-ABR
- R3 is backbone router

R1 originates Type-7 LSAs which are summarized into a single Type-7 into the NSSA by the `summary-address` option and this summarized Type-7 is converted to Type-5 LSA by R2.

Also, the summarized route can be tagged using the `tag` command and the advertisement of summarized routes can be suppressed by the `not-advertise` option.

Topology

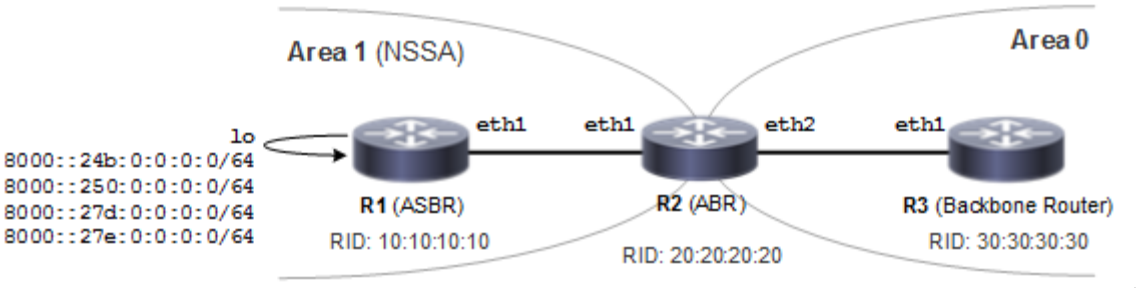

Figure 5-23: Using the summary-address Option

Configuration

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 address 1000::1/64`	Configure ipv6 address for interface eth1
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config-if)#interface lo`	Enter interface mode for loopback
`(config-if)#ipv6 address 8000::24b:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::250:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27d:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#ipv6 address 8000::27e:0:0:0:0/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure the area as NSSA.
`(config-router)#redistribute connected`	Redistribute the configured loopback network into OSPFv3 NSSA. Note: Connected networks can be redistributed by setting the metric and metric type.
`(config-router)#summary-address 8000::/48 all-tag 10`	Summarize the address range and tag the summarized route
`(config-router)#exit`	Exit interface mode

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 address 1000::2/64`	Configure ipv6 address for interface eth1
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).

(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode for eth2
(config-if)#ipv6 address 2000::1/64	Configure ipv6 address for interface eth2
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 20.20.20.20	Configure the router ID to use on this instance (100)
(config-router)#area 1 nssa	Configure the Router in NSSA
(config-router)#exit	Exit interface mode

R3

(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ipv6 address 2000::2/64	Configure ipv6 address for interface eth1
(config-if)#ipv6 router ospf tag 100 area 0	Configure interface in backbone area (0)
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf 100	Configure the routing process and specify the tag (100).
(config-router)#router-id 30.30.30.30	Configure the router ID to use on this instance (100)
(config-router)#exit	Exit interface mode

In the configurations above, you can suppress the external route summarization by NSSA-ASBR by specifying the not-advertise parameter as shown below:

```
(config-router)#summary-address 8000::/48 not-advertise
```

Also, connected networks can be redistributed by setting the metric and metric type as shown below:

```
(config-router)#redistribute connected metric 20 metric-type 1
```

Validation 1

The output below shows the summarized route generated by NSSA-ASBR (R1) with a tag. The output has the LS Type as NSSA-external-LSA with advertising router identifier (10.10.10.10) of the NSSA-ASBR (R1). Also, check the Prefix which is summarized route and external route tag as configured.

```
R1#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (10.10.10.10) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 90
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.11
  Advertising Router: 10.10.10.10
  LS Seq Number: 0x80000003
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 8 (P|-|-|-)
```

```
    External Route Tag: 10
```

Validation 2

```
The output below on the NSSA-ABR that is translating Type-7 LSAs to Type-5
LSAs shows summarized address in Type-7 and Type-5 LSA. Check for the same
prefix, external route tag in both Type7 and Type-5 LSA.
R2#sh ipv6 ospf database nssa-external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)

                NSSA-external-LSA (Area 0.0.0.1)

  LS age: 241
  LS Type: NSSA-external-LSA
  Link State ID: 0.0.0.11
  Advertising Router: 10.10.10.10
  LS Seq Number: 0x80000003
  Checksum: 0x69B3
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 8 (P|-|-|-)
    External Route Tag: 10

R2#sh ipv6 ospf database external

            OSPFv3 Router with ID (20.20.20.20) (Process 100)

                AS-external-LSA

  LS age: 245
  LS Type: AS-External-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 20.20.20.20
  LS Seq Number: 0x80000003
  Checksum: 0x8660
  Length: 40
    Metric Type: 2 (Larger than any link state path)
    Metric: 21
    Prefix: 8000::/48
    Prefix Options: 0 (-|-|-|-)
    External Route Tag: 10
```

Validation 3

The output below on the backbone router shows the summarized address in the translated Type-5 LSA. The prefix and external route tag are the same as the summarized Type-7 LSA originated by R1.

```
R3#sh ipv6 ospf database external

            OSPFv3 Router with ID (30.30.30.30) (Process 100)

                AS-external-LSA
```

```
LS age: 409
LS Type: AS-External-LSA
Link State ID: 0.0.0.3
Advertising Router: 20.20.20.20
LS Seq Number: 0x80000003
Checksum: 0x8660
Length: 40
  Metric Type: 2 (Larger than any link state path)
  Metric: 21
  Prefix: 8000::/48
  Prefix Options: 0 (-|-|-|-)
  External Route Tag: 10
```

NSSA with the Translator Role Option

Type-7 to Type-5 translation is done by an NSSA-ABR. If an NSSA has multiple NSSA-ABRs, only one will perform the translation. The NSSA-ABR translator role options are:

- Candidate (default)
- Always

In the topology in Figure 5-24:

- R1 is NSSA-ASBR
- R2 and R3 are NSSA-ABRs
- R4 is a backbone router

In this example, the NSSA translator role `candidate` is configured on both NSSA-ABRs (R2 and R3). The Type-7 to Type-5 translation is done by the router with the higher router identifier (R3).

Topology

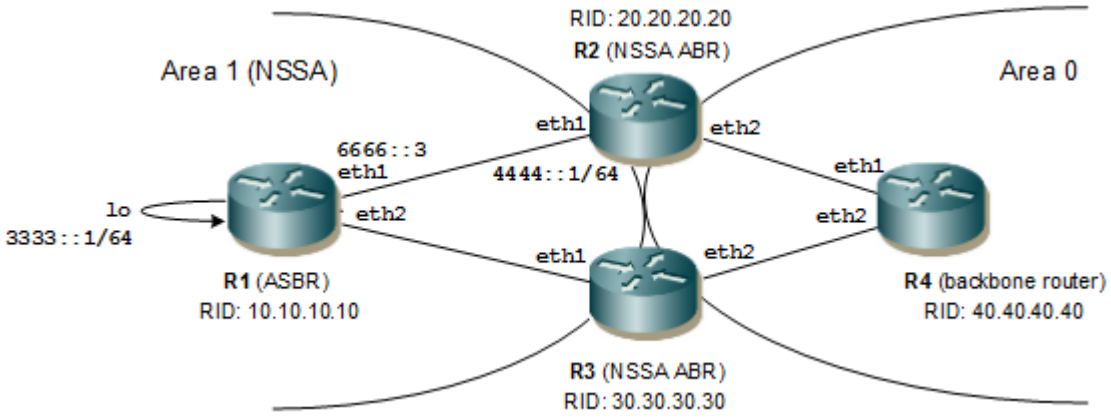

Figure 5-24: Using the translator-role Option

Configuration

When one NSSA-ABR is configured with the translator role as `always` and the other as `candidate`, then translation is done by the router configured as `always`. In this scenario, the translation can be biased by setting the translator role to `always` on the router that has the lower router identifier.

R1

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config-if)#interface lo`	Enter interface mode for Loopback
`(config-if)#ipv6 address 3333::1/64`	Assign IPv6 address to loopback interface
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa`	Configure the area as NSSA.
`(config-router)#redistribute static`	Redistribute the static route configured into the OSPF NSSA
`(config-router)#redistribute connected`	Redistribute the connected network into OSPF NSSA
`(config-router)#exit`	Exit interface mode
`(config)#ipv6 route 4444::1/64 6666::3`	Configure the static route with the nexthop address as R2's `eth1` IPv6 address
`(config)#exit`	Exit interface mode.

R2

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa translator-role candidate`	Configure the NSSA-ABR with the translator role candidate.
`(config-router)#exit`	Exit interface mode

R3

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 1`	Configure interface in an area assigned with the area ID (1).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.

`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 30.30.30.30`	Configure the router ID to use on this instance (100)
`(config-router)#area 1 nssa translator-role candidate`	Configure the NSSA-ABR with the translator role candidate.
`(config-router)#exit`	Exit interface mode

R4

`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config)#interface eth2`	Enter interface mode for `eth2`
`(config-if)#ipv6 router ospf tag 100 area 0`	Configure interface in backbone area (0)
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf 100`	Configure the routing process and specify the tag (`100`).
`(config-router)#router-id 40.40.40.40`	Configure the router ID to use on this instance (100)
`(config-router)#exit`	Exit interface mode

The command to configure the NSSA-Translator role as `always` is:

```
(config-router)#area 1 nssa translator-role always
```

The NSSA-ABR can continue to perform translation after its services are no longer required for the stability interval which is set using the command below on the NSSA-ABR.

```
(config-router)#area 1 nssa stability-interval 7777
```

Validation 1

The translation is done by the NSSA-ABR with the higher router identifier. In the output below, check the router identifier of the NSSA-ABR. Also, check the router which is elected and the router which is disabled.

```
R2#sh ipv6 ospf
 Routing Process "OSPFv3 (100)" with ID 20.20.20.20
 Process uptime is 21 minutes
 SPF schedule delay min 0.500 secs, SPF schedule delay max 50.0 secs
 Minimum LSA interval 5 secs, Minimum LSA arrival 1 secs
 Number of incoming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Number of external LSA 4. Checksum Sum 0x1F816
 Number of AS-Scoped Unknown LSA 0

  Metric: 20
  Prefix: 4444::/64
  Prefix Options: 0 (-|-|-|-)
  Forwarding Address: 6666::3
  External Route Tag: 0
```

Link LSA Suppression

If link LSA suppression is enabled and the interface type is not broadcast or NBMA, the router will not originate a link-LSA for the link. This implies that other routers on that link will determine the router's next hop address using a mechanism other than the link LSA.

Topology

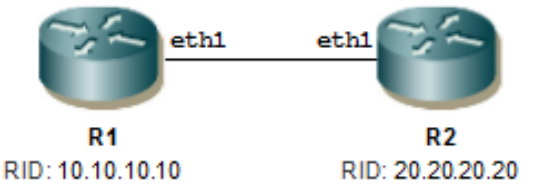

Figure 5-25: LSA Suppression

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.10.10.10`	Configure the router ID to use on this instance.
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf tag 100-ABC area 1`	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
`(config-if)#ipv6 ospf network point-to-point`	Configure the OSPF interface network type as point to point
`(config-if)#ipv6 ospf link-lsa-suppression enable`	Enable the link LSA suppression mechanism
`(config-if)#exit`	Exit interface mode

R2

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 20.20.20.20`	Configure the router ID to use on this instance.

(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf tag 100-ABC area 1	Configure interface in an area assigned with the area ID (1). The tag uniquely identifies the routing process.
(config-if)#ipv6 ospf network point-to-point	Configure the OSPF interface network type as point to point
(config-if)#ipv6 ospf link-lsa-suppression enable	Enable the link LSA Suppression Mechanism
(config-if)#exit	Exit interface mode

Note: This is not applicable for broadcast and NBMA networks.

Validation 1

Verify that adjacency has been established.

```
R1#sh ipv6 ospf neighbor
OSPFv3 Process (100)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
20.20.20.20       1   Full/ -         00:00:37    eth2       0
```

Validation 2

Verify that R1 should not have the Link LSA in the Link state database.

Note: The output below is captured after link lsa suppression enabled which has not Link LSA in the LSDB.

```
R1#sh ipv6 ospf database

            OSPFv3 Router with ID (10.10.10.10) (Process 100-ABC)

```

Address Family IPv4 Unicast Configuration

This chapter contains basic OSPFv3 address family IPv4 unicast configuration examples.

The address family feature lets OSPFv3 IPv6 networks support both IPv6 and IPv4 unicast traffic. It uses multiple instance identifiers to support multiple address families. By default OSPFv3 supports only IPv6 unicast traffic.

The purpose of supporting address families in OSPFv3 is to advertise IPv4 unicast address family routes in OSPFv3 by assigning different instance identifier ranges to different address families. With this feature, users may have two router processes per interface, but only one process per address family. Each instance identifier implies a separate OSPFv3 instance with its own neighbor adjacencies, link state database, and SPF computation. A single IPv4 or IPv6 OSPFv3 process running multiple instances on the same interface is not supported.

Enable Address Family IPv4 Unicast

The diagram below shows the minimum configuration required to enable the OSPFv3 address family feature and to establish the adjacency between R1 and R2 to support the IPv4 address family.

Note: To enable the IPv4 unicast address family in an OSPFv3 router, you need to configure an IPv4 address on the OSPFv3 enabled interface.

Topology

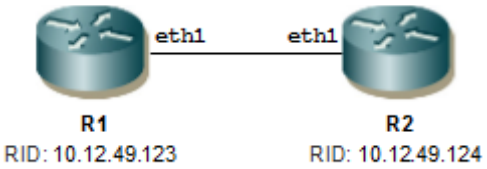

Figure 5-26: IPv4 Address Family on OSPFv3

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 11.1.1.1/24`	Assign IPv4 address to interface eth1
`(config-if)#exit`	Exit interface mode
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process.
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use for this process .
`(config-router)#address-family ipv4 unicast`	Enable the ipv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode

(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in area 0. The tag uniquely identifies the routing process and the instance identifier is 64-95 for the IPv4 address family
(config-if)#exit	Exit interface mode

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode
(config-if)#ip address 11.1.1.2/24	Assign IPv4 address to interface eth1
(config-if)#exit	Exit interface mode
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process.
(config-router)#router-id 10.12.49.124	Configure the router ID to use on this tag.
(config-router)#address-family ipv4 unicast	Enable the ipv4 address family
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in area 0. The tag uniquely identifies the routing process and the instance identifier is 64-95 for the IPv4 address family
(config-if)#end	Exit interface mode

Note: Use the process identifier to tag the interface, The instance identifier should be same on R1 and R2. In the above example, the process identifiers (100-ABC) and the instance identifiers are the same (64).

Validation

Verify that adjacency has been established with the configured instance identifier.

```
R2#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface Instance ID
10.12.49.123      1   Full/DR         00:00:37    eth1           64

R2#sh ipv6 ospf interface eth1
eth1 is up, line protocol is up
  Interface ID 3
  IPv6 Prefixes
    fe80::5054:ff:fe4e:32d1/64 (Link-Local Address)
  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 64
    Router ID 10.12.49.124, Network Type BROADCAST, Cost: 1, TE Metric: 0
    Transmit Delay is 1 sec, State Backup, Priority 1
    Designated Router (ID) 10.12.49.123
      Interface Address fe80::5054:ff:fe7e:3466
    Backup Designated Router (ID) 10.12.49.129
      Interface Address fe80::5054:ff:fe4e:32d1
    Timer interval configured, Hello 10, Dead 40, Wait 40, Retransmit 5
      Hello due in 00:00:04
    Neighbor Count is 1, Adjacent neighbor count is 1
```

Originate Type-7 LSAs and Translate to Type-5

Figure 5-27 shows the configuration to originate Type-7 LSAs and translate them into Type-5 LSAs. R3 is an NSSA-ASBR that originates Type-7 LSAs into the NSSA which are converted to Type-5 LSAs by R2 which is an NSSA-ABR. R1 is a backbone router.

Topology

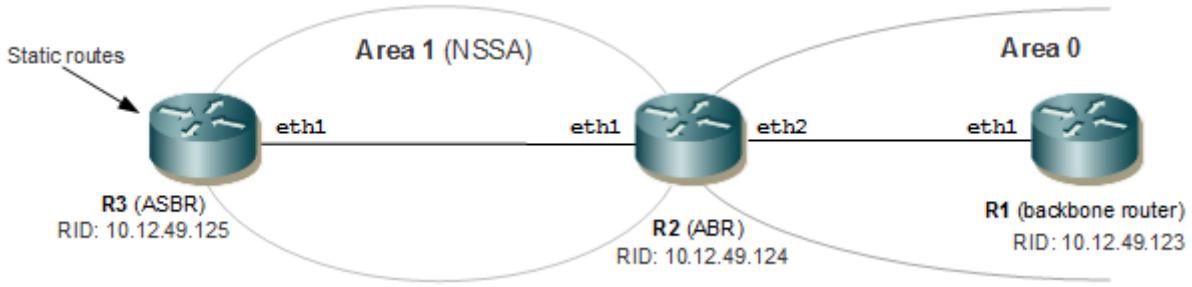

Figure 5-27: Originate Type-7 LSAs and Translate to Type-5 under Address Family IPv4

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 11.1.1.1/24`	Assign IPv4 address to interface eth1
`(config-if)#exit`	Exit interface mode
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use on this tag
`(config-router)#address-family ipv4 unicast`	Enable the IPv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip address 11.1.1.2/24`	Assign IPv4 address to interface eth1
`(config-if)#exit`	Exit interface mode

(config)#interface eth2	Enter interface mode
(config-if)#ip address 22.1.1.1/24	Assign IPv4 address to interface eth2
(config-if)#exit	Exit interface mode
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process.
(config-router)#router-id 10.12.49.124	Configure the router ID to use for this process
(config-router)#area 1 nssa	Configure the area 1 as NSSA.
(config-router)#address-family ipv4 unicast	Enable the ipv4 address family
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode

R3

#configure terminal	Enter configure mode.
(config-router)#ip route 15.15.15.0/24 null	Configure the static route with the nexthop address set to null
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process.
(config-router)#router-id 10.12.49.125	Configure the router ID to use for this process
(config-router)#area 1 nssa	Configure the area 1 as NSSA.
(config-router)#address-family ipv4 unicast	Enable the ipv4 address family
(config-router-af)#redistribute static	Redistribute the static routes configured into the OSPF NSSA
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

Validation 1

Verify that adjacency has been established with the configured instance identifier.

```
R2#sh ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface   Instance ID
```

```
10.12.49.123      1   Full/DR         00:00:31       eth1           64
10.12.49.125      1   Full/Backup     00:00:38    eth2          65
```

Validation 2

Verify that R3 has generated a Type-7 LSA and that the ABR R2 has External LSA Type 5 in its Database.

R3

```
R3#show ipv6 ospf database nssa-external

Summarize Inter-Area and External Routes

Figure 5-28 shows the configuration to enable inter-area and external route summarization. The IPv4 address family is enabled on R1. R2 summarizes the internal OSPF routes which R3 redistributes.

Topology

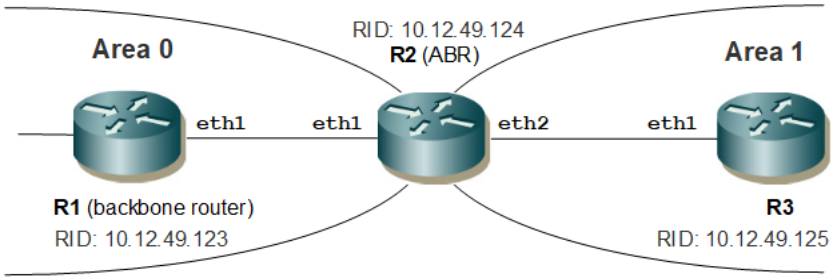

Figure 5-28: Enabling Intra-Area and External Route Summarization

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router ipv6 ospf 100-ABC`	Configure the routing process and specify the tag (`100-ABC`) which uniquely identifies the routing process
`(config-router)#router-id 10.12.49.123`	Configure the router ID to use for this process.
`(config-router)#address-family ipv4 unicast`	Enable the IPv4 address family
`(config-router-af)#exit-address-family`	Exit Router AF configuration mode
`(config-router)#exit`	Exit OSPF router mode

(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.10.10.1/24	Specify IP address for interface eth1
(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

R2

(config)#interface eth1	Enter interface mode
(config-if)#ip address 10.10.10.2/24	Specify an IP address for the interface
(config-if)#ipv6 router ospf area 0 tag 100-ABC instance-id 64	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode
(config)#interface eth2	Enter interface mode
(config-if)#ip address 20.20.20.1/24	Specify an IP address for the interface
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode
(config)#interface lo	Enter interface mode
(config-if)# ip address 100.1.1.100/32 secondary	Specify an IP address for the interface
(config-if)# ip address 100.1.1.110/32 secondary	Specify an IP address for the interface
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.
(config-if)#exit	Exit interface mode
#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process
(config-router)#router-id 10.12.49.124	Configure the router ID to use for this process
(config-router)#address-family ipv4 unicast	Enable the IPv4 address family
R2(config-router-af)#area 1 range 100.1.1.0/24 advertise	Summarize the inter-area OSPF routes
(config-router-af)#exit-address-family	Exit Router AF configuration mode
(config-router)#exit	Exit OSPF router mode

R3

(config)#interface eth1	Enter interface mode
(config-if)#ip address 20.20.20.2/24	Specify an IP address for the interface
(config-if)#ipv6 router ospf area 1 tag 100-ABC instance-id 65	Configure the interface in an area assigned with the area ID (1) which uniquely identifies the routing process and the instance identifier which is 64-95 for the IPv4 address family.

(config)#interface lo	Enter interface mode
(config-if)# ip address 200.1.1.100/32 secondary	Specify an IP address for the interface
(config-if)# ip address 200.1.1.110/32 secondary	Specify an IP address for the interface
(config-if)#exit	Exit interface mode
#configure terminal	Enter configure mode.
(config)#router ipv6 ospf 100-ABC	Configure the routing process and specify the tag (100-ABC) which uniquely identifies the routing process
(config-router)#router-id 10.12.49.125	Configure the router ID to use for this process
(config-router)#address-family ipv4 unicast	Enable the IPv4 address family
(config-router-af)#redistribute connected	Redistribute the connected routes to generate external LSAs
(config-router-af)#summary-address 200.1.1.0/24	Summarize the external routes at the ASBR.

Validation

Validation 1: Verify that adjacency has been established with the configured instance identifier.

```
R2#show ipv6 ospf neighbor
OSPFv3 Process (100-ABC)
Neighbor ID     Pri   State              Dead Time   Interface  Instance ID
10.12.49.123      1   Full/Backup     00:00:38       eth1       64
10.12.49.125      1   Full/DR            00:00:38       eth2       65
```

Validation 2: Verify that a single summarized OSPF IA route and a single summarized external route is available in FIB of R1

```
R1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C            10.0.0.0/8 is directly connected, eth0, 00:45:18
C            11.1.1.0/24 is directly connected, eth1, 00:40:01
O IA         22.1.1.0/24 [110/2] via 11.1.1.2, eth1, 00:37:57
O IA         100.1.1.0/24 [110/2] via 11.1.1.2, eth1, 00:24:59
C            127.0.0.0/8 is directly connected, lo, 00:45:18
O E2         200.1.1.0/24 [110/20] via 11.1.1.2, eth1, 00:00:54

Gateway of last resort is not set

Distribute List

To filter the routes that Open Shortest Path First Version 3 (OSPFv3) installs in the Routing Information Base (RIB), use the `distribute-list in` command in an appropriate configuration mode.

To filter the routes redistributed into Open Shortest Path First Version 3 (OSPFv3) from other routing protocols, use the `distribute-list out` command in an appropriate configuration mode.

Topology

Figure 5-29 shows the configuration to illustrate the distribute-list support for OSPFv3

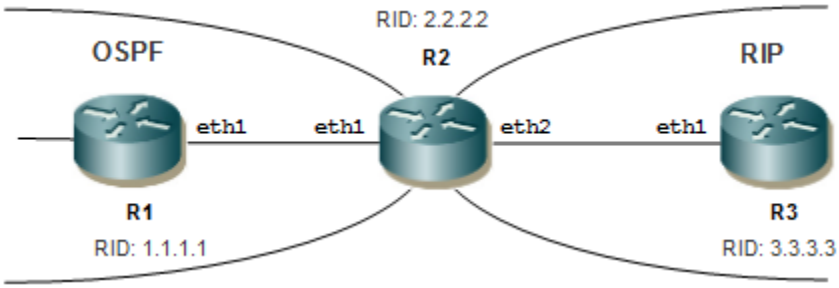

Figure 5-29: Basic Topology for Distribute-list

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::1/64`	Configure the IPv6 address of the interface.
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)# ipv6 address 1111::1/128`	Configure the IPv6 address of the interface.
`(config-if)# ipv6 address 2222::2/128`	Configure the IPv6 address of the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router ipv6 ospf proc1`	Configure the routing process
`(config-router)#router-id 1.1.1.1`	Configure router-id to uniquely identify the router
`(config-router)#redistribute connected`	Redistribute connected routes into ospfv3
`(config-router)#end`	Exit router mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 address 2000::50/64`	Configure the IPv6 address of the interface
`(config-if)#ipv6 router ospf area 0 tag proc1`	Configure the interface in an area assigned with the area ID (0) which uniquely identifies the routing process
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode
`(config-if)#ipv6 address 4000::50/64`	Configure the IPv6 address of the interface.
`(config-if)#exit`	Exit interface mode
`(config-if)#ipv6 router rip`	Configure rip instance under interface
`(config-if)#exit`	Exit interface mode
`(config)#router ipv6 rip`	Configure the rip routing process
`(config-router)#neighbor fe80::5054:ff:fe85:19bc eth2`	Configure RIP neighbor peer
`(config-router)#exit`	Exit router mode.
`(config)#ipv6 access-list 1`	Configure ipv6 access list
`(config-ipv6-acl)# permit any 7777::/64 any`	Configure ipv6 access-list to permit 7777::/64 and deny 8888::/64
`(config-ipv6-acl)#exit`	Exit ipv6 access-list mode
`(config)#ipv6 access-list 2`	Configure ipv6 access-list
`(config-ipv6-acl)#permit any 1111::1/128 any`	Configure ipv6 access-list to permit 1111::1/128 and deny 2222::2/128
`(config-ipv6-acl)#exit`	Exit ipv6 access-list mode

(config)#router ipv6 ospf proc1	Configure the ospfv3 routing process
(config-router)#router-id 2.2.2.2	Configure router-id to uniquely identify the router
(config-router)#redistribute rip	Redistribute rip routes
(config-router)#distribute-list 1 out rip	Configure distribute list to allow only the permitted routes redistributed from RIP
(config-router)#distribute-list 2 in	Configure distribute list to allow the installation of only the permitted OSPFv3 routes in RIB
(config-router)#exit	Exit router mode
(config)#ipv6 access-list 1	Enter access-list mode
(config-ipv6-acl)#permit any 8888::/64 any	Configure the ipv6 access-list to permit 8888::/64 alongwith 7777::/64
(config-ipv6-acl)#exit	Exit access-list mode
(config)#ipv6 access-list 2	Enter access-list mode
(config-ipv6-acl)#permit any 2222::2/128 any	Configure the ipv6 access-list to permit 2222::2/128 alongwith 1111::1/128
(config-ipv6-acl)#exit	Exit access-list mode
(config)#exit	Exit configure mode

R3

#configure terminal	Enter configure mode
(config)#interface eth1	Enter interface mode
(config-if)#ipv6 address 4000::51/64	Configure the IPv6 address of the interface.
(config-if)#ipv6 router rip	Configure rip instance under interface
(config-if)#exit	Exit interface mode
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#neighbor fe80::5054:ff:fec6:69f eth1	Configure rip neighbor peer
(config-router)#end	Exit router mode
(config)#ipv6 route 7777::/64 eth2	Configure static route
(config)#ipv6 route 8888::/64 eth3	Configure static route
(config)#router ipv6 rip	Configure the rip routing process
(config-router)#redistribute static	Redistribute configured static routes
(config-router)#end	Exit router mode

Validation 1

Verify OSPF neighborship is up between R1and R2

R2

```
R2#show ipv6 ospf neighbor
OSPFv3 Process (Proc1)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
1.1.1.1           1   Full/Backup     00:00:38    eth1       0
```

Validation 2

Check if permitted route 7777::/64 is present in R1's routing table and denied route 8888::/64 is not present.

R1

```
R1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
   Destination     Metric           Next-hop
C  2000::/64         1             directly connected, eth1, Area 0.0.0.0
E2 7777::/64        1/20   via    fe80::5054:ff:fe1e:269d, eth1
```

Validation 3

Check both the routes 7777::/64 and 8888::/64 are present after 8888::/64 is permitted

R1

```
rtr1#show ipv6 ospf route
OSPFv3 Process (Proc1)
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

   Destination    Metric    Next-hop
C  2000::/64         1      directly connected, eth1, Area 0.0.0.0
E2 7777::/64        1/20   via fe80::5054:ff:fe1e:269d, eth1
E2 8888::/64        1/20   via fe80::5054:ff:fe1e:269d, eth1
```

Validation 4

Check if permitted route 1111::1/128 is present in R2's routing table and denied route 2222::2/128 is not present.

R1

```
R2#show ipv6 route
IPv6 Routing Table

CHAPTER 6 IS-IS IPv4

This chapter contains basic IS-IS (Intermediate System to Intermediate System) configuration examples.

Enable IS-IS on an Interface

This example shows the minimum configuration required for enabling IS-IS on an interface. R1 and R2 are two routers in the ABC instance connecting to the network 10.10.10.0/24. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

Topology

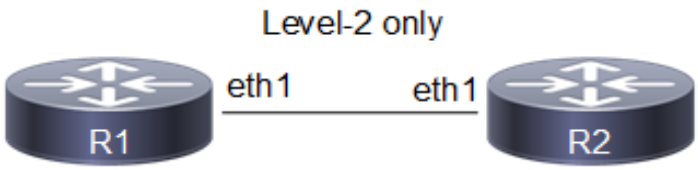

Figure 6-30: Basic IS-IS Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).

`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Set Priority

This example describes how to set the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R3 is configured to have a priority of 70, this is higher than the default priority (64) of R1 and R2. This makes R3 the DIS.

Topology

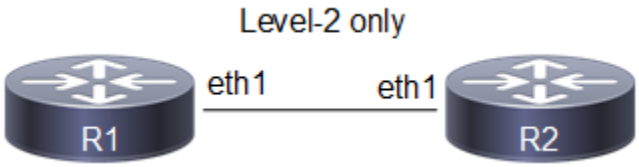

Figure 6-31: Set IS-IS Priority

Configuration

R1

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).

`(config-if)#isis priority 125`	Specify the router priority to a higher priority (125) to make R2 the designated IS (DIS).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Dynamic hostname

This example shows how to configure Dynamic Hostname for an ISIS instance. Dynamic hostname is the method of mapping name-to-systemID. It allows the routing protocol to advertise symbolic names in the IS-IS PDUs. This is done by the addition of a new TLV which allows the IS-IS routers to include the name-to-systemID mapping data in their LSPs. This allows for simple and reliable transport of name mapping across IS-IS networks. Dynamic hostname can be either the hostname of the node or the tag of the configured ISIS instance.

Note: Dynamic-hostname has to be configured on all nodes for it to take effect.

Topology

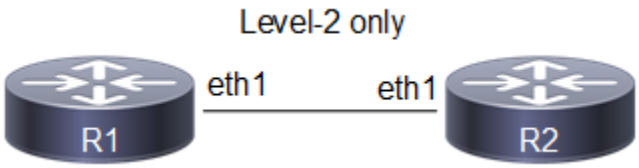

Figure 6-32: Basic dynamic hostname topology

Configuration

R1

(config)#interface eth1	Enter interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config)#ip address 21.21.21.2/24	Configure IP address on interface.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.

R2

(config)#interface eth1	Enter interface mode.
(config)#ip address 21.21.21.1/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#dynamic-hostname	Configure the hostname to be advertised for an ISIS instance.

Redistribute Routes into IS-IS

In this example, the configuration causes OSPF routes to be imported into the IS-IS routing table, and advertised into the ABC instance.

Topology

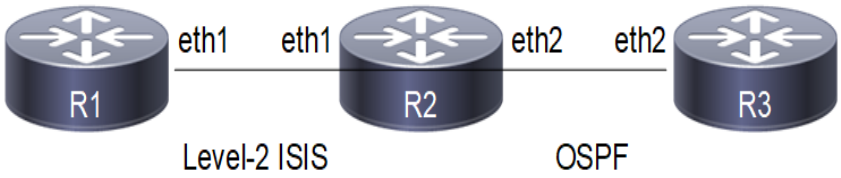

Figure 6-33: Redistribute Routes Into IS-IS

Configuration

R1

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config)#ip address 21.21.21.2/24`	Configure IP address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.

R2

`(config)#interface eth1`	Enter interface mode.
`(config)#ip address 21.21.21.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config)#ip address 31.31.31.1/24`	Configure IP address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#redistribute ospf`	Specify redistributing routes from other routing protocol (OSPF) into IS-IS.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#exit`	Exit interface mode.
`(config)#interface lo`	Configure interface lo
`(config-if)#ip address 2.2.2.2/32 secondary`	Configure secondary IP address to loopback interface
`(config-if)#exit`	Exit interface mode.

(config)#router ospf 100	Configure OSPF routing process and specify the tag (100) which uniquely identifies the routing process
(config-router)#ospf router-id 2.2.2.2	Specify a Router ID (2.2.2.2) for the OSPF routing process.
(config-router)#network 2.2.2.2/32 area 0.0.0.0	Advertising 2.2.2.2 network
(config-router)#network 31.31.31.0/24 area 0.0.0.0	Advertising 31 network
(config-router)#exit	Exit router mode.

R3

(config)#interface eth2	Enter interface mode.
(config)#ip address 31.31.31.2/24	Configure IP address on interface.
(config-if)#exit	Exit interface mode.
(config)#interface lo	Configure interface lo
(config-if)#ip address 3.3.3.3/32 secondary	Configure secondary IP address to loopback interface
(config-if)#exit	Exit interface mode.
(config)#router ospf 100	Configure OSPF routing process and specify the tag (100) which uniquely identifies the routing process
(config-router)#ospf router-id 3.3.3.3	Specify a Router ID (3.3.3.3) for the OSPF routing process.
(config-router)#network 3.3.3.3/32 area 0.0.0.0	Advertising 3.3.3.3 network
(config-router)#network 31.31.31.0/24 area 0.0.0.0	Advertising 31 network

Metric

You can make a route the preferred route by changing its metric. In this example, the cost has been configured to make R3 the next hop for R1.

The default metric for each interface is 10. Interface eth3 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach 10.10.14.0/24 (R4) through R2 and R3 is computed as follows:

R2: 10+20 = 30

R3: 10+30 = 40

In this topology, R1 chooses R2 as its next hop for destination 10.10.14.0/24.

Topology

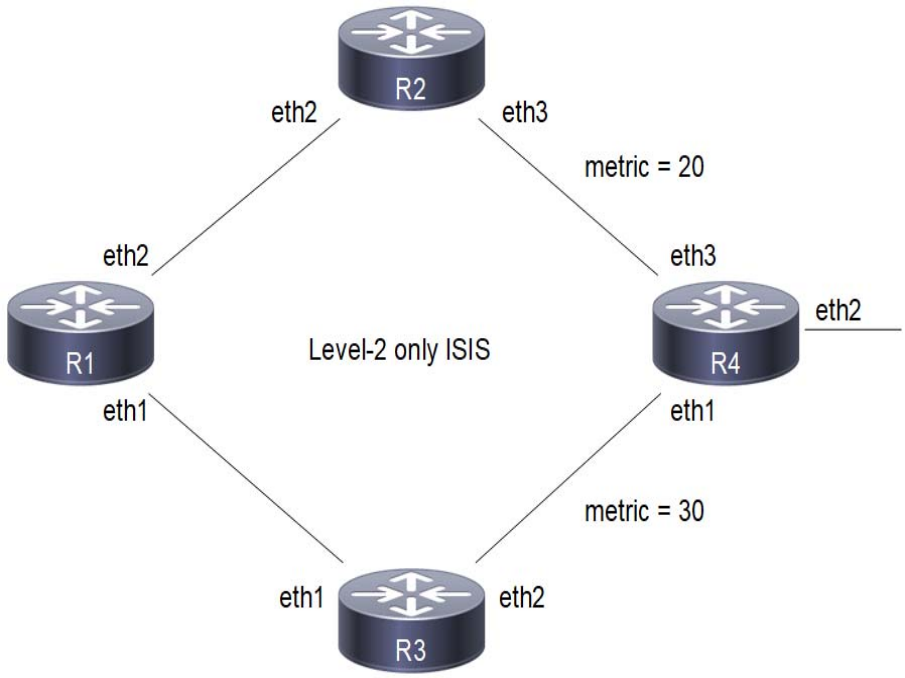

Figure 6-34: Configure IS-IS Metric

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.

(config-if)#ip address 30.30.30.1/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

(config)#interface eth2	Enter interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ip address 40.40.40.1/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis metric 20	Set the value of IS-IS metric (on eth2) to 20.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)#interface eth1	Enter interface mode.
(config-if)#ip address 20.20.20.2/24	Configure IP address on interface.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#ip address 50.50.50.1/24	Configure IP address on interface.
(config-if)#isis metric 30	Set the value of IS-IS metric (on eth2) to 30.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#ip address 50.50.50.2/24`	Configure IP address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth3`	Enter interface mode.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on an interface for area `49 (ABC)`.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as `level-2-only` routing.
`(config-router)#net 49.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

L1-L2 Area Routing with a Single Instance

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the single-instance version of the Level-1-2 router.

Topology

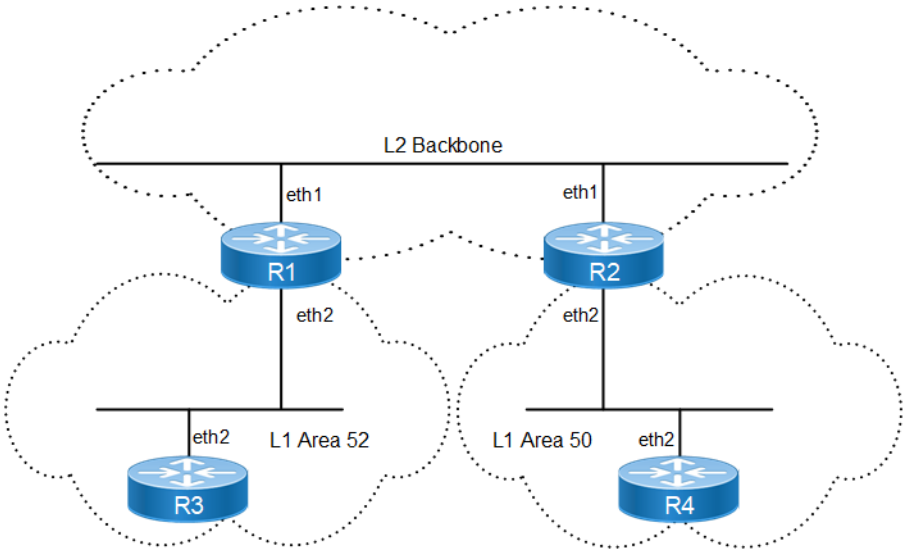

Figure 6-35: Single-Instance L1-L2 Area Routing

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on the interface `eth0` for area ABC.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type for the interface `eth0`.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on the interface `eth1` for area ABC.
`(config-if)#isis circuit-type level-1`	Set the circuit type for interface `eth1` to level 1.
`(config-if)#exit`	Exit interface mode.

`#configure terminal`	Enter configure mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area ABC.
`(config-router)#net 52.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip router isis bb`	Enable IS-IS routing on the interface `eth0` for area `bb`.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type for the interface `eth0` to level-2 only.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IP address on interface.
`(config-if)#ip router isis bb`	Enable IS-IS routing on interface `eth1` for area `bb`.
`(config-if)#isis circuit-type level-1`	Set the circuit type for interface `eth1` to level 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis bb`	Create an IS-IS routing instance for area `bb`.
`(config-router)#net 50.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#ip router isis xyz`	Enable IS-IS routing on the interface `eth0` for area `xyz`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis xyz`	Create an IS-IS routing instance for area `xyz`.
`(config-router)#is-type level-1`	Set the IS level for this area (`xyz`) as `level-1`.
`(config-router)#net 52.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#ip router isis aa`	Enable IS-IS routing on the interface `eth0` for area `aa`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)#is-type level-1`	Set the IS level for this area (`aa`) as `level-1`.
`(config-router)#net 50.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

L1-L2 Area Routing with Multiple Instances

IS-IS supports a two-level hierarchy for handling and scaling the functionality of large networks. The Level-1 (L1) area is mainly for Leaf networks, and the Level-2 (L2) area is the backbone area connecting Level-1 areas. In this example, R3 and R4 are configured as Level-1 routers, and reside in the Level-1 area. R1 and R2 are configured as Level-1-2 routers, and connect these two Level-1 areas with a backbone Level-2 area. You can configure Level-1-2 routers with single or multiple instances: This configuration shows the multiple-instance version of the Level-1-2 router.

Topology

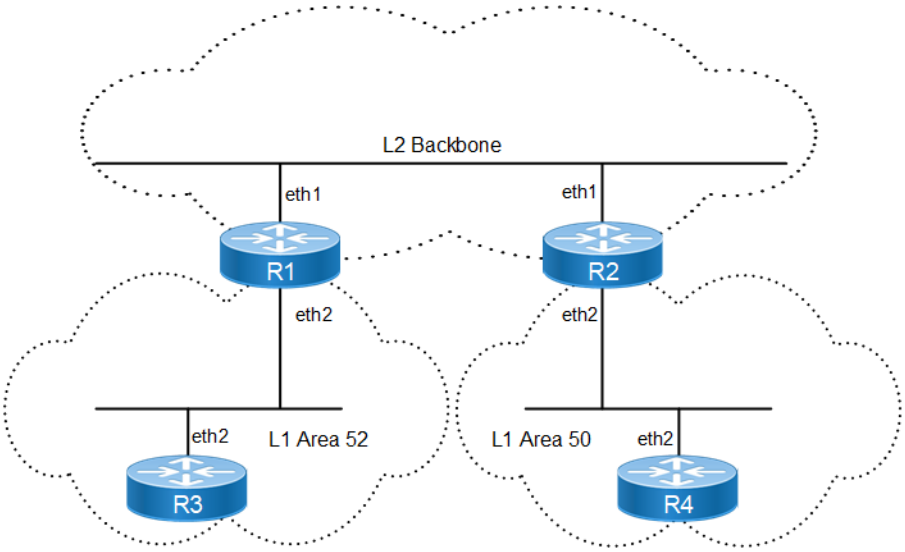

Figure 6-36: Multiple-Instance L1-L2 Area Routing

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#ip router isis aaa`	Enable IS-IS routing on interface `eth0` for area `aaa`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis aaa`	Create an IS-IS routing instance for area `aaa`.
`(config-router)#is-type level-2-only`	Set the IS level for this area (`aaa`) as `level-2-only`.
`(config-router)#net bb.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ccc`	Enable IS-IS routing on interface `eth1` for area `ccc`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ccc`	Create an IS-IS routing instance for area `ccc`.
`(config-router)#is-type level-1`	Set the IS level for this area (`ccc`) as `level-1`.
`(config-router)#net cc.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis bb`	Enable IS-IS routing on interface `eth0` for area `bb.`
`(config-if)#exit`	Exit interface mode.
`(config)#router isis bb`	Create an IS-IS routing instance for area `bb`.
`(config-router)#is-type level-2-only`	Set the IS level for this area (`bb`) as `level-2-only`.
`(config-router)#net bb.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#exit`	Exit Router mode, and return to Configure mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.1/24`	Configure IP address on interface.
`(config-if)#ip router isis ABC`	Enable IS-IS routing on interface `eth1` for area ABC.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area ABC.
`(config-router)#is-type level-1`	Set the IS level for this area (ABC) as `level-1`.
`(config-router)#net cc.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#ip router isis xyz`	Enable IS-IS routing on interface `eth0` for area `xyz`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis xyz`	Create an IS-IS routing instance for area `xyz`.
`(config-router)#is-type level-1`	Set the IS level for this area (`xyz`) as `level-1`.
`(config-router)#net 52.0000.0000.0003.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 40.40.40.2/24`	Configure IP address on interface.
`(config-if)#ip router isis aa`	Enable IS-IS routing on interface `eth0` for area `aa`.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis aa`	Create an IS-IS routing instance for area `aa`.
`(config-router)#is-type level-1`	Set the IS level for this area (`aa`) as `level-1`.
`(config-router)#net 52.0000.0000.0004.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Route Leaking

Route leaking is defined in RFC 2966. For Level-1 (L1) routers, only level-1 routes are populated in the routing table. The L1 router has a default route to the nearest Level-1/Level-2 (L1/L2) router: This could result in sub-optimal routing in certain scenarios. Route leaking causes an L1/L2 router to advertise the level-2 routes in its database to the L1 router, thus allowing the L1 router to acknowledge the prefixes advertised by the Level-2 (L2) router. In this way, the L1 router has the ability to learn the true cost to reach other areas.

In the following example, R1 is the L1 router, R2 is the L1/L2 router doing the route leaking, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacency with R1 and R3 are already up, and the route tables with appropriate routes are already populated.

Topology

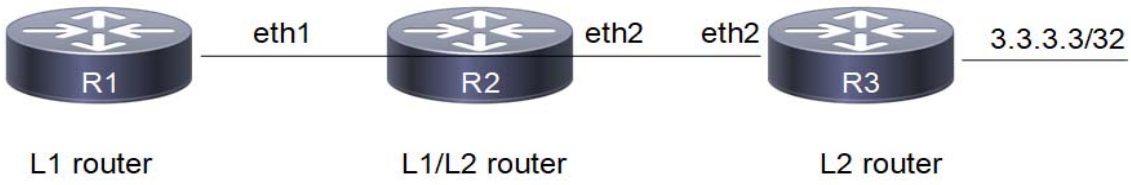

Figure 6-37: Route Leaking Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#is-type level-1`	Configure instance as level-1.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R1).
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth2 (connected to R3).
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0002.00`	Define the NET address.
`(config-router-af)#redistribute isis level-2 into level-1`	Enable redistribution of isis routes from level-2 into level-1

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Specify the interface (lo)to configure and enter Interface mode.
`(config-if)#ip address 3.3.3.3/32 secondary`	Configure IP address on loopback interface.
`(config-if)# ip router isis 1`	Enable IS-IS routing on interface lo
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0001.0000.0000.0003.00`	Define the NET address.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.2/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type as level-2-only for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).

In the example, route, `i ia 3.3.3.3/32 [115/30] via 20.20.20.2, eth1, 00:12:29`, is the L2 route leaked by the L1/L2 router into the L1 router.

Route Summarization

Route summarization makes the routing table smaller, but still allows complete IP connectivity, if everything is configured properly.

The following example consists of a three-router topology, in which R2 is doing the summarization. In this example, R1 is the L1 router, R2 is the L1/L2 router doing the summarization, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacencies with R1 and R3 are already up, and the route tables with the appropriate routes are already populated.

Topology

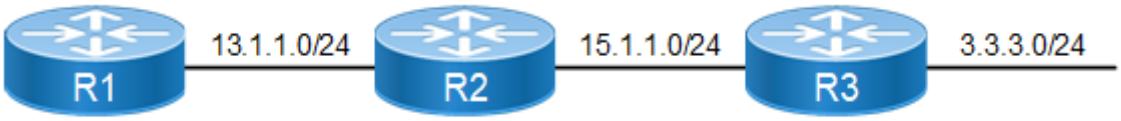

Figure 6-38: Route Summarization Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.
`(config-router)#is-type level-1`	Configure instance as level-1.
`(config-router)#exit`	Exit router mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#ip address 20.20.20.1/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R2).

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (eth1)to configure and enter Interface mode.
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface
`(config-if)#ip address 20.20.20.2/24`	Configure IP address on interface.
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth1 (connected to R1).
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#interface eth2`	Specify the interface (eth2)to configure and enter Interface mode.
`(config-if)#ip address 30.30.30.1/24`	Configure IP address on interface.
`(config-if)#isis circuit-type level-2-only`	Set the circuit type as level-2-only for the interface
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface eth2 (connected to R3).
`(config-if)#exit`	Exit interface mode and return to Configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0002.00`	Define the NET address.

(config-router-af)#redistribute isis level-2 into level-1	Enable redistribution of isis routes from level-2 into level-1
(config-router-af)# summary-address 90.0.0.0/6 level-1 metric 50	Configure the summary address to summarize IP reachability information.

R3

#configure terminal	Enter configure mode.
(config)#ip route 66.66.66.1/24 eth2	Configure ip static route.
(config)#ip route 77.77.77.1/24 eth2	Configure ip static route.
(config)#ip route 88.88.88.1/24 eth2	Configure ip static route.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0001.0000.0000.0003.00	Define the NET address.
(config-router)#redistribute static	Enable redistribution of static routes into ISIS instance.
(config-router)#exit	Exit router mode.
(config)#interface eth2	Specify the interface (eth2)to configure and enter Interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).

IS-IS Distance

Administrative distance in IS-IS can be configured for a specified source ID or for all routes.

This example shows configuring the IS-IS administrative distance for the IPv4 address family.

Topology

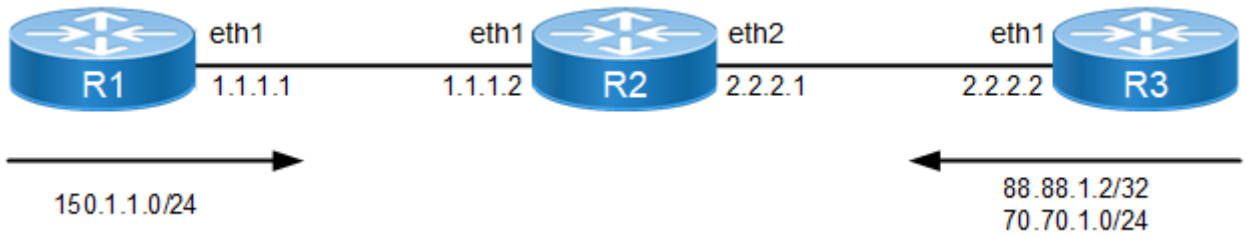

Figure 6-39: IS-IS Distance Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 1.1.1.1/24`	Assign the IP address on this interface (`eth1`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1`.
`(config)#ip route 150.1.1.0/24 eth1`	Configure static routes.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0001.00`	Set a Network Entity Title (NET) for this instance, specifying the address and the system ID.
`(config-router)#redistribute static`	Redistribute the static routes.

R2

`#configure terminal`	Enter configure mode
`(config)#ip access-list DIST`	Enter access list mode
`(config-ip-acl)#permit ipip 88.88.1.2/32 any`	Create an access list to permit the `88.88.1.2/32` route from R3.
`(config-ip-acl)#exit`	Exit access list mode
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 1.1.1.2/24`	Assign the IP address on this interface (`eth1`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1`
`(config-if)#exit`	Exit interface mode
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 2.2.2.1/24`	Assign the IP address on this interface (`eth2`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth2`
`(config-if)#exit`	Exit interface mode
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0002.00`	Specify the NET address.
`(config-router)#distance 100`	Configure the administrative distance for all routes received from R1 and R2.
`(config-router)#distance 20 0001.0000.0001`	Configure the administrative distance for all routes received from R1. This command overwrites the applied distance, 100, and will apply distance 20 for all routes received from R1.
`(config-router)#distance 30 0001.0000.0003 DIST`	Configure the distance, `30`, to the route, 88.88.1.2/32, received from R3. All other routes from R3 (for example, 70.70.1.0/24) will have the distance applied as 100. If the distance, 100, is not configured, all other routes will have a default distance of 115.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 2.2.2.2/24`	Assign the IP address on this interface (`eth1`).
`(config-if)#ip router isis 1`	Enable IS-IS routing on interface `eth1`.
`(config-if)#exit`	Exit interface mode.
`(config)#ip route 88.88.1.2/32 eth2`	Configure static routes
`(config)#ip route 70.70.1.0/24 eth2`	Configure static routes
`(config)#router isis 1`	Create an IS-IS routing instance (`1`).
`(config-router)#net 49.0001.0000.0003.00`	Specify the NET address.
`(config-router)#redistribute static`	Redistribute the static routes.

Passive Interface

In ISP and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the Default Passive-Interface feature, there were two possibilities for obtaining routing information from all of these interfaces:

- Configure a routing protocol on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive, which was time consuming.

The solution to this problem was to configure the routing protocol on all interfaces and manually set the `passive-interface` command on the interfaces where adjacency was not desired. In certain networks, this meant coding 200 or more passive-interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single `passive-interface` default command, then configuring individual interfaces in which adjacencies are desired using the `no passive-interface <interface-name>` command.

Usage

1. When a specific interface is configured as passive using the `passive-interface <interface-name>` command:
   - The interface loses its adjacency on that interface, for example, eth1.
   - The interface (eth1) is still advertised by other IS-IS speaking interfaces to their neighbors.
2. When a specific interface is configured as passive using `passive-interface <interface-name>` command followed by removing the configuration using `no passive-interface <interface-name>` command:
   - The interface is IS-IS disabled and must be enabled using the `ip router isis` command (for example, `ip router isis 1`).
   - If IS-IS is not configured, the interface (for example, eth1) will not be advertised by other IS-IS speaking interfaces to their neighbors.
3. When an interface is configured with the `passive interface` command:
   - All IS-IS enabled interfaces lose their adjacency.
   - All IS-IS enabled interfaces in the system will be made passive.
   - To establish adjacency on a particular interface, `no passive interface <interface-name>`" command must be enabled.
   - All interfaces which were made passive are advertised by the active IS-IS speaking interface to its neighbors.
4. When an interface is configured with the `no passive interface` command:
   - All interfaces which are currently passive, will become active.
   - If IS-IS is configured on those interface, it will start sending out IS-IS packets and attempt to form adjacency.
   - If IS-IS is not configured on those interfaces, it will not be advertised by the active IS-IS speaking interface to its neighbors.

Topology

Figure 6-40 shows a passive-interface configuration example.

Figure 6-40: IS-IS Passive Interface

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#router isis 1`	Create an IS-IS routing instance (1).
`(config-router)#net 49.0001.0000.0000.0001.00`	Define the NET address.

(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#exit	Exit router mode.
(config)#interface eth1	Specify the interface (eth1)to configure and enter Interface mode.
(config-if)#ip address 20.20.20.1/24	Configure IP address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Specify the interface (eth1)to configure and enter Interface mode.
(config-if)#ip address 20.20.20.2/24	Configure IP address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R1).
(config-if)#exit	Exit interface mode and return to Configure mode.
(config)#interface eth2	Specify the interface (eth2)to configure and enter Interface mode.
(config-if)#ip address 30.30.30.1/24	Configure IP address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth2 (connected to R3).
(config-if)#exit	Exit interface mode and return to Configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#net 49.0001.0000.0000.0002.00	Define the NET address.
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#passive-interface eth1	Configure the eth1 interface as passive.

R3

#configure terminal	Enter configure mode.
(config)#router isis 1	Create an IS-IS routing instance (1).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0001.0000.0000.0003.00	Define the NET address.
(config-router)#exit	Exit router mode.
(config)#interface eth2	Specify the interface (eth2)to configure and enter Interface mode.
(config-if)#ip address 30.30.30.2/24	Configure IP address on interface.
(config-if)#ip router isis 1	Enable IS-IS routing on interface eth1 (connected to R2).

IS-IS IPv4 Loop-Free Alternate Fast Reroute

This section contains IS-IS (Intermediate System to Intermediate System) Loop-Free Alternate Fast Reroute (LFA-FRR) configuration examples.

For details about the commands used in these examples, see the *Intermediate System to Intermediate System Command Reference*.

OSPF LFA and ISIS LFA along with MPLS is not supported. Do not configure OSPF LFA or ISIS LFA, if MPLS is configured or vice-versa.

Overview

When a primary next-hop fails, LFA-FRR reduces the failure reaction time to tens of milliseconds using a pre-computed alternate next- hop, so that the alternate can be rapidly used when the failure is detected. A network with this feature experiences less traffic loss and less micro-looping of packets than a network without LFA-FRR.

After you enable LFA-FRR, routers calculate a backup path for each primary path to reach the destination. The backup path is calculated based on the attributes such as node protecting, link protecting, and broadcast link protecting. If there is an ECMP path to reach prefixes, the backup is selected from the same primary set by default; if a secondary tie-breaker is enabled, and if a secondary path is available, the backup will be selected from the secondary path.

Basic Configuration

Topology

Figure 6-41 shows the configuration to enable the basic ISIS LFA feature.

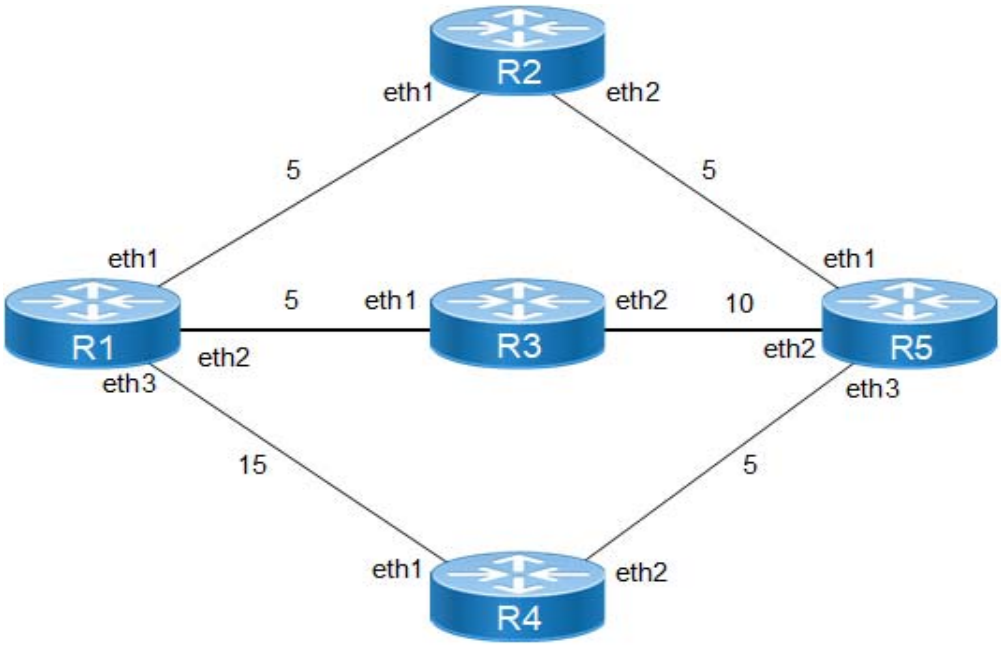

Figure 6-41: ISIS LFA-FRR

R1

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10.10.10.142/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure isis metric value for interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 20.20.20.142/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#isis metric 5`	Configure isis metric value for interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 30.30.30.142/24`	Configure the IP address of the interface.

(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#isis metric 15	Configure isis metric value for interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0000.0000.0001.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#fast-reroute per-prefix level-1 proto ipv4 all	Configure LFA-FRR to calculate the available backup path for all L1 ipv4 prefixes learnt
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

R2

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 10.10.10.141/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 40.40.40.141/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0000.0000.0002.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

R3

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 20.20.20.143/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1

(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 50.50.50.143/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 10	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0000.0000.0003.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

R4

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 30.30.30.144/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 15	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 60.60.60.144/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0000.0000.0004.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

R5

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 40.40.40.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth2`	Enter interface mode.
`(config-if)#ip address 50.50.50.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 10`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#exit`	Exit interface mode.
`(config)#int eth3`	Enter interface mode.
`(config-if)#ip address 60.60.60.145/24`	Configure the IP address of the interface.
`(config-if)#ip router isis 1`	Enable ISIS routing on interface for area 49 with instance 1
`(config-if)#isis metric 5`	Configure isis metric value for interface
`(config-if)#isis circuit-type level-1`	Enable circuit type on interface
`(config-if)#exit`	Exit interface mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0000.0000.0005.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#bfd all-interfaces`	Enable BFD for ISIS on all interfaces
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

```

It is not mandatory that for all primary paths, there exists an LFA backup path only if inequality equation satisfies according to attributes configured on routers, backup path will be calculated.

To prohibit an interface from being used as a repair path, disable fast reroute calculation on the interface:

`R1(config-if)#interface eth1`	Enter interface.
`(config-if)# isis fast-reroute per-prefix candidate disable level-1`	Disable fast reroute calculation on the interface.
`(config-if)#end`	Exit.

Verify that the `eth2` interface is not used for backup path calculation.

```

R1#
```

Backup Path based on Route-Map Prefixes

R1

Route-map and access-list configuration:

`(config)#ip access-list 1`	Create an access-list
`(config-ip-acl)#permit any 40.40.40.0 0.0.0.255 any`	Configuring rule to permit only one prefix
`(config)#route-map rmap1 permit 1`	Create a route-map
`(config-route-map)#match ip address 1`	Apply above created access-list in route-map
`(config)#exit`	Exit config mode.

Apply the above created route-map with fast-reroute:

`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 route-map rmap1`	Configure LFA-FRR to calculate the available backup path for routes allowed through route-map
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

```

```

LFA Tie-Breaker

Based on the index values configured, if inequalities are satisfied, protections will be provided:

- Lower the index will have the highest priority, The path which provides protection with highest priority will be selected. If there are multiple paths providing the highest priority protection then we will check which of the path provides the protection which has 2nd highest priority and so on.
- If all the paths provide same priority, then the LFA route is chosen on the basis of path cost.
- If none of the paths provides the protection with highest priority, then we will see which path provides the 2nd highest priority and so on.

The show command below displays default values for tie-breaker, by default maximum protection (link, node, broadcast, if ecmp, ecmp backup path) will be provided.

After configuring tie-breaker with index, values will be changed accordingly.

```
R1#show ip isis lfa-config level-1

TIE-Breaker Preference values
-----------------------------------------------
 Primary Path                 : 20
 Link Protecting              : 60
 Node Protecting              : 30
 Broadcast Interface Disjoint : 70
 Secondary Path               : 255
 Downstream Path              : 90

 Termination Hold On Interval : 1000 ms
```

R1

To change index values, below configurations should be used, with the lower the index highest the priority.

`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#fast-reroute per-prefix level-1 proto ipv4 all`	Configure LFA-FRR to calculate the available backup path for all L1 ipv4 prefixes learned
`(config-router)#fast-reroute tie-break level-1 proto ipv4 interface-disjoint index 1`	Configure index value to change priority for link protection
`(config-router)#fast-reroute tie-break level-1 proto ipv4 node-protecting index 2`	Configure index value to change priority for node protection
`(config-router)#fast-reroute tie-break level-1 proto ipv4 broadcast-interface-disjoint index 3`	Configure index value to change priority for broadcast link protection
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

```
R1#show ip isis lfa-config level-1

TIE-Breaker Preference values
-----------------------------------------------
 Primary Path                 : 20

                      [FRR-NH] via 30.30.30.144, eth3
```

LFA Termination

A router MUST limit the amount of time an alternate next-hop is used after the primary next-hop has become unavailable. This ensures that the router will start using the new primary next-hops.

LFA termination avoids a micro looping in topology, when particular network goes down, LFA backup path will be installed and if termination interval is configured, LFA backup will be still used till the interval and it is used in order to verify new primary path is loop free.

R1

Configure termination interval on R1 in router mode:

(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#fast-reroute terminate-hold-on interval 100000	Configure LFA termination interval
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

Validation

```
R1#show ip isis lfa-config level-1

LFA For ECMP Paths

Equal-Cost Multi-Path Routing (ECMP) is a routing technique where next-hop packet forwarding to a single destination can occur over multiple “best-paths” that tie in routing metric calculations. Because it is a per-hop decision limited to a single router, it can increase bandwidth by load-balancing traffic over multiple paths.

Here, we provide configuration capabilities for Loop-Free Alternate (LFA) Fast Reroute (FRR) along with ECMP.

Topology

Figure 6-42 shows the configuration to enable the ISIS LFA feature with ECMP.

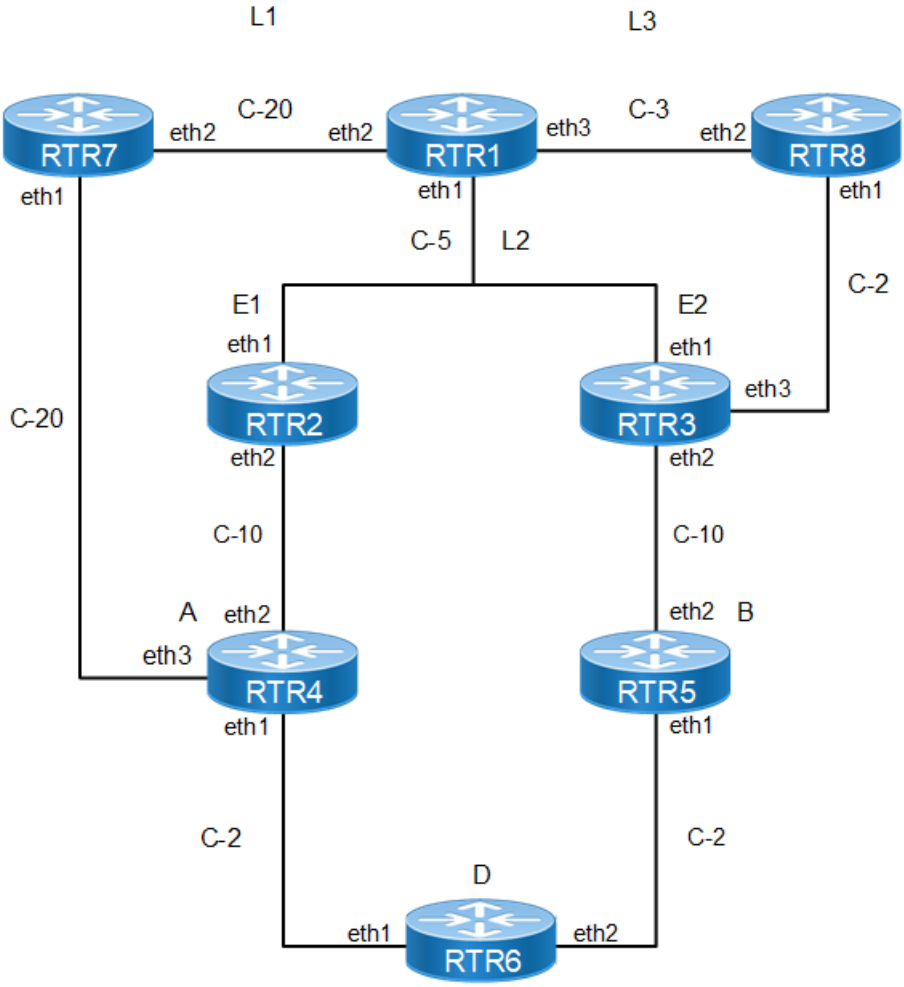

Figure 6-42: ISIS LFA-FRR ECMP

RTR1, S

`#configure terminal`	Enter configure mode.
`(config)#int eth1`	Enter interface mode.
`(config-if)#ip address 10.1.1.142/24`	Configure the IP address of the interface.

(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 20.1.1.142/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 20	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#int eth3	Enter interface mode.
(config-if)#ip address 30.1.1.142/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 3	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1
(config-router)#net 49.0000.0000.0001.00	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable BFD for ISIS on all interfaces
(config-router)#fast-reroute per-prefix level-1 proto ipv4 all	Configure LFA-FRR to calculate the available backup path for all L1 ipv4 prefixes learnt
(config-router)#exit	Exit router mode.
(config)#exit	Exit config mode.

RTR2

#configure terminal	Enter configure mode.
(config)#int eth1	Enter interface mode.
(config-if)#ip address 10.1.1.141/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 5	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#int eth2	Enter interface mode.
(config-if)#ip address 40.1.1.141/24	Configure the IP address of the interface.
(config-if)#ip router isis 1	Enable ISIS routing on interface for area 49 with instance 1
(config-if)#isis metric 10	Configure isis metric value for interface
(config-if)#isis circuit-type level-1	Enable circuit type on interface
(config-if)#exit	Exit interface mode.
(config)#router isis 1	Create an IS-IS routing instance for area 49 with instance 1

Backup Path for ECMP Path from Non-ECMP Path

To select Backup path from secondary/Non-ECMP path, configure the below command in R1 with lowest index value.

If no backup path available from non-ecmp set , then from primary set itself , backup path will be installed

`(config)#router isis 1`	Create an IS-IS routing instance for area 49 with instance 1
`(config-router)#net 49.0000.0000.0001.00`	Establish a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#fast-reroute tie-break level-1 proto ipv4 secondary-path index 1`	Configure secondary path tie-breaker to select backup path from Non-ECMP path
`(config-router)#exit`	Exit router mode.
`(config)#exit`	Exit config mode.

Validation

```
R1#show ip isis lfa-config level-1

CHAPTER 7 IS-IS IPv6 Configuration

This chapter contains basic IS-IS (Intermediate System to Intermediate System) on IPv6 configuration examples.

Enable IS-ISv6 on an Interface

This example shows the minimum configuration required for enabling IS-IS on IPv6 on an interface. R1 and R2 are two routers in the ABC instance connecting to the network 1000::/64. After enabling IS-IS on an interface, create a routing instance, and specify the Network Entity Title (NET). IS-IS explicitly specifies a NET to begin routing. NET is comprised of the area address and the system ID of the router.

Note: ISISv6 session will come up even if IPv6 address is not configured, as it will use the link local address present on the interfaces.

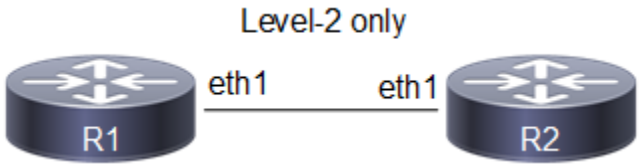

Figure 7-43: Figure 4-46: Basic IS-IS v6 Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.

(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

```

Set Priority

This example describes how to set the priority for an interface. Set a high priority for a router to make it the Designated IS (DIS). Router R3 is configured to have a priority of 70, this is higher than the default priority (64) of R1 and R2. This makes R3 the DIS.

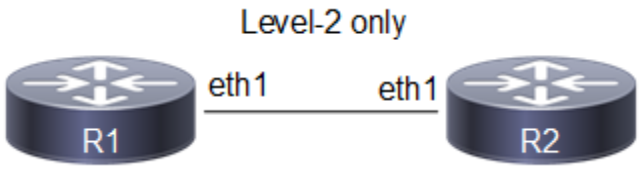

Figure 7-44: Set IS-IS Priority

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#isis priority 125`	Specify the router priority to a higher priority (125) to make R2 the designated IS (DIS).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

Dynamic hostname

This example shows how to configure Dynamic Hostname for an ISIS IPv6 instance. Dynamic hostname is the method of mapping name-to-systemID. It allows the routing protocol to advertise symbolic names in the IS-IS PDUs. This is done by the addition of a new TLV which allows the IS-IS routers to include the name-to-systemID mapping data in their LSPs. This allows for simple and reliable transport of name mapping across IS-IS networks.

Dynamic hostname can be either the hostname of the node or the tag of the configured ISISv6 instance.

Note: Dynamic-hostname has to be configured on all nodes for it to take effect.

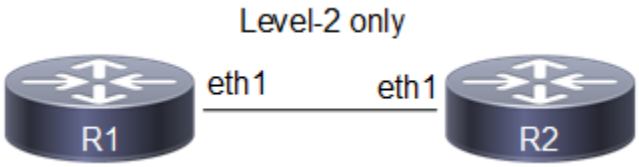

Figure 7-45: Basic dynamic hostname topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#end`	Exit the current mode and enter privilege mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#dynamic-hostname`	Configure the hostname to be advertised for an ISIS instance.
`(config-router)#end`	Exit the current mode and enter privilege mode.

Redistribute Routes into IS-IS

In this example, the configuration causes OSPFv3 routes to be imported into the IS-ISv6 routing table, and advertised into the ABC instance.

Topology

Figure 7-46: Redistribute Routes into IS-IS

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.

(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface and assign the Area ID 0.
(config-if)#ipv6 address 2000::1/64	Configure IPv6 address on interface.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#address-family ipv6	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration
(config-router-af)#redistribute ospf	Enable redistribution of routes from ospf into the ISIS routing table.
(config-router-af)# exit-address-family	Exit address family mode.
(config-router)#exit	Exit router mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 2.2.2.2	Specify a Router ID (2.2.2.2) for the OSPFv3 routing process.
(config-router)#end	Exit the current mode and enter privilege mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router ospf area 0	Enable OSPFv3 routing on an interface and assign the Area ID 0.
(config-if)#ipv6 address 2000::2/64	Configure IPv6 address on interface.
(config-if)#exit	Exit interface mode.
(config)#router ipv6 ospf	Create an OSPFv3 routing instance.
(config-router)#router-id 3.3.3.3	Specify a Router ID (3.3.3.3) for the OSPFv3 routing process.
(config-router)#end	Exit the current mode and enter privilege mode.

Interface Metric

You can make a route the preferred route by changing its metric. In this example, the cost has been configured to make R3 the next hop for R1.

The default metric for each interface is 10. Interface eth2 on R2 has a metric of 20, and Interface eth2 on R3 has a metric of 30. The total cost to reach 9999::/64 (R4) through R2 and R3 is computed as follows: R2: 10+20 = 30 R3: 10+30 = 40

In this topology, R1 chooses R2 as its next hop for destination 9999::/64.

Figure 7-47: Configure IS-IS Metric

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-IS routing on an interface for area 49(ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-IS routing on an interface for area 49(ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0100.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#end`	Exit current mode and enter privilege mode.

R2

`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-IS routing on an interface for area 49 (ABC).

(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis metric 20	Set the value of IS-IS metric (on eth2) to 20.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0100.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R3

(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#isis metric 30	Set the value of IS-IS metric (on eth2) to 30.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0100.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R4

(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 address 9999::1/64	Configure ipv6 address in eth2
(config-if)#exit	Exit interface mode.
(config)#interface eth3	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-IS routing on an interface for area 49 (ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0100.0000.0000.0004.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#address-family ipv6	Enter ipv6 address family.
(config-router-af)#redistribute connected	Enable redistribution of connected routes into ISIS process
(config-router-af)#end	Exit current mode and enter privilege mode

Route Summarization

Route summarization makes the routing table smaller, but still allows complete IP connectivity.

The following example consists of a three-router topology, in which R2 is doing the summarization. In this example, R1 is the L1 router, R2 is the L1/L2 router doing the summarization, and R3 is the L2 router. The following configuration is given only for R2, assuming that the adjacencies with R1 and R3 are already up, and the route tables with the appropriate routes are already populated.

Topology

Figure 7-48: Route Summarization Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#isis circuit-type level-1`	Set the circuit type as level-1 for the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)# is-type level-1`	Configure instance as level-1 routing.
`(config-router)#net 49.0001.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.

(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#isis circuit-type level-1	Set the circuit type as level-1 for the interface.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#net 49.0001.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#address-family ipv6	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.
(config-router-af)#redistribute isis level-2 into level-1	Enable redistribution of isis routes from level-2 into level-1
(config-router-af)#summary-prefix 11:1:1:1::/64 level-1 metric 58	Configure the summary prefix to summarize IPv6 reachability information.
(config-router-af)#exit-address-family	Exit address family mode.
(config-router)#exit	Exit router mode.

R3

#configure terminal	Enter configure mode.
(config)#ipv6 route 11:1:1:1:1:1::/96 eth2	Configure ipv6 static route.
(config)#ipv6 route 11:1:1:1:2:1::/96 eth2	Configure ipv6 static route.
(config)#ipv6 route 11:1:1:1:3:1::/96 eth2	Configure ipv6 static route.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#isis circuit-type level-2-only	Set the circuit type as level-2-only for the interface.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#net 49.0001.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)# is-type level-2-only	Configure instance as level-2 -onlyrouting.
(config-router)#address-family ipv6	Enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.
(config-router-af)#redistribute static	Enable redistribution of static routes into ISIS instance.
(config-router-af)#end	Exit the current mode and enter privilege mode.

Passive Interface

In ISP and large enterprise networks, many of the distribution routers have more than 200 interfaces. Before the Default Passive-Interface feature, there were two possibilities for obtaining routing information from tall of these interfaces:

- Configure a routing protocol on the backbone interfaces and redistribute connected interfaces.
- Configure the routing protocol on all interfaces and manually set most of them as passive, which was time consuming.

The solution to this problem was to configure the routing protocol on all interfaces and manually set the passive interface command on the interfaces where adjacency was not desired. In certain networks, this meant coding 200 or more passive-interface statements. With the Default Passive Interface feature, this problem is solved by allowing all interfaces to be set as passive by default using a single passive-interface default command, then configuring individual interfaces in which adjacencies are desired using the no passive-interface command.

Usage

1. When a specific interface is configured as passive using the passive-interface command:
   - The interface loses its adjacency on that interface, for example, eth1.
   - The interface (eth1) is still advertised by other IS-IS speaking interfaces to their neighbors.
2. When a specific interface is configured as passive using passive-interface command followed by removing the configuration using no passive-interface command:
   - The interface is IS-IS disabled and must be enabled using the ipv6 router isis command (for example, ipv6 router isis 1).
   - The interface (for example, eth1) is not advertised by other IS-IS speaking interfaces to their neighbors.
3. When an interface is configured with the passive interface command:
   - All interfaces lose their adjacency, except the interface with the higher index number. (For example: If eth1, eth2, eth3, and eth4 are the router interfaces, eth4 has the highest index number.)
   - All interfaces are advertised by the active IS-IS speaking interface to its neighbors.
4. When an interface is configured with the no passive interface command:
   - All interfaces are IS-IS disabled, except the interface that was active, and all interfaces must enable IS-IS on these interfaces using the ipv6 router isis command (for example, ipv6 router isis 1).
   - All interfaces are not advertised by the active IS-IS speaking interface to its neighbors.

Topology

Figure 7-49: IS-ISv6 Passive Interface

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#end`	Exit the current mode and enter privilege mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#ipv6 address 1000::2/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)# ipv6 router isis ABC`	Enable OSPFv3 routing on an interface and assign the Area ID 0.
`(config-if)#ipv6 address 2000::1/64`	Configure IPv6 address on interface.
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#passive-interface eth1`	Configure interface eth1 as a passive-interface.
`(config-router)#end`	Exit the current mode and enter privilege mode.

R3

#configure terminal	Enter configure mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#ipv6 address 2000::2/64	Configure IPv6 address on interface.
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0003.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#end	Exit the current mode and enter privilege mode.

Enable BFD over IS-ISv6

This example shows how to configure Bidirectional Forwarding Detection with ISISv6 instance

Topology

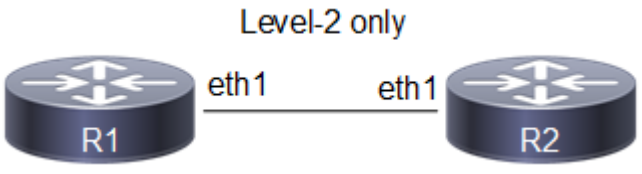

Figure 7-50: Basic BFD over IS-ISv6 Topology

Configuration

R1

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0001.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#end	Exit current mode and enter privilege mode.

R2

#configure terminal	Enter configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ipv6 router isis ABC	Enable IS-ISv6 routing on an interface for area 49(ABC).
(config-if)#exit	Exit interface mode.
(config)#router isis ABC	Create an IS-IS routing instance for area 49 (ABC).
(config-router)#is-type level-2-only	Configure instance as level-2-only routing.
(config-router)#net 49.0005.0000.0000.0002.00	Set a Network Entity Title for this instance, specifying the area address and the system ID.
(config-router)#bfd all-interfaces	Enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.
(config-router)#end	Exit current mode and enter privilege mode.

Originate Default Route to ISISv6 Neighbors

This example shows how to originate default route present to ISISv6 neighbors.

Note: To get a default route in ISIS, we must have it (said default route) in the routing table first.

Topology

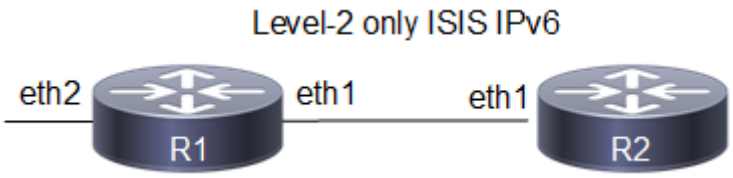

Figure 7-51: Basic IS-ISv6 Topology

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#ipv6 route ::/0 2345::2`	Configure default route.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ipv6 address 2345::1/64`	Configure IPv6 address on interface.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0001.0000.0000.0001.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)# address-family ipv6`	Enter ipv6 address family.
`(config-router-af)#default-information originate`	Originate reachability information to Default destination into LSP.
`(config-router-af)#end`	Exit all modes and enter privilege mode.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ipv6 router isis ABC`	Enable IS-ISv6 routing on an interface for area 49(ABC).
`(config-if)#exit`	Exit interface mode.
`(config)#router isis ABC`	Create an IS-IS routing instance for area 49 (ABC).
`(config-router)#is-type level-2-only`	Configure instance as level-2-only routing.
`(config-router)#net 49.0005.0000.0000.0002.00`	Set a Network Entity Title for this instance, specifying the area address and the system ID.
`(config-router)#end`	Exit current mode and enter privilege mode

CHAPTER 8 IS-IS-TE IPv4

This chapter contains basic IS-IS TE configuration examples.

For details about the commands used in these examples, see the *Intermediate System to Intermediate System Command Reference*.

A TE link represents an IS-IS/OSPF link state advertisement and a link state database of certain physical resources and their properties between two GMPLS nodes. Typically, a TE link is advertised as an adjunct to a “regular” OSPF or IS-IS link. That is, an adjacency is brought up on the link. When the link is up, both the regular IGP properties of the link (for example, the SPF metric) and the TE properties of the link are then advertised.

Enable MPLS-TE in Level-1 and Level-2 on L1-L2 IS

In the following example, R1 is the L1 router, R2 is the L1/L2 router enabling MPLS-TE for both Level-1 and Level-2 IS, and R3 is the L2 router. The following configuration is given for R1, R2 and R3.

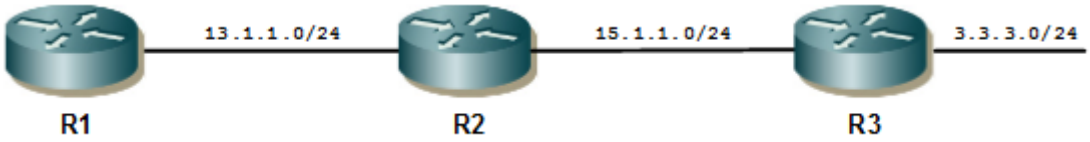

Figure 8-52: MPLS-TE Topology

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 2.2.2.2`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.

`(config-router)#net 49.0001.0000.0000.0002.00`	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
`(config-router)#end`	Exit Router mode.

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (eth1) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-1`	Configure IS-Type as Level-1 router.
`(config-router)#mpls traffic-eng router-id 1.1.1.1`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#net 49.0001.0000.0000.0001.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0001.
`(config-router)#end`	Exit Router mode.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ip address 15.1.1.3/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-2`	Configure IS-Type as Level-1 router.
`(config-router)#mpls traffic-eng router-id 3.3.3.3`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0003.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0003.
`(config-router)#end`	Exit Router mode.

Validation

R2

Check the output of “show clns neighbors” to verify that ISIS adjacency is up.

```
#show clns neighbors
Area 1:
System Id      Interface   SNPA            State  Holdtime  Type Protocol
0000.0000.0001 eth2        5254.00bb.5e85  Up     24        L1   IS-IS
0000.0000.0003 eth4        5254.00ac.f960  Up     9         L2   IS-IS
#
```

Check the output of “show isis database level-1 verbose” to verify that LSP does have correct router-id.

```
#sh isis database level-1 verbose

Maximum Link Bandwidth and Reservable Bandwidth

In the following example, R1 is the L1 router, R2 is the L1/L2 router enabling MPLS-TE for both Level-1 and Level-2 IS, and R3 is the L2 router. The following configuration is given for R1, R2 & R3.

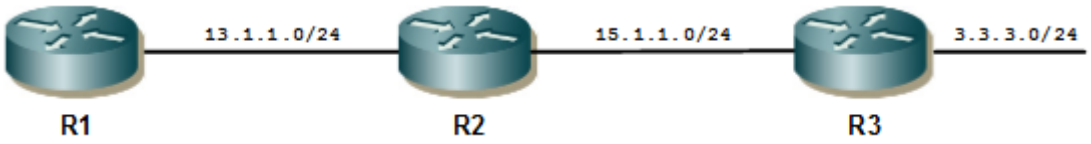

Figure 8-53: MPLS-TE Topology

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#`	ip router isis 1Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#mpls traffic-eng router-id 2.2.2.2`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0002.00`	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth2`	Enter the interface configure mode.
`(config-if)#bandwidth 1g`	Configure Maximum link Bandwidth as 1g bits per second.
`(config-if)#reservable-bandwidth 100m`	Specify the maximum reservable bandwidth per interface.
`(config-if)#exit`	Exit interface configure mode.
`(config)#interface eth4`	Enter the interface configure mode.
`(config-if)#bandwidth 500m`	Configure Maximum link Bandwidth as 500m bits per second.
`(config-if)#reservable-bandwidth 200m`	Specify the maximum reservable bandwidth per interface.
`(config-if)#`	Exit interface configure mode.

R1

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-1`	Configure IS-Type as Level-1 router.
`(config-router)#mpls traffic-eng router-id 1.1.1.1`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#net 49.0001.0000.0000.0001.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0001.
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth1`	Enter the interface configure mode.
`(config-if)#bandwidth 1g`	Configure Maximum link Bandwidth as 1g bits per second.
`(config-if)#reservable-bandwidth 100m`	Specify the maximum reservable bandwidth per interface.
`(config-if)#exit`	Exit interface configure mode.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ip address 15.1.1.3/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#exit`	Exit from interface configuration mode.
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-2`	Configure IS-Type as Level-2 router.
`(config-router)#mpls traffic-eng router-id 3.3.3.3`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0003.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0003.
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth1`	Enter the interface configure mode.

(config-if)#bandwidth 1g	Configure Maximum link Bandwidth as 1g bits per second.
(config-if)#reservable-bandwidth 100m	Specify the maximum reservable bandwidth per interface.
(config-if)#exit	Exit interface configure mode.

Validation

Administrative Group Constraints

To configure administrative group constraints (also known as color constraints) in Level-1 and Level-2 on L1-L2 IS:

- Configure support for required admin groups in NSM on all participating routers
- Configure required administrative groups on all participating interfaces

The configuration in this example forces the primary LSP to be setup through links that belong either to admin group A or C. A link that does not belong to either of these admin groups will not be used for setting up the LSP.

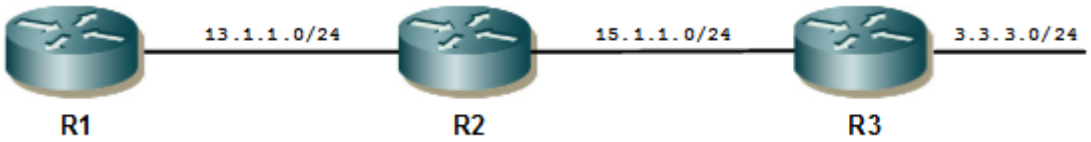

Figure 8-54: MPLS-TE Topology

R2

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to configure, and enter Interface mode.
`(config-if)#ip address 13.1.1.2/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config)#interface eth2`	Enter Interface eth2 configure mode.
`(config-if)#ip address 15.1.1.2/24`	Configure ip address to the interface eth2.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth2.
`(config-if)#isis circuit-type level-2`	Configure ISIS circuit-type as Level-2.
`(config-if)#exit`	Exit from interface configuration mode.

(config)#mpls admin-group a 0	Add new administrative groups and specify their names and assign bit values to them.
(config)#mpls admin-group b 1	
(config)#mpls admin-group c 2	
(config)#mpls admin-group d 3	
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#mpls traffic-eng router-id 2.2.2.2	Configure MPLS-TE unique router-id TLV.
(config-router)#mpls traffic-eng level-1	Enable MPLS-TE in is-type Level-1.
(config-router)#mpls traffic-eng level-2	Enable MPLS-TE in is-type Level-2.
(config-router)#net 49.0001.0000.0000.0002.00	Configure the ISIS net address with area id as: 49.0001 and system id as: 0000.0000.0002.
(config-router)#exit	Exit Router mode.
(config)#interface eth2	Enter the interface configure mode.
(config-if)#admin-group a	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group Previously configured. You can have multiple groups per Interface.
(config-if)#admin-group c	
(config-if)#exit	Exit interface configure mode.
(config)#interface eth4	Enter the interface configure mode.
(config-if)#admin-group b	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group previously configured. You can have multiple groups per Interface.
(config-if)#admin-group d	
(config-if)#end	Exit interface configure mode.

R1

#configure terminal	Enter Configure mode.
(config)#interface eth1	Specify the interface (eth1) to configure, and enter Interface mode.
(config-if)#ip address 13.1.1.2/24	Configure ip address to the interface eth1.
(config-if)#ip router isis 1	Enable ISIS on interface eth1.
(config-if)#isis circuit-type level-1	Configure ISIS circuit-type as Level-1
(config-if)#exit	Exit interface configure mode.
(config)#mpls admin-group a 0	Add new administrative groups and specify their names and assign bit values to them.
(config)#mpls admin-group c 2	
(config)#router isis 1	Create an IS-IS routing instance for area 49 (1).
(config-router)#metric-style wide	Configure the new style of metric type as wide.
(config-router)#is-type level-1	Configure IS-Type as Level-1 router.
(config-router)#mpls traffic-eng router-id 1.1.1.1	Configure MPLS-TE unique router-id TLV.

`(config-router)#mpls traffic-eng level-1`	Enable MPLS-TE in is-type Level-1.
`(config-router)#net 49.0001.0000.0000.0001.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0001.
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth1`	Enter the interface configure mode.
`(config-if)#admin-group a`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group Previously configured. You can have multiple groups per Interface.
`(config-if)#admin-group c`	
`(config-if)#end`	Exit interface configure mode.

R3

`#configure terminal`	Enter Configure mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to configure, and enter Interface mode.
`(config-if)#ip address 15.1.1.3/24`	Configure ip address to the interface eth1.
`(config-if)#ip router isis 1`	Enable ISIS on interface eth1.
`(config-if)#isis circuit-type level-1`	Configure ISIS circuit-type as Level-1
`(config-if)#exit`	Exit interface configure mode.
`(config)#mpls admin-group b 1`	Add new administrative groups and specify their names and assign bit values to them.
`(config)#mpls admin-group d 3`	
`(config)#router isis 1`	Create an IS-IS routing instance for area 49 (1).
`(config-router)#metric-style wide`	Configure the new style of metric type as wide.
`(config-router)#is-type level-2`	Configure IS-Type as Level-2 router.
`(config-router)#mpls traffic-eng router-id 3.3.3.3`	Configure MPLS-TE unique router-id TLV.
`(config-router)#mpls traffic-eng level-2`	Enable MPLS-TE in is-type Level-2.
`(config-router)#net 49.0001.0000.0000.0003.00`	Configure the ISIS net address with area id as: 49.0001 and system-id as: 0000.0000.0003.
`(config-router)#exit`	Exit Router mode.
`(config)#interface eth1`	Enter the interface configure mode.
`(config-if)#admin-group b`	Add administrative groups to the links. When used in the interface mode, this command adds a link between an Interface and a group. The name is the name of the group Previously configured. You can have multiple groups per Interface.
`(config-if)#admin-group d`	
`(config-if)#end`	Exit interface configure mode.

Validation

R2

Check the output of “show clns neighbors” to verify that ISIS adjacency is up.

```
#show clns neighbors

Area 1:

CHAPTER 9 IS-IS Graceful Restart Configuration

The Intermediate System to Intermediate System (IS-IS) routing protocol is a link state intra-domain routing protocol. Normally, when an IS-IS router is restarted, temporary disruption of routing occurs due to events in both the restarting router and the neighbors of the restarting router.

ISIS provides graceful restart, in which the adjacency and routes are maintained in the routing table for the grace period. In this way, the data flow is not affected, and there is no packet loss during the restart phase.

With ISIS GR, the ISIS router should be able to restart gracefully with non-stop forwarding during the recovery. And the Helper ISIS router should be able to help restarting router by maintaining the adjacency.

ISIS Grace Restart Functionality applies to:

- ISIS broadcast network
- ISIS point-to-point network
- IPv4 domain
- IPv6 domain

Topology

In this example, R1 is the L1/L2 router, and R2 is the L1/L2 restart-helper router.

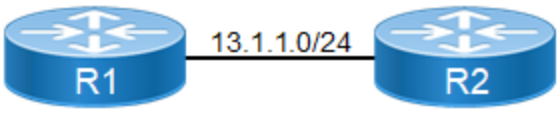

Figure 9-55: IS-IS Graceful Restart

Configuration

The following configuration is given only for R2, assuming that the adjacency with R1 is already up and the route tables with the appropriate routes are already populated.

R2

`#configure terminal`	Enter configure mode.
`(config)#isis restart helper`	Configure this router as a restart helper.
`(config)#isis restart grace-period 100`	Set the grace period to 100 seconds. The restarting router should come up before 100 seconds, otherwise, the adjacency and routes will be deleted.

Note: The IS-IS daemon in the restarting router must be manually restarted using `restart isis graceful` command: it does not restart automatically.

Note: The scope of unplanned GR is that if the ISIS daemon crashes or gets killed with SIGSEGV signal then the routes will be stale marked until the hold time (30 seconds), assuming that ISIS will be restarted within the hold time. Neighbor adjacency cannot be maintained in unplanned GR.

Validation

```

Gateway of last resort is not set
```

CHAPTER 10 Forwarding Plane Load Balancing

OcNOS uses Forwarding Plane Load Balancing when the kernel supports Equal Cost Multipath (ECMP). OcNOS installs the maximum number of ECMP routes supported by the kernel. This allows for load balancing to be performed with more than one nexthop to reach a destination. If the router receives and installs multiple paths with the same administrative distance and cost to a destination, load-balancing is possible.

Ideally, multiple nexthops have different interfaces to the destination, but this is not mandatory. The algorithm for distributing traffic across ECMP routes is dependent on the kernel, and typically based on the protocol, source address, destination address, and port.

Enable Load Balancing

The following example illustrates how to enable Equal Cost Multipath (ECMP), and configure a routing protocol (OSPF is used in this example) for load balancing. However, this example will not work if the kernel does not support load balancing. In this topology, R1, R2, and R3 are three Linux routers connected to each other. R1 can reach R3 through two links available to R2.

Topology

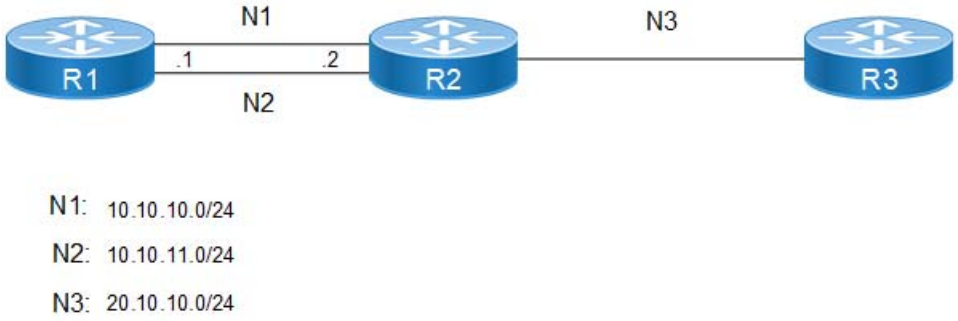

Figure 10-56: Load Balancing Topology

Configuration

R1 - NSM

1. Enable multipath support and set the maximum number of paths to be installed in the Forwarding Information Base (FIB):

```
#configure terminal
(config)#maximum-paths 2
% System Reboot is required for new Maximum-Path value to take effect.
```

Note: User can save and reboot to bring changes into effect.

R1 - OSPF

1. Configure OSPF on all interfaces on R1, R2, and R3.

   R1 learns about R3 through 2 nexthops (both networks N1 and N2).

Validation

R1 - OSPF

Run the `show ip ospf route` command on R1. The OSPF routing table displays that it can reach R3 through both of the nexthops:

```
R1#show ip ospf route
OSPF process 100:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2

   C  10.10.10.0/24 [10] is directly connected, eth1, Area 0.0.0.0
   C  10.10.11.0/24 [10] is directly connected, eth2, Area 0.0.0.0
   O  20.10.10.0/24 [11] via 10.10.10.3, eth1, Area 0.0.0.0
                         via 10.10.11.3, eth2, Area 0.0.0.0
```

Run the `show ip route` command on R1. It displays that R1 has installed both nexthops to reach R3 in the NSM routing table:

```
R1#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C     10.10.10.0/24 is directly connected, eth1, 00:17:08
C     10.10.11.0/24 is directly connected, eth2, 00:16:49
O     20.10.10.0/24 [110/11] via 10.10.11.3, eth2, 00:08:52
             [110/11] via 10.10.10.3, eth1
C     127.0.0.0/8 is directly connected, lo, 00:25:21
C     192.168.52.0/24 is directly connected, eth0, 00:25:16

Gateway of last resort is not set
```

CHAPTER 11 VLAN Interfaces

This chapter contains examples for configuring VLAN interfaces.

Overview

Several Virtual LAN (VLAN) interfaces can be configured on a single Ethernet interface. Once created, a VLAN interface functions the same as any physical interface.

NSM recognizes VLAN interfaces as physical interfaces. Once VLAN interfaces are created in the kernel, and IP addresses are assigned to them, OcNOS commands can be used to configure and display VLAN interfaces the same as any physical interface. OcNOS routing protocols, such as OSPF and BGP can run across networks using VLAN interfaces.

Two systems with physical connectivity (either directly connected or connected through a switch), can communicate with each other via VLAN interfaces that have the same VLAN IDs and belong to the same network.

If the physical interfaces are not directly connected to a switch, the corresponding ports on the switch must be configured as trunks, and should not be associated to any VLANs in the switch. The commands to configure switch ports as trunks depend on the type of the switch, and are beyond the scope of this document.

Topology

Figure 11-57 is used to describe VLAN interface configuration. In this example, there are two routers, R1 and R2, and the eth1 interface of R1 is connected directly to eth2 using an ethernet cable.

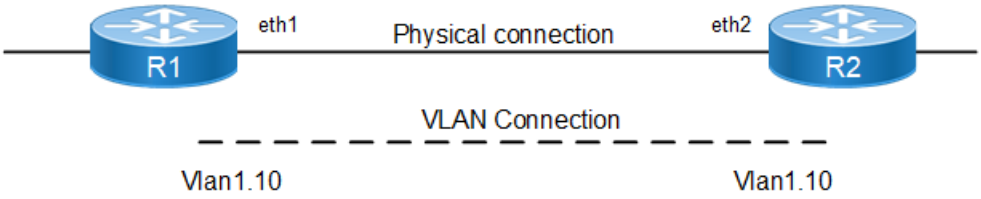

Figure 11-57: VLAN Connections

The `vlan1.10` VLAN interface is created on R1, and `vlan1.10` is created on R2. The VLAN interfaces are configured in the same network: R1 and R2 can reach each other using the VLAN connection.

Note: A VLAN ID of both VLAN interfaces is the same (10). Two systems with different VLAN IDs cannot communicate, even if they are in the same network, since a VLAN ID tags packets sent on a VLAN interface.

Create a VLAN Interface

When a VLAN interface is configured, a Layer 3 interface based on the bridge-group number and VLAN ID is created. This Layer 3 interface is advertised to all the Layer 3 protocols.

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol mstp`	Create a MSTP bridge.
`(config)#vlan database`	Enter VLAN mode.
`(config-vlan)#vlan 10 bridge 1`	Enable VLAN 10 on bridge 1.
`(config-vlan)#exit`	Exit VLAN mode.

`(config)#interface eth1`	Enter interface mode
`(config-if)#switchport`	Configure interface as Layer2 interface.
`(config-if)#bridge-group 1`	Associate bridge group 1.
`(config-if)#switchport mode trunk`	Configure interface eth1 as Layer2 trunk mode.
`(config-if)#switchport trunk allowed vlan add 10`	Associate VLAN 10 as trunk port.
`(config-if)#exit`	Exit interface mode.

Add IP Addresses to VLAN Interface

In NSM, you can add or remove IP addresses from VLAN interfaces, like normal interfaces. Using IMISH type:

```
#configure terminal
(config)#interface vlan1.10
(config-if)#ip address 192.168.1.50/24
```

Display VLAN Interfaces

In OcNOS, VLAN interfaces appear as any physical interfaces, in the `show running-config` or the `show ip interface brief` outputs, and can be configured as any other interface.

The following is a sample output of the `show ip interface brief` command on R1.

Note: The IP address of interface `vlan1.10` has correctly been changed by NSM:

```
#show ip interface brief

'*' - address is assigned by dhcp client

Interface            IP-Address      Admin-Status          Link-Status
eth0                 10.12.56.26     up                    up
lo                   127.0.0.1       up                    up
lo.management        127.0.0.1       up                    up
vlan1.1              unassigned      up                    up
vlan1.10             192.168.1.50    up                    up
xe1                  unassigned      up                    up
xe2                  unassigned      up                    up
xe3                  unassigned      up                    down
xe4                  unassigned      up                    down
xe5                  unassigned      up                    down
xe6                  unassigned      up                    down

C     192.168.52.0/24 is directly connected, eth0, 00:16:39

Gateway of last resort is not set
```

CHAPTER 12 Layer 3 Link Aggregation

This chapter contains a complete sample Link Aggregation Control Protocol (LACP) configuration (L3 LAG).

Link Aggregation is the method of combining individual physical network interfaces or ports to increase the capacity of the link to support and sustain beyond the individual port capability. Features like Spanning Tree, VLAN, FDB, Multicast operate on both physical ports as well as Link Aggregated Logical Ports. It bundles all of the controller's distribution system ports into a single 802.3ad port channel, thereby reducing the number of IP addresses needed to configure the ports on your controller. When LAG is enabled, the system dynamically manages port redundancy and load balances access points transparently to the user.

LACP is based on the 802.3ad IEEE specification. It allows bundling of several physical interfaces to form a single logical channel providing enhanced performance and redundancy. The aggregated interface is viewed as a single link to each switch. The spanning tree views it as one interface and not as two or three interfaces. When there is a failure in one physical interface, the other interfaces stay up and there is no disruption.

The OcNOS LACP implementation supports the aggregation of a maximum of six physical Ethernet links into a single logical channel.

Topology

In this example, 3 links are configured between the two switches R1 and R2. These three links are assigned the same administrative key (1) so that they aggregate to form a single channel 1. They are viewed by STP as one interface.

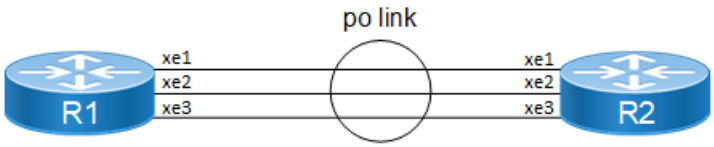

Figure 12-58: L3_LAG Topology

Configuration

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface po10`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.1/24`	Assigning IP Address to PO Interface
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`R1(config)#interface xe1`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#exit`	Exit interface mode.

`R1(config)#interface xe2`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe3`	Enter interface mode.
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#exit`	Exit interface mode.

R2

`R2#configure terminal`	Enter configure mode.
`R1(config)#interface po10`	Enter interface mode.
`R1(config-if)#ip address 1.1.1.2/24`	Assigning IP Address to PO Interface
`R1(config-if)#exit`	Exit interface mode.
`R2(config)#lacp system-priority 20000`	Set the system priority of this switch. This priority is used for determining the system that is responsible for resolving conflicts in the choice of aggregation groups. A lower numerical value has a higher priority.
`R2(config)#interface xe1`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe2`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe3`	Enter interface mode.
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#channel-group 10 mode active`	Add this interface to channel group 10 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#exit`	Exit interface mode.

Static Channel-group

R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface sa12`	Enter interface mode
`R1(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R1(config-if)#ip address 2.2.2.1/24`	Assigning IP Address to PO Interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe1`	Enter interface mode
`R1(config-if)#static-channel-group 12`	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.
`R1(config-if)#exit`	Exit interface mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface sa12`	Enter interface mode
`R2(config-if)#no switchport`	Making Interface as L3 Port (This command will remove if switchport configuration is present).
`R2(config-if)#ip address 2.2.2.2/24`	Assigning IP Address to PO Interface
`R2(config-if)#exit`	Exit interface mode
`R2(config)#interface xe1`	Enter interface mode
`R2(config-if)#static-channel-group 12`	Add this interface to channel group 12 and enable link aggregation so that it can be selected for aggregation by the local system.
`R2(config-if)#exit`	Exit interface mode

CHAPTER 13 Static Routes

This chapter contains basic static routing configuration examples.

This example shows the complete configuration to enable static routing in a simple network topology. A static route is composed of a network prefix (host address) and a nexthop (gateway). Static routes are useful in small networks. They are simple solutions for making a few destinations reachable. Large networks use dynamic routing protocols.

For details about the commands used in these examples, see the *Unicast Routing Information Base Command Reference*.

Topology

Router R1 is configured with these static routes:

- The remote network 10.10.12.0/24
- The loopback address (host addresses) of router R2
- The loopback address of router R3

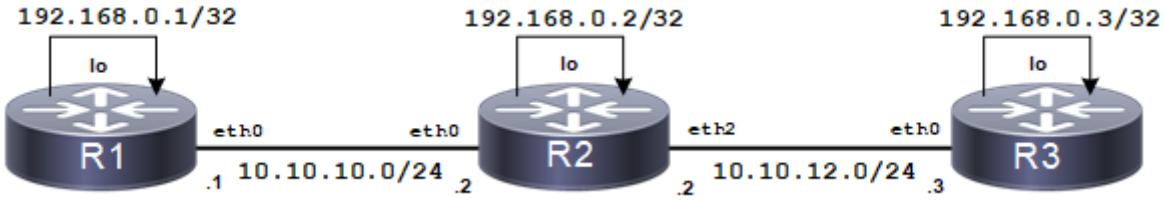

Figure 13-59: Basic Static Route

In all three routes, interface `eth0` of router R2 is the gateway. Router R3 is configured with a default static route that is equivalent to configuring separate static routes with the same gateway or nexthop address. Router R2 has two routes, one for each of the remote routers' loopback address.

Configuration

R1

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.1/32`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#exit`	Exit interface mode.

`(config)#ip route 10.10.12.0/24 10.10.10.2`
`(config)#ip route 192.168.0.2/32 10.10.10.2`
`(config)#ip route 192.168.0.3/32 10.10.10.2`
	Specify the destination prefix and mask for the network and a gateway.
	Because R2 is the only next hop available, you can configure a default route instead of configuring the same static route for individual addresses. See the configuration of R3.

R2

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.2/32`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#exit`	Exit Interface mode.
`(config)#ip route 192.168.0.1/32 10.10.10.1` `(config)#ip route 192.168.0.3/32 10.10.12.3`	Specify the destination and mask for the network and a gateway.

R3

`#configure terminal`	Enter configure mode.
`(config)#interface lo`	Enter interface mode.
`(config-if)#ip address 192.168.0.3/32`	Configure the IP address on this interface, and specify a 32-bit mask, making it a host address.
`(config-if)#exit`	Exit Interface mode.
`(config)#ip route 0.0.0.0/0 10.10.12.2`	Specify 10.10.12.2 as a default gateway to reach any network. Because 10.10.12.2 is the only available route, you can specify it as the default gateway instead of specifying it as the gateway for an individual network or host address.

Validation

IPv6 Static Routing

This example shows complete configuration to enable IPv6 static routing in a simple network topology.

Note: IPv6 static route with interface alone as gateway (without gateway IPv6 address) is not supported.

Topology

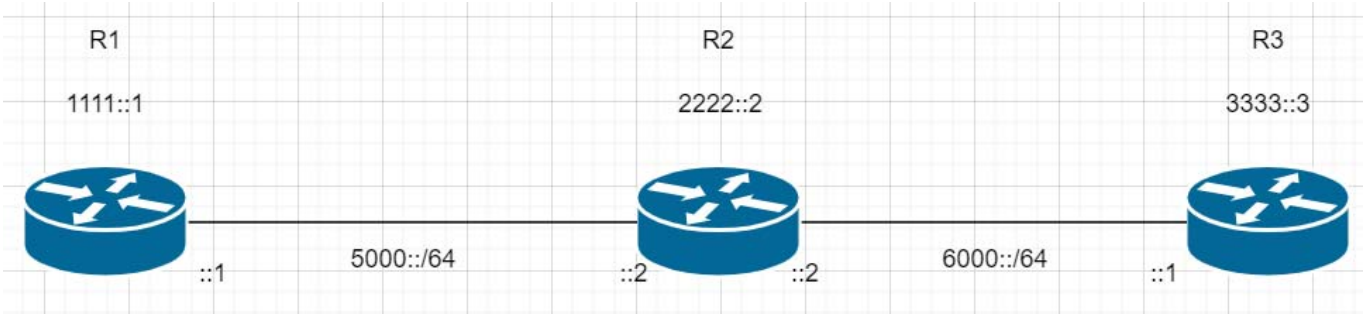

Figure 13-60: IPv6 static routing

Configuration

R1

`R1#conf t`	Enter Configure mode.
`R1(config)#interface lo`	Enter interface mode.
`R1(config-if)#ipv6 address 1111::1/128`	Configure IPv6 address
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#ipv6 route 6000::/64 5000::2`	Configure IPv6 Static route to reach remote network with R2 as nexthop
`R1(config)#ipv6 route 2222::2/128 5000::2`	Configure IPv6 static route to reach R2 lo with R2 as nexthop
`R1(config)#ipv6 route 3333::3/128 5000::2`	Configure IPv6 static route to reach R3 lo with R2 as nexthop

R2

`R2#conf t`	Enter Configure mode.
`R2(config)#int lo`	Enter interface mode.
`R2(config-if)#ipv6 address 2222::2/128`	Configure IPv6 address
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#ipv6 route 1111::1/128 5000::1`	Configure IPv6 static route to reach R1 lo with R1 as nexthop
`R2(config)#ipv6 route 3333::3/128 6000::1`	Configure IPv6 static route to reach R3 lo with R3 as nexthop

R3

`R3#conf t`	Enter Configure mode.
`R3(config)#int lo`	Enter interface mode.
`R3(config-if)#ipv6 add 3333::3/128`	Configure IPv6 address
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#ipv6 route ::/0 6000::2`	Configure Default IPv6 Static route with R2 as nexthop

CHAPTER 14 Static Route Discard Configuration

This chapter show how to configure the static route discard feature.

Overview

If you identify some routers/attackers distributing invalid/bogus routes just to use the resources of the device or to make the device unstable, you can configure route-map rules, discard all routes, and black hole traffic corresponding to those routes.

To so this, you add “discard” route entries for a prefix in a route map with the “set interface null0” command. You then apply that route map to a BGP neighbor.

IPv4 Route Discard

Figure 14-61 shows the configuration required to enable static route discard for IPv4.

Topology

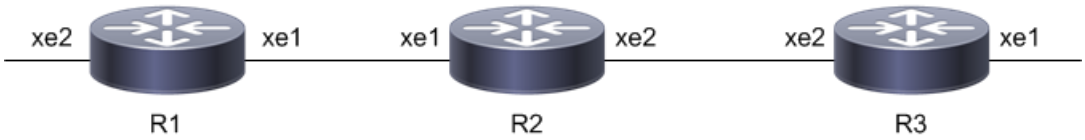

Figure 14-61: Static route discard topology

Configuration

R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ip address 2.2.2.2/24`	Assign an IP address to the interface
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#interface xe2`	Enter interface mode for xe1
`R1(config-if)#ip address 1.1.1.2/24`	Assign an IP address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#neighbor 2.2.2.3 remote-as 3`	Create static BGP neighbor 2.2.2.3 with remote autonomous system value 3
`R1(config-router)#redistribute connected`	Advertise the connected network into BGP
`R1(config-router)#end`	Exit BGP router mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#ip prefix-list p1 permit any`	Configure IP prefix list
`R2(config)#route-map r1`	Enter route-map mode
`R2(config-route-map)#match ip address prefix-list p1`	Configure match ip prefix list p1
`R2(config-route-map)#set interface null0`	Set the interface to null0
`R2(config-route-map)#exit`	Exit route-map mode.
`R2(config)#interface xe1`	Enter interface mode for xe1
`R2(config-if)#ip address 2.2.2.3/24`	Assign an IP address to the interface
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface xe2`	Enter interface mode for xe2
`R2(config-if)#ip address 3.3.3.2/24`	Assign an IP address to the interface
`R2(config-if)#exit`	Exit interface mode
`R2(config)#router bgp 3`	Enter into BGP router mode
`R2(config-router)#neighbor 2.2.2.2 remote-as 2`	Create static BGP neighbor 2.2.2.2 with remote autonomous system value 2
`R2(config-router)#neighbor 3.3.3.3 remote-as 4`	Create static BGP neighbor 3.3.3.3 with remote autonomous system value 4
`R2(config-router)#redistribute connected`	Advertise the connected network into BGP
`R2(config-router)#neighbor 2.2.2.2 route-map r1 in`	Attach the route-map with route discard configured for the neighbor 2.2.2.2 in IN direction
`R2(config-router)#end`	Exit BGP router mode

R3

`R3#configure terminal`	Enter configure mode.
`R3(config)#interface xe2`	Enter interface mode for xe2
`R3(config-if)#ip address 3.3.3.3/24`	Assign an IP address to the interface
`R3(config-if)#exit`	Exit interface mode
`R3(config)#interface xe1`	Enter interface mode for xe1
`R3(config-if)#ip address 4.4.4.2/24`	Assign an IP address to the interface
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#router bgp 4`	Enter into BGP router mode
`R3(config-router)#neighbor 3.3.3.2 remote-as 3`	Create static BGP neighbor 3.3.3.2 with remote autonomous system value 3
`R3(config-router)#redistribute connected`	Advertise the connected network into BGP
`R3(config-router)#end`	Exit BGP router.

IPv6 Route Discard

Figure 14-61 shows the configuration required to enable static route discard for IPv6.

Configuration

R1

`R1#configure terminal`	Enter configure mode.
`R1(config)#interface lo`	Enter interface mode for loopback
`R1(config-if)#ip address 1.1.1.2/24 secondary`	Assign an IPv4 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe1`	Enter interface mode for xe1
`R1(config-if)#ipv6 address 2001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#interface xe2`	Enter interface mode for xe2
`R1(config-if)#ipv6 address 1001::2/64`	Assign an IPv6 address to the interface
`R1(config-if)#exit`	Exit interface mode
`R1(config)#router bgp 2`	Enter BGP router mode
`R1(config-router)#bgp router-id 1.1.1.1`	Specify router ID
`R1(config-router)#neighbor 2001::3 remote-as 3`	Create static BGP neighbor 2001::3 with remote autonomous system value 3
`R1(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R1(config-router-af)#neighbor 2001::3 activate`	Activate neighbor in IPv6 address family
`R1(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R1(config-router)#end`	Exit BGP router mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface lo`	Enter interface mode for loopback
`R2(config-if)#ip address 2.2.2.2/24 secondary`	Assign an IPV4 address
`R2(config-if)#exit`	Exit interface mode
`R2(config)#ipv6 prefix-list p1 permit any`	Configure IPv6 prefix list.
`R2(config)#route-map r1`	Enter route-map mode.
`R2(config-route-map)#match ipv6 address prefix-list p1`	Configure match IPv6 prefix list p1
`R2(config-route-map)#set interface null0`	Set the interface to null0
`R2(config-route-map)#exit`	Exit route-map mode
`R2(config)#interface xe1`	Enter interface mode for xe1
`R2(config-if)#ipv6 address 2001::3/64`	Assign ipv6 address to the interface
`R2(config-if)#exit`	Exit interface mode
`R2(config)#interface xe2`	Enter interface mode for xe2
`R2(config-if)#ipv6 address 3001::2/64`	Assign an IPv6 address to the interface
`R2(config-if)#exit`	Exit interface mode
`R2(config)#router bgp 3`	Enter BGP router mode
`R2(config-router)#bgp router-id 2.2.2.2`	Specify router ID
`R2(config-router)#neighbor 2001::2 remote-as 2`	Create static BGP neighbor 2001::2 with remote autonomous system value 2
`R2(config-router)#neighbor 3001::3 remote-as 4`	Create static BGP neighbor 3001::3 with remote autonomous system value 4
`R2(config-router)#address-family ipv6 unicast`	Enter address family IPv6 unicast mode
`R2(config-router-af)#redistribute connected`	Advertise the connected network into BGP
`R2(config-router-af)#neighbor 2001::2 activate`	Activate the neighbor in IPv6 address family
`R2(config-router-af)#neighbor 3001::3 activate`	Activate the neighbor in IPv6 address family
`R2(config-router-af)#neighbor 2001::2 route-map r1 in`	Attach the route-map with route discard configured for the neighbor 2001::2 in IN direction
`R2(config-router)#end`	Exit BGP router mode

R3

`R3#configure terminal`	Enter configure mode
`R3(config)#interface lo`	Enter interface mode for loopback
`R3(config-if)#ip address 3.3.3.2/24 secondary`	Assign an IPV4 address to the interface
`R3(config-if)#exit`	Exit interface mode
`R3(config)#interface xe1`	Enter interface mode for xe1
`R3(config-if)#ipv6 address 4001::2/64`	Assign an IPv6 address to the interface

R3(config-if)#exit	Exit interface mode
R3(config)#interface xe2	Enter interface mode for xe2
R3(config-if)#ipv6 address 3001::3/64	Assign an IPv6 address to the interface
R3(config-if)#exit	Exit interface mode
R3(config)#router bgp 4	Enter into BGP router mode
R3(config-router)#bgp router-id 3.3.3.3	Specify router ID
R3(config-router)#neighbor 3001::2 remote-as 3	Create static BGP neighbor 3001::2 with remote autonomous system value 3
R3(config-router)#address-family ipv6 unicast	Enter address family IPv6 unicast mode
R3(config-router-af)#neighbor 3001::2 activate	Activate neighbor in IPv6 address family
R3(config-router-af)#redistribute connected	Advertise the connected network into BGP
R3(config-router)#end	Exit BGP router mode.

CHAPTER 15 Layer 3 Subinterface Configuration

This chapter contains examples of configuring subinterfaces.

A subinterface is a virtual interface created by dividing one physical interface into multiple logical interfaces. A subinterface in a router uses the parent physical interface for sending and receiving data.

Subinterfaces are used for a variety of purposes. If you have one router with one physical interface, but need to connect the router to two IP networks to route traffic between two routers, you can create two subinterfaces within the physical interface, assign each subinterface an IP address within each subnet, and then route the data between two subnets.

Subinterfaces let you divide a physical interface into multiple logical interfaces that are tagged with different VLAN identifiers. Because VLANs allow you to keep traffic separate on a given physical interface, you can increase the number of interfaces available to your network without adding additional physical interfaces or security appliances.

Note: Refer to the release note for features supported by L3 Sub-interface.

Topology

Figure 15-62 shows and example of subinterface configuration. In this example, there are two routers, R1 and R2, and the eth1 interface of R1 is connected directly to eth2 of R2 using an Ethernet cable.

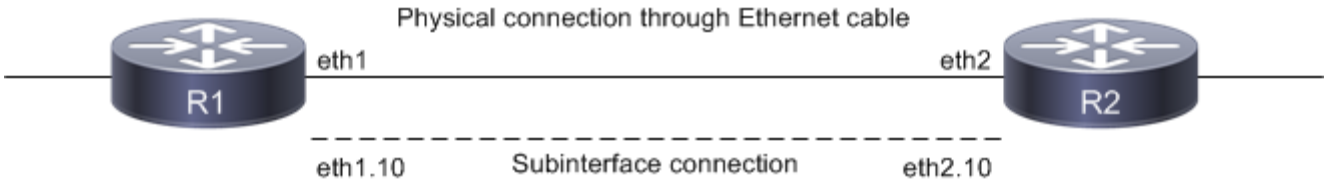

Figure 15-62: Subinterface connections

The eth1.10 subinterface is created on R1, and eth2.10 is created on R2.

Note: Subinterfaces can be created on physical and LAG interfaces in Layer 3 mode (`no switchport`).

Creating a Subinterface

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#interface eth1.10`	Creates a sub-interface as eth1.10
`(config-if)#encapsulation dot1q 10`	Configure the encapsulation as dot1q matching vlan 10
`(config-if)#ip address 10.10.10.1/24`	Assigning IP address to sub-interface
`(config-if)#exit`	Exit interface mode

Creating a Subinterface with Encapsulation

Double encapsulation as dot1q

```
#configure terminal (config)#interface eth1.1010
(config-if)# encapsulation dot1q 10 inner-dot1q 10
(config-if)#ip address 192.168.1.50/24
```

Double encapsulation as dot1ad

```
#configure terminal (config)#interface eth1.20
(config-if)# encapsulation dot1ad 20 inner-dot1q 20
(config-if)#ip address 192.168.2.50/24
```

Note: Use `switchport dot1q ethertype (8100 | 88a8 | 9100 | 9200)`command to configure the service-tpid value on parent port of a subinterface. By this the tpid used for service tag for a subinterface may be inherited from the one applied to parent interface.

Note: For any dot1ad subinterface to be functional, switchport dot1q ethertype should be set to desired value as 88a8/9100/9200. Default value is 8100. To verify the ethertype value for the interface use `show interface <subinterface>` command.

Displaying Subinterfaces

In OcNOS, subinterfaces appear as any physical interface in the `show running-coccnfig` or the show ip interface brief output and can be configured as any other interface.

The following examples display subinterface information from various `show` commands.

Note: The below command output is just for reference and is not directly related to the configuration provided above

show interface brief

```

CHAPTER 16 Two-way Active Measurement Protocol

Two-way Active Measurement Protocol (TWAMP) is an open protocol for measuring network performance between any two devices:

- The TWAMP control protocol sets up performance measurement sessions.
- The TWAMP test protocol sends and receives performance measurement probes.

The control client initiates all requested test sessions with a start session message, and the server acknowledges. When necessary, the control client sends a message to stop all test sessions.

The session sender and the session reflector exchange test packets according to the TWAMP test protocol for each active session. On receiving a TWAMP test packet, the session reflector only reflects a measurement packet and does not collect packet statistics in TWAMP.

TWAMP control can have eight TWAMP sessions on the device and reflector can serve up to eight TWAMP sessions on the reflector device.

This chapter shows a configuration using TWAMP “light” mode.

Topology

Figure 16-63: TWAMP topology

Configuring L3 Reachability between Router1 and Router3

Router 1

`ROUTER1#conf terminal`	Enter to Config mode
`ROUTER1(config)#hostname ROUTER1`	Entering the device name
`ROUTER1(config)#in xe1`	Entering into interface xe1
`ROUTER1(config-if)#ip address 10.10.10.1/24`	Configuring ip address
`ROUTER1(config-if)#ex`	Exit from interface mode
`ROUTER1(config)#in lo`	Entering into interface lo
`ROUTER1(config-if)#ip address 1.1.1.1/32 secondary`	Configure ip address to lo interface
`ROUTER1(config-if)#exit`	Exit from lo interface
`ROUTER1(config)#router ospf 1`	Configure ospf process id

`ROUTER1(config-router)#router-id 1.1.1.1`	Configure router id
`ROUTER1(config-router)#network 10.10.10.0 0.0.0.255 area 0`	Configure the network's in ospf
`ROUTER1(config-router)#network 1.1.1.0 0.0.0.255 area 0`	Configure the network's in ospf

Router 2

`ROUTER2#conf terminal`	Enter to Configure mode
`ROUTER2(config)#hostname ROUTER2`	Entering the device name
`ROUTER2(config)#in xe1`	Entering into interface xe1
`ROUTER2(config-if)#ip address 10.10.10.2/24`	Configuring ip address
`ROUTER2(config-if)#ex`	Exit from interface mode
`ROUTER2(config)#in xe2`	Entering into interface xe2
`ROUTER2(config-if)#ip address 20.20.20.1/24`	Configuring ip address
`ROUTER2(config-if)#ex`	Exit from interface mode
`ROUTER2(config)#in lo`	Entering into interface lo
`ROUTER2(config-if)#ip address 2.2.2.2/32 secondary`	Configure ip address to lo interface
`ROUTER2(config-if)#exit`	Exit from lo interface
`ROUTER2(config)#router ospf 2` `ROUTER2(config)#router-id 2.2.2.2`	Configure ospf process id and router-id
`ROUTER2(config-router)#network 10.10.10.0 0.0.0.255 area 0`	Configure the network's in ospf
`ROUTER2(config-router)#network 20.20.20.0 0.0.0.255 area 0`	Configure the network's in ospf
`ROUTER2(config-router)#network 2.2.2.0 0.0.0.255 area 0`	Configure the network's in ospf

Router 3

`ROUTER3#conf terminal`	Enter to Config mode
`ROUTER3(config)#hostname ROUTER3`	Entering the device name
`ROUTER3(config)#in xe2`	Entering into interface xe2
`ROUTER3(config-if)#ip address 20.20.20.2/24`	Configuring ip address
`ROUTER3(config-if)#ex`	Exit from interface mode
`ROUTER3(config)#in lo`	Entering into interface lo
`ROUTER3(config-if)#ip address 3.3.3.3/32 secondary`	Configure ip address to lo interface

ROUTER3(config-if)#exit	Exit from lo interface
ROUTER3(config)#router ospf 3	Configure ospf process id
ROUTER3(config-router)#router-id 3.3.3.3	Configure router id
ROUTER3(config-router)#network 20.20.20.0 0.0.0.255 area 0	Configure the network's in ospf
ROUTER3(config-router)#network 3.3.3.0 0.0.0.255 area 0	Configure the network's in ospf

Configuring TWAMP on the Router

Router 1

ROUTER1#configure terminal	Enter Configure mode
ROUTER1(config)#twamp-light control	Enter to Twamp-Light control mode
ROUTER1(config-twamp-light-ctrl)#control-admin-state enable	Enabling the Twamp-light Control
ROUTER1(config-twamp-light-ctrl)#test-session-name s1 sender-ip 1.1.1.1 sender-port 1300 reflector-ip 3.3.3.3 reflector-port 1301	Configuring the Twamp Test-Session

Router 3

ROUTER3#configure terminal	Enter Configure mode
ROUTER3(config)#twamp-light reflector	Enter to Twamp-Light reflector mode
ROUTER3(config-twamp-light-ref)#reflector-admin-state enable	Enabling Twamp-light reflector
ROUTER3(config-twamp-light-ref)#reflector-ip 3.3.3.3 reflector-port 1301	Configuring the reflector ip and port number

Start the Twamp-session on ROUTER1:

`ROUTER1#twamp start test-session s1 packet-count 50 interval 500`	Starting the Twamp Test-session on Twamp-Control device

Stop the Twamp-session on ROUTER1

`ROUTER1#twamp stop test-session s1`	Stop the Twamp Test-session on Twamp-Control device

Disabling the TWAMP-Control on ROUTER1

`ROUTER1#configure terminal`	Enter Configure mode
`ROUTER1(config)#twamp-light control`	Enter to Twamp-Light control mode
`ROUTER1(config-twamp-light-ctrl)#control-admin-state disable`	Disable the Twamp-light Control

Disabling the TWAMP-Reflector on ROUTER3

Remove/Un-config of Test Session

`ROUTER3#configure  terminal`	Enter Configure mode
`ROUTER3(config)#twamp-light reflector`	Enter to Twamp-Light reflector mode
`ROUTER3(config-twamp-light-ref)#reflector-admin-state disable`	Disable the Twamp-light reflector

`ROUTER1#configure terminal`	Enter Configure mode
`ROUTER1(config)#twamp-light control`	Enter to Twamp-Light control mode
`ROUTER1(config-twamp-light-ctrl)#no test-session name s1`	Removing/un-configuring of Twamp Test Session

Remove/Un-config of TWAMP-Control

ROUTER1#configure terminal	Enter Configure mode
ROUTER1(config)#no twamp-light control	Removing/un-configuring of Twamp control

Remove/Un-Config of TWAMP-Reflector

ROUTER3#configure terminal	Enter Configure mode
ROUTER3(config)#no twamp-light reflector	Removing/un-configuring of Twamp reflector

Validation

```
ROUTER1#show running-config twamp
ROUTER1#show twamp-statistics
```

Validation of configuration on Twamp-Reflector

```
ROUTER1#sh running-config twamp
twamp-light reflector
 reflector-admin-state enable
 reflector-ip 3.3.3.3 reflector-port 1301
```

Validation of configuration on Twamp-Control

```
ROUTER1#sh running-config twamp
twamp-light control
 control-admin-state enable
 test-session-name s1 sender-ip 1.1.1.1 sender-port 1300 reflector-ip 3.3.3.3
reflector-port 1301
```

Validation of Twamp-session packets on Twamp-Control

```
R1#show twamp-statistics s1
========================================
TWAMP Test-Session Statistics

This document contains these chapters and appendices:

CHAPTER 1 BGP Commands

This chapter describes the BGP configuration commands.

- bgp table-map
- clear bgp (A.B.C.D|X:X::X:X)
- clear bgp *
- clear bgp <1-4294967295>
- clear bgp dampening
- clear bgp external
- clear bgp flap-statistics
- clear bgp peer-group
- clear bgp statistics
- clear bgp view
- clear ip bgp A.B.C.D
- clear ip bgp A.B.C.D vrf
- clear ip bgp A.B.C.D ipv4 labeled-unicast
- clear ip bgp peer-group WORD ipv4 labeled-unicast
- clear ip bgp * ipv4 labeled-unicast
- clear ip bgp table-map
- debug bgp
- distance bgp
- exit-address-family
- ip as-path access-list
- ip community-list <1-99>
- ip community-list <100-500>
- ip community-list expanded
- ip community-list standard
- ip community-list WORD
- ip extcommunity-list <1-99>
- ip extcommunity-list <100-500>
- ip extcommunity-list expanded
- ip extcommunity-list standard
- match ip peer
- max-paths
- neighbor activate
- neighbor additional-paths
- neighbor advertise additional-paths
- neighbor advertisement-interval
- neighbor allowas-in
- neighbor as-origination-interval
- neighbor attribute-unchanged
- neighbor capability dynamic

- neighbor capability orf prefix-list
- neighbor capability route-refresh
- neighbor collide-established
- neighbor connection-retry-time
- neighbor default-originate
- neighbor description
- neighbor disallow-infinite-holdtime
- neighbor distribute-list
- neighbor dont-capability-negotiate
- neighbor ebgp-multihop
- neighbor enforce-multihop
- neighbor fall-over bfd
- neighbor filter-list
- neighbor limit
- neighbor local-as
- neighbor maximum-prefix
- neighbor next-hop-self
- neighbor optional-as
- neighbor override-capability
- neighbor passive
- neighbor authentication-key
- neighbor peer-group
- neighbor port
- neighbor prefix-list
- neighbor remote-as
- neighbor remove-private-AS
- neighbor route-map
- neighbor route-reflector-client
- neighbor route-server-client
- neighbor send-community
- neighbor send-label explicit-null
- neighbor shutdown
- neighbor soft-reconfiguration inbound
- neighbor strict-capability-match
- neighbor timers
- neighbor transparent-as
- neighbor transparent-nexthop
- neighbor unsuppress-map
- neighbor update-source

- neighbor version
- neighbor weight
- neighbor WORD peer-group
- network
- network synchronization
- redistribute
- router bgp
- snmp restart bgp
- synchronization
- timers bgp

address-family

Use the address family command to enter the IPv4 or VPNv4 address family mode allowing configuration of address-family specific parameters. To leave address family mode and return to configure mode, give the exit-address-family command.

This command configures the routing exchange between Provider Edge (PE) and Customer Edge (CE) devices. The BGP sessions between PE routers can carry different types of routes (VPN-IPv4 and IPv4 routes). Address families are used to control the type of BGP session. Configure a BGP address family for each VRF configured on the PE router and a separate address family to carry VPN-IPv4 routes between PE routers. All non VPN BGP neighbors are defined using router mode. All VPN BGP neighbors are defined under its associated address family mode. The BGP process with no address-family specified is the default address-family, where any sessions are configured that either are not associated with a VRF or are used to carry IPv4 routes.

Use the no parameter with this command to disable the address-family configurations.

Command Syntax

```
address-family ipv4
address-family ipv4 (unicast|multicast)
address-family ipv4 vrf NAME
address-family ipv4 labeled-unicast
address-family ipv6 labeled-unicast
address-family l2vpn evpn
address-family rtfilter unicast
address-family vpn4
address-family vpn4 unicast
address-family vpnv6
address-family vpnv6 unicast
no address-family ipv4 vrf NAME
no address-family ipv4 multicast
no address-family l2vpn evpn
no address-family rtfilter unicast
no address-family vpnv4
no address-family vpnv4 unicast
no address-family vpnv6
no address-family vpnv6 unicast
```

Parameters

ipv4	IPv4 address family
unicast	Unicast address prefixes
multicast	Multicast address prefixes
vrf	Virtual Private Network (VPN) routing/forwarding instance
NAME	VPN routing/forwarding instance name

`unicast`	Unicast address prefixes
`labeled-unicast`	Enter IPv4 labeled-unicast address-family mode to advertise labeled unicast routes. When a neighbor activate command is given in this mode, the BGP speaker advertises the BGP-LU capability.
`ipv6`	IPv6 address family
`labeled-unicast`	Enter IPv6 labeled-unicast address-family mode to: Activate an IPv4 neighbor to exchange labeled routes data among ISP PE devices. When a IPv4 neighbor activate command is given in this mode, the device becomes 6PE capable. OR: Activate an IPv6 neighbor to advertise labeled unicast routes. When a IPv6 neighbor activate command is given in this mode, the BGP speaker advertises the BGP-LU capability.
`l2vpn evpn`	Layer 2 VPN routing sessions with EVPN endpoint information distributed to BGP peers
`rtfilter`	Route target filter: on an iBGP peer or Route Reflector (RR), only send IPv4 and IPv6 prefixes to PE routers when a PE has a VRF that imports those specific prefixes.
`unicast`	Unicast address prefixes
`vpnv4`	VPN version 4 address family
`unicast`	Unicast address prefixes
`vpnv6`	VPN version 6 address family
`unicast`	Unicast address prefixes

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#neighbor 3ffe:506::1 remote-as 7657
(config-router)#neighbor 3ffe:506::1 interface eth1

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4
(config-router-af)#neighbor 3ffe:506::1 activate
(config-router-af)#exit-address-family
```

Note:

For 6PE address family, the following commands are not supported.

- table-map filter

In addition, the following neighbor command options are also not supported for 6PE:

- Allow-as in
- attribute-unchanged
- distribute-list
- filter-list
- maximum-prefix
- default-originate

aggregate-address

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route.The `aggregate-address` command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing the more-specific routes to all neighbors. In the following example Router1 will propagate network 172.0.0.0 and suppresses the more specific route 172.10.0.0.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use this parameter to reduce the size of path information by listing the AS number only once, even if it was included in multiple paths that were aggregated. The `as-set` parameter is useful when aggregation of information results in an incomplete path information.

Use the no parameter with this command to disable this function.

Command Syntax

```
aggregate-address A.B.C.D/M
aggregate-address A.B.C.D/M as-set
aggregate-address A.B.C.D/M as-set summary-only
aggregate-address A.B.C.D/M summary only
aggregate-address A.B.C.D/M summary-only as-set
no aggregate-address A.B.C.D/M
no aggregate-address A.B.C.D/M as-set
no aggregate-address A.B.C.D/M as-set summary-only
no aggregate-address A.B.C.D/M summary only
no aggregate-address A.B.C.D/M summary-only as-set
```

Parameters

`A.B.C.D/M`	Aggregate prefix
`as-set`	Generate AS set path information
`summary-only`	Filter more specific routes from updates

Default

By default, aggregate address A.B.C.D/M is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#aggregate-address 10.0.0.0/8 as-set summary-only
```

```
(config)#router bgp 100
(config-router)#no aggregate-address 10.0.0.0/8 as-set summary-only
```

auto-summary

Use this command to enable sending summarized routes by a BGP speaker to its peers in the router configuration mode or in the address-family configuration mode. Auto-summary is used by a BGP router to advertise summarized routes to its peers. Auto-summary can be enabled if certain routes have already been advertised: in this case, configuring auto-summary advertises the summarized routes first, then corresponding non-summarized routes are withdrawn. If certain routes have already been advertised, and auto-summary is disabled, non-summarized routes are first advertised, then the corresponding summarized routes are withdrawn from all the connected peers.

Use the no parameter with this command to disable this function.

Command Syntax

```
auto-summary
no auto-summary
```

Parameters

None

Default

By default, auto-summary is disabled

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables auto-summary in Router mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#auto-summary
```

The following example enables auto-summary using the IPv4 address family.

```
#configure terminal
(config)#router bgp 1
(config)#address-family ipv4
(config-af)#auto-summary
```

bgp additional-paths

Use this command to enable BGP add-path.

Use the no parameter with this command to disable BGP add-path.

Command Syntax

```
bgp additional-paths (send|receive|send-receive)
no bgp additional-paths (send|receive|send-receive)
```

Parameters

`send`	Send additional paths to neighbors
`receive`	Receive additional paths from neighbors
`send-receive`	Send and Receive additional paths from neighbors

Default

By default, bgp additional-paths is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#bgp additional-paths send

(config-router)#no bgp additional-paths send
```

bgp additional-paths select

Use this command to enable BGP add-path advertisement.

Use the no parameter with this command to disable BGP add-path advertisement.

Command Syntax

```
bgp additional-paths select (all|best <2-3>)
no bgp additional-paths select (all|best <2-3>)
```

Parameters

`all`	Select all available paths
`best`	Select best N paths
`<2-3>`	Number of best paths in additional paths to be selected

Default

By default, bgp additional-paths select is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#bgp additional-paths select all

(config-router)#no bgp additional-paths select all
```

bgp aggregate-nexthop-check

Use this command to set the BGP option to perform aggregation only when next-hop matches the specified IP address.

Use the no parameter with this command to disable this functionality.

Command Syntax

```
bgp aggregate-nexthop-check
no bgp aggregate-nexthop-check
```

Parameters

None

Default

By default, bgp aggregate nexthop check is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp aggregate-nexthop-check
```

bgp always-compare-med

Use this command to compare the Multi Exit Discriminator (MED) for paths from neighbors in different autonomous systems. Multi Exit Discriminator (MED) is used in best path selection by BGP. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal. MED comparison is done only among paths from the same autonomous system (AS). Use `bgp always-compare-med` command to allow comparison of MEDs from different ASs. The MED parameter is used to select the best path. A path with lower MED is preferred. If the bgp table shows the following and the always-compare-med is enabled:

```
Route1: as-path 400, med 300
Route2: as-path 200, med 200
Route3: as-path 400, med 250
```

Route1 is compared to Route2. Route2 is best of the two (lower MED). Next, Route2 is compared to Route3 and Route2 is chosen best path again (lower MED). If always-compare-med was disabled, MED is not taken into account when Route1 and Route2 are compared, because of different ASs and MED is compared for only Route1 and Route3. In this case, Route3 would be the best path. The selected route is also affected by the `bgp deterministic-med` command. Please see `bgp deterministic-med` command for details. If this command is used to compare MEDs for all paths, it should be configured on every BGP router in the AS.

Use the `no` parameter with this command to disallow the comparison.

Command Syntax

```
bgp always-compare-med
```

```
no bgp always-compare-med
```

Parameters

None

Default

By default, bgp always compare med is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp always-compare-med
```

bgp as-local-count

Use this command to set the number of times the local-AS (Autonomous System) is to be prepended.

Use the no parameter with this command to stop prepending the local AS count.

Command Syntax

```
bgp as-local-count <2-64>
no bgp as-local-count <2-64>
```

Parameter

<2-64>	The number of times the local-AS is to be prepended

Default

By default, bgp as local count is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp as-local-count 55

(config)#router bgp 100
(config-router)#no bgp as-local-count 55
```

bgp bestpath as-path ignore

Use this command to prevent the router from considering the autonomous system (AS) path length as a factor in the algorithm for choosing a best path route.

Use the no parameter with this command to allow the router to consider the AS path length in choosing a best path route.

Command Syntax

```
bgp bestpath as-path ignore
no bgp bestpath as-path ignore
```

Parameters

None

Default

By default, bgp bestpath as-path ignore is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path ignore

(config)#router bgp 100
(config-router)#no bgp bestpath as-path ignore
```

bgp bestpath as-path multipath-relax

Use this command to relax the “same AS-Path” requirement so any candidate eBGP AS-Path with the same AS-path length might be used for eBGP load-balancing.

Note: This feature does not load-balance between eBGP and iBGP paths.

Normally eBGP load-balancing requires the candidate routes to be equal-cost paths with identical BGP attributes having the same weight, Local-Pref, AS-Path (both the AS numbers and the AS path length), origin, MED, and different next-hop.

Use the no parameter with this command to return to normal operation.

Command Syntax

```
bgp bestpath as-path multipath-relax
no bgp bestpath as-path multipath-relax
```

Parameters

None

Default

By default, as-path multipath-relax is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath as-path multipath-relax

(config)#router bgp 100
(config-router)#no bgp bestpath as-path multipath-relax
```

bgp bestpath compare-confed-aspath

Use this command to allow comparing of the confederation AS path length. This command specifies that the AS confederation path length must be used when available in the BGP best path decision process. It is effective only when bgp bestpath as-path ignore command has not been used.

Use the no parameter with this command to ignore consideration of AS confederation path length in BGP best path selection.

Command Syntax

```
bgp bestpath compare-confed-aspath
no bgp bestpath compare-confed-aspath
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-confed-aspath

(config)#router bgp 100
(config-router)#no bgp bestpath compare-confed-aspath
```

bgp bestpath compare-routerid

Use this command to compare router IDs for identical eBGP paths. When comparing similar routes from peers, the BGP router does not consider the router ID of the routes. By default, it selects the first received route. Use this command to include router ID in the selection process; similar routes are compared and the route with the lowest router ID is selected. The router IS is the highest IP address on the router, with preference given to loopback addresses. Router ID can be manually set by using the bgp router-id command.

Use the no parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath compare-routerid
```

```
no bgp bestpath compare-routerid
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath compare-routerid

(config)#router bgp 100
(config-router)#no bgp bestpath compare-routerid
```

bgp bestpath dont-compare-originator-id

Use this command to change the default bestpath selection by not comparing an originator-ID for an identical EBGP path.

Use the no parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath dont-compare-originator-id
```

```
no bgp bestpath dont-compare-originator-id
```

Parameters

None

Default

BGP receives routes with identical eBGP paths from eBGP peers and selects the first route received as the best path.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath dont-compare-originator-id

(config)#router bgp 100
(config-router)#no bgp bestpath dont-compare-originator-id
```

bgp bestpath med

Use this command to specify two MED (Multi Exit Discriminator) attributes, `confed` and `missing-as-worst`.

The `confed` attribute enables MED comparison along paths learned from confederation peers. The MEDs are compared only if there is no external Autonomous System (an AS not within the confederation) in the path. If there is an external autonomous system in the path, the MED comparison is not made. For example in the following paths, the MED is not compared with Route3 as it is not in the confederation. MED is compared for Route1 and Route2 only.

```
Path1 = 32000 32004, med=4
Path2 = 32001 32004, med=2
Path3 = 32003 1, med=1
```

The `missing-as-worst` attribute to consider a missing MED attribute in a path as having a value of infinity, making the path without a MED value the least desirable path. If `missing-as-worst` is disabled, the missing MED is assigned the value of 0, making the path with the missing MED attribute the best path.

Use the `no` parameter with this command to prevent BGP from considering the MED attribute in comparing paths.

Command Syntax

```
bgp bestpath med confed missing-as-worst
bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
bgp bestpath med missing-as-worst confed
no bgp bestpath med confed missing-as-worst
no bgp bestpath med (confed|missing-as-worst|remove-recv-med|remove-send-med)
no bgp bestpath med missing-as-worst confed
```

Parameters

`confed`	Compare MED along confederation paths
`missing-as-worst`	Treat missing MED as the least preferred one
`remove-recv-med`	Remove received MED attribute
`remove-send-med`	Remove sent MED attribute

Command Mode

Router mode

Default

By default, MED value is zero.

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

```
(config)#router bgp 100
(config-router)#bgp bestpath med missing-as-worst

(config)#router bgp 100
(config-router)#bgp bestpath med remove-recv-med
(config-router)#no bgp bestpath med remove-recv-med

(config)#router bgp 100
(config-router)#bgp bestpath med remove-send-med
(config-router)#no bgp bestpath med remove-send-med
```

bgp bestpath tie-break-on-age

Use this command to always select a preferred older route even when the `bgp bestpath compare-routerid` command is configured.

Use the `no` parameter with this command to disable this functionality.

Command Syntax

```
bgp bestpath tie-break-on-age
```

```
no bgp bestpath tie-break-on-age
```

Parameters

None

Default

By default, tie-break-on-age is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp bestpath tie-break-on-age

(config)#router bgp 100
(config-router)#no bgp bestpath tie-break-on-age
```

bgp client-to-client reflection

Use this command to configure routers as route reflectors. Route reflectors are used when all Interior Border Gateway Protocol (iBGP) speakers are not fully meshed. If the clients are fully meshed the route reflector is not required, use `no bgp client-to-client reflection` command to disable the client-to-client route reflection.

Use the no parameter with this command to turn off client-to-client reflection.

Command Syntax

```
bgp client-to-client reflection
no bgp client-to-client reflection
```

Parameters

None

Default

When a router is configured as a route reflector, client-to-client reflection is enabled by default.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp client-to-client reflection

(config)#router bgp 100
(config-router)#no bgp client-to-client reflection
```

bgp cluster-id

Use this command to configure the cluster ID if the BGP cluster has more than one route reflector. A cluster includes route reflectors and its clients. Usually, each cluster is identified by the router ID of its single route reflector but to increase redundancy sometimes a cluster may have more than one route reflector. All router reflectors in such a cluster are then identified by a cluster ID. The `bgp cluster-id` command is used to configure the 4 byte cluster ID for clusters with more than one route reflectors.

Use the `no` parameter with this command (without any arguments) to remove a previously configured route reflector cluster ID.

Command Syntax

```
bgp cluster-id <1-4294967295>
bgp cluster-id A.B.C.D
no bgp cluster-id
```

Parameters

`<1-4294967295>`	Route reflector ID as a 32-bit quantity
`A.B.C.D`	Route reflector ID in an IPv4 address format

Default

By default, cluster id is set bgp cluster id

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following configuration creates a cluster-id 5 including two route-reflector-clients.

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 3.3.3.3 route-reflector-client
(config-router)#neighbor 5.5.5.5 remote-as 200
(config-router)#neighbor 5.5.5.5 route-reflector-client
(config-router)#neighbor 6.6.6.6 remote-as 200
(config-router)#bgp cluster-id 5
```

bgp confederation identifier

Use this command to specify a BGP confederation identifier.

Use the no parameter with this command to remove a BGP confederation identifier.

Command Syntax

```
bgp confederation identifier <1-65535>
no bgp confederation identifier
```

Parameter

<1-65535>	Routing domain confederation AS number

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation identifier 1
```

bgp confederation peers

Use this command to configure the Autonomous Systems (AS) that belong to a confederation. A confederation allows an AS to be divided into several ASs. The AS is given a confederation identifier. External BGP (eBGP) routers view only the whole confederation as one AS. Each AS is fully meshed within itself and is visible internally to the confederation.

Use the no parameter with this command to remove an autonomous system from the confederation.

Command Syntax

```
bgp confederation peers <1-65535>
no bgp confederation peers <1-65535>
```

Parameter

<1-65535>	AS numbers of eBGP peers that are in the same confederation

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration example, the neighbor 172.210.30.2 and 172.210.20.1 have iBGP connection within AS 100, neighbor 173.213.30.1 is a BGP connection with a confederation peer 200 and neighbor 6.6.6.6 has an eBGP connection to external AS 300.

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp confederation identifier 300
(config-router)#bgp confederation peers 200
(config-router)#neighbor 172.210.30.2 remote-as 100
(config-router)#neighbor 172.210.20.1 remote-as 100
(config-router)#neighbor 173.213.30.1 remote-as 200
(config-router)#neighbor 6.6.6.6 remote-as 300
```

In this configuration, the neighbor 5.5.5.4 has an eBGP connection to confederation 300.

```
#configure terminal
(config)#router bgp 500
(config-router)#neighbor 5.5.5.4 remote-as 300
```

bgp config-type

Use this command to set the BGP configuration to the `standard` type. After setting the configuration to the `standard` type, use the neighbor send-community command to send out BGP community attributes. The `zebos` configuration type is the default and requires no specific configuration for sending out BGP standard community and extended community attributes.

For the `standard` type, the `no synchronization` command is always shown in the configuration, whereas for the `zebos` type, this command is the default.

Use the no parameter with this command to remove this configuration.

Command Syntax

```
bgp config-type (standard|zebos)
no bgp config-type
```

Parameters

`standard`	Standard style configuration
`zebos`	OcNOS style configuration

Default

The default configuration type is: bgp config-type zebos

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp config-type standard
```

bgp dampening

Use this command to enable BGP route dampening and set various parameters. Route dampening minimizes the instability caused by route flapping. A penalty is added for every flap in a flapping route. As soon as the total penalty reaches the `suppress` limit the advertisement of the route is suppressed. This penalty is decayed according to the configured `half time` value. Once the penalty is lower than the `reuse` limit, the route advertisement is un-suppressed. The dampening information is purged from the router once the penalty becomes less than half of the `reuse` limit.

Use the `no` parameter with this command to unset BGP dampening parameters.

Command Syntax

```
bgp dampening
bgp dampening <1-45>
bgp dampening <1-45> <1-20000> <1-20000> <1-255>
bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45>
bgp dampening route-map WORD
no bgp dampening
no bgp dampening <1-45>
no bgp dampening <1-45> <1-20000> <1-20000> <1-255>
no bgp dampening <1-45> <1-20000> <1-20000> <1-255> <1-45>
no bgp dampening route-map
no bgp dampening route-map WORD
```

Parameters

`<1-45>`	Reachability half-life time for the penalty in minutes. The time for the penalty to decrease to one-half of its current value.
`<1-20000>`	Value to start reusing a route. When the penalty for a suppressed route decays below the reuse value, the routes become unsuppressed.
`<1-20000>`	Value to start suppressing a route. When the penalty for a route exceeds the suppress value, the route is suppressed
`<1-255>`	Maximum duration to suppress a stable route in minutes.
`<1-45>`	Un-reachability half-life time for the penalty in minutes.
`route-map`	Route map to specify criteria for dampening.
`WORD`	Route-map name.

Defaults

The default reachability half-life is 15 minutes.

The default reuse limit is 750.

The default suppress limit is 2000.

The default max-suppress value is 4 times the half-life time, or 60 minutes.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 11
(config-router)#bgp dampening 20 800 2500 80 25
```

bgp default ipv4-unicast

Use this command to configure BGP defaults and activate IPv4-unicast for a peer by default. This affects the BGP global configuration.

Use the no parameter with this command to disable the default behavior of the BGP routing process of exchanging IPv4 addressing information with BGP neighbor routers.

Command Syntax

```
bgp default ipv4-unicast
no bgp default ipv4-unicast
```

Parameters

None

Default

IPv4 unicast is the default BGP behavior.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default ipv4-unicast
```

bgp default local-preference

Use this command to change the default local preference value.Local preference indicates the preferred path when there are multiple paths to the same destination. The path having a higher preference is preferred. The preference is sent to all routers and access servers in the local autonomous system.

Use the no parameter with this command to revert to the default value for local preference.

Command Syntax

```
bgp default local-preference <0-4294967295>
no bgp default local-preference
no bgp default local-preference <0-4294967295>
```

Parameter

`<0-4294967295>` Local preference value

Default

By default, local preference value is 100

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp default local-preference 2345555
```

bgp deterministic-med

Use this command to compare the Multi Exit Discriminator (MED) variable when choosing among routes advertised by different peers in the same autonomous system. MED is compared after BGP attributes weight, local preference, AS-path and origin have been compared and are equal.

For a correct comparison result, enable this command on all routers in a local AS. After enabling this command, all paths for the same prefix are grouped together and arranged according to their MED value. Based on this comparison, the best path is then chosen. This command compares MED variable when choosing routes advertised by different peers in the same AS, to compare MED, when choosing routes from neighbors in different ASs use the bgp always-compare-med command.

When the bgp deterministic-med command is enabled, routes from the same AS are grouped together, and the best routes of each group are compared. If the BGP table showed:

```
Route1: as-path 200, med 300, internal
Route2: as-path 400, med 200, internal
Route3: as-path 400, med 250, external
```

BGP would have a group of Route1 and a second group of Route2 and Route3 (the same ASs). The best of each group is compared. Route1 is the best of its group because it is the only route from AS 200. Route1 is compared to the Route2, the best of group AS 400 (the lower MED). Since the two routes are not from the same AS, the MED is not considered in the comparison. The external BGP route is preferred over the internal BGP route, making Route3 the best route; the preferred route would be different if `always-compare-med` command is enabled (See `always-compare-med` command).

Use the `no` parameter with this command to disallow this setting.

Command Syntax

```
bgp deterministic-med
```

```
no bgp deterministic-med
```

Parameters

None

Default

By default, bgp deterministic med is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp deterministic-med

(config)#router bgp 100
(config-router)#no bgp deterministic-med
```

bgp enforce-first-as

Use this command to enforce the first AS for eBGP routes. This command specifies that any updates received from an external neighbor that do not have the neighbor's configured Autonomous System (AS) at the beginning of the AS_PATH in the received update must be denied. Enabling this feature adds to the security of the BGP network by not allowing traffic from unauthorized systems.

Using the no parameter with this command to disable this feature.

Command Syntax

```
bgp enforce-first-as
no bgp enforce-first-as
```

Parameters

None

Default

By default, enforce-first-as is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp enforce-first-as

(config)#router bgp 100
(config-router)#no bgp enforce-first-as
```

bgp extended-asn-cap

Use this command to configure a BGP router to send 4-octet ASN capabilities. If attempting to change the AS capability from 2 to 4 or 4 to 2, a prompt occurs to remove the VRF configuration (if it exists), and reconfiguration is required, because the route distinguisher (RD) configuration would have been created with the current (2 octet or 4 octet) capability, and must be reconfigured before attempting to change the capability.

While loading from a saved configuration with AS4 capability and BGP VRF configuration, the capability will not be changed because of the above described reason.

Use the no parameter with this command to prevent a BGP router from sending 4-octet ASN capabilities.

Command Syntax

```
bgp extended-asn-cap
no bgp extended-asn-cap
```

Parameters

None

Default

By default, the bgp extended ASN capability and Four-octet capabilities are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp extended-asn-cap
```

bgp fast-external-failover

Use this command to reset a BGP session immediately, if the interface used for BGP connection goes down.

Use the no parameter with this command to disable this feature.

Command Syntax

```
bgp fast-external-failover
no bgp fast-external-failover
```

Parameters

None

Default

By default, fast-external failover is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp fast-external-failover
```

bgp log-neighbor-changes

Use this command to enable logging of status change messages without turning on debug bgp commands. OcNOS has many logging services for neighbor status, including `debug bgp fsm` and `debug bgp events`. However, these commands cause system performance degradation. If you need to log neighbor status changes only, IP Infusion Inc. recommends turning off all debug commands and using the `bgp log-neighbor-changes` command instead. A sample output of the log is:

```
%Protocol-Severity-Events: Message-text
```

A sample output of the log for an `interface down` event is:

```
%BGP-5-ADJCHANGE: neighbor 10.10.0.24 Down Interface flap
```

This command logs the following events:

- BGP Notification Received
- Erroneous BGP Update Received
- User reset request
- Peer time-out
- Peer Closing down the session
- Interface flap
- Router ID changed
- Neighbor deleted
- Member added to peer group
- Administrative shutdown
- Remote AS changed
- RR client configuration modification
- Soft reconfiguration modification

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
bgp log-neighbor-changes
no bgp log-neighbor-changes
```

Parameters

None

Default

By default, bgp log neighbor changes is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#router bgp 100
(config-router)#bgp log-neighbor-changes
```

bgp multiple-instance

Use this command to enable BGP multiple instance support.

Use the no parameter with this command to disable this function.

Note: The `no bgp multiple-instance` command is not valid when any BGP instances are present.

Command Syntax

```
bgp multiple-instance (allow-same-peer|)
no bgp multiple-instance (allow-same-peer|)
```

Parameters

`allow-same-peer`

Allow the same peer in multiple instances

Default

By default, there is no multiple-instance support in BGP

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the use of the `bgp multiple-instance` command allowing the configuration of two instances.

```
(config)#bgp multiple-instance

(config)#quit
#show running-config

Current configuration:
hostname OcNOS
password zebra
log stdout
!
debug bgp
debug bgp events
debug bgp updates
debug bgp fsm
!
bgp multiple-instance
!
router bgp 11
 bgp router-id 10.10.10.50
 neighbor 10.10.10.51 remote-as 11
!
```

bgp nexthop-trigger delay

Use this command to set the delay time for nexthop address tracking. This command configures the delay interval between routing table walks for nexthop delay tracking, after which BGP does a routing table scan on receiving a nexthop change trigger from NSM. The time period determines how long BGP waits before it walks the full BGP table to determine which prefixes are affected by the nexthop changes, after it receives the trigger from NSM about one or more nexthop changes.

Use the no parameter with this command to reset the timer value to the default value.

Command Syntax

```
bgp nexthop-trigger delay <1-100>
no bgp nexthop-trigger delay
```

Parameter

<1-100>	Nexthop trigger delay interval in seconds

Default

By default, nexthop-trigger delay time is 5 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp nexthop-trigger delay 6

#configure terminal
(config)#no bgp nexthop-trigger delay
```

bgp nexthop-trigger enable

Use this command to enable nexthop address tracking. Nexthop address tracking is an event-driven notification system that monitors the status of routes installed in the Routing Information Base (RIB) and reports nexthop changes that affect internal BGP (iBGP) or external BGP (eBGP) prefixes directly to the BGP process. This improves the overall BGP convergence time, by allowing BGP to respond rapidly to nexthop changes for routes installed in the RIB.

If nexthop tracking is enabled after certain routes are learned, the registration of all nexthops for selected BGP routes is done after the nexthop tracking feature is enabled. If nexthop tracking is disabled, and if there are still some selected BGP routes, BGP de-registers the nexthops of all selected BGP routes from NSM.

Use the `no` parameter with this command to disable this feature. If the `no` command is given when nexthop tracking is in the process of execution, an error appears and nexthop tracking is not disabled. However, if the nexthop tracking timer is running at the time of negation, the nexthop tracking timer is stopped, and nexthop tracking is disabled.

Command Syntax

```
bgp nexthop-trigger enable
```

```
no bgp nexthop-trigger enable
```

Parameters

None

Default

By default, nexthop address tracking is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp nexthop-trigger enable
```

bgp rfc1771-path-select

Use this command to set RFC 1771 compatible path selection.

Use the no parameter with this command to revert this setting.

Command Syntax

```
bgp rfc1771-path-select
no bgp rfc1771-path-select
```

Parameters

None

Default

Standard compatible path selection mechanism.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-path-select
```

bgp rfc1771-strict

Use this command to set the origin path attribute to “IGP” when the origin is a protocol such as OSPF or ISIS as specified in RFC 1771. Otherwise, the origin is always set to “incomplete” which is the industry standard.

Use the no parameter with this command to revert this setting.

Command Syntax

```
bgp rfc1771-strict
no bgp rfc1771-strict
```

Parameters

None

Default

By default, bgp rfc1771 strict is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp rfc1771-strict
```

bgp router-id

Use this command to manually configure a fixed router ID as a BGP router identifier. When this command is used to configure a fixed router ID, the current router identifier is overridden and the peers are reset.

Use the no parameter with this command to remove a manually configured fixed router ID.

Command Syntax

```
bgp router-id A.B.C.D
no bgp router-id
no bgp router-id A.B.C.D
```

Parameter

A.B.C.D	Router ID in an IPv4 address format

Default

Once the BGP router-id is elected, it may be re-elected in the following cases:

a. When an explicit BGP router-id is configured/un-configured

b. When the router's (global) router-id is set/unset (holds true when (a) is not applicable),

c. When the BGP process is cleared (holds true when both (a) & (b) are not applicable and the IP address(es) on the active interfaces are updated, which may result in a change in the router's router-id).

If no loopback interface is configured, the highest IP address is the BGP router-id.

When a loopback interface is configured, the BGP router-id is set to the IP address of the loopback interface.

Note: IP Infusion Inc. recommends that you always configure a router identifier to avoid unpredictable behavior if the address of a loopback interface changes.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp router-id 10.1.2.7

(config)#router bgp 100
(config-router)#no bgp router-id 10.1.2.7
```

bgp scan-time

Use this command to configure scanning intervals of BGP routers. This interval is the period after which router checks the validity of the routes in its database. To disable BGP scanning, set the scan-time interval to 0 seconds.

Use the no parameter with this command to disable this function.

Note: When BGP scan timer is disabled, existing routes in BGP RIB will not be updated with the updated redistributed configuration.

Command Syntax

```
bgp scan-time <0-60>
no bgp scan-time
no bgp scan-time <0-60>
```

Parameter

<0-60>	Scanning interval in seconds

Default

By default, scan-time interval is 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp scan-time 10
```

bgp table-map

Use this command to enable or disable suppression/modification of incoming BGP updates to IP RIB/FIB table installation.

In a dedicated route reflector, all the routes it receives may not be required to be stored or only few selected routes need to be stored, because it may not lie in the data path.

Table maps are particularly useful to attain this restriction. Table-map command can be used in two ways:

- When a simple table-map command is given, the route map referenced in the table-map command shall be used to set certain properties (such as the traffic index) of the routes for installation into the RIB. The route is always downloaded, regardless of whether it is permitted or denied by the route map.
- When the option ‘filter’ is given in the table map command, the route map referenced is used to control whether a BGP route is to be downloaded to the IP RIB (hence the filter). A BGP route is not downloaded to the RIB if it is denied by the route map.

Use this command in Router mode to set the table map rule for all address families. Use this command in Address Family mode to set the table map rule per an IPv4 or IPv6 family.

Use the no parameter with this command to remove the table-map rule.

Command Syntax

```
table-map WORD (|filter)
```

Parameter

WORD	Specify the route-map name to apply.
filter	Filer the routes. If present, the incoming routes are pruned as per the rule specified in route-map-name. If not, it is used to alter the incoming packet information.

Default

All BGP routes will be downloaded to IP RIB

Command Mode

Router mode, Address Family IPv4 mode, and Address Family IPv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to set the table-map command without a filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#table-map abc
```

The following example shows how to set the table-map command with a filter for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#table-map abc filter
```

The following example shows how to set the table-map command without a filter for BGP for the IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc
```

The following example shows how to set the table-map command with a filter for BGP for the IPv6 address family.

```
(config)#router bgp 100
(config-router)#address-family ipv6
(config-router-af)#table-map abc filter
```

clear bgp (A.B.C.D|X:X::X:X)

Use this command to reset a BGP neighbor address.

Command Syntax

```
clear bgp (A.B.C.D|X:X::X:X)
clear bgp (A.B.C.D|X:X::X:X) in
clear bgp (A.B.C.D|X:X::X:X) in prefix-filter
clear bgp (A.B.C.D|X:X::X:X) out
```

Parameters

`A.B.C.D`	IPv4 neighbor address.
`X:X::X:X`	IPv6 neighbor address.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 3.3.3.3
```

clear bgp *

Use this command to reset the BGP connection for all peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp *
clear bgp * in
clear bgp * in prefix-filter
clear bgp * out
clear bgp * soft
clear bgp * soft in
clear bgp * soft out
clear ip bgp *
clear ip bgp * in
clear ip bgp * in prefix-filter
clear ip bgp * out
clear ip bgp * soft
clear ip bgp * soft in
clear ip bgp * soft out
clear ip bgp * ipv4 (unicast|multicast) in
clear ip bgp * ipv4 (unicast|multicast) in prefix-filter
clear ip bgp * ipv4 (unicast|multicast) out
clear ip bgp * ipv4 (unicast|multicast) soft
clear ip bgp * ipv4 (unicast|multicast) soft in
clear ip bgp * ipv4 (unicast|multicast) soft out
```

Parameters

`in`	Incoming advertised routes should be cleared.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp *
#clear ip bgp * ipv4 unicast in prefix-filter
```

clear bgp <1-4294967295>

Use this command to reset a BGP connection for all peers in a specified Autonomous System.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp <1-4294967295>
clear bgp <1-4294967295> in
clear bgp <1-4294967295> in prefix-filter
clear bgp <1-4294967295> out
clear bgp <1-4294967295> soft
clear bgp <1-4294967295> soft in
clear bgp <1-4294967295> soft out
clear ip bgp <1-4294967295>
clear ip bgp <1-4294967295> in
clear ip bgp <1-4294967295> in prefix-filter
clear ip bgp <1-4294967295> out
clear ip bgp <1-4294967295> soft
clear ip bgp <1-4294967295> soft in
clear ip bgp <1-4294967295> soft out
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) in prefix-filter
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) out
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft in
clear ip bgp <1-4294967295> ipv4 (unicast|multicast) soft out
```

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.

	Clear incoming advertised routes.
`in`	Clear incoming advertised routes.
`prefix-filter`	
	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp 4294967277
#clear ip bgp 4294967277
```

clear bgp dampening

Use this command to reset BGP route flap dampening information.

Command Syntax

```
clear bgp ipv4 (unicast|multicast) dampening
clear bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
clear ip bgp dampening
clear ip bgp dampening A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) dampening
clear ip bgp ipv4 (unicast|multicast) dampening A.B.C.D/M
```

Parameters

`ipv4`	IPv4 address family.
`multicast`	Multicast prefixes
`unicast`	Unicast prefixes
`A.B.C.D/M`	IP prefix (network/length), for example, 35.0.0.0/8

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp dampening 10.10.0.121/24
#clear ip bgp ipv4 unicast dampening
```

clear bgp external

Use this command to reset the BGP connection for all external peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp external
clear bgp external in
clear bgp external in prefix-filter
clear bgp external out
clear bgp external soft
clear bgp external soft in
clear bgp external soft out
clear ip bgp external
clear ip bgp external in
clear ip bgp external in prefix-filter
clear ip bgp external out
clear ip bgp external soft
clear ip bgp external soft in
clear ip bgp external soft out
clear ip bgp external ipv4 (unicast|multicast) in
clear ip bgp external ipv4 (unicast|multicast) in prefix-filter
clear ip bgp external ipv4 (unicast|multicast) out
clear ip bgp external ipv4 (unicast|multicast) soft
clear ip bgp external ipv4 (unicast|multicast) soft in
clear ip bgp external ipv4 (unicast|multicast) soft out
```

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip bgp external
```

clear bgp flap-statistics

Use this command to reset BGP flap statistics.

Command Syntax

```
clear bgp ipv4 (unicast|multicast) flap-statistics
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default |
  VRFNAME )
clear bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
clear ip bgp flap-statistics
clear ip bgp flap-statistics A.B.C.D/M
clear ip bgp ipv4 (unicast|multicast) flap-statistics
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M vrf (all | default
  | VRFNAME )
clear ip bgp ipv4 (unicast|multicast) flap-statistics A.B.C.D/M
```

Parameters

`ipv4`	IPv4 address family.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
`A.B.C.D/M`	IP prefix (network/length), for example, 35.0.0.0/8
`VRFNAME`	VPN routing or forwarding instance name
`all`	All VRF's
`default`	Default VRF

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp flap-statistics
#clear ip bgp ipv4 unicast flap-statistics
```

clear bgp peer-group

Use this command to reset the BGP connection for all members of a peer group.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp peer-group WORD
clear bgp peer-group WORD in
clear bgp peer-group WORD in prefix-filter
clear bgp peer-group WORD out
clear bgp peer-group WORD soft
clear bgp peer-group WORD soft in
clear bgp peer-group WORD soft out
clear ip bgp peer-group WORD
clear ip bgp peer-group WORD in
clear ip bgp peer-group WORD in prefix-filter
clear ip bgp peer-group WORD out
clear ip bgp peer-group WORD soft
clear ip bgp peer-group WORD soft in
clear ip bgp peer-group WORD soft out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) in prefix-filter
clear ip bgp peer-group WORD ipv4 (unicast|multicast) out
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft in
clear ip bgp peer-group WORD ipv4 (unicast|multicast) soft out
```

Parameters

`WORD`	BGP peer-group name.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.

	`unicast`	Unicast prefixes.
		Clear incoming advertised routes.
	`in`	Clear incoming advertised routes.
	`prefix-filter`	
		Push out prefix-list ORF and do inbound soft reconfig.
	`out`	Clear outgoing advertised routes.
	`soft`	Clear both incoming and outgoing routes.
	`in`	Soft reconfig inbound update.
	`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp peer-group P1
```

clear bgp statistics

Use this command to reset all BGP statistics.

Command Syntax

```
clear bgp statistics
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear bgp statistics
```

clear bgp view

Use this command to reset all peers in a BGP view.

Command Syntax

```
clear bgp view WORD *
clear bgp view WORD * soft
clear bgp view WORD * soft in
clear bgp view WORD * soft out
clear ip bgp view WORD *
clear ip bgp view WORD * in prefix-filter
clear ip bgp view WORD * soft
clear ip bgp view WORD * soft in
clear ip bgp view WORD * soft out
clear ip bgp view WORD * ipv4 (unicast|multicast) in prefix-filter
clear ip bgp view WORD * ipv4 (unicast|multicast) soft
clear ip bgp view WORD * ipv4 (unicast|multicast) soft in
clear ip bgp view WORD * ipv4 (unicast|multicast) soft out
```

Parameters

`WORD`	BGP peer group name.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	IPv4 address family.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp view myview *
```

clear ip bgp A.B.C.D

Use this command to reset an IPv4 BGP neighbor address.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp A.B.C.D in
clear ip bgp A.B.C.D in prefix-filter
clear ip bgp A.B.C.D out
clear ip bgp A.B.C.D soft
clear ip bgp A.B.C.D soft in
clear ip bgp A.B.C.D soft out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) in prefix-filter
clear ip bgp A.B.C.D ipv4 (unicast|multicast) out
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft in
clear ip bgp A.B.C.D ipv4 (unicast|multicast) soft out
```

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`ipv4`	Clear incoming advertised routes.
`multicast`	Multicast prefixes.
`unicast`	Unicast prefixes.
`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 in
```

clear ip bgp A.B.C.D vrf

Use this command to reset the VPN Routing/Forwarding (VRF) instance for a peer address.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp A.B.C.D vrf WORD
clear ip bgp A.B.C.D vrf WORD in
clear ip bgp A.B.C.D vrf WORD out
clear ip bgp A.B.C.D vrf WORD soft
clear ip bgp A.B.C.D vrf WORD soft in
clear ip bgp A.B.C.D vrf WORD soft out
```

Parameters

`A.B.C.D`	IPv4 address
`WORD`	VPN routing/forwarding instance name
`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 35.0.0.1 vrf
```

clear ip bgp A.B.C.D ipv4 labeled-unicast

Use this command to soft reset an IPv4 Labeled-unicast BGP neighbor.

Command Syntax

```
clear ip bgp A.B.C.D ipv4 labeled-unicast soft
clear ip bgp A.B.C.D ipv4 labeled-unicast soft in
clear ip bgp A.B.C.D ipv4 labeled-unicast soft out
```

Parameters

`A.B.C.D`	BGP neighbor address
`soft`	Soft clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#clear ip bgp A.B.C.D ipv4 labeled-unicast soft in
```

clear ip bgp peer-group WORD ipv4 labeled-unicast

Use this command to soft reset an peer-group of ipv4 labeled-unicast peer members.

Command Syntax

```
clear ip bgp peer-group WORD ipv4 labeled-unicast soft
clear ip bgp peer-group WORD ipv4 labeled-unicast soft in
clear ip bgp peer-group WORD ipv4 labeled-unicast soft out
```

Parameters

`WORD`	Peer-group name
`soft`	Soft clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#clear ip bgp peer-group LU_GROUP ipv4 labeled-unicast soft in
```

clear ip bgp * ipv4 labeled-unicast

Use this command to soft reset all IPv4 Labeled-unicast BGP neighbors.

Command Syntax

```
clear ip bgp * ipv4 labeled-unicast soft
clear ip bgp * ipv4 labeled-unicast soft in
clear ip bgp * ipv4 labeled-unicast soft out
```

Parameters

`soft`	Soft clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#clear ip bgp * ipv4 labeled-unicast soft in
```

clear ip bgp table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

Command Syntax

```
clear ip bgp table-map (vrf (VRFNAME|all|default))
clear ip bgp ipv4 (unicast | multicast) table-map(vrf (VRFNAME|all|default))
```

Parameters

`vrf`	Select a VPN Routing/Forwarding Instance.
`VRFNAME`	Specify a VPN Routing/Forwarding instance name.
`all`	Select all VRFs.
`default`	Select default VRFs.
`unicast`	Unicast prefixes.
`multicast`	Multicast prefixes.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp table-map vrf all
```

debug bgp

Use this command to enable all BGP troubleshooting functions. Use this command without any parameters to turn on normal bgp debug information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug bgp (all|)
debug bgp bfd
debug bgp dampening
debug bgp events
debug bgp filters
debug bgp fsm
debug bgp keepalives
debug bgp mpls
debug bgp nht
debug bgp nsm
debug bgp updates
debug bgp updates (in|out)
debug bgp vpls
no debug bgp (all|)
no debug bgp bfd
no debug bgp events
no debug bgp dampening
no debug bgp filters
no debug bgp fsm
no debug bgp keepalives
no debug bgp mpls
no debug bgp nht
no debug bgp nsm
no debug bgp updates
no debug bgp vpls
undebug bgp (all|)
undebug bgp bfd
undebug bgp dampening
undebug bgp events
undebug bgp filters
undebug bgp fsm
undebug bgp keepalives
```

```
undebug bgp mpls
undebug bgp nht
undebug bgp nsm
undebug bgp updates
undebug bgp vpls
```

Parameters

`all`	Used only with the no form; turns off all debugging for BGP
`bfd`	Enable debugging for BGP Bidirectional Forwarding Detection
`dampening`	Enable debugging for BGP dampening
`events`	Enable debugging for BGP events
`filters`	Enable debugging for BGP filters
`fsm`	Enable debugging for BGP Finite State Machine (FSM)
`keepalives`	Enable debugging for BGP keepalives
`mpls`	Enable debugging for BGP Multiprotocol Label Switching (MPLS)
`nht`	Enable debugging for BGP NHT
`nsm`	Enable debugging for NSM messages
`updates`	Enable debugging for BGP updates
`in`	Debug inbound updates
`out`	Debug outbound updates
`vpls`	Enable debugging for BGP Virtual Private LAN Service (VPLS)

Command Mode

Privileged Exec mode and Configure Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug bgp
#debug bgp events
```

distance bgp

Use this command to define an administrative distance. A distance is a rating of trustworthiness of a router. The higher the distance the lower the trust rating. Administrative distances can be set for external, internal and local routes. External paths are routes learned from a neighbor outside of the AS. Internal routes are routes learned from another router within the same AS. Local routes are for a router that is redistributed from another process.

If the administrative distance is changed, it could create inconsistency in the routing table and obstruct routing. Use this command in Router mode to set the administrative distance for all address families. Use this command in Address Family mode to set the administrative distance per an IPv4 family.

Use the no parameter with this command to remove an administrative distance.

Command Syntax

```
distance bgp <1-255> <1-255> <1-255>
no distance bgp
no distance bgp <1-255> <1-255> <1-255>
```

Parameters

<1-255>	Distance for BGP external routes
<1-255>	Distance for BGP internal routes
<1-255>	Distance for BGP local routes

Command Mode

Router mode, Address Family IPv4 mode

Defaults

Default distance for external routes is 20.

Default distance for internal routes is 200.

Default distance for local routes is 200.

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to set the administrative distance for BGP for all address families.

```
#configure terminal
(config)#router bgp 100
(config-router)#distance bgp 34 23 15
```

exit-address-family

Use this command to exit address-family mode.

For information on how to enter address family mode, see address-family.

Command Syntax

```
exit-address-family
```

Parameters

None

Default

Not applicable

Command Mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 multicast
(config-router-af)#exit-address-family
(config-router)#
```

ip as-path access-list

Use this command to define a BGP Autonomous System (AS) path access list. A named community list is a filter based on regular expressions. If the regular expression matches the specified string representing the AS path of the route, then the permit or deny condition applies. Use this command to define the BGP access list globally; use the neighbor router configuration command to apply a specific access list.

Use the no parameter with this command to disable use of the access list.

Command Syntax

```
ip as-path access-list WORD (deny|permit) LINE
no ip as-path access-list WORD
no ip as-path access-list WORD (deny|permit) LINE
```

Parameters

`WORD`	Access list name
`deny`	Reject packets
`permit`	Forward packets
`LINE`	An ordered list as a regular expression

Default

Not applicable

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip as-path access-list mylist deny ^65535$
```

ip community-list <1-99>

Use this command to specify a standard community list (1 to 99) that specifies BGP community attributes.

Use the no parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list <1-99> (deny|permit)
ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list <1-99> (deny|permit)
no ip community-list <1-99> (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

`deny`	Reject the community
`permit`	Accept the community
`AA:NN`	Community number
`internet`	Advertise routes to the internet community
`local-AS`	Do not advertise routes to external BGP peers
`no-advertise`	Do not advertise routes to other BGP peers
`no-export`	Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 55 permit 7675:80 7675:90

(config)#no ip community-list 55 permit 7675:80 7675:90
```

ip community-list <100-500>

Use this command to specify an expanded community list (100 to 500) that specifies BGP community attributes.

Use the no parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list <100-500> (deny|permit)
ip community-list <100-500> (deny|permit) LINE
no ip community-list <100-500>
no ip community-list <100-500> (deny|permit) LINE
```

Parameters

deny	Reject community
permit	Accept community
LINE	An ordered list as a regular expression

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 225 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

ip community-list expanded

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long.

There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format and not with regular expressions. The expanded community-list defines the community attributes with regular expressions.Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list expanded WORD (deny|permit) LINE
no ip community-list expanded WORD
no ip community-list expanded WORD (deny|permit) LINE
```

Parameters

`WORD`	Community list name
`deny`	Reject community
`permit`	Accept community
`LINE`	An ordered list as a regular expression

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list 125 permit 6789906
(config)#ip community-list expanded CLIST permit .*
```

ip community-list standard

Use the community-lists to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. It includes community values that are 32-bits long. There are two kinds of community-lists: expanded and standard. The standard community-list defines the community attributes in a specified format without regular expressions. The expanded community-list defines the community attributes with regular expressions.

Use this command to add a standard community-list entry. The standard community-list is compiled into binary format and is directly compared with the BGP communities attribute in the BGP updates. The comparison is faster than the expanded community-list. Any community value that does not match the standard community value is automatically treated as expanded.

Use the `no` parameter with this command to delete the standard community-list entry.

Command Syntax

```
ip community-list standard WORD (deny|permit)
ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
no ip community-list standard WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-export]
```

Parameters

`WORD`	Community list name
`deny`	Reject the community
`permit`	Accept the community
`AA:NN`	Community number
`internet`	Advertise routes to the internet community
`local-AS`	Do not advertise routes to external BGP peers
`no-advertise`	Do not advertise routes to other BGP peers
`no-export`	Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list standard CLIST permit 7675:80 7675:90 no-export
(config)#ip community-list 34 permit 5675:50 no-advertise
```

ip community-list WORD

Use the community-list commands to specify BGP community attributes. The community attribute is used for implementing policy routing. It is an optional, transitive attribute and facilitates transfer of local policies through different autonomous systems. There are two kinds of community-lists: the expanded and standard. The `standard community-list` defines the community attributes in a specified format and not with regular expressions. The `expanded community-list` defines the community attributes with regular expressions.

Use the `no` parameter with this command to delete the community list entry.

Command Syntax

```
ip community-list WORD (deny|permit)
ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-
  export]
no ip community-list WORD
no ip community-list WORD (deny|permit) [AA:NN|internet|local-AS|no-advertise|no-
  export]
```

Parameters

`WORD`	Community list name
`deny`	Reject the community
`permit`	Accept the community
`AA:NN`	Community number
`internet`	Advertise routes to the internet community
`local-AS`	Do not advertise routes to external BGP peers
`no-advertise`	Do not advertise routes to other BGP peers
`no-export`	Do not advertise routes outside of Autonomous System boundary

Default

By default, ip community list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip community-list mylist permit 7675:80 7675:90

(config)#no ip community-list mylist permit 7675:80 7675:90
```

ip extcommunity-list <1-99>

Use this command to create an entry for a standard extended community list.

Use the no parameter with this command to delete the community-list entry.

Command Syntax

```
ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
no ip extcommunity-list <1-99> (deny|permit) LINE (rt|soo)
```

Parameters

deny	Reject community
permit	Accept community
LINE	One of the following:
rt	Route target extended community in aa:nn or IPaddr:nn format
soo	Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list 3 permit rt 10.10.23.123:67

(config)#ip extcommunity-list 25 deny soo 1465:22
```

ip extcommunity-list <100-500>

Use this command to create an extended community list.

Use the no parameter with this command to delete the community-list entry.

Command Syntax

```
ip extcommunity-list <100-500> (deny|permit) LINE
no ip extcommunity-list <100-500> (deny|permit) LINE
```

Parameters

`<100-500>`	Extended community list number (expanded)
`deny`	Reject the community
`permit`	Accept the community
`LINE`	Any regular expression:

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list 125 permit 4567:335

(config)#ip extcommunity-list 231 deny *.
```

ip extcommunity-list expanded

Use this command to create an expanded community list.

Use the no parameter with this command to delete the expanded community-list entry.

Command Syntax

```
ip extcommunity-list expanded WORD
ip extcommunity-list expanded WORD (deny|permit) LINE
no ip extcommunity-list expanded WORD
no ip extcommunity-list expanded WORD (deny|permit) LINE
```

Parameters

WORD	Expanded community list name
deny	Reject the community
permit	Accept the community
LINE	One of the following:
rt	Route target extended community in aa:nn or IPaddr:nn format
soo	Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list 125 permit 4567335
(config)#ip extcommunity-list expanded CLIST permit .*
```

ip extcommunity-list standard

Use this command to create and delete a standard extended-community list. The extended community attribute is 8 bytes in 2 formats. The sub-type can be route target (`rt`) or site of origin (`soo`). Thus, the sub-type of each community must be specified when creating the extended community list. Regarding the formats, an extended community is based on a 6-byte value. These 6-bytes are represented in 4-btye:2-byte format, and may be entered in one of the following forms:

- Format 1, aa.nn: The 16-bit value of the AS (aa) number is represented in the higher-order 4-bytes. If the extended ASN capability is enabled, the AS number is represented using higher-order 4-bytes. The nn assigned value is represented in the low-order 2-bytes in both cases.
- Format 2, IPaddr:nn: In this format, the higher-order 4-bytes are used to represent the IP address, and the low-order 2-bytes are used to represent the assigned value.

Use the `no` parameter with this command to delete the extended-community-list entry.

Command Syntax

```
ip extcommunity-list standard WORD (deny|permit) (rt|soo) (aa:nn)
no ip extcommunity-list standard WORD (deny|permit) (rt|soo) (aa:nn)
```

Parameters

`WORD`	Extended community list name
`deny`	Reject the community
`permit`	Accept the community
`rt`	Route target extended community in aa:nn or IPaddr:nn format
`soo`	Site-of-origin extended community in aa:nn or IPaddr:nn format

Default

By default, ip extcommunity list is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip extcommunity-list standard 36 permit rt 5675:50
(config)#ip extcommunity-list standard CLIST permit soo 10.10.32.15:70
```

match ip peer

Use this command to apply policies based on the route source of which the BGP TCP/IP session formed using an IPv4 address in the update message.

Use the no parameter with this command to disable this function.

Command Syntax

```
match ip peer (<1-199>|<1300-2699>|WORD)
no match ip peer (<1-199>|<1300-2699>|WORD)
```

Parameters

<1-199>	IP access-list number
<1300-2699>	IP access-list number (expanded range)
WORD	Access-list name

Default

By default, import bgp route is disabled

Command Mode

Route-map mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#route-map in-A permit 10
(route-map)#match ip peer 1
```

max-paths

Use this command to set the number of equal-cost multi-path (ECMP) routes for eBGP or iBGP. You can install multiple BGP paths to the same destination to balance the load on the forwarding path.

Use the no parameter with this command to disable this feature.

Command Syntax

```
max-paths (ebgp|ibgp|) <2-64>
no max-paths ebgp (<2-64>|)
no max-paths ibgp (<2-64>|)
```

Parameters

ebgp	eBGP ECMP session
ibgp	iBGP ECMP session
<2-64>	Number of routes

Default

Available for the default BGP instance and for IPv4 and IPv6 unicast addresses

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures 7 routes for ECMP for iBGP.

```
#configure terminal
(config)#router bgp 11
(config-router)#max-paths ibgp 7
```

neighbor activate

Use this command to enable the exchange of specific address family routes with a neighboring router. After a TCP connection is opened with a neighboring router, use this command to enable or disable the exchange of address family information. To enable the exchange of multicast and VPNv4 address prefix types, activate neighbors using this command in address family mode.

Use the no parameter with this command to disable exchange of information with a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) activate
no neighbor (A.B.C.D|X:X::X:X|WORD) activate
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

A neighbor under address-family IPv4 is activated by default. For all other address-families, use this command to enable a neighbor to exchange routing information of a specific address-family with a neighbor.

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 1.2.3.4 activate

(config)#router bgp 100
(config-router)#neighbor 10.10.20.1 remote-as 100
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 10.10.20.1 activate
```

neighbor additional-paths

Use this command to enable neighbour BGP add-path.

Use the no parameter with this command to disable neighbour BGP add-path.

Command Syntax

```
neighbor A.B.C.D additional-paths (send|receive|send-receive|disable)
no neighbor A.B.C.D additional-paths (send|receive|send-receive|disable)
```

Parameters

`send`	Send additional paths to neighbors
`receive`	Receive additional paths from neighbors
`send-receive`	Send and Receive additional paths from neighbors
`disable`	Disable additional paths

Default

By default additional-path is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#neighbor 1.1.1.2 additional-paths send

(config-router)#no neighbor 1.1.1.2 additional-paths send
```

neighbor advertise additional-paths

Use this command to enable BGP add-path at neighbor level.

Use the no parameter with this command to disable BGP add-path at neighbor level.

Command Syntax

```
neighbor A.B.C.D advertise additional-paths (all|best <2-3>)
no neighbor A.B.C.D advertise additional-paths (all|best <2-3>)
```

Parameters

all	Select all available paths
best	Select best N paths
<2-3>	Number of best paths in additional paths to be selected

Default

By default, neighbor advertise additional path is disabled

Command Mode

Router BGP Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 2
(config-router)#address-family ipv4 unicast
(config-router)#neighbor  1.1.1.2 advertise additional-paths all

(config-router)#no neighbor  1.1.1.2 advertise additional-paths all
```

neighbor advertisement-interval

Use this command to set a minimum interval between the sending of BGP routing updates. To reduce the flapping of routes, set a minimum advertisement interval so that the BGP routing updates are sent only per interval seconds. BGP dampening can also be used to control the effects of flapping routes.

Use the no parameter with this command to set the interval time to default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) advertisement-interval <0-65535>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<0-65535>	Advertisement interval value in seconds

Default

By default, neighbor value for ebgp peer is 30 seconds and IBGP peer is 5 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.3 advertisement-interval 45
```

neighbor allowas-in

Use this command to advertise prefixes (routes) even when the source of the prefixes is from the same Autonomous System (AS) number.

Use this command in a scenario where two routers at different locations use the same Autonomous System number and are connected via an ISP. Once prefixes arrive from one branch at the ISP, they are tagged with the customer's AS number. By default, when the ISP passes the prefixes to the other router, the prefixes are dropped if the other router uses the same AS number. Use this command to advertise the prefixes at the other side. Control the number of times an AS number is advertised by specifying a number.

In a hub and spoke configuration in a VPN, a PE (Provider Edge) router advertises all prefixes containing duplicate AS numbers. Use this command to configure two VRFs on each PE router to receive and advertise prefixes. One of the VRFs receives prefixes with AS numbers from all PE routers and then advertises them to neighboring PE routers. The other VRF receives prefixes with AS numbers from the CE (Customer Edge) router and advertises them to all PE routers in the hub and spoke configuration.

Use the `no` parameter with this command to reset to default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in
neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in <1-10>
no neighbor (A.B.C.D|X:X::X:X|WORD) allowas-in
```

Parameters

`A.B.C.D`	IPv4 neighbor address.
`X:X::X:X`	IPv6 neighbor address.
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`<1-10>`	Number of times to allow the advertisement of an AS number.

Default

By default, when the ISP passes the prefixes to the other router, the prefixes are dropped if the other router uses the same AS number. The default number of local AS is 3.

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.3 allowas-in 4

#configure terminal
(config)#router bgp 7657
```

```
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 allowas-in 3

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 allowas-in 3
```

neighbor as-origination-interval

Use this command to set the minimum interval between sending of AS-origination routing updates.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval
no neighbor (A.B.C.D|X:X::X:X|WORD) as-origination-interval <1-65535>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-65535>	AS origination interval in seconds

Default

By default, neighbor as origination interval is 15 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.75 as-origination-interval 555
```

neighbor attribute-unchanged

Use this command to advertise unchanged BGP attributes to the specified neighbor.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged ({ as-path|next-hop|med }|)
no neighbor (A.B.C.D|X:X::X:X|WORD) attribute-unchanged (({ as-path|next-hop|
  med }|)
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`as-path`	AS path attribute
`next-hop`	Nexthop attribute
`med`	Multi-exit discriminator attribute

Default

By default, the neighbor attribute-unchanged is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.75 attribute-unchanged as-path med
```

neighbor capability dynamic

Use this command to enable the dynamic capability for a specific peer. This command allows a BGP speaker to advertise or withdraw an address family capability to a peer in a non-disruptive manner.

Use the no parameter with this command to disable the dynamic capability.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability dynamic
no neighbor (A.B.C.D|X:X::X:X|WORD) capability dynamic
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor capability dynamic is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.1 capability dynamic
```

neighbor capability orf prefix-list

Use this command to enable Outbound Router Filtering (ORF) and advertise the ORF capability to its neighbors. The ORFs send and receive capabilities to lessen the number of updates exchanged between neighbors. By filtering updates, this option minimizes generating and processing of updates.

The two routers exchange updates to maintain the ORF for each router:

- The local router advertises the ORF capability in `send` mode.
- The remote router receives the ORF capability in `receive` mode, applying the filter as outbound policy.

Only an individual router or a peer group can be configured to be in `receive` or `send` mode. A peer-group member cannot be configured to be in `receive` or `send` mode.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
no neighbor (A.B.C.D|X:X::X:X|WORD) capability orf prefix-list (both|receive|send)
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`both`	The local router can send ORF entries to its peer, as well as receive ORF entries from its peer.
`receive`	The local router is willing to receive ORF entries from its peer
`send`	The local router is willing to send ORF entries to its peer

Default

By default, the orf prefix-list is disabled

Command Mode

Router mode and Address Family (IPv4 unicast, IPv4 multicast, IPv6) mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.5 capability orf prefix-list both
(config-router)#neighbor effe:2897::0003:3ed5 capability orf prefix-list
receive
```

neighbor capability route-refresh

'Route Refresh Capability', which would allow the dynamic exchange of route refresh request between BGP speakers and subsequent re-advertisement of the respective Adj-RIB-Out.

Default

By default, neighbor capability route refresh is enabled and it can not be disabled.

neighbor collide-established

Use this command to include a neighbor already in an established state for conflict resolution when a TCP connection collision is detected. This command is not required for most network deployments, so users should only use this command when required.

Note: The associated functionality of including an “established” neighbor into TCP connection collision conflict resolution is automatically enabled when a neighbor is configured for BGP graceful-restart.

Use the no option with this command to turn this feature off.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
no neighbor (A.B.C.D|X:X::X:X|WORD) collide-established
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor collide is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 collide-established
```

neighbor connection-retry-time

Use this command to set the connection retry time for a specific BGP neighbor.

Use the no parameter with this command to clear the connection retry time for a specific BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) connection-retry-time <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) connection-retry-time
no neighbor (A.B.C.D|X:X::X:X|WORD) connection-retry-time <1-65535>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-65535>	Connection retry time in seconds

Default

By default, connection retry time is 120 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 connection-retry-time 125
```

neighbor default-originate

Use this command to allow a BGP local router to send the default route 0.0.0.0 to a neighbor to use as a default route. This command can be used with standard or extended access lists.

Use the no parameter with this command to send no route as a default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate
no neighbor (A.B.C.D|X:X::X:X|WORD) default-originate route-map WORD
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
WORD	Route map name

Default

By default, neighbor default originate is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.1 default-originate route-map myroute
```

neighbor description

Use this command to associate a description with a neighbor. This command helps to identify a neighbor quickly. This command is useful for an ISP that has multiple neighbor relationships.

Use the no parameter with this command to remove the description.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
no neighbor (A.B.C.D|X:X::X:X|WORD) description
no neighbor (A.B.C.D|X:X::X:X|WORD) description LINE
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
LINE	Neighbor description (up to 80 characters)

Default

By default, the neighbor description is disabled

Command Mode

Router mode and Address Family

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 1.2.3.4 description Backup router for sales

(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 description Bank of America

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 description Bank of America
```

neighbor disallow-infinite-holdtime

Use this command to disallow configuration of infinite hold-time. This command enables the local BGP speaker to reject a hold-time of “0” seconds from a peer (during exchange of open messages) or a user (during configuration).

The no form of this command allows the BGP speaker to accept a hold-time of “0” from a peer or during configuration.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
no neighbor (A.B.C.D|X:X::X:X|WORD) disallow-infinite-holdtime
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor disallow infinite holdtime is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config-router)#neighbor 10.11.4.26 disallow-infinite-holdtime
(config-router)#neighbor 3ffe::45 disallow-infinite-holdtime
```

neighbor distribute-list

Use this command to filter route updates from a particular BGP neighbor. Use only one distribute list per BGP neighbor.

Use the no parameter with this command to remove an entry.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD)
  (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) distribute-list (<1-199>|<1300-2699>|WORD)
  (in|out)
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-199>	IP access-list number
<1300-2699>	IP access-list number (expanded-range)
WORD	Access-list name
in	Filter incoming advertised routes
out	Filter outgoing advertised routes

Default

By default, neighbor distribute list is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 1.2.3.4 distribute-list mylist out
```

neighbor dont-capability-negotiate

Use this command to disable capability negotiation. This command is used to allow compatibility with older BGP versions that have no capability parameters used in open messages between peers.

Use the no parameter with this command to enable capability negotiation.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) dont-capability-negotiate
no neighbor (A.B.C.D|X:X::X:X|WORD) dont-capability-negotiate
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, capability negotiation is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 dont-capability-negotiate
```

neighbor ebgp-multihop

Use this command to accept and try BGP connections to external peers on indirectly connected networks. Multihop is not established if the only route to the multihop peer is a default route. This avoids loop formation.

Use the no parameter with this command to return to the default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) ebgp-multihop <1-255>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-255>	Maximum hop count

Default

By default, maximum hop count is 255

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.34 remote-as 20
(config-router)#neighbor 10.10.10.34 ebgp-multihop 5
```

neighbor enforce-multihop

Use this command to enforce BGP neighbors to perform multihop.

Use the no parameter with this command to turn off this feature.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
no neighbor (A.B.C.D|X:X::X:X|WORD) enforce-multihop
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, the maximum hop count is 255

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#neighbor 10.10.0.34 enforce-multihop
```

neighbor fall-over bfd

Use this command to create BFD session with BGP neighbor.

Use the no parameter with this command to delete BFD session with BGP neighbor.

Note: To have multihop BFD session with BGP neighbor, use 'multihop' option.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
no neighbor (A.B.C.D|X:X::X:X|WORD) fall-over bfd (multihop|)
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, BFD session is not created with BGP neighbor.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
OcNOS(config)#router bgp 100
OcNOS(config-router)#neighbor 1.1.1.1 remote-as 100
OcNOS(config-router)#neighbor 2.2.2.2 remote-as 200
OcNOS(config-router)#neighbor 1.1.1.1 fall-over bfd multihop
OcNOS(config-router)#neighbor 2.2.2.2 fall-over bfd
OcNOS(config-router)#
```

neighbor filter-list

Use this command to set up a BGP filter. This command specifies an access list filter on updates based on the BGP autonomous system paths. Each filter is an access list based on regular expressions.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) filter-list WORD (in|out)
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
WORD	Name of an autonomous system path access list
in	Filter incoming advertised routes
out	Filter outgoing advertised route

Default

By default, filter list is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.34 remote-as 20
(config-router)#neighbor 10.10.0.34 filter-list out in
```

neighbor limit

Use this command to specify the maximum number of peers that can be configured in the BGP dynamic peer-group.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor WORD limit <1-200>
no neighbor WORD (limit <1-200>|)
```

Parameters

WORD	Name of a BGP peer group created with the neighbor WORD peer-group command.
<1-200>	The maximum number of peers that can be configured in a BGP dynamic peer-group.

Default

By default, neighbor word limit is disabled

Command Mode

Router mode and Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor group1 limit 120
```

neighbor local-as

Use this command to specify an AS (autonomous system) number to use with BGP neighbor.

Use the no parameter with this command to disable this command.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295>
no neighbor (A.B.C.D|X:X::X:X|WORD) local-as <1-4294967295>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-4294967295>	Neighbor's AS number when extended capabilities are configured

Note: The AS number 23456 is a reserved 2-byte AS number. An old BGP speaker (2-byte implementation) should be configured with 23456 as its remote AS number while peering with a non-mappable new BGP speaker (4-byte implementation).

Default

By default, local as is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor 10.10.0.34 local-as 12345
```

neighbor maximum-prefix

Use this command to set the number of prefixes that can be received from a neighbor.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295>
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> stop-update
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> warning-only
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100>
neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> <1-100> warning-only
no neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix
no neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295>
no neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> stop-update
no neighbor (A.B.C.D|X:X::X:X|WORD) maximum-prefix <1-4294967295> warning-only
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-4294967295>	Maximum number of prefixes accepted from this peer
stop-update	Stop installing routes when the maximum number of prefixes is exceeded.
warning-only	Only give a warning message when the maximum number of prefixes is exceeded. When this parameter is not specified and extra prefixes are received, the router ends the peering. A terminated peer remains down until the clear ip bgp A.B.C.D command is given.
<1-100>	Threshold value percent <1-100>

Default

By default, neighbor maximum prefix is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 maximum-prefix 1244 warning-only
```

neighbor next-hop-self

Use this command to make the router the next hop for a BGP-speaking neighbor or peer group. This command allows a BGP router to change the nexthop information that is sent to the iBGP peer. Peers are reset and the new nexthop information is set to the IP address of the interface used to communicate with the neighbor.

Use the no parameter with this command to disable this feature.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
no neighbor (A.B.C.D|X:X::X:X|WORD) next-hop-self
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, next hop self is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 remote-as 100
(config-router)#neighbor 10.10.0.72 next-hop-self
```

neighbor optional-as

Use this command to specify an AS (autonomous system) number to use with BGP dynamic peer-group.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor WORD optional-as <1-4294967295>
no neighbor WORD optional-as <1-4294967295>
```

Parameters

WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-4294967295>	The range from which the optional AS number must be configured.

Default

By default, neighbor optional as is disabled

Command Mode

Router mode and Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor group1 optional-as 400
```

neighbor override-capability

Use this command to ignore received capabilities and use locally configured values.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
no neighbor (A.B.C.D|X:X::X:X|WORD) override-capability
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, override-capability is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 override-capability
```

neighbor passive

Use this command to make a BGP neighbor passive.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) passive
no neighbor (A.B.C.D|X:X::X:X|WORD) passive
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor passive is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 passive
```

neighbor authentication-key

Use this command to enable message digest5 (MD5) authentication on a TCP connection between two BGP peers. Configuring MD5 authentication between two BGP peers, means that each segment sent on the TCP connection between the peers is verified. MD5 authentication must be configured with the same password on both BGP peers; otherwise, the connection between them will not be established.

Use the no parameter with this command to delete the MD5 authentication.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key 0 <WORD>
no neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key 0 <WORD>
<WORD> plain text password

neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
no neighbor (A.B.C.D|X:X::X:X|WORD) authentication-key <WORD>
<WORD> encrypted password
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of the BGP peer group
WORD	Password (Maximum length is 80 characters)

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73 authentication-key 0 myPass

(config-router)#no neighbor 10.10.0.73 authentication-key 0 myPass
```

neighbor peer-group

Use this command to add a neighbor to an existing peer group. Neighbors with the same update policies are grouped into peer groups. This facilitates the updates of various policies, such as distribute and filter lists. The peer group is then configured easily with any of the neighbor commands. Any changes made to the peer group affect all members.

To create a peer group, use the `neighbor WORD peer-group` command, and then use this command to add neighbors to the group.

Use the no parameter with this command to remove a neighbor from a named peer group.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X) peer-group WORD
no neighbor (A.B.C.D|X:X::X:X) peer-group WORD
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Peer group name

Default

Not applicable

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group
```

neighbor port

Use this command to set the BGP port number of a neighbor.

Use the no parameter with this command to remove a port number from a BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) port
no neighbor (A.B.C.D|X:X::X:X|WORD) port <0-65535>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<0-65535>	Port number

Default

By default, neighbor port is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 port 643
```

neighbor prefix-list

Use this command to specify a prefix list for filtering BGP advertisements.

Filtering by prefix list matches the prefixes of routes with those listed in the prefix list. If there is a match, the route is used. An empty prefix list permits all prefixes. If a given prefix does not match any entries of a prefix list, the route is denied access. When multiple entries of a prefix list match a prefix, the entry with the smallest sequence number is considered to be a real match.

The router begins the search at the top of the prefix list, with the sequence number 1. Once a match or deny occurs, the router does not need to go through the rest of the prefix list. For efficiency the most common matches or denies are listed at the top. The neighbor distribute-list command is an alternative to this command and only one of them can be used to filter the same neighbor in any direction.

Use the no parameter with this command to remove an entry.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) prefix-list WORD (in|out)
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
WORD	Name of an access list
in	Apply access list to incoming advertisements
out	Apply access list to outgoing advertisements

Default

By default, neighbor prefix list is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip prefix-list list1 deny 30.0.0.0/24
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 prefix-list list1 in
```

neighbor remote-as

Use this command to establish a BGP peering relationship with a customer edge router.

The specified neighbor only exchanges unicast address prefixes, unless the neighbor is also activated using the neighbor activate command, which allows the exchange of other routing information.

Use the no parameter with this command to delete this peering.

Note: BGP IPv6 VRF neighbor creation or activation is allowed in IPv6 VRF address-family and not allowed in IPv4 VRF address-family.

Note: BGP IPv4 VRF neighbor creation or activation is allowed in IPv4 VRF address-family and not allowed in IPv6 VRF address-family.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remote-as <1-4294967295>
no neighbor (A.B.C.D|X:X::X:X|WORD) remote-as <1-4294967295>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-4294967295>	Neighbor's autonomous system number (ASN) when extended capabilities are configured. If the specified ASN matches the ASN number specified in the router BGP global configuration, the neighbor is identified as internal. If the ASN does no match, the neighbor is identified as external to the local AS.

Default

By default, neighbor remote is disabled

Command Mode

Router mode and Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 11
(config-router)#neighbor 10.10.0.73 remote-as 345
(config-router)#neighbor 11.11.0.74 remote-as 23456
```

Note: The last command in the example above should be used when the local speaker is OBGP and the neighbor is NBGP with a 4-octet ASN.

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 remote-as 65000
```

```
(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 remote-as 65000
```

neighbor remove-private-AS

Use this command to remove the private autonomous system number (ASN) from outbound updates. Private ASNs are not advertised to the Internet. This command is used with external BGP peers only. The router removes the ASNs only if the update includes private ASNs. If the update includes both private and public ASNs, the system treats it as an error.

Use the no parameter with this command to revert to default.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
no neighbor (A.B.C.D|X:X::X:X|WORD) remove-private-AS
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor remove private AS is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.63 remove-private-AS
```

neighbor route-map

Use this command to apply a route map to incoming or outgoing routes. This command filters updates and modifies attributes. A route map is applied to inbound or outbound updates. Only the routes that pass the route map are sent or accepted in updates.

Use the no parameter with this command to a route map.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
no neighbor (A.B.C.D|X:X::X:X|WORD) route-map WORD (in|out)
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
WORD	Name of the route map
in	Apply access list to incoming advertisements
out	Apply access list to outgoing advertisements

Default

Not applicable

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the configuration of the route map named rmap2 and then the use of this map name in the neighbor route-map command.

```
#configure terminal
(config)#route-map rmap2 permit 6
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 route-map rmap2 in
```

neighbor route-reflector-client

Use this command to make the router a BGP route reflector and set a specified neighbor as its client.

Using route reflectors reduces the number of iBGP peers within an AS. An AS can have more than one route reflector. A route reflector treats other route reflectors as other iBGP speakers.

Use the no parameter with this command to indicate that the neighbor is not a client.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-reflector-client
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

Not applicable

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following configuration, Router1 is the route reflector for clients 3.3.3.3 and 2.2.2.2; it also has a non-client peer 6.6.6.6.

```
#configure terminal
(config)#router bgp 200
(config-router)#neighbor 3.3.3.3 remote-as 200
(config-router)#neighbor 3.3.3.3 route-reflector-client
(config-router)#neighbor 2.2.2.2 remote-as 200
(config-router)#neighbor 2.2.2.2 route-reflector-client
(config-router)#neighbor 6.6.6.6 remote-as 200
```

neighbor route-server-client

Use this command to make a neighbor a route server client.

Use the no parameter with this command to remove the configuration of a neighbor as route server client.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
no neighbor (A.B.C.D|X:X::X:X|WORD) route-server-client
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

Not applicable

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 route-server-client

#configure terminal
(config)#router bgp 10
(config-router)#no neighbor 10.10.0.72 route-server-client
```

neighbor send-community

Use this command to send that a community attribute to a BGP neighbor.

The community attribute groups destinations in a certain community and applies routing decisions according to those communities. On receiving community attributes, the router reannounces them to the neighbor.

By default, both `standard` and `extended` community attributes are sent to a neighbor. To explicitly send only the `standard` or `extended` community attribute, run the bgp config-type command with the `standard` parameter before running this command.

Use the no parameter with this command to not announce community attributes to the neighbor. Use the `extended` and no parameters to remove extended communities. Specifying no other parameter with no removes standard communities only.

See also neighbor send-community in Chapter 4, *BGP Virtual Private Network Commands*.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`both`	Send Standard and Extended Community attributes
`extended`	Send Extended Community attributes
`standard`	Send Standard Community attributes

Default

Both `standard` and `extended` community attributes are sent to a neighbor.

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bgp config-type standard
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 send-community extended
```

neighbor send-label explicit-null

Use this command to exchange explicit –null label for the specific AF routes advertised between the neighbors. The AFI, SAFI combination of [1, 4] is the associated capability parameter (labelled-unicast) and is enabled by this command. This command is viable only on the ipv4 unicast and ipv4 vrf address families. This command has to be configured on both the neighbors for the capability to be negotiated.

Use the no parameter with this command to disable exchange of labels and remove the associated capability parameter.

Command Syntax

```
neighbor (WORD|x.x.x.x) send-label explicit-null
no neighbor (WORD|x.x.x.x) send-label explicit-null
```

Parameters

x.x.x.x	Address of the BGP neighbor in IPv4 format
WORD	Specify the neighbor router.

Default

By default, only the IPV4 unicast capability is enabled. Only configuration of this command on both neighbors will enable the Labelled Unicast capability.

Command mode

Address family and router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
# configure terminal
(config)# router bgp 100
(config-router)#neighbor 192.168.0.1 send-label explicit-null

# configure terminal
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF-1
    (config-router-af)#neighbor 192.168.0.3 send-label explicit-null
```

neighbor shutdown

Use this command to terminate active sessions for a specified neighbor and clear all related routing information.

If a peer group is specified, a large number of peering sessions might be terminated. The `show ip bgp summary` command displays a summary of BGP neighbors and their connections.

Use the no parameter with this command to re-enable a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) shutdown
no neighbor (A.B.C.D|X:X::X:X|WORD) shutdown
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor shutdown is enabled

Command Mode

Router mode and Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 shutdown

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 shutdown
```

neighbor soft-reconfiguration inbound

Use this command to store updates for inbound soft reconfiguration.

Soft-reconfiguration can be used instead of BGP route refresh capability. Using this command enables local storage of all the received routes and their attributes. This requires additional memory. When a soft reset (inbound) is done on this neighbor, the locally stored routes are re-processed according to the inbound policy. The BGP neighbor connection is not affected.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) soft-reconfiguration inbound
no neighbor (A.B.C.D|X:X::X:X|WORD) soft-reconfiguration inbound
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, the neighbor soft reconfiguration inbound is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 soft-reconfiguration inbound
```

neighbor strict-capability-match

Use this command to close the BGP connection if a capability value does not match the remote peer.

Use the no parameter with this command to disable this function.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match
no neighbor (A.B.C.D|X:X::X:X|WORD) strict-capability-match
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, strict capability match is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 strict-capability-match
```

neighbor timers

Use this command to set the timers for a specific BGP neighbor.

Use the no parameter with this command to clear the timers for a BGP neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) timers <0-65535> <0-65535>
neighbor (A.B.C.D|X:X::X:X|WORD) timers connect <1-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) timers
no neighbor (A.B.C.D|X:X::X:X|WORD) timers connect
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<0-65535>	Keepalive interval. Keepalive messages are sent by a router to inform another router that the BGP connection between the two is still active. The keepalive interval is the period of time between each keepalive message sent by the router.
<0-65535>	Holdtime interval which is the time the router waits to receive a keepalive message. If the router does not receive a message in this period, the router declares the neighbor dead. The holdtime value should be at least 3 times the keepalive time.
connect	BGP connect timer
<1-65535>	Connect timer

Defaults

By default, keepalive timer value is 30 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 timers 60 230
(config-router)#neighbor 10.10.10.10 timers connect 10

(config-router)#no neighbor 10.10.10.10 timers
```

neighbor transparent-as

Use this command to not to append the AS path number even when the peer is an eBGP peer.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) transparent-as
```

Parameters

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, transparent as is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.7.1 transparent-as
```

neighbor transparent-nexthop

Use this command to keep the nexthop value of the route even when the peer is an eBGP peer.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) transparent-nexthop
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 transparent-nexthop
```

neighbor unsuppress-map

Use this command to selectively leak more-specific routes to a particular neighbor.

When the aggregate-address command is used with the `summary-only` option, the more-specific routes of the aggregate are suppressed to all neighbors. Use the `neighbor unsuppress-map` command to selectively leak more-specific routes to a particular neighbor.

Use the no parameter with this command to restore the setting to the default level.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) unsuppress-map WORD
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`WORD`	Name of the route map used to select routes to unsuppress

Default

By default, neighbor unsuppress map is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.73 unsuppress-map mymap

#configure terminal
(config)#router bgp 10
(config-router)#address-family ipv4 unicast
(config-router-af)#neighbor 10.10.0.70 unsuppress-map mymap
```

neighbor update-source

Use this command to allow internal BGP sessions to use any operating interface for TCP connections.

A loopback interface is most commonly used with this command. The use of loopback interface eliminates a dependency and BGP does not have to rely on the availability of a particular interface for making TCP connections.

Use the no parameter with this command to restore the interface assignment to the closest interface.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) update-source WORD
no neighbor (A.B.C.D|X:X::X:X|WORD) update-source
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
WORD	Interface name

Default

By default, neighbor update source is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.0.72 update-source myif
```

neighbor version

Use this command to accept only a particular BGP version.

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2. Using this command disables the router's version-negotiation capability and forces the router to use only a specified version with the neighbor.

Use the no parameter with this command to use the default version level of a neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) version 4
no neighbor (A.B.C.D|X:X::X:X|WORD) version
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
4	BGP version number

Default

By default, the system uses BGP version 4 and on request dynamically negotiates down to version 2

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 version 4

(config)#router bgp 12
(config-router)#no neighbor 10.10.10.10 version
```

neighbor weight

Use this command to specify a weight value, per address-family, for all routes learned from a neighbor.

The route with the highest weight gets preference when the same prefix is learned from more than one peer. Unlike the local-preference attribute, the weight attribute is relevant only to the local router. The weights assigned using the `set weight` command override the weights assigned using this command.

Use this command in router mode to specify a weight value for all address families. Use this command in address family mode to specify a weight value per IPv4/IPv6/VPNv4/6PE address family,

When the weight is set for a peer group, all members of the peer group get the same weight. This command can also be used to assign a different weight to an individual peer-group member. When an individually-configured weight of a peer-group member is removed, its weight is reset to its peer group's weight.

Use the `no` parameter with this command to remove a weight assignment.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) weight
no neighbor (A.B.C.D|X:X::X:X|WORD) weight <0-65535>
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`<0-65535>`	Weight value

Default

By default, neighbor weight value is 0

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#neighbor 10.10.10.10 weight 60

(config-router)#no neighbor 10.10.10.10 weight 60
```

neighbor WORD peer-group

Use this command to create a peer group.

Use the no parameter with this command to remove a peer group.

Command Syntax

```
neighbor WORD peer-group
no neighbor WORD peer-group
```

Parameters

WORD	Name of BGP peer group

Default

Not applicable

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to create a peer group named group1.

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor group1 peer-group
```

network

Use this command to specify the networks to be advertised by the BGP routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Use the `backdoor` parameter to specify a backdoor route to a BGP border router that will provide better information about the network. For data to be advertised by BGP, its routing table must include a route to the specified network. This command specifies the networks to be advertised. The network command works if the network being advertised is known to the router.

The `backdoor` parameter enables a route to be the preferred route even if it has a greater distance. A network that is specified as a backdoor network is dynamically assigned an administrative distance of 200 ensuring that IGP learned routes are preferred. If a backdoor network is not sourced by the local router, the network is learned from the external routers. If the route is learned from eBGP for a backdoor network, the distance is set to 20 or 200.

Use the `no` form of this command to remove a network route entry.

Command Syntax

```
network A.B.C.D (backdoor|)
network A.B.C.D/M (backdoor|)
network A.B.C.D mask A.B.C.D (backdoor|)
network A.B.C.D mask A.B.C.D route-map WORD (backdoor|)
network A.B.C.D route-map WORD (backdoor|)
network A.B.C.D/M route-map WORD (backdoor|)
no network A.B.C.D (backdoor|)
no network A.B.C.D/M (backdoor|)
no network A.B.C.D mask A.B.C.D (backdoor|)
no network A.B.C.D mask A.B.C.D route-map WORD (backdoor|)
no network A.B.C.D route-map WORD (backdoor|)
no network A.B.C.D/M route-map WORD (backdoor|)
```

Parameters

`A.B.C.D`	IP prefix <network>, for example, 35.0.0.0
`A.B.C.D/M`	IP prefix <network>/<length>, for example., 35.0.0.0/8
`backdoor`	BGP backdoor route
`routemap`	Route map used to modify the attributes
`WORD`	Name of the route map
`mask`	Network mask, for example, 255.255.0.0
`A.B.C.D`	Network mask, e.g., 255.255.0.0

Default

Not applicable

Command Mode

Router mode and Address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example illustrates a Class-A address configured as a network route. The natural Class-A network prefix mask length of 8 is internally derived, that is, 2.0.0.0/8.

```
(config)#router bgp 1
(config-router)#network 2.0.0.0
```

network synchronization

Use this command to enable IGP synchronization for BGP static network routes.

Use this no parameter with this command to disable synchronization of BGP static routes.

Command Syntax

```
network synchronization
no network synchronization
```

Parameters

None

Default

By default, network synchronization is disabled

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables IGP synchronization of BGP static network routes in the router configuration mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#network synchronization
```

The following example enables IGP synchronization of BGP static network routes in the IPv6 unicast address-family mode.

```
#configure terminal
(config)#router bgp 11
(config)#address-family ipv6 unicast
(config-af)#network synchronization
```

redistribute

Use this command to inject routes from one routing process into another. Redistribution is used by routing protocols to advertise routes that are learned by some other means, such as by another routing protocol or by static routes. Since all internal routes are dumped into BGP, careful filtering is applied to make sure that only routes to be advertised reach the internet, not everything. This command allows redistribution by injecting prefixes from one routing protocol into another routing protocol.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
redistribute [connected|isis|kernel|ospf|rip|static]
redistribute [connected|isis|kernel|ospf|rip|static] route-map WORD
no redistribute [connected|isis|kernel|ospf|rip|static]
no redistribute [connected|isis|kernel|ospf|rip|static] route-map
no redistribute [connected|isis|kernel|ospf|rip|static] route-map WORD
```

Parameters

`connected`	Redistribute connected routes
`isis`	Redistribute connected ISO IS-IS routes
`kernel`	Redistribute connected kernel routes
`ospf`	Redistribute OSPFv2 routes
`rip`	Redistribute RIP routes
`static`	Redistribute static routes
`route-map`	Route map reference
`WORD`	Route map entries

Default

By default, redistribute is disabled

Command Mode

Router mode and Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the configuration of the route-map name `rmap1` and then the use of this map name in the `redistribute route-map` command.

```
#configure terminal
(config)#route-map rmap1 permit 1
(config-route-map)#match origin incomplete
(config-route-map)#set metric 100
(config-route-map)#exit
(config)#router bgp 12
```

```
(config-router)#redistribute ospf route-map rmap1

(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#redistribute static

(config)#router bgp 100
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#redistribute static
```

router bgp

Use this command to start a BGP process.

Use the no form of this command to disable an existing routing process.

Command Syntax

```
router bgp <1-4294967295>
no router bgp <1-4294967295>
```

Parameters

`<1-4294967295>`

Associate the routing process with this autonomous system number

Default

Not applicable

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 12
(config-router)#
```

snmp restart bgp

Use this command to restart SNMP in Border Gateway Protocol (BGP)

Command Syntax

```
snmp restart bgp
```

Parameters

None

Default

Not applicable

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart bgp
```

synchronization

Use this command to enable IGP synchronization of Internal BGP (iBGP) learned routes with the Internal Gateway Protocol (IGP) system in the router configuration mode or in the address-family configuration mode.

Synchronization is used when a BGP router should not advertise routes learned from iBGP neighbors, unless those routes are also present in an IGP (for example, OSPF). Synchronization may be enabled when all the routers in an autonomous system do not speak BGP, and the autonomous system is a transit for other autonomous systems.

The `no synchronization` command is used when BGP router can advertise routes learned from its iBGP neighbors without waiting for the IGP reachability to be present.

Command Syntax

```
synchronization
no synchronization
```

Parameters

None

Default

Not applicable

Command Mode

Router mode and Address Family modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables IGP synchronization of iBGP routes in Router mode.

```
#configure terminal
(config)#router bgp 11
(config-router)#synchronization
```

The following example enables IGP synchronization of iBGP routes in the IPv6-Unicast address family.

```
#configure terminal
(config)#router bgp 11
(config-router)#address-family ipv6 unicast
(config-af)#synchronization
```

timers bgp

Use this command to globally set or reset the keepalive and holdtime values for all the neighbors.

Use the no parameter with this command to reset timers to default value.

Command Syntax

```
timers bgp <0-65535> <0-65535>
no timers bgp
no timers bgp <0-65535> <0-65535>
```

Parameters

<0-65535>	Frequency with which keepalive messages are sent to the neighbors
<0-65535>	Interval after which a neighbor is considered dead if keepalive messages are not received

Default

By default, keepalive timer value is 30 seconds

By default, holdtime value is 90 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#timers bgp 40 120
```

CHAPTER 2 BGP Graceful Restart Commands

This chapter describes the BGP graceful restart commands.

bgp graceful-restart

Use this command to enable BGP graceful-restart capabilities. The restart-time parameter is used for setting the maximum time that a graceful-restart neighbor waits to come back up after a restart. This value is applied to all neighbors unless you explicitly override it by configuring the corresponding value on the neighbor. The stalepath-time parameter is used to set the maximum time to preserve stale paths from a gracefully restarted neighbor. All stalepaths, unless reinstated by the neighbor after a re-establishment, will be deleted at the expiration of this timer.

Use the no parameter with this command to restore the router to its default state.

Command Syntax

```
bgp graceful-restart
bgp graceful-restart graceful-reset
bgp graceful-restart restart-time <1-3600>
bgp graceful-restart stalepath-time <1-3600>
no bgp graceful-restart
no bgp graceful-restart graceful-reset
no bgp graceful-restart restart-time
no bgp graceful-restart stalepath-time
```

Parameters

`graceful-reset`	The BGP daemon is not restarted, so that any changes in network configurations that cause BGP reset do not affect packet forwarding.
`restart-time`	Maximum time needed for neighbors to restart. Default is 90 seconds.
`<1-3600>`	Delay value in seconds.
`stalepath-time`	Maximum time to retain stale paths from restarting neighbors. Default is 360 seconds.
`<1-3600>`	Delay value in seconds.

Default

By default, the maximum time for neighbors to restart is 90 seconds.

By default, the maximum time to retain stale paths from restarting neighbors is 360 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp graceful-restart

#configure terminal
(config)#router bgp 10
```

```
(config-router)#no bgp graceful-restart
```

bgp g-shut

Use this command to gracefully shut down all BGP IPv4 sessions under this router. The BGP graceful shutdown feature reduces packet loss during maintenance activity.

Use the no parameter with this command to bring up all the sessions under this router after completion of maintenance activity using the `bgp g-shut` command.

Command Syntax

```
bgp g-shut
no bgp g-shut
```

Parameters

None

Default

By default, bgp g-shut is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut
```

bgp g-shut-capable

Use this command to enable the graceful shutdown capability at the router level and make available the graceful-shutdown related commands at the router and BGP neighbor levels.

Use the no parameter with this command to disable the graceful shutdown capability on a router.

Note: The graceful shutdown capability cannot be disabled on a router that is in a graceful shutdown state until it comes out this state--after the graceful shutdown has been initiated and the impacted BGP sessions are up again.

Command Syntax

```
bgp g-shut-capable
no bgp g-shut-capable
```

Parameters

None

Default

By default, the graceful shutdown capability is disabled at the router level

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut-capable

#configure terminal
(config)#router bgp 100
(config-router)#no bgp g-shut-capable
```

bgp g-shut-local-preference

Use this command to sets the local preference of the router to use during graceful shutdown. The local preference value indicates the preferred path when there are multiple paths to the same destination in a single routing database. The path with a higher preference value is the preferred one. The preferred path is sent to all routers and access servers in the local autonomous system.

Use the no parameter with this command to revert to the default setting.

Command Syntax

```
bgp g-shut-local-preference <0-4294967295>
no bgp g-shut-local-preference
```

Parameters

`<0-4294967295>` Local preference value

Default

By default, the local preference value is set to 0

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp g-shut-local-preference 22
```

bgp update-delay

Use this command to set the update delay for a graceful-restart capable router. The update-delay value is the maximum time a graceful-restart capable router, which is restarting, will defer route-selection and advertisements to all its graceful-restart capable neighbors. This maximum time starts from the instance the first neighbor attains established state after restart. The restarting router prematurely terminates this timer when end-of-RIB markers are received from all its graceful-restart capable neighbors.

Use the no form of this command to set to the update delay to its default value.

Command Syntax

```
bgp update-delay <1-3600>
no bgp update-delay
no bgp update-delay <1-3600>
```

Parameters

<1-3600>	Delay interval in seconds

Default

By default, update-delay value is 120 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#bgp update-delay 345
```

neighbor capability graceful-restart

Use this command to advertise the graceful restart capability to its neighbor. This configuration indicates that the BGP speaker has the ability to preserve its forwarding state for the address family when BGP restarts.

You must first specify a neighbor's `remote-as` identification number assigned by the neighbor router.

Note: The graceful restart capability is advertised only when the graceful restart capability has been enabled using the bgp graceful-restart command.

Use the `no` parameter with this command to not advertise the graceful restart capability to its neighbor.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
no neighbor (A.B.C.D|X:X::X:X|WORD) capability graceful-restart
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, the graceful-restart is disabled

Command Mode

Router mode

Address family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 10.10.10.50 capability graceful-restart
```

neighbor g-shut

Use this command to start a graceful shutdown for the BGP session of the specified BGP neighbor. The BGP session for this neighbor is shut down after the graceful shutdown timer expires.

If there is no alternate path available for traffic to flow prior the actual shutdown of the BGP session, this path is made available for 60 seconds or for configured time after which the path is no longer available and traffic is dropped.

Use the `no` parameter with this command to bring up the session again for the specified BGP neighbor whose BGP session had been shut down using the `neighbor g-shut` command.

Note: The graceful shutdown capability is not supported on iBGP sessions.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut
```

Parameters

`A.B.C.D`	Neighbor IPv4 address
`X:X::X:X|`	Neighbor IPv6 address
`WORD`	Neighbor tag

Default

By default, neighbor g-shut is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut

#configure terminal
(config)#router bgp 100
(config-router)#no neighbor 1.1.1.2 g-shut
```

neighbor g-shut-timer

Use this command to configure the value of the graceful shutdown timer. After the timer expires, the BGP session initiated for graceful shutdown is shut down.

Use the no parameter with this command to revert to the default setting.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
no neighbor (A.B.C.D|X:X::X:X|WORD) g-shut-timer <10-65535>
```

Parameters

A.B.C.D	Neighbor IPv4 address
X:X::X:X	Neighbor IPv6 address
WORD	Neighbor tag
<10-65535>	Graceful shutdown timer in seconds

Default

By default, the timer value is set to 60 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 1.1.1.2 g-shut-timer 120
```

neighbor restart-time

Use this command to set a different restart-time than the global restart-time configured using the bgp graceful-restart command.

Use the no parameter with this command to restore the router to its default state.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
no neighbor (A.B.C.D|X:X::X:X|WORD) restart-time <1-3600>
```

Parameters

A.B.C.D	Address of the BGP neighbor in an IPv4 format
X:X::X:X	Address of the BGP neighbor in an IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
<1-3600>	The maximum time that a graceful-restart neighbor waits to come back up after a restart. Make sure that this value does not exceed the stalepath-time specified in router mode.

Default

By default, restart time is 90 seconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router bgp 10
(config-router)#neighbor 3.3.3.3 restart-time 45
```

restart bgp graceful

Use this command to enable a BGP-speaker router for graceful restart. This command stops the whole BGP process and makes OcNOS retain the BGP routes and mark them as stale. Receiving BGP speakers, retain and mark as stale all BGP routes received from the restarting speaker for all address families received in the Graceful Restart Capability exchange.

Command Syntax

```
restart bgp graceful
```

Parameters

None

Default

By default, bgp graceful is disabled

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart bgp graceful
```

CHAPTER 3 BGP4+ Commands

This chapter describes the BGP4+ configuration commands.

- address-family ipv6 (see address-family in Chapter 1, *BGP Commands*)
- aggregate-address X:X::X:X/M
- bgp g-shut (see bgp log-neighbor-changes in n Chapter 1, *BGP Commands*)
- clear bgp * ipv6
- clear bgp ipv6 (A.B.C.D|X:X::X:X)
- clear bgp ipv6 <1-4294967295>
- clear bgp ipv6 external
- clear bgp ipv6 peer-group
- clear bgp ipv6 unicast flap-statistics
- clear bgp ipv6 unicast flap-statistics
- clear ipv6 bgp * vrf
- clear ipv6 bgp X:X::X:X vrf
- clear ip bpg ipv6 unicast table-map
- neighbor activate (see neighbor activate in Chapter 1, *BGP Commands*)
- neighbor attribute-unchanged (see neighbor attribute-unchanged in Chapter 1, *BGP Commands*)
- neighbor capability dynamic (see neighbor capability dynamic in Chapter 1, *BGP Commands*)
- neighbor capability route-refresh (see neighbor collide-established in Chapter 1, *BGP Commands*)
- neighbor default-originate (see neighbor default-originate in Chapter 1, *BGP Commands*)
- neighbor distribute-list (see neighbor distribute-list in Chapter 1, *BGP Commands*)
- neighbor filter-list (see neighbor filter-list in Chapter 1, *BGP Commands*)
- neighbor maximum-prefix (see neighbor maximum-prefix in Chapter 1, *BGP Commands*)
- neighbor next-hop-self (see neighbor next-hop-self in Chapter 1, *BGP Commands*)
- neighbor peer-group (see neighbor peer-group in Chapter 1, *BGP Commands*)
- neighbor prefix-list (see neighbor prefix-list in Chapter 1, *BGP Commands*)
- neighbor remove-private-AS (see neighbor remove-private-AS in Chapter 1, *BGP Commands*)
- neighbor route-map (see neighbor route-map in Chapter 1, *BGP Commands*)
- neighbor route-reflector-client (see neighbor route-reflector-client in Chapter 1, *BGP Commands*)
- neighbor send-community (see neighbor send-community in Chapter 1, *BGP Commands*)
- neighbor soft-reconfiguration inbound (see neighbor soft-reconfiguration inbound in Chapter 1, *BGP Commands*)
- neighbor unsuppress-map (see neighbor unsuppress-map in Chapter 1, *BGP Commands*)
- network X:X::X:X
- redistribute (see redistribute in Chapter 1, *BGP Commands*)

aggregate-address X:X::X:X/M

Use this command to configure BGP aggregate entries.

Aggregates are used to minimize the size of routing tables. Aggregation combines the characteristics of several different routes and advertises a single route. This command creates an aggregate entry in the BGP routing table if any more-specific BGP routes are available in the specified range. Using the `summary-only` parameter advertises the prefix only, suppressing more-specific routes to neighbors.

The `as-set` parameter creates an aggregate entry advertising the path for this route, consisting of all elements contained in all paths being summarized. Use the `as-set` parameter to reduce the size of path information by listing the AS number only once, even if it was included in multiple paths that were aggregated. The `as-set` parameter is useful when aggregation of information results in an incomplete path information.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
aggregate-address X:X::X:X/M
aggregate-address X:X::X:X/M as-set
aggregate-address X:X::X:X/M as-set summary-only
aggregate-address X:X::X:X/M summary-only
aggregate-address X:X::X:X/M summary-only as-set
no aggregate-address X:X::X:X/M
no aggregate-address X:X::X:X/M as-set
no aggregate-address X:X::X:X/M as-set summary-only
no aggregate-address X:X::X:X/M summary-only
no aggregate-address X:X::X:X/M summary-only as-set
```

Parameters

`X:X::X:X/M`	Aggregate IPv6 prefix
`as-set`	Generate AS set path information
`summary-only`	Filter more specific routes from updates

Command Mode

Address Family mode

Default

By default, aggregate address is disabled

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#neighbor 2.2.2.2 remote-as 100
(config-router)#neighbor 3.3.3.3 remote-as 200
```

```
(config-router)#address-family ipv6
(config-router-af)#aggregate-address 3ffe::/32 as-set summary-only
```

clear bgp * ipv6

Use this command to reset the BGP IPv6 connection for all peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 *
clear bgp ipv6 * in
clear bgp ipv6 * in prefix-filter
clear bgp ipv6 * out
clear bgp ipv6 * soft
clear bgp ipv6 * soft in
clear bgp ipv6 * soft out
clear ip bgp * ipv6 unicast in
clear ip bgp * ipv6 unicast out
clear ip bgp * ipv6 unicast soft
clear ip bgp * ipv6 unicast soft in
clear ip bgp * ipv6 unicast soft out
```

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.
`unicast`	Unicast prefixes
`in`	Clear incoming advertised routes.
`out`	Soft reconfig outbound update
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Clear outgoing advertised routes

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp * ipv6 unicast soft out
```

clear bgp ipv6 (A.B.C.D|X:X::X:X)

Use this command to reset the BGP neighbor addresses (IPv4 or IPv6) for IPv6 peers.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 (A.B.C.D|X:X::X:X)
clear bgp ipv6 (A.B.C.D|X:X::X:X) in
clear bgp ipv6 (A.B.C.D|X:X::X:X) in prefix-filter
clear bgp ipv6 (A.B.C.D|X:X::X:X) out
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft in
clear bgp ipv6 (A.B.C.D|X:X::X:X) soft out
```

Parameters

`in`	Clear incoming advertised routes
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 10.5.2.7
```

clear bgp ipv6 <1-4294967295>

Use this command to reset the BGP connection with a specified AS (Autonomous System) number for IPv6 peers.

Command Syntax

```
clear bgp ipv6 <1-4294967295>
clear bgp ipv6 <1-4294967295> in
clear bgp ipv6 <1-4294967295> in prefix-filter
clear bgp ipv6 <1-4294967295> out
clear bgp ipv6 <1-4294967295> soft
clear bgp ipv6 <1-4294967295> soft in
clear bgp ipv6 <1-4294967295> soft out
```

Parameters

`in`	Clear incoming advertised routes.
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig.
`out`	Clear outgoing advertised routes.
`soft`	Clear both incoming and outgoing routes.
`in`	Soft reconfig inbound update.
`out`	Soft reconfig outbound update.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 12345
```

clear bgp ipv6 external

Use this command to reset the BGP connection for all external IPv6 peers or for a specified external IPv6 peer.

Command Syntax

```
clear bgp ipv6 external
clear bgp ipv6 external in prefix-filter
clear bgp ipv6 external soft
clear bgp ipv6 external soft in
clear bgp ipv6 external soft out
clear bgp ipv6 external WORD in
clear bgp ipv6 external WORD out
```

Parameters

`in`	Clear incoming advertised routes
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update
`WORD`	Name of external IPv6 peer
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp ipv6 external soft in
```

clear bgp ipv6 peer-group

Use this command to reset the BGP connection for all members of a peer group.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear bgp ipv6 peer-group WORD
clear bgp ipv6 peer-group WORD in
clear bgp ipv6 peer-group WORD in prefix-filter
clear bgp ipv6 peer-group WORD out
clear bgp ipv6 peer-group WORD soft
clear bgp ipv6 peer-group WORD soft in
clear bgp ipv6 peer-group WORD soft out
```

Parameters

`in`	Clear incoming advertised routes
`prefix-filter`	Push out prefix-list ORF and do inbound soft reconfig
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update
`WORD`	BGP peer-group name

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp peer-group P1
```

clear bgp ipv6 unicast flap-statistics

Use this command to reset IPv6 BGP route flap statistics.

Command Syntax

```
clear bgp ipv6 unicast flap-statistics
clear bgp ipv6 unicast flap-statistics X:X::X:X
clear bgp ipv6 unicast flap-statistics X:X::X:X/M
clear ip bgp ipv6 unicast flap-statistics
clear ip bgp ipv6 unicast flap-statistics X:X::X:X
clear ip bgp ipv6 unicast flap-statistics X:X::X:X/M
```

Parameters

`X:X::X:X`	IP prefix (network) for example, 35.0.0.0
`X:X::X:X/M`	IP prefix (network and length) for example, 35.0.0.0/8

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp ipv6 unicast flap-statistics 1:2::3:4/7
```

clear ipv6 bgp * vrf

Use this command to reset an IPv6 BGP connection for all virtual routing forwarding addresses.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ipv6 bgp * vrf WORD
clear ipv6 bgp * vrf WORD in
clear ipv6 bgp * vrf WORD out
clear ipv6 bgp * vrf WORD soft
clear ipv6 bgp * vrf WORD soft in
clear ipv6 bgp * vrf WORD soft out
```

Parameters

`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update
`WORD`	BGP peer-group name

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 bgp * vrf BGPpeer7
```

clear ipv6 bgp X:X::X:X vrf

Use this command to reset the specified VPNv6 Routing/Forwarding (VRF) instance for BGP connections. If the neighbor address is specified with this command, it clears the specified connection. If no address is specified, this command clears all the BGP routes.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ipv6 bgp (X:X::X:X) vrf WORD
clear ipv6 bgp X:X::X:X vrf WORD in
clear ipv6 bgp X:X::X:X vrf WORD out
clear ipv6 bgp X:X::X:X vrf WORD soft in
clear ipv6 bgp X:X::X:X vrf WORD soft out
```

Parameters

`vrf`	Specify a VPN routing/forwarding instance for IPv6
`WORD`	VPN routing/forwarding instance name
`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 bgp vrf 10:10::0:12 vrf vrfname
```

clear ip bpg ipv6 unicast table-map

Use this command to apply the modified table map or route map rules to the BGP routes in the existing IP routing table.

Command Syntax

```
clear ip bpg ipv6 unicast table-map (vrf (VRFNAME|all|default))
```

Parameters

`vrf`	Select a VPN Routing/Forwarding Instance.
`VRFNAME`	Specify a VPN Routing/Forwarding instance name.
`all`	Select all VRFs.
`default`	Select default VRFs.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp ipv6 unicast table-map vrf all
```

network X:X::X:X

Use this command to specify the networks to be advertised by the BGP routing process. A unicast network address without a mask is accepted if it falls into the natural boundary of its class. A class-boundary mask is derived if the address matches its natural class-boundary.

Use the `backdoor` parameter to specify a backdoor route to a BGP border router that will provide better information about the network. For data to be advertised by BGP, its routing table must include a route to the specified network. This command specifies the networks to be advertised. The network command works if the network being advertised is known to the router.

The `backdoor` parameter enables a route to be the preferred route even if it has a greater distance. A network that is specified as a backdoor network is dynamically assigned an administrative distance of 200 ensuring that IGP learned routes are preferred. If a backdoor network is not sourced by the local router, the network is learned from the external routers. If the route is learned from eBGP for a backdoor network, the distance is set to 20 or 200.

Use the `no` parameter with this command to remove an entry.

Command Syntax

```
network X:X::X:X/M
network X:X::X:X/M backdoor
network X:X::X:X/M route-map WORD (backdoor|)
no network X:X::X:X/M
no network X:X::X:X/M backdoor
no network X:X::X:X/M route-map WORD (backdoor|)
```

Parameters

`X:X::X:X`	IPv6 prefix <network>, for example, 3ffe::
`backdoor`	Specify a BGP backdoor route
`WORD`	Name of the route map

Default

No default value is specified

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 10
(config-router)#network 172.26.0.0/16
```

If Router1 receives updates from 172.10.0.0 via two routing protocols RIP (distance 120) and eBGP (distance 20), router1 chooses the shorter route. Use the `backdoor` parameter to allow Router1 to learn about 172.10.0.0 via RIP.

```
(config)#router rip
(config)#network 172.10.0.0
(config)#router bgp 200
```

```
(config)#neighbor 3.3.3.3 remote-as 500
(config)#network 172.10.0.0 backdoor
(config-router)#network 172.16.1.0/24 route-map myRM
```

CHAPTER 4 BGP Virtual Private Network Commands

This chapter describes the BGP Virtual Private Network (VPN) configuration commands.

- address-family (see address-family in Chapter 1, *BGP Commands*)
- bgp inbound-route-filter
- clear bgp * l2vpn vpls
- clear ip bgp * vpnv4
- clear bgp <1-4294967295> l2vpn vpls
- clear ip bgp <1-4294967295> vpnv4
- clear bgp A.B.C.D l2vpn vpls
- clear ip bgp A.B.C.D vpnv4
- debug bgp mpls
- exit-address-family (see exit-address-family in Chapter 1, *BGP Commands*)
- ip vrf
- neighbor activate (see neighbor activate in Chapter 1, *BGP Commands*)
- neighbor allow-ebgp-vpn
- neighbor allowas-in (see neighbor allowas-in in Chapter 1, *BGP Commands*)
- neighbor as-origination-interval (see neighbor as-origination-interval in Chapter 1, *BGP Commands*)
- neighbor as-override
- neighbor description (see neighbor description in Chapter 1, *BGP Commands*)
- neighbor remote-as (see neighbor remote-as in Chapter 1, *BGP Commands*)
- neighbor send-community (see neighbor send-community in Chapter 1, *BGP Commands*)
- neighbor shutdown (see neighbor shutdown in Chapter 1, *BGP Commands*)
- neighbor soo
- redistribute (see redistribute in Chapter 1, *BGP Commands*)
- rd (route distinguisher)
- route-target

bgp inbound-route-filter

Use this command to enable the MPLS (Multiprotocol Label Switching) VPN/BGP inbound route filter. This command is used to control the installation of routing information into the BGP table.

When a router runs MPLS VPN/BGP PE, it exchanges routing information with a routing distinguisher. By default, OcNOS does not install routing information that does not match the configured routing distinguisher value. When the local box has two VRFs where each routing distinguisher value is 10:100 and 20:200, routing information with routing distinguisher 10:200 is not installed into BGP table.

When `no bgp inbound-route-filter` is configured, all of routing information is installed into the BGP table.

Command Syntax

```
bgp inbound-route-filter
no bgp inbound-route-filter
```

Parameter

None

Default

By default, the router performs the routing distinguisher value check is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 100
(config-router)#bgp inbound-route-filter
```

clear bgp * l2vpn vpls

Use this command to reset the session with all neighbors for VPLS address family

Command Syntax

```
clear bgp * l2vpn vpls
```

Parameters

None

Command Mode

Exec and Privileged Exec Modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp * l2vpn vpls
```

clear ip bgp * vpnv4

Use this command to reset a VPNv4 BGP connection for all peers. This command clears the BGP connection and dynamically resets the outbound routing table. This frees up additional memory required for storing updates to generate new updates.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp * vpnv4 unicast in
clear ip bgp * vpnv4 unicast out
clear ip bgp * vpnv4 unicast soft
clear ip bgp * vpnv4 unicast soft in
clear ip bgp * vpnv4 unicast soft out
```

Parameters

`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp *
#clear ip bgp * vpnv4 unicast out
```

clear bgp <1-4294967295> l2vpn vpls

Use this command to reset the session for the neighbors with a specific ASN number for L2VPN VPLS.

Command Syntax

```
Clear bgp <1-4294967295> l2vpn vpls
```

Parameters

`<1-4294967295>` Autonomous System number of the BGP neighbor.

Command Mode

Exec and Privileged Exec Modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 100 l2vpn vpls
```

clear ip bgp <1-4294967295> vpnv4

Use this command to reset a BGP connection for all VPN peers in a specified Autonomous System.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp <1-4294967295> vpnv4 unicast in
clear ip bgp <1-4294967295> vpnv4 unicast out
clear ip bgp <1-4294967295> vpnv4 unicast soft
clear ip bgp <1-4294967295> vpnv4 unicast soft in
clear ip bgp <1-4294967295> vpnv4 unicast soft out
```

Parameters

`<1-4294967295>`	Clear peers with this AS number
`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 500 vpnv4 unicast soft out
```

clear bgp A.B.C.D l2vpn vpls

Use this command to reset the session for neighbor with address A.B.C.D.

Command Syntax

```
clear bgp A.B.C.D l2vpn vpls
```

Parameters

A.B.C.D	BGP neighbor address.

Command Mode

Exec and Privileged Exec Modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear bgp 192.168.0.3 l2vpn vpls
```

clear ip bgp A.B.C.D vpnv4

Use this command to reset an VPNv4 BGP connection for a specific IPv4 address.

Note: The `soft in` or `in` and `soft out` or `out` in the BGP commands performs the same functionality. User can use any of the commands to soft reset.

Command Syntax

```
clear ip bgp A.B.C.D vpnv4 unicast in
clear ip bgp A.B.C.D vpnv4 unicast out
clear ip bgp A.B.C.D vpnv4 unicast soft
clear ip bgp A.B.C.D vpnv4 unicast soft in
clear ip bgp A.B.C.D vpnv4 unicast soft out
```

Parameters

`in`	Clear incoming advertised routes
`out`	Clear outgoing advertised routes
`soft`	Clear both incoming and outgoing routes
`in`	Soft reconfig inbound update
`out`	Soft reconfig outbound update

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip bgp 10.10.0.12 vpnv4 unicast soft
#clear ip bgp 10.10.0.10 vpnv4 unicast out
```

debug bgp mpls

Use this command to enable the display of MPLS related information.

Use the `no` parameter with this command to disable this function.

Note: This command is available only when `vrf` option is enabled.

Command Syntax

```
debug bgp mpls
no debug bgp mpls
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
debug bgp mpls
```

ip vrf

Use this command to assign a VPN Routing Forwarding (VRF) instance.

Use the no option with this command to remove the VRF from the instance.

Command Syntax

```
ip vrf WORD
no ip vrf WORD
```

Parameter

WORD	Name of the VRF instance

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Command Example

```
(config)#ip vrf myVRF
(config-vrf)#
```

neighbor allow-ebgp-vpn

Use this command to allow an eBGP neighbor to be a VPN peer. By default, BGP VPN functionality is allowed only for iBGP peers.

Use the no parameter with this command to remove the configuration.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
no neighbor (A.B.C.D|X:X::X:X|WORD) allow-ebgp-vpn
```

Parameters

A.B.C.D	Address of the BGP neighbor in IPv4 format
X:X::X:X	Address of the BGP neighbor in IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, BGP VPN functionality is allowed only for iBGP peers

Command Mode

Address Family-vpnv4 mode and Address Family-vpnv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 200
(config-router)#neighbor 66.66.66.66 remote-as 100
(config-router)#neighbor 66.66.66.66 update-source lo
(config-router)#address-family vpnv4 unicast
(config-router-af)#neighbor 66.66.66.66 allow-ebgp-vpn
(config-router-af)#neighbor 66.66.66.66 activate
(config-router-af)#exit-address-family
```

neighbor as-override

Use this command to configure a provider edge (PE) router to override the autonomous system number (ASN) of a site with the ASN of a provider. BGP normally ignores routes from the same autonomous system. However, this command is used so that the Customer Edge (CE) routers router accepts and installs routes from the same autonomous system.

Typically, this command is used when CE routers have the same ASN in some or all sites. As per BGP requirement, a BGP speaker rejects a route that has the same ASN as itself in the AS_PATH attribute. Thus the CE routers having the same ASN do not accept routes from each other. Giving this command on the PE router removes the CE neighbor's ASN from the AS_PATH attribute allowing CE routers with the same ASN to accept routes from each other.

Use the no parameter with this command to remove VPN IPv4 prefixes from a specified router.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) as-override
no neighbor (A.B.C.D|X:X::X:X|WORD) as-override
```

Parameters

A.B.C.D	Address of the BGP neighbor in IPv4 format
X:X::X:X	Address of the BGP neighbor in IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.

Default

By default, neighbor as override is disabled

Command Mode

Address Family-vrf mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.0.1 as-override

#configure terminal
(config)#router bgp 7657
(config-router)#address-family ipv6 vrf VRF_A
(config-router-af)#neighbor 3ffe:15:15:15:15::0 as-override
```

neighbor send-community

Use this command to send the extended-community attribute to a customer edge router. In VPN, the route-distinguisher and route-target are encoded in BGP extended-community.

See also neighbor send-community in Chapter 1, *BGP Commands*.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) send-community
neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community
no neighbor (A.B.C.D|X:X::X:X|WORD) send-community (both|extended|standard)
```

Parameters

`A.B.C.D`	Address of the BGP neighbor in an IPv4 format
`X:X::X:X`	Address of the BGP neighbor in an IPv6 format
`WORD`	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
`both`	Send standard and extended community attributes
`extended`	Send extended community attributes
`standard`	Send standard community attributes

Default

By default, no extended-community attribute is sent to a customer router is disabled

Command Mode

Router mode and Address Family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 10.10.10.1 remote-as 200
(config-router-af)#neighbor 10.10.0.1 send-community extended
```

neighbor soo

Use this command to enable the site-of-origin (SOO) feature. If the customer AS is multi-homed to the ISP, this command ensures that the PE does not advertise the routes back to the same AS.

Use the no parameter with this command to disable this feature.

Command Syntax

```
neighbor (A.B.C.D|X:X::X:X|WORD) soo AS:nn_or_IP:nn
no neighbor (A.B.C.D|X:X::X:X|WORD) soo
```

Parameters

A.B.C.D	Address of the BGP neighbor in IPv4 format
X:X::X:X	Address of the BGP neighbor in IPv6 format
WORD	Name of a BGP peer group created with the neighbor WORD peer-group command. When you specify this parameter, the command applies to all peers in the group.
ASN:nn_or_IP-address:nn	An AS number and an arbitrary number (for example, 100:1), or a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

By default, the site-of-origin (SOO) feature is disabled.

Command Mode

Address Family VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router bgp 100
(config-router)#address-family ipv4 vrf VRF_A
(config-router-af)#neighbor 1.1.1.1 remote-as 200
(config-router-af)#neighbor 10.10.0.1 soo 100:1
```

rd (route distinguisher)

Use this command to assign a route distinguisher (RD) for the VRF. The route distinguisher value must be a unique value on the router.

This command creates routing and forwarding tables and specifies the default RD for a VPN. The RD is added to the customer's IPv4 prefixes, changing them into globally unique VPN-IPv4 prefixes.

Command Syntax

```
rd ASN:nn_or_IP-address:nn
```

Parameters

`ASN:nn_or_IP-address:nn`

AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

No default value is specified

Command Mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#ip vrf VRF_A
(config-vrf)#rd 100:1
```

route-target

Use this command to add a list of import and export route-target extended communities to the VRF.

This command creates lists of import and export route-target extended communities for the VRF. It specifies a target VPN extended community. Execute the command once for each community. All routes with the specific route-target extended community are imported into all VRFs with the same extended community as an import route-target.

Use the no parameter with this command to delete a route target.

Command Syntax

```
route-target (import|export|both) ASN:nn_or_IP-address:nn
no route-target (import|export|both) ASN:nn_or_IP-address:nn
```

Parameters

`import`	Import routing information
`export`	Export routing information
`both`	Import and export routing information
`ASN:nn_or_IP-address:nn`	AS number and an arbitrary number (for example, 100:1). Otherwise, specify a 32-bit IP address and an arbitrary number (for example, 192.16.10.1:1).

Default

No default value is specified

Command Mode

VRF mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#ip vrf VRF_A
(config-vrf)#route-target both 100:10

(config)#ip vrf VRF_A
(config-vrf)#route-target import 100:20
```

CHAPTER 5 BGP Show Commands

This chapter describes the BGP show commands.

- show ip bgp peer-group vrf all
- show ip bgp rtfilter all
- show ip bgp scan
- show ip bgp vpnv4
- show ip bgp vpnv6 all neighbors
- show ip bgp vpnv6 rd neighbors
- show ip extcommunity-list
- show ip protocols
- show ip vrf

show bgp

Use this command to display the status of BGP routes.

Command Syntax

```
show bgp ipv4
show bgp (ipv6)
show bgp (ipv4|ipv6) (unicast|multicast)
show ip bgp
show ip bgp ipv4 (unicast|multicast)
show bgp (vrf (VRFNAME|all|default))
show ip bgp (vrf (VRFNAME|all|default))
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp ipv4
```

show bgp A.B.C.D

Use this command to display BGP route information for a network.

Command Syntax

```
show bgp (ipv4) (unicast|multicast) A.B.C.D
show ip bgp A.B.C.D
show ip bgp ipv4 (unicast|multicast) A.B.C.D
```

Parameters

`ipv4`	IPv4 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`A.B.C.D`	IP prefix (network), for example, 35.0.0.0

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip bgp 80.80.80.0

BGP routing table entry for 80.80.80.0/24
Paths: (1 available, no best path)
 Not advertised to any peer
 300
   15.15.15.1 (inaccessible) from 11.11.11.2 (15.15.15.2)
     Origin incomplete, metric 0, localpref 100, valid, internal
     rx path_id: 0      tx path_id: -1
     Last update: Wed May 11 15:22:36 2016
```

Table 5-108 explains the output fields.

Table 5-108: show ip bgp output details

Field	Description
Paths	The paths listed in the routing table, along with path information, and whether the path are being advertised.
Metric	If shown, the value of the inter-autonomous system metric.
LocalPref	Local preference value as set with the set local-preference route-map configuration command.
rx path_id	Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.

Table 5-108: show ip bgp output details

Field	Description
tx path_id	Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path.
Last update	Last time since the neighbor transitioned to or from the established state.

show bgp A.B.C.D/M

Use this command to display BGP route information for a network prefix.

Command Syntax

```
show bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M
show ip bgp A.B.C.D/M (vrf (VRFNAME|all|default))
show ip bgp A.B.C.D/M longer-prefixes
show ip bgp ipv4 (unicast|multicast) A.B.C.D/M longer-prefixes
show ip bgp A.B.C.D/M longer-prefixes (vrf (VRFNAME|all|default))
```

Parameters

`ipv4`	IPv4 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`A.B.C.D/M`	IP prefix (network/length), for example, 35.0.0.0/8
`longer-prefixes`	Display route and more specific routes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp ipv4 unicast 35.0.0.1/8
```

show bgp client

Use this command to display BGP client information.

Command Syntax

```
show bgp client
```

Parameters

None

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
R1#sh bgp client
BGP client ID: 11
 PIM, socket 10
  Service: AS number service, Route Service
  Messsage received 1, sent 1
  Connection time: Tue May 14 03:11:01 2019
  Last message read: Service Request
  Last message write: Service Reply
R1#
```

show bgp community

Use this command to display BGP routes that match a community.

Command Syntax

```
show bgp ip (unicast|multicast) community
show bgp ip (unicast|multicast) community (vrf (VRFNAME|all|default))
show bgp ip (unicast|multicast) community [AA:NN|local-AS|no-advertise|no-export]
  (exact-match|)
show ip bgp community
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-
  match|)
show ip bgp community (vrf (VRFNAME|all|default))
show ip bgp community [AA:NN|local-AS|no-advertise|no-export|internet] (exact-
  match|)
show ip bgp community-list WORD (exact-match|) (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) community
show ip bgp ipv4 (unicast|multicast) community (vrf (VRFNAME|all|default))
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF
`AA:NN`	Community number
`local-AS`	Do not send outside local AS (well-known community)
`no-advertise`	Do not advertise to any peer (well-known community)
`no-export`	Do not export to next AS (well-known community)
`internet`	Internet community (well-known community)
`exact-match`	Exact match of the communities

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp community local-as no-export
```

```
#show bgp community local-AS exact-match
#show ip bgp ipv4 multicast community 12:34 exact-match
```

show bgp community-list

Use this command to display BGP routes that match a community list.

Command Syntax

```
show bgp community-list WORD (exact-match|)
show bgp ip (unicast|multicast) community-list WORD (exact-match|)
show bgp ip (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv4|ipv6) (unicast|multicast) community-list WORD (exact-match|)
show bgp (ipv6) community-list WORD (exact-match|)
show ip bgp community-list WORD (exact-match|)
show ip bgp ipv4 (unicast|multicast) community-list WORD (exact-match|)
```

Parameters

`WORD`	Community list name
`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`exact-match`	Only routes that exactly match the community

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp community-list mylist exact-match
#show ip bgp ipv4 multicast community-list mylist exact-match
```

show bgp dampening dampened-paths

Use this command to display detailed information about paths suppressed due to dampening.

Command Syntax

```
show bgp dampening dampened-paths
show bgp (ipv4|ipv6) (unicast|multicast) dampening dampened-paths
show bgp (ipv6) dampening dampened-paths
show ip bgp dampening dampened-paths
show ip bgp dampening dampened-paths (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening dampened-paths
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp dampening dampened-paths
BGP table version is 32, local router ID is 3.3.3.3
Status codes: s suppressed, d damped, h history, * valid, > best, i -
internal,l - labeled, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network            From                 Reuse   Path
 d   11.11.11.0/24    90.90.90.1            00:27:20 200 i
```

Table 5-108 shows the status codes displayed at the start of a route entry.

Table 5-109: status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale **.**
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Table 5-113 shows the codes at the end of each route entry that indicate where the route originated.

Table 5-110: origin details

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Table 5-114 explains the output fields.

Table 5-111: show bgp dampening dampened-paths output details

Field	Description
Network	Internet address of a network.
From	IP address of the advertising peer.
Reuse	The amount of time remaining until this route will be un-suppressed and can be used again.
Path	Autonomous system path to the destination network.

show bgp dampening flap-statistics

Use this command to display BGP dampening flap statistics.

Command Syntax

```
show bgp dampening flap-statistics
show bgp (ipv4|ipv6) (unicast|multicast) dampening flap-statistics
show bgp (ipv6) dampening flap-statistics
show ip bgp dampening flap-statistics
show ip bgp dampening flap-statistics (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) dampening flap-statistics
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This sample output shows that the internal route (`i`), has flapped 3 times and is now categorized as history (h).

```
#show ip bgp dampening flap-statistics
BGP table version is 1, local router ID is 30.30.30.77
Status codes: s suppressed, d damped, h history, * valid, > best, i -
internal, S Stale
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network          From               Flaps  Duration  Reuse   Path
hi1.1.1.0/24     10.100.0.62       3  00:01:20       i
```

Table 5-108 shows the status codes displayed at the start of a route entry.

Table 5-112: status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale **.**
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Table 5-113 shows the codes at the end of each route entry that indicate where the route originated.

Table 5-113: origin details

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Table 5-114 explains the output fields.

Table 5-114: show bgp dampening flap-statistics output details

Field	Description
Network	Internet address of a network.
From	IP address of the advertising peer.
Flaps	Number of times this route has failed and returned (flapped).
Duration	Elapsed time since the first penalty points were assessed.
Reuse	The amount of time remaining until this route will be un-suppressed and can be used again.
Path	Autonomous system path to the destination network.

show bgp dampening parameters

Use this command to display the BGP dampening parameters.

Command Syntax

```
show bgp dampening parameters
show bgp (ipv4|ipv6) (unicast|multicast) dampening parameters
show bgp (ipv6) dampening parameters
show ip bgp dampening parameters
show ip bgp ipv4 (unicast|multicast) dampening parameters (vrf
  (VRFNAME|all|default))
show ip bgp dampening parameters (vrf (VRFNAME|all|default))
```

Parameters

ipv4	IPv4 routes
ipv6	IPv6 routes
unicast	Unicast prefixes
multicast	Multicast prefixes
VRFNAME	VPN routing/forwarding instance name
all	All VRFs
default	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip bgp dampening parameters
 dampening 5 750 2000 60 15
 Dampening Control Block(s):
  Reachability Half-Life time    : 5 min
  Reuse penalty                  : 750
  Suppress penalty               : 2000
  Max suppress time              : 60 min
  Un-reachability Half-Life time : 15 min
  Max penalty (ceil)             : 11999
  Min penalty (floor)            : 375
#
```

Table 5-115 explains the output fields.

Table 5-115: show ip bgp dampening parameters output details

Field	Description
Dampening Control Block(s)	Flap damping reduces the number of update messages by marking routes as ineligible for selection as the active or preferable route.
Reachability Half-Life time	Number of minutes after which an arbitrary value is halved if a route stays stable.
Reuse penalty	Reuse threshold—Arbitrary value below which a suppressed route can be used again.
Suppress penalty	Cutoff (suppression) threshold—Arbitrary value above which a route can no longer be used or included in advertisements.
Max suppress time	Maximum hold-down time for a route, in minutes.
Un-reachability Half-Life time	Number of minutes after which an arbitrary value is not halved if a route stays stable.
Max penalty (ceil)	Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (ceil).
Min penalty (floor)	Maximum penalty corresponds to the time it would take max-suppress to decay and reach the reuse level (floor).

show bgp filter-list

Use this command to display routes that match a regular expression filter list.

Command Syntax

```
show bgp filter-list WORD
show bgp (ipv4|ipv6) (unicast|multicast) filter-list WORD
show bgp (ipv6) filter-list WORD
show ip bgp filter-list WORD
show ip bgp ipv4 (unicast|multicast) filter-list WORD
show ip bgp filter-list WORD (exact-match)
show ip bgp filter-list WORD (exact-match) (vrf (VRFNAME|all|default))
show ip bgp filter-list WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) filter-list WORD (exact-match)(vrf
  (VRFNAME|all|default))
```

Parameters

`WORD`	Regular-expression filter list
`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`exact-match`	Exact match of the filter list
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF
`vrf`	VPN Routing/Forwarding instance name

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp filter-list mylist
```

show bgp inconsistent-as

Use this command to display routes with inconsistent AS paths.

Command Syntax

```
show bgp inconsistent-as
show bgp (ipv4|ipv6) (unicast|multicast) inconsistent-as
show bgp (ipv6) inconsistent-as
show ip bgp inconsistent-as
show ip bgp ipv4 inconsistent-as
show ip bgp ipv4 (unicast|multicast) inconsistent-as
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp inconsistent-as
```

show bgp ipv6

Use this command to display the BGP routing table.

Command Syntax

```
show bgp ipv6 (unicast|multicast|labeled|)
show bgp ipv6 (unicast|multicast|labeled|) X:X::X:X/M
```

Parameters

`multicast`	IPv6 multicast address prefixes
`unicast`	IPv6 unicast address prefixes
`labeled`	Labeled IPv6 routes
`X:X::X:X/M`	IPv6 prefix network/length, such as 3ffe:a::/64

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: iBGP and eBGP Routes

This example shows routes learned from both iBGP and eBGP.

```
#show bgp ipv6
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal S stale,
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network                                    Metric LocPrf Weight  Path
*> 2001:58::/32                                                 0  20 ?
     fe80::202:b3ff:fec8:9fdb
*> 2002:58::/32                                                 0  20 i
     fe80::202:b3ff:fec8:9fdb
*>i2003:58::/32                                      100        0  i
     fe80::208:a1ff:fe16:797d
```

Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- BGP table version
- BGP router ID is `10.100.0.77`

```
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
```

Table 5-108 shows the status codes displayed at the start of a route entry.

Table 5-116: status details

Status Code	Description	Comments
s	suppressed	Whether the route is suppressed and is not advertised to neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale **.**
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The selected route to be installed in the kernel routing table.
i	internal	The prefix was learned from an iBGP peer.

Origin codes: i - IGP, e - EGP, ? - incomplete

Table 5-117 shows the codes at the end of each route entry that indicate where the route originated.

Table 5-117: origin codes

Origin Code	Description	Comments
i	IGP	The route is from an Interior Gateway Protocol.
e	EGP	The route is from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an IGP.

Route Entry Examples

```
*> 2002:58::/32     fe80::202:b3ff:fec8:9fdb                              0 20 i
```

- This route entry shows that this route is learned from eBGP.
- The origin code “i” means that the prefix is added by the network statement at originating AS.
- The path 20 indicates that the prefix advertisement originated from AS20.
- The administrative weight parameter applies only to routes within an individual router.
- Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.

```
*> 2001:58::/32      fe80::202:b3ff:fec8:9fdb                              0 20 ?
```

- This route entry shows that the prefix is learnt from eBGP.The origin code i indicates that the prefix is added by network statement at originating AS.The path attribute 20 indicates that the route advertisement originated from AS20.The administrative weight parameter applies only to routes within an individual router. Since this route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.The origin code “?” means the route was learned through redistribution.

```
*>i2003:58::/32      fe80::208:a1ff:fe16:797d                    100     0 i
```

- The status code “i” means that the route was learned through iBGP. The Local Preference attribute of the route, which is used only with the local AS, is set to 100 (the default value).

Example: IPv6 Prefix Routes

This example shows labeled routes for a given IPv6 prefix:

```
#show bgp ipv6 labeled 3ffe:a::/64
          BGP routing table entry for 3ffe:a::/64
          Paths: (1 available, best #1, table Default-IP-Routing-Table)
          Not advertised to any peer
          Local
          ::ffff:114:1414 from 20.20.20.1 (92.92.92.92)
          Origin incomplete metric 0, localpref 100, label    5420,
          valid, internal, best
          Last update: Mon May 26 17:48:18 2008
```

Table 5-118 explains the output fields.

Table 5-118: show bgp ipv6 output details

Field	Description
Paths	The paths listed in the routing table, along with path information, and whether the path are being advertised.
Metric	If shown, the value of the inter-autonomous system metric.
LocalPref	Local preference value as set with the set local-preference route-map configuration command.
rx path_id	Autonomous system receive path to the source network. There can be one entry in this field for each autonomous system in the path.
tx path_id	Autonomous system transmit path to the destination network. There can be one entry in this field for each autonomous system in the path.
Last update	Last time since the neighbor transitioned to or from the established state.

show bgp l2vpn vpls

Command Syntax

```
show bgp l2vpn vpls (rr|) (detail|)
```

Parameters

`rr`	Display the information of auto-discovered peers at Route reflector node.
`detail`	Display the detailed information of auto-discovered peers.

Command Mode

Exec and Privileged Exec Modes

Applicability

This command was introduced in version OcNOS version 1.3.

Example

```
#show bgp l2vpn vpls
VPLS-ID   VE-ID    Discovered-Peers   Route-Target
10        3        1                   10:100

#show bgp l2vpn vpls  detail

VPLS ID: 10
VE-ID: 3
Discovered Peers: 1
Route-Target: 10:100
Local RD: 10:100
 Mesh Peers:
  Address:3.3.3.3, RD:10:100, VE-ID:4
  VC Details: VC-ID:34
  Remote (LB:52480,VBO:1,VBS:64)  Local (LB:52480,VBO:1,VBS:64)
  LB sent on known VEID:Yes
  In Label:52483, Out Label:52482
  PW Status:Established
```

Table 5-119 explains the output fields.

Table 5-119: show bgp l2vpn vpls output details

Field	Description
VPLS-ID	L2VPN address family database information for the Virtual Private LAN Service (VPLS).
VE-ID	L2VPN address family database information for the Virtual Expansion.
Discovered Peers	Peer discovery is used to find peers that are available for data using LLDP.
Route-Target	An identifier prepended to IP addresses to assure the uniqueness of the address.

Table 5-119: show bgp l2vpn vpls output details

Field	Description
Local RD	The Local Route Descriptor – the first two numbers of the Route-Target.
Mesh Peers	Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.
Address	Mesh session information for the peer specified with the ip-address argument.
RD	Mesh peer's Route-Descriptor.
VC Details	The virtual circuit session information with the ip-address for the Provider Edge (PE) routers.
Remote	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router. VBS (VE Block Size) – the size of the label block.
Local	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain. VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router. VBS (VE Block Size) – the size of the label block.
LB sent on known VEID	Whether the Label Base came on a known Virtual Expansion Identifier – yes or no.
In Label	The ingress (incoming interface) label for this segment.
Out Label	Label received from downstream neighbor for route.
PW Status	The status of the VPLS Pseudo-Wire. Values can be: Idle, Active, Open, or Established.

```
#show bgp l2vpn vpls rr
RD        RR-Clients     Non-Clients          Route-Target
10:100     2                  0                 10:100
10:100     2                  0                 10:100

#show bgp l2vpn vpls rr detail

Route-Target: 10:100
  Peer:1.1.1.1
    RR Client  : Yes
    VE-ID:3  LB:52480  VBO:1  VBS:64

Route-Target: 10:100
  Peer:3.3.3.3
    RR Client  : Yes
    VE-ID:4  LB:52480  VBO:1  VBS:64
```

Table 5-120 explains the output fields.

Table 5-120: show bgp l2vpn vpls rr output details

Field	Description
Route-Target	An identifier prepended to IP addresses to assure the uniqueness of the address.
Peer	Internal BGP peers – devices that do not re-advertise routes to other IBGP devices.
RR Client	Device is a client of the Route Reflector – yes or no.
VE-ID	L2VPN address family database information for the Virtual Expansion.
LB	LB (Label Base) – the first label value of a free set of labels that can be reserved by the PE router to be used for this VPLS domain.
VBO	VBO (VE Block Offset) – the offset value to be used when multiple label blocks must be created by a PE router.
VBS	VBS (VE Block Size) – the size of the label block.

show bgp neighbors

Use this command to display information about BGP neighbor connections.

Command Syntax

```
show bgp neighbors
show bgp ipv6 neighbors
show ip bgp ipv4 (unicast|multicast) neighbors
show ip bgp neighbors
show ip bgp neighbors (A.B.C.D|X:X::X:X)(advertise-routes|)
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (hold-time|keepalive-interval|connection-
  retrytime)
show ip bgp neighbors (A.B.C.D|X:X::X:X) (sent-msgs|rcvd-
  msgs|notification|update|open|keepalive
```

Parameters

`ipv4`	IPv4 neighbors
`ipv6`	IPv6 neighbors
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`A.B.C.D`	IPv4 neighbor
`X:X::X:X`	IPv6 neighbor
`advertised-routes`	Routes advertised to a BGP neighbor
`hold-time`	Hold time
`keepalive-interval`	Keepalive interval
`connection-retrytime`	Connection retry time
`sent-msgs`	Sent packets
`rcvd-msgs`	Received packets
`notification`	Notification messages
`update`	Update messages
`open`	Open messages
`keepalive`	Keepalive messages

Command Mode

Privileged Exec and Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp neighbors
BGP neighbor is 2.2.2.2, remote AS 200, local AS 200, internal link
 Member of peer-group myPeer for session parameters
  BGP version 4, remote router ID 10.12.7.155
  BGP state = Established, up for 00:04:55
  Last read 00:04:55, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 11 messages, 0 notifications, 0 in queue
  Sent 11 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 IPv4
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  myPeer peer-group member
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 0
Local host: 2.2.2.1, Local port: 33865
Foreign host: 2.2.2.2, Foreign port: 179
Nexthop: 2.2.2.1
Nexthop global: 1111::1
Nexthop local: fe80::a00:27ff:fecc:47a6
BGP connection: non shared network
Last Reset: 00:32:48, due to BGP Notification sent
Notification Error Message: (OPEN Message Error/Bad Peer AS.)
```

BGP Neighbor Fields

Table 5-121 explains the output fields.

Table 5-121: show bgp neighbor output details

Field	Description
BGP neighbor	BGP session information for the neighbor with the ip-address argument.
remote AS	Remote Autonomous system used to exchange exterior routing information between neighboring ASs.
local AS	Local Autonomous system used to exchange internal routing information within AS.

Table 5-121: show bgp neighbor output details

Field	Description
internal link external link	Internal link is used to forward route advertisements received from an external BGP router through the internal network (in the same AS). External link is used for exchanging routing information between Autonomous Systems (AS) and routing traffic across the Internet (eBGP neighbor).
member of peer-group	Peer group information for the peer group specified with the peer-group argument.
BGP version	Negotiated BGP version for this session.
remote router ID	IP address of the neighbor. BGP uses the highest loopback address as the Router ID. If no loopback interface is configured, BGP uses the highest configured IP address on a system.
BGP state	Session state as explained in Table 5-126. The exchange of routing information begins between peers only after the neighbor session is in an Established state.
up for	Time that the underlying TCP connection has been up.
last read	Time since BGP last received a message from this neighbor.
hold time	Time, in seconds, that BGP will maintain the session with this neighbor without receiving messages. The maximum time that can elapse between successive messages from this neighbor is 180 seconds. If no message is received for 180 seconds, this neighbor will be declared dead.
last write	Time since BGP last sent a message to this neighbor.
keepalive interval	Time interval, in seconds, at which keepalive messages are transmitted to this neighbor. The time interval between successive keepalive messages is 60 seconds. Typically, the hold time value is set to three times the keepalive interval.
neighbor capabilities	BGP capabilities advertised and received from this neighbor. “Advertised and received” is displayed when a capability is successfully exchanged between two routers.
received	Total number of received messages. notifications: Number of notification (error) messages received. in queue: Number of messages in the input queue
sent	Total number of sent messages. notifications: Number of notification (error) messages sent. in queue: Number of messages in the output queue
route refresh request	Number of route refresh request messages sent and received.
minimum time between advertisement runs.	The minimum time gap, in seconds, between successive route updates sent to the neighbor. Generally, a jitter (of 25%) is applied to this time interval, which means that if the time between advertisements is configured as 30, successive advertisements can have a time gap of as low as 22.5 (after applying a 25% jitter to the 30 seconds, which is 7.5 seconds).
for address family	The peers have exchanged address family capability.
BGP table version	For each of the address families agreed upon, BGP maintains a separate table.
neighbor version	Tracks prefixes that have been sent and those that need to be sent.
connections established	The number of times the router has established a TCP connection and the two peers have agreed to speak BGP with each other. “Dropped” means the number of time the connection has failed or gone down.

Table 5-121: show bgp neighbor output details

Field	Description
local host foreign host	Local host is the IP address and the port number of the local system used for the peering session. Foreign host is the IP address and the port of the neighbor. BGP always uses the TCP port number 179 for the peer originating the session.
nexthop	The IP address of the next hop used to reach the neighbor. eBGP or iBGP peers do not need to be directly connected. Peering sessions can be set up across multiple hops. If the neighbors are directly connected, the IP address of the local system is listed as the next hop.
nexthop global	The global IPv6 address of the next hop
nexthop local	The link-local IPv6 address of the next hop
non shared network	The peering session is running on a non shared network.
last reset	Time since this peering session was last reset. The reason for the reset is displayed on this line.
notification error message	Last error message sent.

show bgp neighbors advertised-routes

Use this command to display the routes advertised to a BGP neighbor.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes (vrf
  (VRFNAME|all|default))
show ip bgp neighbors (A.B.C.D|X:X::X:X) advertised-routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) advertised-routes
```

Parameters

`A.B.C.D`	IPv4 neighbor
`X:X::X:X`	IPv6 neighbor
`ipv4`	IPv4 addresses
`multicast`	Multicast prefixes
`unicast`	Unicast prefixes
`vrf`	VPN Routing/Forwarding instance name

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp ipv4 multicast neighbors 1.2.3.4 advertised-routes
```

show bgp neighbors received prefix-filter

Use this command to display the prefix list filter.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp neighbors (A.B.C.D|X:X::X:X) received prefix-filter
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received prefix-
  filter
```

Parameters

`A.B.C.D`	IPv4 address
`X:X::X:X`	IPv6 address
`ipv4`	IPv4 addresses
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp neighbors 1.2.3.4 received prefix-filter
```

show bgp neighbors received-routes

Use this command to display the received routes from a neighbor.

To display all the received routes from a neighbor, perform a BGP soft reconfigure first.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) received-routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) received-routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) received-routes
```

Parameters

`A.B.C.D`	IPv4 address
`X:X::X:X`	IPv6 address
`ipv4`	IPv4 addresses
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp neighbors 10.10.10.2 received-routes
```

show bgp neighbors routes

Use this command to display all accepted routes learned from neighbors.

Command Syntax

```
show bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp neighbors (A.B.C.D|X:X::X:X) routes
show ip bgp ipv4 (unicast|multicast) neighbors (A.B.C.D|X:X::X:X) routes
```

Parameters

`A.B.C.D`	IPv4 address
`X:X::X:X`	IPv6 address
`ipv4`	IPv4 addresses
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following output displays detailed information about the neighbor.

```
#show bgp neighbors 10.10.10.2 routes
BGP neighbor is fe80::203:47ff:feb0:d72b, remote AS 10, local AS 10, internal
link
  BGP version 4, remote router ID 10.10.10.50
  BGP state = Established, up for 00:02:01
  Last read 00:00:01, hold time is 180, keepalive interval is 60 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv6 Unicast: advertised and received
  Received 3 messages, 0 notifications, 0 in queue
  Sent 5 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 Unicast
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes
```

Table 5-122 explains the output fields.

Table 5-122: show bgp neighbors routes output details

Field	Description
BGP neighbor	Neighbor identifier along with the local and remote Autonomous System numbers.
BGP version	The version of BGP being used by the neighbor device, along with the remote router ID number.
BGP state	The current state of the neighbor connection and length of time within the current state. Possible states are: Idle, Connect, Active, and Established.
Last read	The amount of time in Hours**:** Minutes**:** Seconds since this device last checked the Hold Time parameters.
hold time	The amount of time this device waits for a Keepalive or Update message before the BGP connection is closed.
Keepalive interval	KEEPALIVE messages are sent periodically to ensure that the connection is live.
Neighbor capabilities	New or optional parameters called “Capabilities.” Provides a graceful way to advertise new or unique options without causing peering to terminate. The capabilities are communicated in TLV fields. (see RFC 3392). In the example output above, the following capabilities were advertised by the neighbor and were received and understood by this device: 1. Route refresh 2. Address family IPv4 Unicast 3. Address family IPv6 Unicast
Route refresh	This helps to identify that and synchronize the peers without a hard reset.
For address family	Address Family Identifier (AFI) IPv4 Unicast.
Received messages	Information received from the neighbors.
notifications	Passes information to a router about sessions.
in que	Number of messages currently residing in the queue awaiting action.
Route refresh request	Information received and sent.
Minimum time between advertisement runs	Interval between exchange of messages.
For address family: IPv4 Unicast	The following three values are subordinate to the IPv4 Unicast Address Family.
Community attributes sent to this neighbor	Both the standard and the extended community information has been sent to the neighbor.
accepted prefixes	Configure a limit to the number of prefixes that can be accepted in a BGP peer session.
announced prefixes	A prefix announced in BGP consists of the IPV4 or IPV6 address block being announced.

show bgp nexthop-tracking

Use this command to display BGP nexthop-tracking status.

Command Syntax

```
show bgp nexthop-tracking
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp nexthop-tracking

Configured NHT: ENABLED
NHT Delay time-interval : 6
BGP VRF: (Default) VRF_ID 0
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Recvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0

BGP VRF: VRF_A VRF_ID 2
BGP Instance: (Default), AS: 100, router-id 4.4.4.40
NHT is Enabled
Recvd Msg count from RIB: 0
NHT delay-timer remaining seconds: 0
BGP nexthop(s):
Total number of IPV4 nexthops : 0
Total number of IPV6 nexthops : 0
```

Table 5-123 explains the output fields.

Table 5-123: show bgp nexthop-tracking output details

Field	Description
Configured NHT	Whether Next Hop Tracking (NHT) is enabled or disabled.
NHT Delay time-interval	A delay timer that indicates how long this device waits before checking its RIB for changes.

Table 5-123: show bgp nexthop-tracking output details

Field	Description
BGP VRF	Name and ID number of this BGP VRF.
BGP Instance	Autonomous System number and router ID.
NHT is Enabled	NHT Network enables the measurement and comparison of performance.
Recvd Msg count from RIB	Number of received change-messages from the RIB.
NHT delay-timer remaining seconds	Time remaining until the next decision cycle.
BGP nexthop(s)	Nexthop in the BGP to reach a certain destination.
Total number of IPV4 nexthops	Number of nexthops in the IPv4 Address Family.
Total number of IPV6 nexthops	Number of nexthops in the IPv6 Address Family.

show bgp nexthop-tree-details

Use this command to display BGP nexthop-tree details.

Command Syntax

```
show bgp nexthop-tree-details
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp nexthop-tree-details
BGP Instance: (Default), AS: 65534, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0

BGP Instance: (Default), AS: 0, router-id 51.1.1.3
AFI_IP Nexthop count : 0
AFI_IP6 Nexthop count : 0
```

Table 5-124 explains the output fields.

Table 5-124: show bgp nexthop-tree-details output details

Field	Description
Bgp Instance	The Autonomous System number and router ID.
AFI_IP Nexthop count	Nexthop count for the IPv4 Address Family
AFI_IP6 Nexthop count	Nexthop count for the IPv6 Address Family

show bgp paths

Use this command to display BGP path information.

Command Syntax

```
show bgp paths
show bgp (ipv6) paths
show ip bgp paths
show ip bgp ipv4 (unicast|multicast) paths
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp paths

Address        Refcnt    Path
[0x1af8ee0:0]   (21)
[0x1b3ceb0:345] (14)     64602
[0x1c71d40:821] (12008)  64602 65500
[0x1d03fb0:822] (12008)  64602 65501
```

Table 5-125 explains the output fields.

Table 5-125: show bgp paths output details

Field	Description
Address	Hash and hash key separated by the colon character.
Refcnt	Number of routed using that path.
Path	Autonomous System Number (ASN) for the route.

show bgp prefix-list

Use this command to display routes matching the prefix-list.

Command Syntax

```
show bgp prefix-list WORD
show bgp (ipv4|ipv6) (unicast|multicast|) prefix-list WORD (vrf
  (VRFNAME|all|default|))
show ip bgp prefix-list WORD
show ip bgp prefix-list WORD (exact-match)
show ip bgp prefix-list WORD (exact-match) (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) prefix-list WORD
show ip bgp ipv4 (unicast|multicast) prefix-list WORD (exact-match)
```

Parameters

`WORD`	Name of the IP prefix list
`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`exact-match`	Exact match of the prefix list
`vrf`	VPN Routing/Forwarding instance
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp prefix-list mylist
```

show bgp quote-regexp

Use this command to display route matching an AS path quoted regular expression.

Command Syntax

```
show bgp quote-regexp WORD
show bgp (ipv4|ipv6) (unicast|multicast|) quote-regexp WORD
show ip bgp quote-regexp WORD
show ip bgp ipv4 (unicast|multicast) quote-regexp WORD
```

Parameters

`WORD`	A regular expression to match the AS paths. Use quotes to enclose the regular expression.
`ipv4`	IPv4 route information
`ipv6`	IPv6 route information
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp quote-regexp "myPath"
```

show bgp regexp

Use this command to display routes matching the AS path regular expression.

Command Syntax

```
show bgp regexp LINE
show bgp (ipv4|ipv6) (unicast|multicast) regexp LINE
show bgp (ipv6) regexp LINE
show ip bgp regexp LINE
show ip bgp regexp LINE (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) regexp LINE
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`LINE`	A regular expression to match the AS paths
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp regexp myPath
```

show bgp route-map

Use this command to display routes that match the specified route map.

Command Syntax

```
show bgp route-map WORD
show bgp (ipv4|ipv6) (unicast|multicast) route-map WORD
show bgp (ipv6) route-map WORD
show ip bgp route-map WORD
show ip bgp route-map WORD (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) route-map WORD
```

Parameters

`WORD`	Routes matching the route-map
`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`vrf`	VPN routing/forwarding instance
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp route-map myRM
```

show bgp statistics

Use this command to display BGP statistics.

Command Syntax

```
show bgp statistics
```

Parameters

None

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp statistics

============================================================

#
```

show bgp summary

Use this command to display a summary of BGP neighbor status.

Command Syntax

```
show bgp summary
show bgp (ipv4|ipv6) (unicast|multicast|) summary
show ip bgp summary
show ip bgp summary (vrf (VRFNAME|all|default))
show ip bgp ipv4 (unicast|multicast) summary
```

Parameters

`ipv4`	IPv4 routes
`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp summary

BGP router identifier 6.6.6.6, local AS number 64601

BGP table version is 1

1 BGP AS-PATH entries

0 BGP community entries

Neighbor V   AS   MsgRcv    MsgSen TblVer   InQ   OutQ    Up/Down   State/PfxRcd

*12.1.1.24 64902    7          7       1      0      0   00:02:54       0

* Dynamically created based on a listen range command

BGP dynamic peer-group: group1
```

```
listen range:  12.1.0.0/16
Total number of dynamically created neighbors/limit: 1/(200)
Total number of dynamically created neighbors: 1
Total number of activated dynamic peer-groups for IPv4 Unicast address-family:
Total number of neighbors 1
Total number of Established sessions 1

BGP dynamic peer-group: group2
listen range:  12.2.0.0/16
Total number of dynamically created neighbors/limit: 0/(200)
Total number of dynamically created neighbors: 0
Total number of activated dynamic peer-groups for IPv4 Unicast address-family: 1
```

Header

```
BGP router identifier 10.10.15.50, local AS number 65000
1 BGP AS-PATH entries
0 BGP community entries
```

- The BGP router identifier is 10.10.15.50 and the local router AS number is 65000.
- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- There is one BGP AS-PATH entry and no community entries.

Neighbor Entry Fields

Table 5-126 explains the fields for each neighbor entry.

Table 5-126: neighbor entry fields

Field	Description
Neighbor	IP address of peer.
V	BGP version of peer.
AS	Autonomous system number of peer.
MsgRcvd	Messages received since the BGP connection was established.
MsgSent	Messages sent since the BGP connection was established.
TblVer	Last version of the local router's BGP database advertised to the peer.
InQ	Received messages waiting in the input queue for further processing.
OutQ	Messages waiting in the output queue to be sent.

Table 5-126: neighbor entry fields (Continued)

Field	Description
Up/Down	Connection up time and down time.
State/PfxRcd	If the TCP session is up and the BGP peers have formed an adjacency, this field shows how many prefixes have been received from the remote neighbor. Other states: Idle: The local router has not allocated resources for the peer connection, so incoming connection requests are refused Idle (Admin): The peer has shut down Idle (PfxCt): Prefix overflow Idle (G-shut): Graceful shutdown Connect: BGP is waiting for the TCP connection to complete Active: the local router is trying to establish a TCP connection to the remote peer. You might see this if the local peer has been configured, but the remote peer is unreachable or has not been configured. OpenSent: BGP is waiting for an open message from its peer OpenConfirm: BGP received an open message from the peer and is now waiting for a keepalive or notification message. If BGP receives a keepalive message from the peer, the state changes to established. If the message is a notification, the state changes to idle. Established: BGP is ready to exchange update, notification, and keepalive messages with its peer Invalid: The session state is invalid

Neighbor Entry Example

```
10.10.14.51   4   100  93       120     0      0    0     00:42:16        0
```

- The neighbor has the IP address 10.10.14.51 and AS number 100.
- The neighbor uses BGP version 4.
- 93 messages have been received.
- 120 messages have been sent.
- The BGP routing table version is 0.
- There are no received messages waiting in the input queue for further processing.
- There are no messages waiting in the output queue to be sent.
- The connection has been up for 0 hours, 42 minutes and 53 seconds.
- The local router has received no prefixes from this neighbor.

show bgp view

Use this command to display information for a BGP view.

Command Syntax

```
show bgp ipv6 view WORD
show ip bgp view WORD
show ip bgp view WORD A.B.C.D
show ip bgp view WORD A.B.C.D/M
show ip bgp view WORD ipv4 (unicast|multicast) summary
show ip bgp view WORD neighbors
show ip bgp view WORD neighbors (A.B.C.D|X:X::X:X)
show ip bgp view WORD summary
```

Parameters

ipv6	IPv6 addresses
WORD	BGP view name
A.B.C.D	Network in the BGP routing table
A.B.C.D/M	IP prefix <network>/<length>, e.g., 35.0.0.0/8, in the BGP routing table
ipv4	IPv4 addresses
multicast	Multicast prefixes
unicast	Unicast prefixes
summary	Summary of BGP neighbor status
neighbors	Detailed information on TCP and BGP neighbor connections
A.B.C.D	IPv4 neighbor
X:X::X:X	IPv6 neighbor

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp view I2
BGP table version is 0, local router ID is 10.10.10.50
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i -
internal
Origin codes: i - IGP, e - EGP, ? - incomplete

   Network          Next Hop            Metric LocPrf Weight Path
*>i100.156.70.0/24  10.10.10.52                  0      0 i
*>i100.156.71.0/24  10.10.10.52                  0      0 i
*>i100.156.72.0/24  10.10.10.52                  0      0 i
```

```
*>i100.156.73.0/24  10.10.10.52                    0      0 i
*>i100.156.74.0/24  10.10.10.52                    0      0 i

Total number of prefixes 5
```

show bgp X:X::X:X

Use this command to display BGP network information in an IPv6 environment.

Command Syntax

```
show bgp X:X::X:X
show bgp (ipv6) X:X::X:X
show bgp (ipv6) (unicast|multicast) X:X::X:X
```

Parameters

`ipv6`	IPv6 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`X:X::X:X`	IPv6 prefix (network), for example, 2003::

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bgp ipv6 3ffe::8
```

show bgp X:X::X:X/M longer prefixes

Use this command to display BGP network information along with mask information.

Command Syntax

```
show bgp X:X::X:X/M longer-prefixes
```

Parameters

`X:X::X:X/M`	IPv6 prefix (network/length), for example, 2003::/16

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show bgp 3ffe::8/8 longer-prefixes
```

show debugging bgp

Use this command to display BGP debugging options.

Command Syntax

```
show debugging bgp
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the show debugging bgp command.

```
#show debugging bgp
BGP debugging status:
 BGP debugging is on
 BGP events debugging is on
 BGP updates debugging is on
 BGP fsm debugging is on
```

show ip bgp

Use this command to display BGP routes.

Command Syntax

```
show ip bgp
show ip bgp ipv4 (unicast|multicast)(vrf (VRFNAME|all|default))
```

Parameters

`ipv4`	IPv4 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes
`VRFNAME`	VPN routing/forwarding instance name
`all`	All VRFs
`default`	Default VRF

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows routes learned from both iBGP and eBGP peers.

```
#show ip bgp
BGP table version is 0, local router ID is 10.100.0.77
Status codes: s suppressed, d damped, h history, * valid, > best, i - internal, S stale,
      Origin codes: i - IGP, e - EGP,? - incomplete
       Network             Next Hop      Metric LocPrf   Weight   Path
   *> 172.16.1.0/24     10.10.10.78                          0       1 4 i
   *> 192.16.1.0        10.10.10.78       200                0       1 4 ?
   *                    10.100.0.62       100                0       3 4 ?
   *>i 192.17.1.0       10.100.0.62                 100      0       i

Total number of prefixes 2
```

Header

```
BGP table version is 0, local router ID is 10.100.0.77
```

- The BGP table version tracks the local BGP table version. Any time the BGP best path algorithm executes, the table version increments.
- The Router ID of the local router is `10.100.0.77`.

```
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i - internal
```

Table 5-127 explains the status codes in the header.

Table 5-127: status codes

Status code	Description	Comments
s	suppressed	Whether the route is suppressed and will not be advertised to the neighbors.
d	damped	When the penalty of a flapping route exceeds the suppress limit, the route is damped and remains in a withdrawn state until its penalty decreases below the reuse limit.
h	history	When the penalty of a flapping route does not exceed the suppress limit, the route is not damped and BGP maintains a history of the flapping route.
p	stale	When the BGP neighbor from which a route is learned is in graceful restart, the route is retained in the BGP routing table, but marked as stale.
*	valid	Whether the route is valid. When a route is not suppressed, damped, or present in the history, it is valid.
>	best	The route selected as the best path and installed in the kernel routing table.
i	internal	Whether the route is learned from an iBGP peer. If this symbol is not present, the route was learned from an eBGP peer.

```
Origin codes: i - IGP, e - EGP, ? - incomplete
```

Table 5-128 explains the codes are at the end of each routing entry that show where the route originated.

Table 5-128: origin codes

Origin code	Description	Comments
i	IGP	The route originated from an Interior Gateway Protocol.
e	EGP	The route originated from an Exterior Gateway Protocol.
?	incomplete	Origin not known. Typically, these are routes redistributed from an Interior Gateway Protocol.

Route Entry Fields

Table 5-129 explains the fields shows for each route.

Table 5-129: route entry fields

Field	Description
Network	Network prefix installed in BGP. If multiple routes exist for the same prefix, only the first prefix is identified and others have blank spaces. The status codes are explained in Table 5-127.
Next Hop	IP address of the nexthop for this route.
Metric	Multiple-Exit Discriminator (MED). If there are multiple paths to the same destination from a single routing protocol, then the multiple paths have the same administrative distance and the best path is selected based on this metric. The path with the lowest metric is selected as the optimal path and installed in the routing table.

Table 5-129: route entry fields (Continued)

Field	Description
LocPrf	Local preference set with the `set local-preference` command. This value is used only with iBGP sessions within the local autonomous system to determine if a route towards a destination is the “best” one. The path with the highest local preference is preferred.
Weight	This field applies only to routes within an individual router. If a route was learned from a peer, it has a default weight of 0. All routes generated by the local router have a weight of 32,768.
Path and origin	The autonomous systems through which the prefix advertisement passed. The origin codes are explained in Table 5-128

Route Entry Examples

```
*> 172.16.1.0/24     10.10.10.78                            0    1 4 i
```

- The absence of status code “i” means the route is external and was learned from an eBGP peer.
- The “>” means this route is selected to be installed in the kernel routing table. Its network address is 172.16.1.0/24.
- The IP address of the nexthop for this route is 10.10.10.78.
- This route was learned from a peer, so it has a default weight of 0.
- The path “1 4” means the prefix advertisement passed through AS1 and AS4.
- The origin code “i” means the prefix was added by a network statement at an originating AS.

```
*> 192.16.1.0        10.10.10.78            200            0    1 4 ?
*                    10.100.0.62            100            0    3 4 ?
```

- The same prefix was learned from two different ASs, AS1 and AS3.
- The route learned from AS1 is chosen as the best route because AS1 has a lower Router ID (10.10.10.78) than AS2 (10.100.0.62). Although the metric of the route learned from AS1 is higher (200) than the route learned from AS3 (100), this attribute is not used in the best path selection decision because the metrics are compared only if the first (neighboring) AS is the same in the two paths.
- The origin code “?” indicates that the routes were learned through redistribution.

```
*>i192.17.1.0        10.100.0.62                     100     0    i
```

- The route is learned through an iBGP peer as indicated by the status code “i”.
- The preference of the route, used only with the local AS, is 100 (the default value).

show ip bgp cidr-only

Use this command to display routes with non-natural network masks.

Command Syntax

```
show ip bgp cidr-only
show ip bgp ipv4 (unicast|multicast) cidr-only
```

Parameters

`ipv4`	IPv4 routes
`unicast`	Unicast prefixes
`multicast`	Multicast prefixes

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show ip bgp cidr-only` command.

```
#show ip bgp cidr-only
BGP table version is 0, local router ID is 10.10.10.50
Status codes: s suppressed, d damped, h history, p stale, * valid, > best, i -
internal
Origin codes: i - IGP, e - EGP, ? - incomplete
   Network          Next Hop            Metric LocPrf Weight Path
*> 3.3.3.0/24       10.10.10.10                              0 11 i
Total number of prefixes 2
```

show ip bgp community-info

Use this command to list all BGP community information.

Command Syntax

```
show ip bgp community-info
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp community-info

Address Refcnt Community
```

show ip bgp peer-group

Use this command to list the BGP peer group information.

Command Syntax

```
show ip bgp peer-group <name>
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp peer-group group1
BGP dynamic peer-group is group1, EBGP, remote AS 64902
  BGP dynamic peer-group group1 listen range group members:
  12.1.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
  Peer-group member:
  *12.1.1.2
  Index 0, Offset 0, Mask 0x1
  0 accepted prefixes, 0 announced prefixes
```

show ip bgp peer-group vrf all

Use this command to list all BGP peer group VRF information.

Command Syntax

```
show ip bgp peer-group vrf all
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp peer-group vrf all
% VRF: VRF1

BGP dynamic peer-group is group2, EBGP, remote AS 64902
  BGP dynamic peer-group group2 listen range group members:
  12.2.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
% VRF: management
Peer-Group not found

% VRF: default

BGP dynamic peer-group is group1, EBGP, remote AS 64902
  BGP dynamic peer-group group1 listen range group members:
  12.1.0.0/16
  BGP version 4
Minimum time between advertisement runs is 30 seconds
For address family: IPv4 Unicast
  Peer-group member:
  *12.1.1.2
  Index 0, Offset 0, Mask 0x1
  0 accepted prefixes, 0 announced prefixes
```

show ip bgp rtfilter all

Use this command to display route target filters sent and received.

Command Syntax

```
show ip bgp rtfilter all
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp rtfilter all
```

show ip bgp scan

Use this command to display BGP scan status.

Command Syntax

```
show ip bgp scan
```

Parameters

None

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip bgp scan
BGP VRF: (Default) VRF_ID 0
BGP scan interval is 60 secs
scan remain-time: 3 secs
Current BGP nexthop cache:
BGP connected route:
 10.10.10.0/24
 10.10.11.0/24
```

show ip bgp vpnv4

Use this command to display information relating to VPNv4.

Command Syntax

```
show ip bgp vpnv4 all
show ip bgp vpnv4 all A.B.C.D
show ip bgp vpnv4 all neighbors
show ip bgp vpnv4 all neighbors A.B.C.D
show ip bgp vpnv4 all summary
show ip bgp vpnv4 all tags
show ip bgp vpnv4 rd WORD
show ip bgp vpnv4 rd WORD A.B.C.D
show ip bgp vpnv4 rd WORD label
show ip bgp vpnv4 rd WORD neighbors
show ip bgp vpnv4 rd WORD neighbors A.B.C.D
show ip bgp vpnv4 rd WORD summary
show ip bgp vpnv4 view WORD all
show ip bgp vpnv4 vrf NAME
show ip bgp vpnv4 vrf NAME A.B.C.D
show ip bgp vpnv4 vrf NAME label
show ip bgp vpnv4 vrf NAME summary
```

Parameters

`all`	Displays information about all VPNv4 NLRIs
`A.B.C.D`	Network
`neighbors`	TCP and BGP neighbor connections
`A.B.C.D`	Network
`summary`	Summary display
`tags`	BGP tags for prefixes
`rd`	Route distinguisher
`WORD`	BGP view name
`A.B.C.D`	Network
`label`	MPLS Labels for prefixes
`neighbors`	TCP and BGP neighbor connections
`A.B.C.D`	Network
`summary`	Summary display
`view`	VPNv4 NLRI-specific information
`WORD`	BGP view name

`vrf`	VRF VPNv4 NLRIs
`NAME`	VPN Routing/Forwarding instance name
`A.B.C.D`	Network
`label`	MPLS Labels for prefixes
`summary`	Summary display

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show ip bgp vpnv4 all` command displaying VPNv4 specific information

```
#show ip bgp vpnv4 all
   Network          Next Hop            Metric LocPrf Weight Path
Route Distinguisher: 100:1 (VRF1)
* i 10.10.9.0/24     10.10.0.1                0   141      0  65000 ?
*>  10.10.9.0/24     10.10.14.50              0            0  65000 ?
*>  10.10.10.0/24    10.10.14.50                           0  65000 ?
* i 10.10.15.0/24    10.10.0.1                    141      0  65000 ?
*>  10.10.15.0/24    10.10.14.50              0            0  65000 ?

#show ip bgp vpnv4 all neighbors

BGP neighbor is 24.10.10.2, remote AS 65000, local AS 65000, internal link
  BGP version 4, remote router ID 179.112.0.1
  BGP state = Established, up for 10:04:14
  Last read 10:04:14, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (new)
    Address family IPv4 Unicast: advertised and received
    Address family IPv4 Multicast: received
    Address family IPv6 Unicast: received
  Received 1641 messages, 0 notifications, 0 in queue
  Sent 1280 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
 For address family: IPv4 Unicast
  BGP table version 676, neighbor version 676
  Index 2, Offset 0, Mask 0x4
  Community attribute sent to this neighbor (both)
  60000 accepted prefixes
  0 announced prefixes

 Connections established 2; dropped 1
Local host: 24.10.10.1, Local port: 179
Foreign host: 24.10.10.2, Foreign port: 32959
Nexthop: 24.10.10.1
Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
```

Table 5-130 explains the fields shows for each route.

Table 5-130: show ip bgp vpnv4 all neighbors output details

Field	Description
BGP neighbor	Router ID of the BGP neighbor.
remote AS	Autonomous system number of the neighbor.
local AS	Autonomous system number of the local system.
internal link	internal link: iBGP neighbor (in the same AS).
BGP version	The version of BGP being used by the neighbor device.
BGP state	The current state of the neighbor connection and length of time within the current state.Possible states are: Idle, Connect, Active, and Established.
Last read	The amount of time in Hours **:** Minutes **:** Seconds since this device last checked the Hold Time parameters.
hold time	The amount of time this device waits for a Keepalive or Update message before the BGP connection is closed.
Keepalive interval	KEEPALIVE messages are sent periodically to ensure that the connection is live.
Neighbor capabilities	New or optional parameters called “Capabilities.” Provides a graceful way to advertise new or unique options without causing peering to terminate. The capabilities are communicated in TLV fields. (see RFC 3392). In the example output above, the following capabilities were advertised by the neighbor and were received and understood by this device: 1. Route refresh 2. Address family IPv4 Unicast 3. Address family IPv6 Unicast
Received	Message count, notification count, number of messages waiting in the queue.
Sent	Message count, notification count, number of messages waiting in the queue.
Route refresh request	Route requests sent and received.
For address family	As stated – in this case IPv4 Unicast.
BGP table version	For each of the address families agreed upon, BGP maintains a separate table.
neighbor version	Tracks prefixes that have been sent and those that need to be sent.
connections established	The number of times the router has established a TCP connection and the two peers have agreed to speak BGP with each other. “Dropped” means the number of time the connection has failed or gone down.
local host foreign host	Local host is the IP address and the port number of the local system used for the peering session. Foreign host is the IP address and the port of the neighbor. BGP always uses the TCP port number 179 for the peer originating the session.

Table 5-130: show ip bgp vpnv4 all neighbors output details (Continued)

Field	Description
nexthop	The IP address of the next hop used to reach the neighbor. eBGP or iBGP peers do not need to be directly connected. Peering sessions can be set up across multiple hops. If the neighbors are directly connected, the IP address of the local system is listed as the next hop.
nexthop global	The global IPv6 address of the next hop
nexthop local	The link-local IPv6 address of the next hop
non shared network	The peering session is running on a non shared network.
last reset	Time since this peering session was last reset. The reason for the reset is displayed on this line.
notification error message	Last error message sent.

show ip bgp vpnv6 all neighbors

Use this command to display VPNv6 NLRI information for all neighbors or for a given neighbor.

Command Syntax

```
show ip bgp vpnv6 all neighbors
show ip bgp vpnv6 all neighbors (A.B.C.D|X:X::X:X)
```

Parameters

A.B.C.D	IPv4 neighbor address
X:X::X:X	IPv6 neighbor address

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ip bgp vpnv6 all neighbors
BGP neighbor is 10.32.0.3, remote AS 1, local AS 1, internal link
  BGP version 4, local router ID 10.32.0.2, remote router ID 10.32.0.3
  BGP state = Established, up for 00:37:31
  Last read 00:00:09, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
    Address family VPNv6 Unicast: advertised and received
  Received 25711 messages, 0 notifications, 0 in queue
  Sent 25673 messages, 1 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is lo
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 For address family: VPNv4 Unicast

```

show ip bgp vpnv6 rd neighbors

Use this command to display VPNv6 NLRI information for a given route distinguisher and optionally for a given neighbor.

Command Syntax

```
show ip bgp vpnv6 rd WORD neighbors
show ip bgp vpnv6 rd WORD neighbors (A.B.C.D|X:X::X:X)
```

Parameters

WORD	Route distinguisher
A.B.C.D	IPv4 neighbor address
X:X::X:X	IPv6 neighbor address

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ip bgp vpnv6 rd 1:1 neighbors
BGP neighbor is 10.32.0.3, remote AS 1, local AS 1, internal link
  BGP version 4, local router ID 10.32.0.2, remote router ID 10.32.0.3
  BGP state = Established, up for 00:43:57
  Last read 00:00:08, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
    Address family VPNv4 Unicast: advertised and received
    Address family VPNv6 Unicast: advertised and received
  Received 25726 messages, 0 notifications, 0 in queue
  Sent 25689 messages, 1 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 5 seconds
  Update source is lo
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 For address family: VPNv4 Unicast
  BGP table version 837, neighbor version 837
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
```

```
  0 accepted prefixes
  0 announced prefixes

 For address family: VPNv6 Unicast
  BGP table version 302, neighbor version 302
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (both)
  0 accepted prefixes
  0 announced prefixes

 Connections established 2; dropped 1
```

show ip extcommunity-list

Use this command to display BGP routes that match an extended community list.

Command Syntax

```
show ip extcommunity-list (WORD | )
show ip extcommunity-list (<1-199>|WORD)
show ip bgp extcommunity-list WORD (exact-match|)(vrf VRFNAME|)
```

Parameters

WORD	Name of extended community list
<1-199>	Number of extended community list
VRFNAME	VPN routing/forwarding instance name

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip extcommunity-list 33
```

show ip protocols

Use this command to display information about the IP protocols such as IP routing process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols bgp
```

Parameters

bgp	BGP information

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip protocols bgp
Routing Protocol is "bgp 100"
Sending updates every 30 seconds with +/-50%, next due in 12 seconds
Timeout after 180 seconds, garbage collect after 120 seconds
Outgoing update filter list for all interface is not set
Incoming update filter list for all interface is not set
Default redistribution metric is 1
Redistributing: connected static
Default version control: send version 2, receive version 2
Interface        Send  Recv   Key-chain
   eth0                2     2
Routing for Networks:
  10.10.0.0/24
Routing Information Sources:
  Gateway          BadPackets BadRoutes  Distance Last Update
 Distance: (default is 120)
```

Table 5-131 explains the fields shows for each route.

Table 5-131: show ip protocols output details

Field	Description
Routing Protocol is "bgp 100"	Specifies the routing protocol used.
Sending updates every 30 seconds	Specifies the time between sending updates.
Next due in 12 seconds	Precisely when the next update is due to be sent.
Timeout after 180 seconds	Specifies the value of the timeout parameter.
Redistributing	Lists the protocol that is being redistributed.

Table 5-131: show ip protocols output details

Field	Description
Routing for Networks	Specifies the networks for which the routing process is currently injecting routes.
Routing Information Sources	Lists all the routing sources the IP Infusion software is using to build its routing table.

show ip vrf

Use this command to display the routing information of the VRF, such as interface, route distinguisher, route-target, and so on.

Command Syntax

```
show ip vrf
show ip vrf WORD
```

Parameter

WORD	VRF name

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip vrf VRF_A
VRF VRF_A; (table=1)
```

Appendix A Regular Expressions

Table A-132 shows the regular expression special characters used in BGP commands. You can use these characters in combination to build complex regular expressions.

Table A-132: Regular expression characters

Symbol	Character	Meaning
^	Caret	Matches the beginning of the input string. When used at the beginning of a string of characters, it negates a pattern match.
$	Dollar sign	Matches the end of the input string.
.	Period	Matches a single character (including white spaces).
*	Asterisk	Matches none or more sequences of a pattern.
+	Plus sign	Matches one or more sequences of a pattern.
?	Question mark	Matches none or one occurrence of a pattern.
_	Underscore	Matches spaces, commas, braces, parenthesis, or the beginning and end of an input string.
[]	Brackets	A range of single-characters.
-	Hyphen	Separates the end points of a range.

VRF Lite Configuration Guide

Contents

This document contains these chapters and appendices:

CHAPTER 1 BGP Configuration

Overview

Border Gateway Protocol (BGP) makes core routing decisions on the Internet using a table of IP networks or “prefixes” which designate network reachability among autonomous systems (AS). BGP is a path vector protocol or a variant of a distance-vector routing protocol. BGP does not involve traditional Interior Gateway Protocol (IGP) metrics, but routing decisions are made based on path, network policies, and/or rule sets. For this reason, it is more appropriately termed a reachability protocol rather than routing protocol.

Topology

Figure 1-64: BGP topology for VRF

Configuration

R1

`#con t`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#rd 800:1`	Specify the route distinguisher in the VRF
`(config-vrf)#route-target import 800:1`	Specify the import route target
`(config-vrf)#route-target export 800:1`	Specify the export route target
`(config-vrf)#exit`	Exit VRF mode
`(config)#router bgp 200`	Enter the bgp configuration mode
`(config-router)#address-family ipv4 vrf  vrf1`	Enter address family mode for vrf1
`(config-router-af)#neighbor 2.2.2.2 remote-as 100`	Specify the BGP neighbor and remote-AS.
`(config-router-af)#exit`	Exit address family mode.
`(config-router)#ex`	Exit router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf1`	Associate the interface to vrf1
`(config-if)#ip address 2.2.2.1/24`	Configure the IP address 2.2.2.1 to eth1

R2

`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf1`	Create vrf1

(config-vrf)#rd 800:1	Specify the route distinguisher in the VRF
(config-vrf)#route-target import 800:1	Specify the import route target
(config-vrf)#route-target export 800:1	Specify the export route target
(config-vrf)#exit	Exit vrf mode
(config)#router bgp 100	Enter router mode.
(config-router)#address-family ipv4 vrf vrf1	Enter address family mode for vrf1
(config-router-af)#neighbour 2.2.2.1 remote-as 200	Specify the BGP neighbor and remote-as.
(config-router-af)#exit	Exit address family mode.
(config-router)#ex	Exit router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding vrf1	Associate the interface to vrf1
(config-if)#ip address 2.2.2.2/24	Configure the IP address 2.2.2.1 to eth1

Validation

Verify the routing table in R1:

```
#show ip bgp neighbors
BGP neighbor is 2.2.2.2, vrf vrf1, remote AS 2, local AS 1, external link
  BGP version 4, remote router ID 3.3.3.2
  BGP state = Established, up for 00:00:00
  Last read 00:00:00, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 2 messages, 0 notifications, 0 in queue
  Sent 2 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 0
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (standard)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 0
Local host: 2.2.2.1, Local port: 48116
Foreign host: 2.2.2.2, Foreign port: 179
Nexthop: 2.2.2.1
Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
```

Verify the routing table in R2:

```
#show ip bgp neighbors
```

```
BGP neighbor is 2.2.2.1, vrf vrf1, remote AS 1, local AS 2, external link
  BGP version 4, remote router ID 2.2.2.1
  BGP state = Established, up for 00:02:01
  Last read 00:02:01, hold time is 90, keepalive interval is 30 seconds
  Neighbor capabilities:
    Route refresh: advertised and received (old and new)
    Address family IPv4 Unicast: advertised and received
  Received 6 messages, 0 notifications, 0 in queue
  Sent 6 messages, 0 notifications, 0 in queue
  Route refresh request: received 0, sent 0
  Minimum time between advertisement runs is 30 seconds
 For address family: IPv4 Unicast
  BGP table version 1, neighbor version 1
  Index 1, Offset 0, Mask 0x2
  Community attribute sent to this neighbor (standard)
  0 accepted prefixes
  0 announced prefixes

 Connections established 1; dropped 0
Local host: 2.2.2.2, Local port: 179
Foreign host: 2.2.2.1, Foreign port: 48116
Nexthop: 2.2.2.2
Nexthop global: ::
Nexthop local: ::
BGP connection: non shared network
[II]
```

R1

```
#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1

Gateway of last resort is not set
```

R2

```
#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
```

```
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1

Gateway of last resort is not set
```

Verify BGP Adjacency

Use the following show commands to verify the BGP adjacency:

```
show ip bgp neighbor
```

CHAPTER 2 VRF Configuration

Overview

Virtual routing and forwarding (VRF) is a technology that allows multiple instances of a routing table to co-exist within the same router at the same time. Because the routing instances are independent, the same or overlapping IP addresses can be used without conflicting with each other. VRF may be implemented in a network device by distinct routing tables known as forwarding information bases – one per routing instance.

Topology

Figure 2-65: Device topology

Default VRF

`#con t`	Enter the router configuration mode
`(config)#interface eth1`	Switch to interface eth1
`(config-if)#ip address 3.3.3.2/24`	Configure the ip address **`3.3.3.2`** to eth1
`(config-if)#exit`	Exit interface mode.

Adding a Static Route

`#con t`	Enter the router configuration mode
`(config)#ip route  20.20.20.0/24 eth1`	Add static route with eth1 as exit interface

User-Defined VRF

`#con t`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1. Use no ip vrf vrf-1 to delete the created vrf
`(config)#exit`	Exit configure mode.
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf1`	Associate eth1 to vrf1. Use no ip vrf forwarding vrf1 for un-configuration

(config-if)#ip address 3.3.3.2/24	Configure the IP address 3.3.3.2 to eth1
(config-if)#exit	Exit interface mode.

Adding a Static Route

#con t	Enter the router configuration mode
(config)# ip route vrf vrf1 20.20.20.0/24 eth1	Add static route in vrf1 with eth1 as exit interface

Validation

```
#show ip route vrf all
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "default"
C     127.0.0.0/8 is directly connected, lo, 00:14:59
C     192.168.52.0/24 is directly connected, eth0, 00:14:55
IP Route Table for VRF "management"
IP Route Table for VRF "vrf1"
C     3.3.3.0/24 is directly connected, eth1, 00:00:44
S     20.20.20.0/24 [1/0] is directly connected, eth1, 00:00:08

Gateway of last resort is not set
```

To display the IP routing table associated with a VRF, use the show ip route vrf vrf-name command

```
#sh ip route vrf vrf-1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
       ia - IS-IS inter area, E - EVPN,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "vrf-1"
C            3.3.3.0/24 is directly connected, eth1, 00:01:22
S            20.20.20.0/24 [1/0] is directly connected, eth1, 00:00:13

Gateway of last resort is not set
```

Use this show command to display the static routes configured

```
#sh ip route vrf  vrf-1 static
     IP Route Table for VRF "vrf-1"
     S            20.20.20.0/24 [1/0] is directly connected, eth1, 00:01:13

     Gateway of last resort is not set
```

CHAPTER 3 OSPF Configuration

Overview

Open Shortest Path First (OSPF) is an interior routing protocol operating within a single autonomous system (AS) that uses a link state routing algorithm. OSPF gathers link state information from available routers and constructs a topology map of the network. The topology determines the routing table presented to the Internet layer which makes routing decisions based solely on the destination IP address in IP packets.

This chapter covers OSPF configuration in non-default VRF.

Topology

Figure 3-66: OSPF topology for VRF

Configuration IPv4 VRF

R1

`#con t`	Enter the router config mode.
`(config)#ip vrf vrf1`	Create vrf1
`((config-vrf)#exit`	Exit VRF mode
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1.
`(config-router)#network 2.2.2.0/24 area 0`	Specify the network type and area 0.
`(config-router)#ex`	Exit the OSPF configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip vrf forwarding vrf1`	Associate eth1 to vrf1.
`(config-if)#ip address 2.2.2.1/24`	Assign the IP address 2.2.2.1 to eth1 in vrf1

R2

`#con t`	Enter the router config mode
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#router ospf 1 vrf1`	Associate the ospf process with vrf1
`(config-router)#network 2.2.2.0/24 area 0`	Specify the network type and area 0.

(config-router)#ex	Exit router mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip vrf forwarding vrf1	Associate eth1 to vrf1.
(config-if)#ip address 2.2.2.2/24	Assign the IP address 2.2.2.1 to eth1 in vrf1

Validation

R1

```
#show ip ospf neighbor
OSPF process 1 VRF(vrf1):
Neighbor ID     Pri   State       Dead Time   Address    Interface Instance ID
2.2.2.2         1   Full/Backup   00:00:30   2.2.2.2     eth1       0

#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1
Gateway of last resort is not set
```

R2

```
#show ip ospf neighbor
OSPF process 1 VRF(vrf1):
Neighbor ID   Pri   State    Dead Time   Address         Interface Instance ID
2.2.2.1       1   Full/DR    00:00:35    2.2.2.1           eth1    0

#show ip route vrf vrf1
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area
       N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
       E1 - OSPF external type 1, E2 - OSPF external type 2
       i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area,
       v - vrf leaked
       * - candidate default

IP Route Table for VRF "vrf1"
C       2.2.2.0/24 is directly connected, eth1
Gateway of last resort is not set
```

CHAPTER 4 ISIS Configuration

Overview

Intermediate System to Intermediate System (IS-IS) is an interior routing protocol operating within a single administrative domain.It is a link-state routing protocol, operating by reliably flooding link state information throughout a network of routers. Each IS-IS router independently builds a database of the network's topology, aggregating the flooded network information. IS-IS uses Dijkstra's algorithm for computing the best path through the network. Packets (datagrams) are then forwarded, based on the computed ideal path, through the network to the destination.

Topology

Figure 4-67: ISIS Topology for VRF

Configuration IPv4 VRF

R1

`#configure terminal`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#router isis 1 vrf1`	Associate the ISIS process to vrf1
`(config-router)#net 49.0001.0000.0000.0001.00`	Establish a network entity title for this instance, specifying the area address and the system ID.
`(config-router)#is-type level-1`	Configure instance 1 as level-1 routing
`(config-router)#exit`	Exit router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf1`	Associate the interface to vrf1
`(config-if)#ip address 2.2.2.1/24`	Configure the IP address 2.2.2.1 to eth1
`(config-if)#ip router isis 1`	Enable ISIS routing on an instance for area 49
`(config-if)#isis circuit-type level-1`	Configure interface as level-1
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit config mode

R2

#con t	Enter configuration mode.
(config)#ip vrf vrf1	Create vrf1
(config-vrf)#exit	Exit VRF mode
(config)#router isis 1 vrf1	Associate the ISIS process to vrf1
(config-router)#net 49.0001.0000.0000.0002.00	Establish a network entity title for this instance, specifying the area address and the system ID.
(config-router)#is-type level-1	Configure instance 1 as level-1 routing
(config-router)#exit	Exit router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding vrf1	Associate the interface to vrf1
(config-if)#ip address 2.2.2.2/24	Configure the IP address 2.2.2.1 to eth1
(config-if)#ip router isis 1	Enable ISIS routing on an instance for area 49
(config-if)#isis circuit-type level-1	Configure interface as level-1
(config-if)#exit	Exit interface mode
(config)#exit	Exit config mode

Validation

```

CHAPTER 5 ISIS IPv6 VRF Configuration

Overview

Intermediate System to Intermediate System (IS-IS) is an interior routing protocol operating within a single administrative domain.It is a link-state routing protocol, operating by reliably flooding link state information throughout a network of routers. Each IS-IS router independently builds a database of the network's topology, aggregating the flooded network information. IS-IS uses Dijkstra's algorithm for computing the best path through the network. Packets (datagrams) are then forwarded, based on the computed ideal path, through the network to the destination.

Topology

Figure 5-68: ISISv6 Topology for VRF

R1

`#configure terminal`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1
`(config-vrf)#exit`	Exit VRF mode
`(config)#router isis 1 vrf1`	Associate the ISIS process to vrf1
`(config-router)#net 49.0001.0000.0000.0001.00`	Establish a network entity title for this instance, specifying the area address and the system ID.
`(config-router)#is-type level-1`	Configure instance 1 as level-1 routing
`(config-router)#exit`	Exit router mode
`(config)#interface eth1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf1`	Associate the interface to vrf1
`(config-if)#ipv6 address 1000::1/64`	Configure ipv6 address on eth1
`(config-if)#ipv6 router isis 1`	Enable ISISv6 routing on an instance for area 49
`(config-if)#isis circuit-type level-1`	Configure interface as level-1
`(config-if)#exit`	Exit interface mode
`(config)#exit`	Exit config mode

R2

`#con t`	Enter configuration mode.
`(config)#ip vrf vrf1`	Create vrf1

(config-vrf)#exit	Exit VRF mode
(config)#router isis 1 vrf1	Associate the ISIS process to vrf1
(config-router)#net 49.0001.0000.0000.0002.00	Establish a network entity title for this instance, specifying the area address and the system ID.
(config-router)#is-type level-1	Configure instance 1 as level-1 routing
(config-router)#exit	Exit router mode
(config)#interface eth1	Enter interface mode
(config-if)#ip vrf forwarding vrf1	Associate the interface to vrf1
(config-if)#ipv6 address 1000::2/64	Configure ipv6 address on eth1
(config-if)#ipv6 router isis 1	Enable ISISv6 routing on an instance for area 49
(config-if)#isis circuit-type level-1	Configure interface as level-1
(config-if)#exit	Exit interface mode
(config)#exit	Exit config mode

Open Shortest Path First Command Reference

Contents

This document contains these chapters and appendices:

CHAPTER 1 OSPFv2 Commands

This chapter provides an alphabetized reference for each of the OSPFv2 commands. It includes the following commands:

- show ip ospf database detail
- show ip ospf igp-shortcut-lsp
- show ip ospf igp-shortcut-route
- show ip ospf interface
- show ip ospf multi-area-adjacencies
- show ip ospf neighbor
- show ip ospf route
- show ip ospf valid
- show ip ospf virtual-links
- show ip protocols
- show ip route fast-reroute
- shutdown
- snmp restart ospf
- summary-address
- timers lsa arrival
- timers spf exp
- timers throttle lsa

area authentication

Use this command to enable authentication for an OSPF area. Specifying the area authentication sets the authentication to Type 1 authentication or simple text password authentication (details in RFC 2328). Setting up a Type 1 authentication configures a 64-bit field for that particular network. All packets sent on this network must have this configured value in their OSPF header. This allows only routers that have the same passwords to join the routing domain. Give all routers that are to communicate with each other through OSPF the same authentication password.

Use the ip ospf authentication-key command to specify a simple text password.

Use the ip ospf message-digest-key command to specify an MD5 password.

Use the no parameter to remove the authentication specification for an area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) authentication
area (A.B.C.D|<0-4294967295>) authentication message-digest
no area (A.B.C.D|<0-4294967295>) authentication
```

Parameters

`A.B.C.D`	OSPF Area ID in IPv4 address format.
`<0-4294967295>`	OSPF Area ID as 4-octet unsigned integer value.
`message-digest`	Enables MD5 authentication in the specified area ID.

Default

Null authentication

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 authentication message-digest

(config)#router ospf 100
(config-router)#no area 1 authentication
```

area default-cost

Use this command to specify a cost for the default summary route sent into a stub or NSSA area. This command provides the metric for the summary default route, generated by the area border router, into the NSSA or stub area. Use this option only on an area border router that is attached to the NSSA or stub area. Refer to the RFC 3101 for information on NSSA.

Use the no form of this command to remove the assigned default-route cost.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) default-cost <0-16777215>
no area (A.B.C.D|<0-4294967295>) default-cost
```

Parameters

A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
default-cost	Indicates the cost for the default summary route used for a stub or NSSA area.
<0-16777215>	Stub's advertised default summary cost. The default is 1.

Default

By default, route cost is 1

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example sets the default-cost to 10 for area 1.

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 default-cost 10

(config)#router ospf 100
(config-router)#no area 1 default-cost
```

area filter-list

Use this command to configure a filter to advertise summary routes on an Area Border Router (ABR).

This command suppresses incoming and outgoing summary routes between this area and other areas. You use this command in conjunction with the `prefix-list` and `access-list` commands.

Use the `no` form of this command to remove a filter.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) filter-list prefix WORD (in|out)
area (A.B.C.D|<0-4294967295>) filter-list access WORD (in|out)
no area (A.B.C.D|<0-4294967295>) filter-list prefix WORD (in|out)
no area (A.B.C.D|<0-4294967295>) filter-list access WORD (in|out)
```

Parameters

`A.B.C.D`	OSPF area ID as an IPv4 address.
`<0-4294967295>`	OSPF area ID as a decimal value.
`prefix`	Use prefix list to filter summary.
`WORD`	Name of the prefix list.
`access`	Use access list to filter summary.
`WORD`	Name of the access list.
`in`	Filter routes from other areas into this area.
`out`	Filter routes from this area into other areas.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#access-list 1 deny 172.22.0.0
(config)#router ospf 100
(config-router)#area 1 filter-list access 1 in
```

area nssa

Use this command to set an area as a Not-So-Stubby-Area (NSSA). There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. However, the external routes from other areas still do not enter the NSSA. You can configure an area to be a stub area or an NSSA, but not both.

This command simplifies administration when connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as a NSSA.

Use the no form of this command to remove this designation.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) nssa {translator-role (candidate|always)| stability-
  interval < 0-2147483647>|no-redistribution|default-information-originate (metric
  < 0-16777214>|metric-type <1-2>|metric <0-16777214> metric-type <1-2>|metric-
  type< 1-2> metric <0-16777214>|)|no-summary}

area (A.B.C.D|<0-4294967295>) nssa {translator-role (candidate|always|never)|
  stability-interval < 0-2147483647>|no-redistribution|default-information-
  originate (metric < 0-16777214>|metric-type <1-2>|metric <0-16777214> metric-type
  <1-2>|metric-type< 1-2> metric <0-16777214>|)|no-summary}

no area (A.B.C.D|<0-4294967295>) nssa

no area (A.B.C.D|<0-4294967295>) nssa {translator-role|stability-interval|no-
  redistribution |default-information-originate (route-map |) |no-summary}
```

Parameters

A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
translator-role	
	NSSA-ABR translator role
candidate	Translate NSSA-LSA to Type-5 LSA if router is elected.
never	Do not translate NSSA-LSA to Type-5 LSA.
always	Always translate NSSA-LSA to Type-5 LSA.
stability-interval	
	Stability timer for a NSSA area. If an elected translator determines its services are no longer required, it continues to perform its duties for this time interval. This minimizes excess flushing of translated Type-7 LSAs and provides a more stable translator transition.
<0-2147483647>	
	Stability interval in seconds.
no-redistribution	
	Do not redistribute into the NSSA.
default-information-originate	
	Originate Type-7 default LSA into the NSSA.

`metric`	Specify metric for default routes.
`<0-16777214>`	Specify metric value.
`metric-type`	Specify metric type (see RFC 3101).
`<1-2>`	Specify metric type: 1: Type 1 external route 2: Type 2 external route
`route-map`	OSPF default Route map reference.
`WORD`	Pointer to route-map entries.
`no-summary`	Do not inject inter-area routes into the NSSA.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#area 3 nssa translator-role candidate no-redistribution
default-information-originate metric 34 metric-type 2
```

area range

Use this command to summarize OSPF routes at an area boundary. A single summary route is then advertised to other areas by the Area Border Routers (ABRs). Routing information is condensed at area boundaries and outside the area. If the network numbers in an area are assigned in a way such that they are contiguous, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the no parameter with this command to disable this function.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D)
area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D) advertise
area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D) not-advertise
area (A.B.C.D|<0-4294967295>) range A.B.C.D A.B.C.D (advertise|non-advertise)
no area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D)
no area (A.B.C.D|<0-4294967295>) range (A.B.C.D/M | A.B.C.D A.B.C.D)
  (advertise|not-advertise)
```

Parameters

A.B.C.D	Area range prefix or length e.g. X.X.X.X/length
A.B.C.D	Area range prefix e.g. A.B.C.D
<0-4294967295>	OSPF Area ID as a decimal value.
A.B.C.D/M	The area range prefix and length.
advertise	Advertises this range.
not-advertise	Does not advertise this range.

Default

By default, area range is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 range 192.16.0.0/24

(config)#router ospf 100
(config-router)#no area 1 range 192.16.0.0/24
```

area stub

Use this command to define an area as a stub area. There are two stub area router configuration commands: the `stub` and `default-cost` commands. In all routers attached to the stub area, configure the area by using the `stub` option of the area command. For an area border router (ABR) attached to the stub area, use the `area default-cost` command.

Use the `no-summary` parameter with this command to define a totally stubby area. Define an area as a totally stubby area when routers in the area do not need to learn about summary LSAs from other areas.

Use the `no` form of this command to disable this function.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) stub
area (A.B.C.D|<0-4294967295>) stub no-summary
no area (A.B.C.D|<0-4294967295>) stub
no area (A.B.C.D|<0-4294967295>) stub no-summary
```

Parameters

`A.B.C.D`	OSPF Area ID in IPv4 address format.
`<0-4294967295>`	OSPF Area ID as a decimal value.
`no-summary`	Stops an ABR from sending summary link advertisements into the stub area.

Default

By default, no stub area is defined.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 stub no-summary
```

area virtual-link

Use this command to configure a link between two backbone areas that are physically separated through other non-backbone area.

In OSPF, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection. Configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these routers joined by a virtual link as if they were connected by an unnumbered point-to-point network.

Configure the hello-interval to be the same for all routers attached to a common network. A short hello-interval results in the router detecting topological changes faster but also an increase in the routing traffic. The retransmit-interval is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The transmit-delay is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet, are incremented by this amount. Set the transmit-delay to be greater than zero. Also, take into account the transmission and propagation delays for the interface. Include the transit area ID and the corresponding virtual link neighbor's router ID in each virtual link neighbor to properly configure a virtual link.

Use the `no` parameter with this command to remove a virtual link.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {authentication (message-
  digest|null|)|authentication-key LINE|message-digest-key <1-255> md5 LINE|dead-
  interval <1-65535>|hello-interval <1-65535>|retransmit-interval <1-
  3600>|transmit-delay <1-3600>}
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {authentication
  (messagedigest| null|)|authentication-key LINE|message-digest-key <1-255> md5
  LINE|deadinterval <1-65535>|hello-interval <1-65535>|retransmit-interval <1-
  3600>|transmit-delay <1-3600>}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
```

Parameters

`A.B.C.D`	OSPF Area ID in IPv4 address format.
`<0-4294967295>`	OSPF Area ID as a decimal value.
`A.B.C.D`	Specify IP address of the virtual link neighbor.
`authentication`	Enable authentication on this virtual link
`message-digest`	Cryptographic authentication.
`null`	Null authentication.
`authentication-key`	Set authentication key.
`LINE`	Authentication key ID of 8 characters.
`message-digest-key`	

	Set message digest key.
<1-255>	Set message digest key.
md5	Specify the MD5 key.
LINE	MD5 key.
dead-interval	The interval during which no packets are received and after which the router acknowledges a neighboring router as off-line.
<1-65535>	The interval in seconds. The default is 40 seconds.
hello-interval	The interval the router waits before it sends a hello packet.
<1-65535>	The interval in seconds. The default is 10 seconds.
retransmit-interval	
	The interval the router waits before it retransmits a packet.
<1-3600>	The interval in seconds. The default is 5 seconds.
transmit-delay	The interval the router waits before it transmits a packet.
<1-3600>	The interval in seconds. The default is 1 second
fall-over	Specify fall-over detection.
bfd	Bidirectional Forwarding Detection (BFD)

Default

Default intervals:

Dead interval : 40 seconds

Hello interval: 10 seconds

Retransmit interval: 5 seconds

Transmit delay: 1 second

Command Mode

Router mode

OcNOS version 1.3

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#area 1 virtual-link 10.10.11.50 hello 5 dead 10
```

auto-cost reference bandwidth

Use this command to control how OSPF calculates the default metric for the interface.

Use the no form of this command to assign cost based only on the interface bandwidth.

Command Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameters

<1-4294967>	The reference bandwidth in Mbps per second. The default is 100 Mbps.

Default

By default, OSPF calculates the OSPF metric for an interface by dividing the reference bandwidth by the interface bandwidth. The default value for the reference bandwidth is 100Mbps. The auto-cost command is used to differentiate high bandwidth links. For multiple links with high bandwidth, specify a larger reference bandwidth value to differentiate cost on those links.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#auto-cost reference-bandwidth 50

(config)#router ospf 100
(config-router)#no auto-cost reference-bandwidth
```

bfd all-interfaces

Use this command to enable Bidirectional Forwarding Detection (BFD) on all interfaces.

Use the no form of this command to disable BFD.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#bfd all-interfaces

(config)#router ospf 100
(config-router)#no bfd all-interfaces
```

capability cspf

Use this command to enable the CSPF (Constrained Shortest Path First) feature for an OSPFv2 or OSPFv3 instance.

Use the `no` parameter with this command to disable CSPF functionality for the OSPFv2 or OSPFv3 instance.

Command Syntax

```
capability cspf
no capability cspf
```

Parameters

None

Default

By default, CSPF functionality for the OSPFv2 or OSPFv3 instance is enabled.

When CSPF is enabled, `disable-better-protection` option is by default enabled for OSPFv2.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability cspf

(config)#router ospf 100
(config-router)#no capability cspf
```

capability lls

Use this command to enable link-local signaling feature on OSPF router.

Use no parameter to disable link-local signaling feature on OSPF router.

Command Syntax

```
capability lls
no capability lls
```

Parameters

None

Default

By default, capability lls is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability lls

(config-router)#no capability lls
```

capability opaque

Use this command to enable opaque-LSAs which are Type 9, 10 and 11 LSAs that deliver information used by external applications.

Use the no form of this command to disable the feature.

Command Syntax

```
capability opaque
no capability opaque
```

Parameters

None

Default

By default, opaque-LSA is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability opaque

(config)#router ospf 100
(config-router)#no capability opaque
```

capability te/traffic-engineering

Use this command to enable traffic engineering feature on OSPF router.

Use no parameter to disable traffic engineering feature on OSPF router.

Command Syntax

```
capability traffic-engineering
capability te
no capability traffic-engineering
no capability te
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#capability traffic-engineering

(config-router)#no capability traffic-engineering
```

capability vrf-lite

Use this command to apply multi-VRF capability to OSPF process or to decouple the PE router from the VPN backbone.

Use no parameter to deny multi-VRF capability to OSPF process or to avoid decoupling the PE router from the VPN backbone.

Command Syntax

```
capability vrf-lite
no capability vrf-lite
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#capability vrf-lite

(config-router)#no capability vrf-lite
```

clear ip ospf

Use this command to clear and restart all OSPF routing processes or a given OSPF routing process.

Command Syntax

```
clear ip ospf (<0-65535>|) process
```

Parameter

<0-65535>	Specify the process ID.

Command Mode

Privileged Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip ospf process
#clear ip ospf 555 process
```

compatible rfc1583

Use this command to restore the method used to calculate summary route costs per RFC.

RFC 1583 specified a method for calculating the metrics for summary routes based on the minimum metric of the component paths available. RFC 2328 specifies a method for calculating metrics based on maximum cost. With this change, it is possible that all of the ABRs in an area might not be upgraded to the new code at the same time. This command addresses this issue and allows the selective disabling of RFC 2328 compatibility.

Use the `no` parameter with this command to disable RFC 1583 compatibility.

Command Syntax

```
compatible rfc1583
```

```
no compatible rfc1583
```

Parameters

None

Default

By default, OSPF is RFC 2328 compatible

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#compatible rfc1583

(config)#router ospf 100
(config-router)#no compatible rfc1583
```

debug ospf

Use this command to specify debugging options for OSPF.

Use the `no` parameter with this command to disable this function.

Command Syntax

```
debug ospf (all|bfd|database-timer|events|ifsm|lsa|nfsm|nsm| packet|route|sr|)
debug ospf rib ({interface|redistribute}|)
no debug ospf (all|bfd|database-timer|events|ifsm|lsa|nfsm|nsm| packet|route|sr|)
undebug ospf (all|bfd|database-timer|events|ifsm|lsa|nfsm|nsm| packet|route|)
no debug all ospf
undebug all ospf
no debug all
no debug ospf rib ({interface|redistribute}|)
undebug all
```

Parameters

`all`	Enable or disable debugging for `ifsm`, `nsfm`, `lsa`, `nsm`, `events`, and `route`.
`bfd`	Debug Bidirectional Forwarding Detection (BFD)
`database-timer`	Debug OSPF rate-limiting values for LSA throttling (see debug ospf database-timer rate-limit)
`events`	Debug OSPF events information (see debug ospf events)
`ifsm`	Debug OSPF Interface State Machine (see debug ospf ifsm)
`lsa`	Debug OSPF Link State Advertisement (see debug ospf lsa)
`nfsm`	Debug OSPF Neighbor State Machine (see debug ospf nfsm)
`nsm`	Debug OSPF NSM information (see debug ospf nsm)
`packet`	Debug OSPF packets (see debug ospf packet)
`route`	Debug OSPF route information (see debug ospf route)
`rib`	Debug OSPF RIB information
`sr`	Debug OSPF segment routing information
`interface`	Debug OSPF RIB interface
`redistribute`	Debug OSPF RIB redistribute

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf all

#debug ospf bfd
#no debug ospf bfd
```

debug ospf database-timer rate-limit

Use this command to log when link-state advertisement (LSA) rate-limiting timers will expire. These messages are logged only when debug ospf lsa `generate` or debug ospf lsa `refresh` is enabled

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf database-timer rate-limit

no debug ospf database-timer rate-limit
undebug ospf database-timer rate-limit
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf database-timer rate-limit
#undebug ospf database-timer rate-limit
```

debug ospf events

Use this command to specify debugging options for OSPF event troubleshooting. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf events ({abr|asbr|lsa|nssa|os|router|vlink}|)

no debug ospf events ({abr|asbr|lsa|nssa|os|router|vlink}|)
undebug ospf events ({abr|asbr|lsa|nssa|os|router|vlink}|)
```

Parameters

abr	Debug OSPF ABR events.
asbr	Debug ASBR events.
lsa	Debug LSA events.
nssa	Debug NSSA events.
os	Debug OS interaction events.
router	Debug other router events.
vlink	Debug virtual link events.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf event abr
#debug ospf event asbr
#debug ospf event lsa
#no debug ospf event nssa
#debug ospf event os
#debug ospf event router
#debug ospf event vl
```

debug ospf ifsm

Use this command to specify debugging options for OSPF Interface Finite State Machine (IFSM) troubleshooting.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf ifsm ({events|status|timers}|)

no debug ospf ifsm ({events|status|timers}|)
undebug ospf ifsm ({events|status|timers}|)
```

Parameters

`events`	Debug IFSM event information
`status`	Debug IFSM status information
`timers`	Debug IFSM timer information

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf ifsm events
#debug ospf ifsm status
#debug ospf ifsm timers
```

debug ip ospf lfa

Use this command to specify the debugging options for OSPFv2 Loop-free Alternate path

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf lfa
no debug ip ospf lfa
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf lfa
```

debug ip ospf redist

Use this command to display debugging option for OSPF redistribute information

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf redist (detail|terse|)
no debug ip ospf redist (detail|terse|)
```

Parameters

`detail`	Debug OSPF redistribute detail information
`terse`	Debug OSPF redistribute summary information

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf redistribute detail
```

debug ip ospf retransmission

Use this command to display debug logs of OSPF retransmission information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf retransmission
no debug ip ospf retransmission
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf retransmission
```

debug ospf lsa

Use this command to specify debugging options for OSPF Link State Advertisements (LSA) troubleshooting.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf lsa ({flooding|generate|install|maxage|refresh}|)

no debug ospf lsa ({flooding|generate|install|maxage|refresh}|)
undebug ospf lsa ({flooding|generate|install|maxage|refresh}|)
```

Parameters

`flooding`	Debug LSA flooding.
`generate`	Debug LSA generation.
`install`	Debug LSA installation.
`maxage`	Debug the maximum age processing.
`refresh`	Debug LSA refresh.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ospf lsa refresh
#debug ospf lsa flooding
#debug ospf lsa install
#debug ospf lsa maxage
#debug ospf lsa generate
```

debug ospf nfsm

Use this command to specify debugging options for OSPF Neighbor Finite State Machines (NFSMs).

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf nfsm ({events|status|timers}|)

no debug ospf nfsm ({events|status|timers}|)
undebug ospf nfsm ({events|status|timers}|)
```

Parameters

events	Debug NFSM event information
status	Debug NFSM status information
timers	Debug NFSM timer information

Command Mode

Privileged Exec mode Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf nfsm events
#no debug ospf nfsm timers
```

debug ospf nsm

Use this command to specify debugging options for OSPF NSM information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf nsm ({interface|redistribute}|)

no debug ospf nsm ({interface|redistribute}|)
undebug ospf nsm ({interface|redistribute}|)
```

Parameters

`interface`	Debug NSM interface information.
`redistribute`	Debug NSM redistribute information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The `debug ospf nsm` command enables the display of debug information related to NSM.

```
#debug ospf nsm interface
#no debug ospf nsm redistribute
```

debug ospf packet

Use this command to specify debugging options for OSPF packets.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)

no debug ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)
undebug ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)
```

Parameters

`hello`	Debug OSPF hello packets.
`dd`	Debug OSPF database.
`ls-request`	Debug OSPF link state requests.
`ls-update`	Debug OSPF link state updates.
`ls-ack`	Debug OSPF link state acknowledgments.
`send`	Debug OSPF sent packets.
`recv`	Debug OSPF received packets.
`detail`	Debug OSPF detailed information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf packet detail
#debug ospf packet dd send detail
#no debug ospf packet ls-request recv detail
```

debug ospf rib

Use this command to display debug information about the interaction between the OSPF process and the Routing Information Base (RIB).

Use no parameter of this command to disable debugging output.

Command Syntax

```
debug ospf rib ({interface|redistribute}|)
no debug ospf rib ({interface|redistribute}|)
debug ip ospf ({client|redistribute}|)
no debug ip ospf ({client|redistribute}|)
undebug ospf rib ({interface|redistribute}|)
```

Parameters

`interface`	Debug RIB interface information.
`redistribute`	Debug RIB redistribute information.
`client`	Debug RIB client information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ospf rib interface
#no debug ospf rib redistribute
```

debug ospf route

Use this command to debug route calculation. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ospf route ({ase|ia|install|spf}|)
no debug ospf route ({ase|ia|install|spf}|)
undebug ospf route ({ase|ia|install|spf}|)
```

Parameters

ase	Debug OSPF external route calculation.
ia	Debug OSPF Inter-Area route calculation.
install	Debug OSPF route installation.
spf	Debug OSPF SPF calculation.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ospf route
#no debug ospf route ia
#debug ospf route install
```

default-information originate

Use this command to create a default external route into an OSPF routing domain.

Use the no parameter with this command to disable this feature.

The system acts like an Autonomous System Boundary Router (ASBR) when you use the `default-information originate` command to redistribute routes into an OSPF routing domain. An ASBR does not by default generate a default route into the OSPF routing domain.

When you give the `default-information originate` command, also specify a `route-map` to avoid a dependency on the default network in the routing table.

Command Syntax

```
default-information originate
default-information originate {metric <0-16777214>|metric-type (1|2)|?route-map
  WORD|always}
no default-information originate
no default-information originate {metric|metric-type|?route-map|always}
```

Parameters

`always`	Used to advertise the default route regardless of whether there is a default route.
`metric`	Sets the OSPF metric used in creating the default route.
`<0-16777214>`	Sets the OSPF metric used in creating the default route. The default metric value is 10. The value used is specific to the protocol.
`metric-type`	The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).
`1`	Sets OSPF External Type 1 metric.
`2`	Sets OSPF External Type 2 metric (default).
`route-map`	Route map.
`WORD`	Specify the name of route map.

Default

Sets the OSPF metric used in creating the default route. The default metric value is 10.

The value used is specific to the protocol. metric-type The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).

By default, 2 Sets OSPF External Type 2 metric.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#default-information originate always metric 23 metric-type 2
route-map myinfo

(config)#router ospf 100
(config-router)#no default-information originate metric metric-type route-map
```

default-metric

Use this command to set a default metric for OSPF.

A default metric facilitates redistributing routes with incompatible metrics. If the metrics do not convert, the default metric provides an alternative. Use this command to use the same metric value for all redistributed routes. Use this command in conjunction with the redistribute command.

Use the no parameter with this command to return to the default state.

Command Syntax

```
default-metric <1-16777214>

no default-metric
no default-metric <1-16777214>
```

Parameters

<1-16777214>	Default metric value.

Default

Built-in, automatic metric translations, as appropriate for each routing protocol.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#default-metric 100
```

distance

Use this command to set OSPF administrative distances.

The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 255 means that the routing information source cannot be trusted and should be ignored.

Use the no form of this command to restore the default value (110).

Command Syntax

```
distance <1-255>
distance <1-255> A.B.C.D/M (WORD|)
distance ospf {intra-area <1-255>|inter-area <1-255>|external <1-255>}
no distance <1-255>
no distance <1-255> A.B.C.D/M (WORD|)
no distance ospf {intra-area |inter-area |external}
```

Parameters

<1-255>	Used alone, this parameter specifies a default administrative distance used when no other specification exists for a routing information source.
intra-area	Routes within an area.
<1-255>	Distance for all routes within an area
inter-area	Routes from one area to another area.
<1-255>	Distance for all routes from one area to another area.
external	Routes from other routing domains learned by redistribution.
<1-255>	Distance for routes from other routing domains learned by redistribution.
A.B.C.D/M	Distance for routes to prefixes whose nexthop matches this address.
WORD	Name of access list to apply to route updates.

Default

By default, distance for each type of route (intra-, inter-, or external) is 110

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#distance ospf inter-area 20 intra-area 10 external 40
```

distribute-list

Use this command to filter networks in routing updates. This command redistributes other routing protocols into the OSPF routing table.

Use the no parameter with this command to disable this function.

Command Syntax

```
distribute-list WORD out (kernel|connected|static|rip|bgp|isis|ospf (<1-65535>|))
distribute-list WORD in
no distribute-list WORD out (kernel|connected|static|rip|bgp|isis|ospf (<1-65535>|))
no distribute-list WORD in
```

Parameters

`WORD`	Specify the name of the access list.
`in`	Filter incoming routing updates.
`out`	Filter outgoing routing updates.
`kernel`	Specify kernel routes.
`connected`	Specify connected routes.
`static`	Specify static routes.
`rip`	Specify RIP routes.
`bgp`	Specify BGP routes.
`isis`	Specify IS-IS routes.
`ospf`	Specify OSPF process.
`<1-65535>`	Specify OSPF process ID <1-65535>. If not specified, this command redistribute OSPF instance with process ID 0.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the distribution of BGP routing updates based on the access list `list1` (network 172.10.0.0).

```
#configure terminal
(config)#access-list list1 permit 172.10.0.0
(config)#router ospf 100
(config-router)#distribute-list list1 out bgp
```

```
(config-router)#redistribute bgp
```

enable db-summary-opt

Use this command to enable the database summary list optimization for OSPFv2.

When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor, if the LSA instance in database summary list is the same as or less recent than the listed LSA in the database description packet received from the neighbor.

Use the no form of this command to disable database summary list optimization.

Command Syntax

```
enable db-summary-opt
```

```
no enable db-summary-opt
```

Parameters

None

Default

By default, database summary list optimization for OSPFv2 is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf
(config-router)#enable db-summary-opt
(config-router)#no enable db-summary-opt
```

fast-reroute keep-all-paths

Use this command to enable fast rerouting on all OSPF interfaces.

Use the no parameter with this command to disable fast rerouting.

Command Syntax

```
fast-reroute keep-all-paths
no fast-reroute keep-all-paths
```

Parameters

None

Defaults

By default, fast rerouting is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 200
(config-router)#fast-reroute keep-all-paths
```

fast-reroute terminate-hold-on interval

Use this command to set the delay of primary route installation (to avoid micro loop) after a failover.

Use the no form of this command to set the termination hold-on timer to its default value (600 milliseconds).

Command Syntax

```
fast-reroute terminate-hold-on interval <100-100000>
no fast-reroute terminate-hold-on interval
```

Parameters

<100-100000>Hold on interval in milliseconds

Defaults

600 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 1
(config-router)#fast-reroute terminate-hold-on interval 7000
(config-router)#no fast-reroute terminate-hold-on interval
```

fast-reroute tie-break

Use this command to set the tie-breaking policy for selecting a fast reroute repair path. You assign a priority to each type of repair path. The tie-breaker value is used to select an LFA FRR route when multiple LFA FRR routes are available for the same primary route.

Use the no form of this command to set the tie-break preference value for a protection type to its default value as shown in Table 1-133.

To set all types of repair paths to their default priorities, do not specify a repair path with the no form of this command.

Command Syntax

```
fast-reroute tie-break (primary-path|interface-disjoint|node-protecting|broadcast-
  interface-disjoint|downstream-path|secondary-path) index <1-255>

no fast-reroute tie-break

no fast-reroute tie-break (primary-path|interface-disjoint|node-
  protecting|broadcast-interface-disjoint|downstream-path|secondary-path)
```

Parameters

`primary-path` Use a path from the Equal-Cost Multipath Path (ECMP) set. An ECMP found during the primary shortest path first (SPF) repair might not be desirable in networks where traffic exceeds the capacity of any single link.

`interface-disjoint`

Prefer a backup path that uses a different interface than the interface used to reach destination via the primary path.

`node-protecting`

Bypass the `primary-path` gateway router which might not protect the router that is the next hop in the primary path. This ensures complete traffic protection even if the primary next-hop router fails.

`broadcast-interface-disjoint`

Do not use the interface if connected to a broadcast network. Repair paths protect links when a repair path and a protected primary path use *different* next-hop interfaces. However, on broadcast interfaces, if the repair path is computed via the same interface as the primary path, but their next-hop gateways are different, the router is protected but the link might not be.

`downstream-path`

Prefer a backup path to the destination which satisfies the downstream condition where the path cost to reach the destination from the LFA next hop is less than the path cost to the destination from the self node via primary next hop:

Distance_opt(N, D) < Distance_opt(S, D)

This might result in lost traffic, but prevents looping.

`secondary-path` Prefer a non-ECMP backup path.

`index` Tie break priority. A lower value has higher preference.

`<1-255>` Range of priority values.

Defaults

primary-path	20
interface-disjoint	60
node-protecting	30
broadcast-interface-disjoint	70
secondary-path	255
downstream-path	90

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 200
(config-router)#fast-reroute tie-break interface-disjoint index 1
```

host area

Use this command to configure a stub host entry belonging to a particular area.

Using this command, you can advertise specific host routes in the router-LSA as stub link. Since stub host belongs to the specified router, specifying cost is not important.

Use the no form of this command to remove the host area configuration.

Command Syntax

```
host A.B.C.D area (A.B.C.D|<0-4294967295>)
host A.B.C.D area (A.B.C.D|<0-4294967295>) cost <0-65535>
no host A.B.C.D area (A.B.C.D|<0-4294967295>)
no host A.B.C.D area (A.B.C.D|<0-4294967295>) cost (<0-65535>|)
```

Parameters

A.B.C.D	Specify IP address of the host.
area	Set the OSPF area ID
A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
cost	Specify cost for stub host entry.
<0-65535>	Specify cost for stub host entry.

Default

No host entry is configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#host 172.16.10.100 area 1
(config-router)#host 172.16.10.101 area 2 cost 10
```

ip ospf authentication

Use this command to send and receive OSPF packets with the specified authentication method on the current interface.

Use the no parameter with this command to disable the authentication.

Command Syntax

```
ip ospf authentication (null|message-digest|)
ip ospf A.B.C.D authentication (null|message-digest|)
no ip ospf (A.B.C.D|) authentication
```

Parameters

A.B.C.D	The IP address of the interface.
null	Use no authentication.
message-digest	Use message digest authentication.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In this example, interface eth0 is configured to have no authentication. This will override any text or MD5 authentication configured on this interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf authentication null
```

ip ospf authentication-key

Use this command to specify an OSPF authentication password for neighboring routers.

This command creates a password (key) that is inserted into the OSPF header when OcNOS originates packets. Assign a separate password to each network for different interfaces. All neighboring routers on the same network with the same password exchange OSPF routing data.

The key can be used only when authentication is enabled for an area with the `area authentication` command.

Simple password authentication allows a password to be configured for each area. Configure the routers in the same routing domain with the same password.

Use the `no` parameter with this command to remove an OSPF authentication password.

Command Syntax

```
ip ospf (A.B.C.D|) authentication-key WORD
ip ospf (A.B.C.D|) authentication-key 0 WORD
no ip ospf (A.B.C.D|) authentication-key
```

Parameters

`A.B.C.D`	The IP address of the interface.
`authentication-key`	
	Specify the authentication password.
`WORD`	Specify the OSPF Encrypted password (key) of 8 bytes.
`0`	Specify the unencrypted password (key).
`WORD`	Specify the OSPF password (key) up to maximum 8 characters.

Default

By default, no password used when exchanging OSPF routing data

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, an authentication key `test` is created on interface `eth0` in area `0`. Note that first authentication is enabled for area `0`.

```
#configure terminal
(config)#router ospf 100
(config-router)#network 10.10.10.0/24 area 0
(config-router)#area 0 authentication
(config-router)#exit
(config)#interface eth0
(config-if)#ip ospf 3.3.3.3 authentication-key test
```

ip ospf bfd

Use this command to enable Bidirectional Forwarding Detection (BFD).

Use this command with either the `no` or `disable` parameter to disable BFD.

Command Syntax

```
ip ospf bfd (disable|)
no ip ospf bfd (disable|)
```

Parameters

`disable`	Specify to disable BFD.

Default

By default, ip ospf bfd is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf bfd
```

ip ospf cost

Use this command to explicitly specify the cost of the link-state metric in a router-LSA.

The interface cost indicates the overhead required to send packets across an interface. This cost is stated in the Router-LSA's link. The cost is inversely proportional to the bandwidth of an interface. By default, the cost of an interface is calculated based on the bandwidth (10^8/ bandwidth). Use this command to set the cost manually.

Use the `no` parameter with this command to reset the cost to its default value.

Command Syntax

```
ip ospf (A.B.C.D|) cost <1-65535>
no ip ospf (A.B.C.D|) cost
```

Parameters

`A.B.C.D`	The IP address of the interface.
`<1-65535>`	Specify the link-state metric.

Default

By default, the cost of an interface is calculated based on the bandwidth (10^8/ bandwidth). The default cost value is 10.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the cost as 10 on interface `eth0` for IP address 10.10.10.50.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf 10.10.10.50 cost 10
```

ip ospf database-filter

Use this command to turn on the LSA database-filter for a particular interface.

OSPF floods new LSAs over all interfaces in an area, except the interface on which the LSA arrives. This redundancy ensures robust flooding. However, too much redundancy can waste bandwidth and might lead to excessive link and CPU usage in certain topologies, resulting in destabilizing the network. To avoid this, use this command to block flooding of LSAs over specified interfaces.

Use the no parameter with this command to turn off the filter.

Command Syntax

```
ip ospf (A.B.C.D|) database-filter all out
no ip ospf (A.B.C.D|) database-filter
```

Parameters

A.B.C.D	The IP address of the interface.

Default

Disabled, all outgoing LSAs are flooded to the interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf database-filter all out
```

ip ospf dead-interval

Use this command to set the interval during which the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down. This value is advertised in the router's hello packets. It must be a multiple of hello-interval and be the same for all routers on a specific network.

Use the no parameter with this command to return to the default time. If you have configured this command specifying the IP address of the interface and want to remove the configuration, use the no parameter with the specified IP address (`no ip ospf dead-interval A.B.C.D`).

Command Syntax

```
ip ospf (A.B.C.D|) dead-interval <1-65535>
no ip ospf (A.B.C.D|) dead-interval
```

Parameters

`A.B.C.D`	The IP address of the interface.
`dead-interval`	Specify the interval.
`<1-65535>`	Specify the interval in seconds.

Default

By default, dead interval is 40 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows configuring dead-interval for 10 seconds on eth0 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf dead-interval 10
```

ip ospf disable

Use this command to completely disable OSPF packet processing on an interface.

This command overrides the network command.

Use the no option with this command to return to the default setting.

Command Syntax

```
ip ospf disable all
no ip ospf disable all
```

Parameters

None

Default

By default, this feature is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf disable all
```

ip ospf fast-reroute per-prefix candidate disable

Use this command to prohibit the interface from being used as the next hop in a repair path.

Use the no option with this command to use the interface as the next hop in a repair path.

Command Syntax

```
ip ospf fast-reroute per-prefix candidate disable
no ip ospf fast-reroute per-prefix candidate disable
```

Parameters

None

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf fast-reroute per-prefix candidate disable
```

ip ospf flood-reduction

Use this command to enable flood reduction on an interface. When this command is configured, an LSA sent out on the interface is set with the DNA bit in the LSA age field. The LSA is not refreshed every refresh interval if there is no change in LSA. Only changed LSAs are sent out on the interface

Use the no option with this command to disable flood reduction on an interface.

Command Syntax

```
ip ospf flood-reduction
no ip ospf flood-reduction
```

Parameters

None

Default

By default, flood reduction on an interface is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip ospf flood-reduction

(config-if)#no ip ospf flood-reduction
```

ip ospf hello-interval

Use this command to specify the interval between hello packets.

The hello-interval is advertised in the hello packets. Configure the same hello-interval for all routers on a specific network. A shorter hello interval ensures faster detection of topological changes but results in more routing traffic.

Use the no parameter with this command to return to the default time.

Command Syntax

```
ip ospf (A.B.C.D|) hello-interval <1-65535>
no ip ospf (A.B.C.D|) hello-interval
```

Parameters

A.B.C.D	The IP address of the interface.
hello-interval	Specify the interval.
<1-65535>	Specify the interval in seconds.

Default

By default, hello interval is 10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the hello-interval for 3 seconds on interface eth0.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf hello-interval 3
```

ip ospf multi-area

Use this command to enable multi-area adjacency on point-to-point network and other network types. Multi-area adjacency establishes adjacency between the Area Border Routers (ABRs). The interface of the ABR where this command is configured, shall be associated with multiple areas.

Use the no parameter to disable multi-area adjacency on the given interface on point-to-point network.

Command Syntax

```
ip ospf <0-65535> multi-area (A.B.C.D|<0-4294967295>)(neighbor A.B.C.D |)
no ip ospf <0-65535> multi-area (A.B.C.D|<0-4294967295>)
```

Parameters

<0-65535>	OSPF process ID.
A.B.C.D	OSPF area ID in IP address format.
<0-4294967295>	OSPF area ID as a decimal value.
A.B.C.D	Neighbor IP address.

Default

By default, multi-area adjacency is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ip ospf 0 multi-area 1

(config-if)# no ip ospf 0 multi-area 1
```

ip ospf message-digest-key

Use this command to register an MD5 key for OSPF authentication.

Use the no parameter with this command to remove an MD5 key.

Message Digest Authentication is cryptographic authentication. A key (password) and key-id are configured on each router. The router uses an algorithm based on the OSPF packet, the key, and the key-id to generate a message digest that is appended to the packet.

Use this command for uninterrupted transitions between passwords. This is helpful for administrators who want to change the OSPF password without disrupting communication. The system begins a rollover process until all the neighbors have adopted the new password. This allows neighboring routers to continue communication while the network administrator is updating them with a new password. The router will stop sending duplicate packets once it detects that all of its neighbors have adopted the new password.

Maintain only one password per interface, removing the old password whenever you add a new one. This prevents the local system from continuing to communicate with the system that is using the old password. Removing the old password also reduces overhead during rollover. All neighboring routers on the same network must have the same password value to enable exchange of OSPF routing data.

Command Syntax

```
ip ospf (A.B.C.D|) message-digest-key <1-255> md5 LINE
no ip ospf (A.B.C.D|) message-digest-key <1-255>
```

Parameters

A.B.C.D	IPv4 address of the interface.
message-digest-key	
	Specify a key ID.
<1-255>	Specify a key ID.
md5	Specify a key (password).
LINE	Specify the OSPF password (1-16 characters).

Default

By default, MD5 key for OSPF authentication is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows OSPF authentication on the interface eth0 when IP address has not been specified.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf authentication message-digest
(config-if)#ip ospf message-digest-key 1 md5 yourpass
```

The following example shows OSPF authentication on the interface eth0 for the IP address 1.1.1.1. (If the interface has two IP addresses assigned-- 1.1.1.1 & 2.2.2.2, OSPF authentication will be enabled only for the IP address 1.1.1.1)

```
(config)#interface eth0
(config-if)#ip ospf 1.1.1.1 authentication message-digest
(config-if)#ip ospf 1.1.1.1 message-digest-key 2 md5 yourpass
```

ip ospf mtu

Use this command to set MTU size for OSPF to construct packets based on this value. Whenever OSPF constructs packets, it uses interface MTU size as Maximum IP packet size. This command forces OSPF to use the specified value overriding the actual interface MTU size.

This command does not configure the MTU settings in the kernel. OSPF does not recognize MTU size changes made in the kernel until the MTU size is updated through this command.

Use the `no` parameter with this command to return to the default value.

Command Syntax

```
ip ospf mtu <576-65535>
no ip ospf mtu
```

Parameters

`mtu`	Specify an MTU size.
`<576-65535>`	Specify an MTU size.

Default

By default, OSPF uses interface MTU derived from the kernel.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf mtu 1480
```

ip ospf mtu-ignore

Use this command to configure OSPF so that it does not check the MTU size during DD (Database Description) exchange.

Use the no form of this command to make OSPF check the MTU size during DD exchange.

Command syntax

```
ip ospf (A.B.C.D|) mtu-ignore
no ip ospf (A.B.C.D|) mtu-ignore
```

Parameters

A.B.C.D	IP address of the interface.

Default

By default, during the DD exchange process, OSPF checks the MTU size described in DD packets received from its neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-router)#ip ospf mtu-ignore
```

ip ospf network

Use this command to set the OSPF network type.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf network (broadcast|non-broadcast|point-to-multipoint|point-to-point)
ip ospf network point-to-multipoint non-broadcast
no ip ospf network
```

Parameters

`broadcast`	Sets the network type to broadcast.
`non-broadcast`	Sets the network type to NBMA.
`point-to-multipoint`	Sets the network type to point-to-multipoint.
`non-broadcast`	Sets the network type to NBMA.
`point-to-point`	Sets the network type to point-to-point.

Default

By default, OSPF network type is broadcast

Command Mode

interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the network to `point-to-point` type on the `eth0` interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf network point-to-point
```

ip ospf priority

Use this command to set the router priority to determine the designated router (DR) for the network.

A router with the higher router priority becomes the DR. If the priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with a nonzero priority value are eligible to become the designated or backup designated router. Configure router priority for broadcast or NBMA networks only and not for point-to-point networks.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf (A.B.C.D|) priority <0-255>
no ip ospf (A.B.C.D|) priority
```

Parameters

A.B.C.D	The IP address of the interface.
priority	Specify the router priority of the interface.
<0-255>	Specify the router priority of the interface. The default value is 1.

Default

By default, ip ospf priority is 1

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the OSPF priority value to 3 on the eth0 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf priority 3
```

ip ospf retransmit-interval

Use this command to specify the time between link-state advertisement (LSA) retransmissions for adjacencies belonging to the interface.

After sending an LSA to a neighbor, the router keeps the LSA until it receives an acknowledgement. If the router does not receive an acknowledgement during the retransmit interval, it retransmits the LSA. Set the retransmission interval value conservatively to avoid needless retransmission. The interval should be greater than the expected round-trip delay between two routers.

Use the `no` parameter with this command to return to the default value.

Command Syntax

```
ip ospf (A.B.C.D|) retransmit-interval <5-65535>
no ip ospf (A.B.C.D|) retransmit-interval
```

Parameters

`A.B.C.D`	The IPv4 address of the interface.
`retransmit-interval`	Specify the interval.
`<5-65535>`	Specify the interval in seconds.

Default

By default, retransmit interval is 5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the `ospf retransmit interval` to 6 seconds on the eth0 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf retransmit-interval 6
```

ip ospf transmit-delay

Use this command to set the estimated time it takes to transmit a link-state-update packet on the interface.

The transmit delay value adds a specified time to the age field of an update. If the delay is not added, the time in which the LSA transmits over the link is not considered. This command is especially useful for low speed links. Add transmission and propagation delays when setting the transmit delay value.

Use the no parameter with this command to return to the default value.

Command Syntax

```
ip ospf (A.B.C.D|) transmit-delay <1-65535>
no ip ospf (A.B.C.D|) transmit-delay
```

Parameters

`A.B.C.D`	The IPv4 address of the interface.
`transmit-delay`	Specify the time to transmit a link-state update.
`<1-65535>`	Specify the time in seconds to transmit a link-state update.

Default

By default, transmit delay is 1 second

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the OSPF transmit delay time to 3 seconds on the `eth0` interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ip ospf transmit-delay 3
```

log-adjacency-changes

Use this command for the router to send a SYSLOG message when an OSPF neighbor goes up or down.

Use no parameter of this command to stop sending SYSLOG message.

Command Syntax

```
log-adjacency-changes (detail|)
no log-adjacency-changes (detail|)
```

Parameters

`detail`	Sends a SYSLOG message for each state change, not just when a neighbor goes up or down.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#log-adjacency-changes
(config-router)#log-adjacency-changes detail
(config-router)#no log-adjacency-changes
(config-router)#no log-adjacency-changes detail
```

max-concurrent-dd

Use this command to limit the number of Database Descriptors (DD) that can be processed concurrently.

This command is useful when a router's performance is affected from simultaneously bringing up several OSPF adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPF instance, thus allowing for all of the adjacencies to come up.

Use the no option with this command to remove the limit.

Command Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameters

`<1-65535>`	Specify the number of DD processes.

Default

By default, max concurrent dd value is 64

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example set the `max-concurrent-dd` value to 4.

```
#configure terminal
(config)#router ospf 100
(config-router)#max-concurrent-dd 4
```

maximum-area

Use this command to configure the maximum number of OSPF areas.

Use the `no` parameter with this command to disable the limit.

Command Syntax

```
maximum-area <1-4294967294>
no maximum-area
```

Parameters

`<1-4294967294>` Specify the maximum number of OSPF areas.

Default

By default, ospf maximum area is 4294967294

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#maximum-area 5
```

neighbor

Use this command to configure OSPF routers interconnecting to NBMA (Non-Broadcast Multi-Access) networks. Include one neighbor entry for each known non-broadcast network neighbor. Configure the neighbor address on the primary address of the interface.

Use the no parameter with this command to remove a configuration.

Command Syntax

```
neighbor A.B.C.D
neighbor A.B.C.D (priority <0-255>|poll-interval <1-2147483647>)
no neighbor A.B.C.D
no neighbor A.B.C.D {priority (<0-255>|)|poll-interval (<1-2147483647>|)}
```

Parameters

A.B.C.D	Specify the interface IP address of the neighbor.
priority	Specify the router priority of the non-broadcast neighbor associated with the specified IP address.This parameter does not apply to point-to-multipoint interfaces.
<0-255>	Specify the router priority value of the non-broadcast neighbor associated with the specified IP address.
poll-interval	The reduced rate at which routers continue to send hello packets when a neighboring router has become inactive.
<1-2147483647>	Dead neighbor polling interval in seconds. Set this value much larger than hello interval.

Default

The default priority is 0 and polling interval is 120 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows neighbor configured with a priority value and poll interval time.

```
#configure terminal
(config)#router ospf 100
(config-router)#neighbor 1.2.3.4 priority 1 poll-interval 90
```

network

Use this command to enable OSPF routing with a specified area ID (and optionally an instance ID) on interfaces with IP addresses that match the specified network address.

OSPF routing is enabled per IPv4 subnet basis. You define the network address using the prefix length or a subnet mask.

Use the `no` parameter with this command to disable OSPF routing on the interfaces.

Command Syntax

Network address defined using the prefix length:

```
network A.B.C.D/M area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
no network A.B.C.D/M area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
```

Network address defined using subnet mask:

```
network A.B.C.D A.B.C.D area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
no network A.B.C.D A.B.C.D area (A.B.C.D|<0-4294967295>) (instance-id <0-255>|)
```

Parameters

`A.B.C.D/M`	IPv4 network address with prefix length.
`A.B.C.D`	IPv4 network address.
`A.B.C.D`	Subnet mask where the bits on left side are set to 1 to represent the network part and the bits on the right side are set to 0 to represent the host part.
`area`	OSPF area ID
`A.B.C.D`	OSPF area ID in IPv4 address format.
`<0-4294967295>`	OSPF area ID as a decimal value.
`instance-id`	Instance ID
`<0-255>`	Instance ID value.

Default

No network area is configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following the use of the `network` command with OSPF multiple-instance support disabled.

```
#configure terminal
(config-router)#network 10.0.0.0/8 area 3
(config-router)#network 10.0.0.0/8 area 1.1.1.1
```

The following shows the use of the network command with OSPF multiple-instance support enabled.

```
(config)#router ospf 100
(config-router)#network 10.0.0.0/8 area 3 instance-id 4
```

ospf abr-type

Use this command to set an OSPF Area Border Router (ABR) type.

Use the `no` parameter with this command to revert the ABR type to the default setting (`cisco`).

Specifying the ABR type allows better functioning in a multi-vendor environment. The ABR types are:

- Cisco (RFC 3509): A router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM (RFC 3509): A router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard (RFC 2328): A router is considered an ABR if it has more than one area actively attached to it.

Command Syntax

```
ospf abr-type (cisco|ibm|standard)
no ospf abr-type (cisco|ibm|standard|)
```

Parameters

`cisco`	Specify an alternative ABR using Cisco implementation. This is the default ABR type.
`ibm`	Specify an alternative ABR using IBM implementation.
`standard`	Specify a standard ABR.

Default

By default, ABR type is Cisco

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf abr-type ibm
```

ospf flood-reduction

Use this command to Enable flood reduction on all OSPF interface. When this command is configured, an LSA sent out on the OSPF interface is set with the DNA bit in the LSA age field. If there is no change in LSA, it is not refreshed every refresh interval. LSAs are sent out on the interface only if there is a change in an LSA

Use the no option with this command to disable flood reduction on all OSPF interfaces.

Command Syntax

```
ospf flood-reduction
no ospf flood-reduction
```

Parameters

None

Default

By default, flood reduction on all OSPF interfaces is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf flood-reduction

(config-router)#no ospf flood-reduction
```

ospf router-id

Use this command to specify a router ID for the OSPF process.

Configure each router with a unique router ID. In an OSPF router process which has active neighbors, a new router ID is used at the next reload or when you start the OSPF manually.

Use the no parameter with this command to force OSPF to use the previous router ID.

Command Syntax

```
ospf router-id A.B.C.D
router-id A.B.C.D

no ospf router-id
no router-id (A.B.C.D|)
```

Parameters

A.B.C.D	Specify the router ID in IPv4 address format.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows a specified router ID 2.3.4.5.

```
#configure terminal
(config)#router ospf 100
(config-router)#ospf router-id 2.3.4.5
```

overflow database

Use this command to limit the maximum number of LSAs that can be supported by the OSPF instance.

Use the no parameter with this command to have an unlimited number of LSAs.

Command Syntax

```
overflow database <0-4294967294> (hard|soft|)
no overflow database
```

Parameters

<0-4294967294>	The maximum number of LSAs
hard	Shutdown occurs if the number of LSAs exceeds the specified value.
soft	Warning message appears if the number of LSAs exceeds the specified value.

Default

No default value is specified. unlimited number of LSAs.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the database overflow to 5 and shutting down in that event.

```
#configure terminal
(config)#router ospf 100
(config-router)#overflow database 5 hard
```

overflow database external

Use this command to limits the number of AS-external-LSAs a router can receive once it is in the wait state.

Use the no parameter with this command to revert to default.

Command Syntax

```
overflow database external <0-2147483647> <0-65535>
no overflow database external
```

Parameters

<0-2147483647>	The maximum number of LSAs. This value should be the same on all routers in the AS.
<0-65535>	The number of seconds the router waits before trying to exit the database overflow state. If this parameter is 0, the router exits the overflow state only after an explicit administrator command.

Default

The default OSPF exit overflow interval is 0 second and number of external LSDB limit is unlimited.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the maximum number of LSAs to 5 and the time to recover from overflow state to be 3.

```
#configure terminal
(config)#router ospf 100
(config-router)#overflow database external 5 3
```

passive-interface

Use this command to suppress sending Hello packets on all interfaces or on a specified interface.

This command configures OSPF on simplex Ethernet interfaces. Since a simplex interface represents only one network segment between two devices, configure the transmitting interface as a passive interface. This ensures that OSPF does not send hello packets for the transmitting interface. Both the devices can see each other via the hello packet generated for the receiving interface.

Use the no form with this command to resume sending `hello` packets on all interfaces, or on a specified interface.

Command Syntax

```
passive-interface IFNAME
passive-interface (IFNAME A.B.C.D |)
no passive-interface IFNAME
no passive-interface (IFNAME A.B.C.D |)
```

Parameters

`IFNAME`	The name of the interface.
`A.B.C.D`	IP address of the interface.

Default

The default OSPF exit overflow interval is 0 second and number of external LSDB limit is 100000.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#passive-interface eth0
```

redistribute

This command redistributes routes from a routing protocol, static route, and kernel route into an OSPF routing table.

Use the no parameter with this command to disable this function.

Command Syntax

```
redistribute (kernel|connected|static|rip|bgp|isis|ospf (<1-65535>|)) {metric <0-
  16777214>|metric-type (1|2)|?route-map WORD|tag <0-4294967295>}
no redistribute (kernel|connected|static|rip|bgp|isis|ospf (<1-65535>|))
  metric|metric-type|?route-map|tag}
```

Parameters

kernel	Specify kernel routes.
connected	Specify connected routes.
static	Specify static routes.
rip	Specify RIP routes.
bgp	Specify BGP routes.
isis	Specify IS-IS routes.
ospf	Specify OSPF process.
<1-65535>	Specify an OSPF process ID to redistribute a particular OSPF instance into another OSPF instance. If not specified, this command redistribute OSPF instance with process ID 0.
metric	Specify the external metric.
<0-16777214>	Specify the external metric.
metric-type	Specify the external metric-type (see RFC 3101):
1	Set OSPF External Type 1 metrics.
2	Set OSPF External Type 2 metrics.
route-map	Specify a route map reference.
WORD	Specify name of the route-map.
tag	Tag value to use as a “match” value for controlling redistribution via route maps
<0-4294967295>	Specify the route tag.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ospf 100
(config-router)#redistribute bgp metric 12
```

The following example shows redistributing OSPF instance 2 into OSPF instance 1.

```
#configure terminal
(config)#router ospf 1
(config-router)#redistribute ospf 2
```

The following example shows redistributing OSPF instance 2 into OSPF instance 1, with an external metric of 10, metric type 1, a route-map named rmp1, and an external route tag of 3.

```
#configure terminal
(config)#router ospf 1
(config-router)#redistribute ospf 2 metric 10 metric-type 1 route-map rmp1 tag
3
```

router ospf

Use this command to enter router mode and to configure an OSPF routing process.

Specify the process ID to configure multiple instances of OSPF. When running a single instance of OSPF, you do not need to specify a process ID.

Use the no parameter with this command to terminate an OSPF routing process.

Command Syntax

```
router ospf
router ospf <1-65535>

no router ospf
no router ospf <1-65535>
```

Parameters

<1-65535>	Process ID; should be unique for each routing process.

Default

No routing process defined

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows the use of the `router ospf` command to enter router mode. Note the change in the prompt.

```
#configure terminal
(config)#router ospf 100
(config-router)#
```

show debugging ospf

Use this command to display the set OSPF debugging option.

Command Syntax

```
show debugging ospf
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show debugging ospf` command. Some lines in this output wrap around, they might not wrap around in the actual display.

```
#show debugging ospf
OSPF debugging status:
  OSPF packet Link State Update debugging is on
  OSPF all events debugging is on
```

show ip ospf

Use this command to display general information about all OSPF routing processes.

Command Syntax

```
show ip ospf (<0-65535>|)
```

Parameters

<0-65535>	The ID of the router process for which information will be displayed. If this parameter is specified, only the information for the specified routing process is displayed.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf 1
 Routing Process "ospf 1" with ID 4.1.1.1
 Process uptime is 1 minute
 Process bound to VRF default
 Conforms to RFC2328, and RFC1583 Compatibility flag is disabled
 Supports only single TOS(TOS0) routes
 Supports opaque LSA
 Supports Graceful Restart
 This router is an ASBR (injecting external routing information)
 SPF schedule delay min 0 secs 500 msecs
 SPF schedule delay max 50 secs 0 msecs
 Refresh timer 10 secs
 Number of incomming current DD exchange neighbors 0/5
 Number of outgoing current DD exchange neighbors 0/5
 Initial LSA throttle delay 10 secs 0 msecs
 Minimum hold time for LSA throttle 20 secs 0 msecs
 Maximum wait time for LSA throttle 45 secs 0 msecs
 Minimum LSA arrival 1 secs 0 msecs
 Number of external LSA 5. Checksum 0x010632
 Number of opaque AS LSA 0. Checksum 0x000000
 Number of non-default external LSA 5
 External LSA database is unlimited.
 Number of LSA originated 6
 Number of LSA received 0
 Number of areas attached to this router: 1
    Area 0 (BACKBONE)
        Number of interfaces in this area is 1(1)
        Number of fully adjacent neighbors in this area is 0
        Area has no authentication
        SPF algorithm last executed 00:00:47.558 ago
```

```
        SPF algorithm executed 2 times
        Number of LSA 1. Checksum 0x0041e0
```

OSPF Routing Process Fields

Table 1-133 explains the routing process fields.

Table 1-133: show ip ospf output details

Field	Description
Routing Process with ID	OSPF process identifier and router identifier.
Process is not up	OSPF process is not running.
Process uptime is	OSPF process running time.
Process bound to VRF	VRF name
Router is in Graceful Restart	When in graceful restart.
Router is in Restart Signaling	When in restart signalling.
Bidirectional Forwarding Detection is configured	When BFD is enabled.
Conforms to RFC2328, and RFC1583 Compatibility flag is enabled	RFC compatibility.
Supports only single TOS (TOS0) routes	OSPF TOS-based routing was never deployed.
Supports opaque LSA	When opaque LSAs are supported.
Do not support Restarting	When restart is not supported.
Supports Graceful Restart	Method of restart in process.
Supports Restart Signaling	Method of restart in signaling process.
Connected to MPLS VPN Super backbone	VRF is enabled and the process is connected to the MPLS VPN backbone.
This router is an ABR, ABR Type is	Type of ABR: Standard (RFC2328) Alternative Cisco (RFC3509) Alternative IBM (RFC3509) Alternative Shortcut
This router is an ASBR (injecting external routing information)	Type of router function in the process.
SPF schedule delay initial	Initial SPF schedule delay.
SPF schedule delay min	Minimum delay between receiving a change to SPF calculation.
SPF schedule delay max	Maximum delay between receiving a change to SPF calculation.
Refresh timer	LSA refresh interval.
Number of incoming current DD exchange neighbors	Incoming neighbor Database Descriptors and maximum concurrent DDs.

Table 1-133: show ip ospf output details (Continued)

Field	Description
Number of outgoing current DD exchange neighbors	Outgoing neighbor Database Descriptors and maximum concurrent DDs.
Initial LSA throttle delay	Initial delay for the generation of LSAs.
Minimum hold time for LSA throttle	Minimum hold time between generation of the same LSA.
Maximum wait time for LSA throttle	Maximum wait time between generation of the same LSA.
Minimum LSA arrival	Minimum time between reception of new LSAs during flooding.
Number of external LSA	Number of AS external LSAs and checksum.
Number of opaque AS LSA	Number of AS opaque LSAs and checksum.
Number of non-default external LSA	For database overflow, number of non-default external LSAs.
External LSA database is unlimited	When the external LSA database is unlimited.
External LSA database limit	Maximum number of LSAs in database.
Exit database overflow state interval is	Exit database overflow state interval.
Exit database overflow state interval is not configured	When the exit database overflow state interval is not set.
OSPF is [not] in database overflow state now	Whether OSPF is in database overflow state now.
Next attempt to exit database overflow state in	How long until OSPF tries to exit the database overflow state.
LSDB database overflow limit	Maximum number of LSAs that can be supported by the OSPF instance.
LSDB exceed overflow limit	Whether OSPF is exceeding the maximum number of LSAs.
Number of LSA originated	LSAs originated by the OSPF instance.
Number of LSA received	LSAs received by the OSPF instance.
Number of areas attached to this router	As stated
Next fields are repeated for each area	As stated
Area	Area identifier.
(BACKBONE)	Area is a backbone.
no-summary	Area is a stub and does no import summaries.
(Inactive)	Area is not active.
Number of interfaces in this area is	Number of interfaces in this area.
Number of fully adjacent neighbors in this area	As stated.
Number of fully adjacent virtual neighbors through this area	As stated.

Table 1-133: show ip ospf output details (Continued)

Field	Description
Area has no authentication	Area does not use authentication.
Area has simple password authentication	Area uses password authentication.
Area has message digest authentication	Area uses MD5 authentication.
SPF algorithm last executed	As stated.
SPF algorithm executed	As stated.
Number of LSA	Number of LSAs in area link-state database and checksum.
End of area field	As stated.
NSSA Translator Role is	candidate: Translate Type-7 LSAs to Type-5 if router is elected. never: Do not translate Type-7 LSAs to Type-5. always: Always translate Type-7 LSAs to Type-5.
NSSA Translator State is	disabled: Router is not a border router. enabled: Router is a border router. elected: Router has been elected to be an NSSA translator.
Stability Interval	If an elected translator determines its services are no longer required, how long it continues to perform its services.
Number of NSSA Translator Events	As stated.
Shortcutting mode	Shortcut ABR that installs inter-area routes through non-backbone areas if non-backbone paths are really better: Default Enabled Disabled
S-bit consensus	Whether other ABR agrees on S-bit: ok no
Dste Status	Whether DSTE is enabled or disabled.

show ip ospf border-routers

Use this command to display the ABRs and ASBRs for OSPF instances.

Command Syntax

```
show ip ospf (<0-65535>|) border-routers
```

Parameters

`<0-65535>`	The ID of the router process for which information will be displayed.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the `show ip ospf border-routers` command.

```
#show ip ospf border-routers
OSPF process 1 internal Routing Table
Codes: i - Intra-area route, I - Inter-area route
i 10.15.0.1 [10] via 10.10.0.1, eth0, ASBR, Area 0.0.0.0
i 172.16.10.1 [10] via 10.10.11.50, eth1, ABR, ASBR, Area 0.0.0.0
```

Border Router Fields

Table 1-134 explains the border router fields.

Table 1-134: border router output details

Field	Description
Code	i: Intra-area route I: Inter-area route
Router ID	Router identifier of the destination
Cost	Cost of using this route.
via	Next hop IP address toward the destination.
is directly connected	Destination is directly connected.
Interface	Outgoing interface name.
Type	Router type of the destination: ABR or ASBR.
through Transit Area	Next hop is an area that carries traffic that neither originates nor terminates in the area itself.
Area	Area identifier from which this route was learned.
Transit	Area is a transit area.

show ip ospf database brief

Use this command to display a summary of the OSPF database.

Command Syntax

```
show ip ospf database (self-originate|max-age|adv-router A.B.C.D|)
show ip ospf <0-65535> database(self-originate|max-age|adv-router A.B.C.D|)
```

Parameters

`self-originate`	Self-originated link states.
`max-age`	LSAs which have reached the maximum age (3600 seconds).
`A.B.C.D`	IPv4 address of the advertising router.
`<0-65535>`	ID of the router process

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf database
       OSPF Router process 100 with ID (100.100.100.72)
                Router Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum  Link count
10.100.12.57    10.100.12.57     930  0x80000003 0x90de 2
100.100.100.72  100.100.100.72   933  0x80000004 0x7592 2
                Net Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum
10.100.10.72    100.100.100.72   933  0x80000001 0x0bef
                Summary Link States (Area 0.0.0.0)
Link ID         ADV Router      Age   Seq#       CkSum  Route
10.60.0.0       10.100.12.57     928  0x80000001 0x5108 10.60.0.0/24
71.87.120.0     10.100.12.57     928  0x80000001 0xc2c5 71.87.120.0/24
127.0.0.1       10.100.12.57     928  0x80000001 0x23fb 127.0.0.1/32
```

OSPF Database Fields

Table 1-135 explains the fields for each database entry.

Table 1-135: ospf database output details

Field	Description
Link ID	The meaning of this field depends on the type of Link-State Advertisement (LSA). Type 1: Router LSA (depends on the type of network to which the router connects): Point-to-point network: neighbor's router ID. Transit network: IP address of the designated router's interface. Stub network: IP network or subnet address Virtual link: Neighbor's Router ID. Type 2: Network LSA: The IP address of the designated router's interface. Type 3: Summary LSA: The IP address of the network or subnet being advertised.
ADV Router	The ID of the router advertising the LSA.
Age	The age of the LSA.
Seq#	The sequence number of the LSA. This number increments each time a new instance of the LSA originates. This update helps other routers identify the most recent instance of the LSA.
CkSum	The fetch checksum of the complete LSA except the Age field.
Link count	Total number of links.
Route	Summary prefix address.

show ip ospf database detail

Use this command to display details of the OSPF database.

Command Syntax

```
show ip ospf database (asbr-summary|external|network|router|summary|nssa-
  external|opaque-link|opaque-area|opaque-as) (self-originate|adv-router A.B.C.D|)
show ip ospf <0-65535> database (asbr-summary|external|network|router|summary)
  (self-originate|adv-router A.B.C.D|)
show ip ospf database (asbr-summary|external|network|router|summary|nssa-
  external|opaque-link|opaque-area|opaque-as) A.B.C.D (self-originate|adv-router
  A.B.C.D|)
show ip ospf <0-65535> database (asbr-summary|external|network|router|summary|nssa-
  external|opaque-link|opaque-area|opaque-as) A.B.C.D (self-originate|adv-router
  A.B.C.D|)
```

Parameters

`<0-65535>`	The ID of the router process for which information should be displayed.
`asbr-summary`	Type 4 ASBR summary LSAs.
`external`	Type 5 external LSAs.
`network`	Type 2 network LSAs.
`router`	Type 1 router LSAs.
`summary`	Type 3 summary LSAs.
`nssa-external`	Type 7 NSSA external LSAs.
`opaque-link`	Type 9 LSAs which are not flooded beyond the local network.
`opaque-area`	Type 10 LSAs which are not flooded beyond the borders of their area.
`opaque-as`	Type 11 LSAs which are flooded throughout the AS.
`A.B.C.D`	Link state ID as an IP address.
`self-originate`	Display self-originated link states.
`adv-router`	Advertising router link states.
`A.B.C.D`	IPv4 address of advertising router.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: external and self-originate Parameters

This is sample output with the `external` and `self-originate` parameters.

```
#show ip ospf database external self-originate

 OSPF Router process 100 with ID (10.10.11.50)
```

```
 AS External Link States
  LS age: 298
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external-LSA
  Link State ID: 10.10.100.0 (External Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x7033
  Length: 36
  Network Mask: /24
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 20
 Forward Address: 10.10.11.50
 External Route Tag: 0
```

Example: opaque-as and self-originate Parameters

This is sample output with the `opaque-as` and `self-originate` parameters.

```
#show ip ospf database opaque-as self-originate
 OSPF Router process 100 with ID (10.10.11.50)
 AS-Global Opaque-LSA
  LS age: 325
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external Opaque-LSA
  Link State ID: 11.10.9.23 (AS-external Opaque-Type/ID)
  Opaque Type: 11
  Opaque ID: 657687
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xb018
 Length: 25
```

Example: adv-router Parameter

This is a sample output with the `adv-router` parameter.

```
#show ip ospf database nssa-external adv-router 10.10.11.50
 OSPF Router process 100 with ID (10.10.11.50)
 NSSA-external Link States (Area 0.0.0.0)
 NSSA-external Link States (Area 0.0.0.1 [NSSA])
  LS age: 78
  Options: 0x0 (*|-|-|-|-|-|-|-)
  LS Type: AS-NSSA-LSA
  Link State ID: 0.0.0.0 (External Network Number For NSSA)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0xc9b6
  Length: 36
  Network Mask: /0
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 1
 NSSA: Forward Address: 0.0.0.0
OSPF Router process 100 with ID (10.10.11.50)
 NSSA-external Link States (Area 0.0.0.0)
 NSSA-external Link States (Area 0.0.0.1 [NSSA])
```

```
   LS age: 78
   Options: 0x0 (*|-|-|-|-|-|-|-)
   LS Type: AS-NSSA-LSA
  Link State ID: 0.0.0.0 (External Network Number For NSSA)
```

Example: router and Link State ID Parameters

This is sample output with the `router` and link state ID parameters.

```
#show ip ospf database router 10.10.11.50
 OSPF Router process 100 with ID (10.10.11.50)
 Router Link States (Area 0.0.0.0)
  LS age: 878
  Options: 0x2 (*|-|-|-|-|-|E|-)
  Flags: 0x3 : ABR ASBR
  LS Type: router-LSA
  Link State ID: 10.10.11.50
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000004
  Checksum: 0xe39e
  Length: 36
Number of Links: 1
 Link connected to: Stub Network
 (Link ID) Network/subnet number: 10.10.10.0
 (Link Data) Network Mask: 255.255.255.0
Number of TOS metrics: 0
 TOS 0 Metric: 10
 Router Link States (Area 0.0.0.1)
  LS age: 877
  Options: 0x2 (*|-|-|-|-|-|E|-)
  Flags: 0x3 : ABR ASBR
  LS Type: router-LSA
  Link State ID: 10.10.11.50
  Advertising Router: 10.10.11.50
 LS Seq Number: 80000003
```

Example: adv-router Parameter

This is sample output using the `adv-router` parameter for flood reduction.

```
#show ip ospf database summary adv-router 10.10.11.50

 OSPF Router process 100 with ID (10.10.11.50)
 Summary Link States (Area 0.0.0.0)
  LS age: 1(DoNotAge)
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: summary-LSA
  Link State ID: 10.10.11.0 (summary Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x36ac
  Length: 28
  Network Mask: /24
 TOS: 0 Metric: 10
Summary Link States (Area 0.0.0.1)
  LS age: 989
  Options: 0x2 (*|-|-|-|-|-|E|-)
LS Type: summary-LSA
  Link State ID: 10.10.11.0 (summary Network Number)
```

```
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x36ac
  Length: 28
  Network Mask: /24
 TOS: 0 Metric: 10

#show ip ospf database external self-originate

 OSPF Router process 100 with ID (10.10.11.50)

 AS External Link States
  LS age: 298
  Options: 0x2 (*|-|-|-|-|-|E|-)
  LS Type: AS-external-LSA
  Link State ID: 10.10.100.0 (External Network Number)
  Advertising Router: 10.10.11.50
  LS Seq Number: 80000001
  Checksum: 0x7033
  Length: 36
  Network Mask: /24
 Metric Type: 2 (Larger than any link state path)
 TOS: 0
 Metric: 20
 Forward Address: 10.10.11.50
 External Route Tag: 0
```

Database Detail Header Fields

Table 1-136 explains the fields for each database entry.

Table 1-136: ospf database detail header fields

Field	Description
LS age	Age of the LSA in seconds. “Do Not Age” is displayed if the DNA bit is set.
Options	LSA options as explained in Table 1-137.
Flags	ABR: Area border router ASBR: AS boundary router VL-endpoint: Endpoint of an active virtual link that is using the described area as a transit area Shortcut: shortcut ABR NSSA-Translator: NSSA border router with NSSA Translate or State enabled
LS Type	Type of LSA: Router-LSA Network-LSA Summary-LSA ASBR-summary-LSA AS-external-LSA AS-NSSA-LSA Link-Local Opaque-LSA Area-Local Opaque-LSA AS-external Opaque-LSA

Table 1-136: ospf database detail header fields

Field	Description
Link State ID	Identifier of the router described by the LSA.
Opaque Type	Opaque type used to identify the application type of the LSA: 9: link-local scope 10: area-local scope 11: LSA flooded throughout the AS
Opaque ID	Identifier used to differentiate LSAs of the same type.
Advertising Router	Identifier of the router that originated the LSA.
LS Seq Number	Sequence number of the LSA. This number increments each time a new instance of the LSA originates. This update helps other routers identify the most recent instance of the LSA.
Checksum	Checksum of the entire LSA, except the LS age field.
Length	Length of the LSA
I LSA	Indication LSA: ASBR set the infinity metric to tell all routers in the backbone not to originate DNA LSAs.

OSPF LSA Option Bits

Table 1-137 explains the fields for each database entry.

Table 1-137: ospf LSA option bits output details

Bit	Description
DN	Used in MPLS-based L3 VPNs. When a route learned from a customer network via OSPF is advertised across a BGP/MPLS VPN using Multiprotocol BGP and advertised back to a customer network via OSPF, a loop can happen where the OSPF route is redistributed back to the VPN service provider network via BGP. The DN-bit prevents this type of routing loop. When an OSPF router receives a Type 3, 5, or 7 LSA with the DN-bit set, it foes use that LSA for OSPF route calculations.
O	Originating router supports Type 9, 10, and 11 Opaque LSAs.
DC	Originating router supports OSPF over Demand Circuits.
L	Whether the OSPF packet contains a Link-Local Signaling (LLS) data block. This bit is set only in Hello and database description packets.
N/P	The N-bit is used only in Hello packets when the originating router supports Type-7 NSSA-External-LSAs. Neighboring routers with mismatched N-bit will not form a neighbor relationship. This restriction ensures that all OSPF routers within an area support NSSA capabilities. When the N-bit is set, the E-bit must be 0. The P-bit is used only in Type-7 NSSA-External-LSA headers. Due to this reason, the N- and P-bits share the same position in the options field. The P (Propagate) bit is set to inform an NSSA ABR to translate Type-7 LSAs into Type-5 LSAs.
MC	Originating router supports multicast extensions to OSPF (MOSPF)

Table 1-137: ospf LSA option bits output details (Continued)

Bit	Description
E	Originating router accepts AS External LSAs. The bit is set in all AS External LSAs and in all LSAs originated in the backbone and non-stub areas; and is be set to 0 in all Hellos and LSAs originated within a stub area. Additionally, this bit is used in Hello packets to indicate the capability of a router interface to send and receive Type-5 AS-External-LSAs. Neighboring routers with mismatched E-bit do not form a neighbor relationship. This restriction ensures that all OSPF routers within an area support the stub capabilities.
T	Originating router supports Multitopology OSPF (MT-OSPF.) Older OSPF specifications used this bit when the originating router support TOS-based routing. However, OSPF TOS-based routing was never deployed; therefore the T-bit was never used.

Type 1 Router LSAs (“router” Parameter)

Table 1-138 explains the fields for each database entry.

Table 1-138: router LSAs

Field	Description
Number of Links	Number of router links the LSA describes.
Link connected to	Description of the router link: another Router (point-to-point) a Transit Network Stub Network a Virtual Link
(Link ID)	Identifier of the router to which the link connects: Neighboring Router ID Designated Router address Network/subnet number Neighboring Router ID
(Link Data)	Extra information: Router Interface address Network Mask
Number of TOS metrics	Number of TOS (Type of Service) metrics for this link, not including the metric for TOS 0.
TOS 0 Metric	Cost of using this router link for TOS 0.

Type 2 Net Link States (“network” Parameter)

Table 1-139 explains the fields for each database entry.

Table 1-139: net LSAs

Field	Description
Network Mask	IP address mask for the network.
Attached Router	Identifiers of each router attached to the network.

Type 3 Summary LSAs (“summary” Parameter) and Type 4 ASBR Summary LSAs (“asbr-summary” Parameter)

Table 1-140 explains the fields for each database entry.

Table 1-140: summary and ASBR summary link states

Field	Description
Network Mask	For Type 3 LSAs, the destination network's IP address mask. Not meaningful for Type 4 link state advertisements.
TOS: 0 Metric	Cost of using this router link for TOS 0.

Type 5 AS External LSAs (“external” Parameter)

Table 1-141 explains the fields for each database entry.

Table 1-141: external LSAs

Field	Description
Network Mask	IP address mask for the advertised destination
Metric Type	1: Type 1 external metric that is comparable directly (without translation) to the link state metric 2: Type 2 external metric that is considered larger than any link state path
TOS	Always zero.
Metric	The cost of this route.
Forward Address	Data traffic for the advertised destination is forwarded to this address.
External Route Tag	Custom field attached to each external route whose use is defined by the application.

Type 7 NSSA External Link States (“nssa-external” Parameter)

Table 1-142 explains the fields for each database entry.

Table 1-142: NSSA external LSAs

Field	Description
Network Mask	IP address mask for the advertised destination
Metric Type	1: Type 1 external metric that is comparable directly (without translation) to the link state metric 2: Type 2 external metric that is considered larger than any link state path
Metric	The cost of this route.
NSSA: Forward Address	Data traffic for the advertised destination is forwarded to this address.
External Route Tag	Custom field attached to each external route whose use is defined by the application.

show ip ospf igp-shortcut-lsp

Use this command to show the IGP shortcut LSP used by OSPF.

Command Syntax

```
show ip ospf igp-shortcut-lsp
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf igp-shortcut-lsp
 Tunnel-endpoint     Tunnel-id     Tunnel-metric
 8.8.8.8             101           2              active
```

Table 1-143 explains the fields in the output.

Table 1-143: show ip ospf igp-shortcut-lsp output details

Field	Description
Tunnel-endpoint	Tunnel endpoint address of ospf.
Tunnel-id	Tunnel address (destination port) for the session.
Tunnel-metric	Number of tunnel-metric.
active/inactive	Whether the tunnel is active or inactive.

show ip ospf igp-shortcut-route

Use this command to show the IGP shortcut route calculated by OSPF.

Command Syntax

```
show ip ospf (<0-65535>|) igp-shortcut-route
```

Parameters

`<0-65535>`	ID of the router process.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf igp-shortcut-route
OSPF process 0:
8.8.8.8/32 [2] tunnel-id: 101, 8.8.8.8
15.15.15.15/32 [0] tunnel-id: 101, 8.8.8.8
20.20.15.0/24 [0] tunnel-id: 101, 8.8.8.8
```

Table 1-144 explains the fields in the output.

Table 1-144: show ip igp-shortcut-route output details

Field	Description
OSPF process	OSPF process identifier.
Destination	IP address of the destination port.
Metric	Number of tunnel metric.
Tunnel-ID	Tunnel address (destination port) for the session.
Tunnel-End-Point	Tunnel endpoint address of ospf.

show ip ospf interface

Use this command to display interface information for OSPF.

Command Syntax

```
show ip ospf interface (IFNAME|)
```

Parameters

IFNAME	Interface name.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf interface
eth1 is up, line protocol is up
 Internet Address 10.100.10.72/24, Area 0.0.0.0, MTU 1500
    Router ID 100.100.100.72, Network Type BROADCAST, Cost: 10, TE Metric 0
    Transmit Delay is 1 sec, State DR, Priority 1
    LDP-OSPF Sync configured
    Holddown timer : 50 seconds, Remaining time =  30seconds
    Designated Router (ID) 100.100.100.72, Interface Address 10.100.10.72
    Backup Designated Router (ID) 10.100.12.57, Interface Address 10.100.10.105
    Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
      Hello due in 00:00:05
    Neighbor Count is 1, Adjacent neighbor count is 1
    Crypt Sequence Number is 0
    Hello received 19 sent 106, DD received 4 sent 3
    LS-Req received 1 sent 1, LS-Upd received 3 sent 3
    LS-Ack received 2 sent 3, Discarded 0
```

OSPF Interface Fields

Table 1-145 explains the fields for each interface entry.

Table 1-145: OSPF interface output details

Field	Description
Internet address	IP address and subnet mask of the interface.
Area	OSPF area to which the interface belongs.
MTU	Maximum Transmission Unit (MTU) of the interface.
Transmit Delay	Transmit delay of the interface.

Table 1-145: OSPF interface output details

Field	Description
Priority	OSPF priority of the interface used for election of Designated Router (DR) and Backup Designated Router (BDR).
Hello	OSPF hello-interval.
Dead	OSPF dead-interval.
Wait	Hello wait-interval.
Retransmit	The period, in seconds, for which the router waits between retransmissions of OSPF packets that have not been acknowledged.
Hello due in	Time period for which router expects to receive hello packet.
Neighbor Count	OSPF neighbor count.
Adjacent neighbor	OSPF adjacent neighbor count.
Crypt Sequence Number	Used for authentication.
Hello received	Number of Hello packets and DD packets sent and received.
LS-Req	Number of LSA requests and LSA updates sent and received.
LS-Ack	Number of LSA acknowledgments sent and received number of LSA acknowledgment discards.

Example: DoNotAge

The following is sample output of this command when DoNotAge is enabled:

```
#show ip ospf interface eth1
eth1 is up, line protocol is up
 Internet Address 1.1.1.1/24, Area 0.0.0.0, MTU 1500
 Process ID 0, Router ID 33.33.33.33, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State Waiting, Priority 1, TE Metric 0
 No designated router on this network
 No backup designated router on this network
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Neighbor Count is 0, Adjacent neighbor count is 0
 Crypt Sequence Number is 1106347721
 Hello received 0 sent 1, DD received 0 sent 0
 LS-Req received 0 sent 0, LS-Upd received 0 sent 0
 LS-Ack received 0 sent 0, Discarded 0
 Reduce LSA flooding
```

Example: Hello Suppression

The following is sample output of this command when Hello-Suppression is enabled:

```
#sh ip os interface
p7p1 is up, line protocol is up
  Internet Address 14.1.1.2/24, Area 0.0.0.0, MTU 1500
```

```
  Process ID 1, VRF (default), Router ID 2.2.2.2, Network Type POINTOMULTIPOINT, Cost:
1
  Reduce LSA flooding.
  Transmit Delay is 1 sec,  State Point-To-Point, TE Metric 1
  Timer intervals configured, Hello 30, Dead 120, Wait 120, Retransmit 5
    Hello due in 00:00:03
  Neighbor Count is 1, Adjacent neighbor count is 1
  Suppress hello for 1 neighbor(s)
  Hello received 5 sent 8, DD received 8 sent 6
  LS-Req received 2 sent 2, LS-Upd received 8 sent 9
  LS-Ack received 6 sent 6, Discarded 0
  No authentication
```

show ip ospf multi-area-adjacencies

Use this command to display multi-area adjacency information for OSPF.

Command Syntax

```
show ip ospf (<0-65535>|) multi-area-adjacencies
```

Parameters

`<0-65535>`	The ID of the router process for which information should be displayed.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command:

```
#show ip ospf 1 multi-area-adjacencies

Multi-area-adjacency on interface eth1 to neighbor 20.20.20.10
Internet Address 20.20.20.11/24, Area 0.0.0.1, MTU 1500
Process ID 1, Router ID 10.10.10.10, Network Type POINTOPOINT, Cost: 10
Transmit Delay is 1 sec, State Point-To-Point
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
Neighbor Count is 0, Adjacent neighbor count is 0
Crypt Sequence Number is 1229928206
Hello received 0 sent 513, DD received 0 sent 0
LS-Req received 0 sent 0, LS-Upd received 0 sent 0
LS-Ack received 0 sent 0, Discarded 0
```

Table 1-146 explains the fields for each adjacency entry.

Table 1-146: show ip ospf multi-area-adjacencies output details

Field	Description
Multi-area-adjacency	Specifies the interface name and the router ID to which it is connected.
Internet Address	As Stated
Area	As Stated
MTU	Maximum Transmission Unit in bytes.
Process ID	The Process Identifier.
Router ID	As Stated
Network Type	In multi-area adjacencies, this is a point-to-point network with the neighbor.

Table 1-146: show ip ospf multi-area-adjacencies output details (Continued)

Field	Description
Cost	A reference bandwidth of 100 Mbps for cost calculation. The formula to calculate the cost is reference bandwidth divided by interface bandwidth.
Transmit Delay	A stated
State	As stated
Timer intervals configured	Hello timer = 10, Dead timer = 40, Wait timer = 40, Retransmit timer = 5
Hello due in	Countdown timer for a Hello message from the neighbor.
Neighbor Count	The number of neighbor.
Adjacent neighbor count	The number of neighbors participating in adjacencies.
Crypt Sequence Number	The 32-bit cryptographic sequence number appended on each OSPF protocol packet.
Hello received, sent	Hello packets sent and received.
DD received, sent	Database Description packets sent and received.
LS-Req received, sent	Link State Request packets sent and received.
LS-Upd received, sent	Link State Update packets sent and received.
LS-Ack received, sent, discarded	Link State Acknowledgement packets sent, received, or discarded.

show ip ospf neighbor

Use this command to display information about OSPF neighbors.

Command Syntax

```
show ip ospf (<0-65535>|) neighbor
show ip ospf (<0-65535>|) neighbor all
show ip ospf (<0-65535>|) neighbor interface A.B.C.D
show ip ospf (<0-65535>|) neighbor A.B.C.D
show ip ospf (<0-65535>|) neighbor A.B.C.D detail
show ip ospf (<0-65535>|) neighbor detail
show ip ospf (<0-65535>|) neighbor detail all
```

Parameters

`<0-65535>`	The ID of the router process
`all`	Include downstatus neighbor
`A.B.C.D`	IPv4 address
`detail`	Details of neighbors

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf neighbor

Total number of full neighbors: 3
OSPF process 1 VRF(default):
Neighbor ID     Pri   State       Dead Time   Address      Interface    Instance ID
1.1.1.1           1   Full/ -     inactive    14.1.1.1     p7p1                0
3.3.3.3           1   Full/ -     00:01:41    15.1.1.2     p8p1                0
3.3.3.3           1   Full/ -     inactive    15.1.1.2     VLINK0
```

OSPF Neighbor Fields

Table 1-147 explains the fields for each neighbor entry.

Table 1-147: OSPF neighbor output details

Field	Description
OSPF process	OSPF process identifier.
Neighbor ID	OSPF router identifier of the neighbor.

Table 1-147: OSPF neighbor output details

Field	Description
Pri	OSPF priority of the neighbor.
State	State of the OSPF neighbor: DependUpon: dummy state Down: no OSPF neighbors detected at this instant Attempt: in an NBMA environment, the router sends unicast hello packets every poll interval to the neighbor, from which hellos have not been received within the dead interval Init: hello packet received, but the receiving router's ID was not included in the hello packet 2-Way: bi-directional communication established between two routers ExStart: master and slave roles determined Exchange: database description packets (DBD) sent Loading: exchange of LSRs (link state request) and LSUs (link state update) packets Full: routers fully adjacent with each other.
Dead Time	If a new Hello is not received within this duration, the neighbor is declared dead.
Address	IP address of neighbor's interface attached to the network.
Interface	The interface attached to the network on which the neighbor is located.
Instance ID	Instance identifier for the session.

Example: Detail Parameter

This is sample output from the command when the `detail` parameter is specified:

```
#show ip ospf neighbor detail
 Neighbor 10.10.10.50, interface address 10.10.10.50
 In the area 0.0.0.0 via interface eth0
 Neighbor priority is 1, State is Full, 5 state changes
 DR is 10.10.10.50, BDR is 10.10.10.10
 Options is 0x42 (*|O|-|-|-|-|E|-)
 Dead timer due in 00:00:38
 Neighbor is up for 00:53:07
 Database Summary List 0
 Link State Request List 0
 Link State Retransmission List 0
 Crypt Sequence Number is 0
 Thread Inactivity Timer on
 Thread Database Description Retransmission off
```

OSPF Neighbor Detail Fields

Table 1-148 explains the fields for each neighbor detail entry.

Table 1-148: OSPF neighbor output detail

Field	Description
Neighbor	OSPF router identifier of the neighbor.
interface address	IP address of the neighbor interface.
In the area	Area and interface through which the OSPF neighbor is known.
Neighbor priority	OSPF priority of the neighbor.
State	OSPF state as explained in Table 1-147.
state changes	Number of state changes since the neighbor was created.
Hello is suppressed	Hello suppression is enabled.
Poll interval	Poll timer value.
DR is	Router ID of the designated router for the interface.
BDR is	Router ID of the backup designated router for the interface.
Options	LSA options as explained in Table 1-137.
LLS Options	LSDB Resynchronization (LR) Restart Signal (RS-bit) Whether link-local signalling (LLS) and out-of-band (OOB) link-state database resynchronization are performed for nonstop forwarding (NSF).
OOB-Resync in progress (receiver)/last OOB-Resync	Last successful OOB resynchronization with the NSF-capable neighbor. The router waits before taking a neighbor adjacency down if the OOB resynchronization has not taken place since the time a restart signal (Hello packet with RS-bit set) was received from the neighbor.
Dead timer due in	Expected time before declaring the neighbor dead.
Poll due in	Poll timer thread.
Neighbor is up for	Time since the neighbor went into the two-way state.
Database Summary List	Number of LSAs in the neighbor’s database.
Link State Request List	Number of LSAs that need to be received from this neighbor to synchronize the neighbors' topological databases.
Link State Retransmission List	Number of advertisements flooded out an adjacency. To ensure flooding is reliable, advertisements are retransmitted until they are acknowledged.
Crypt Sequence Number is	MD5 cryptographic sequence number.
Thread Inactivity Timer	Off if hello suppression is enabled, on otherwise.
Thread Database Description Retransmission	Off if hello suppression is enabled, on otherwise.
Thread Link State Request Retransmission	Off if hello suppression is enabled, on otherwise.

Table 1-148: OSPF neighbor output detail (Continued)

Field	Description
Thread Link State Update Retransmission	Off if hello suppression is enabled, on otherwise.
Thread Poll Timer	Whether the poll timer thread is on.
Bidirectional Forwarding Detection is enabled	Status of BFD, enabled or disabled.

Example: Hello-Suppression Option

This is sample output from the command when the `detail` parameter is specified and Hello-Suppression is enabled:

```
#sh ip os neighbor detail
 Neighbor 1.1.1.1, interface address 14.1.1.1
    In the area 0.0.0.0 via interface p7p1
    Neighbor priority is 1, State is Full, 5 state changes
    Hello is suppressed
    DR is 0.0.0.0, BDR is 0.0.0.0
    Options is 0x62 (-|O|DC|-|-|-|E|-)
    Dead timer due in inactive
    Neighbor is up for 00:05:03
    Database Summary List 0
    Link State Request List 0
    Link State Retransmission List 0
    Crypt Sequence Number is 0
    Thread Inactivity Timer off
    Thread Database Description Retransmission off
    Thread Link State Request Retransmission off
    Thread Link State Update Retransmission off
```

show ip ospf route

Use this command to display the OSPF routing table.

Command Syntax

```
show ip ospf (<0-65535>|) route ( A.B.C.D |A.B.C.D/M |summary |)
show ip ospf (<0-65535>|) route ( A.B.C.D |A.B.C.D/M |summary | fast-reroute |)
```

Parameters

`<0-65535>`	Router process identifier.
`A.B.C.D`	Single route.
`A.B.C.D/M`	Single exact match route.
`summary`	Route counts.
`fast-reroute`	Fast-reroute routes.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip ospf route
OSPF process 10:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 50.0.0.0/24 [10] is directly connected, eth1, Area 0.0.0.10
C 60.0.0.0/24 [10] is directly connected, eth3, Area 0.0.0.10
OSPF process 15:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 80.0.0.0/24 [1] is directly connected, eth4, Area 0.0.0.15
```

Header

Each entry in this table has a code preceding it indicating the source of the routing entry.

Table 1-149 explains the fields of route codes.

Table 1-149: route codes

Code	Meaning	Description
C	connected	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from routing protocols.
O	OSPF	Modifiers: IA - OSPF inter area N1 - OSPF NSSA external type 1 N2 - OSPF NSSA external type 2 E1 - OSPF external type 1 E2 - OSPF external type 2
D	discard	An ABR or ASBR performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the router doing the summarization has a less specific route that points back to the sending router for the network.

Route Entry Fields

Table 1-150 shows the route entry fields.

Table 1-150: route entry output details

Field	Description
Codes	As explained in Table 1-149.
IP address	IP address of the remote network.
Metric	For OSPF the metric is cost, which indicates the best quality path to use to forward packets.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.
Area	OSPF area identifier

Example: Process Identifier

The following is a sample output with the process identifier parameter.

```
#show ip ospf 10 route
OSPF process 10:
Codes: C - connected, D - Discard, O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
C 50.0.0.0/24 [10] is directly connected, eth1, Area 0.0.0.10
C 60.0.0.0/24 [10] is directly connected, eth3, Area 0.0.0.10
```

show ip ospf valid

Use this command to display information about opaque LSAs.

Command Syntax

```
show ip ospf (<0-65535>|) opaque-link valid
```

Parameters

`<0-65535>`	The ID of the router process for which information will be displayed.
`opaque-link`	Displays information about the opaque link-local LSAs.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip ospf 1 opaque-link valid
```

show ip ospf virtual-links

Use this command to display virtual link information.

Command Syntax

```
show ip ospf (<0-65535>|) virtual-links (brief|)
```

Parameters

`<0-65535>`	The ID of the router process for which information will be displayed.
`brief`	Display summary of OSPF virtual-links.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is the display of the virtual link information for two routers, one with the virtual link up and one with virtual link down.

```
ospfd#show ip ospf virtual-links
Virtual Link VLINK0 to router 10.10.0.9 is up
 Transit area 0.0.0.1 via interface eth0
 Transmit Delay is 1 sec, State Point-To-Point,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
 Transit area 0.0.0.1 via interface *
 Transmit Delay is 1 sec, State Down,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in inactive
 Adjacency state Down
```

The following is the display of the virtual link information for two routers, one with the virtual link up and one with virtual link down when flood reduction is enabled

```
ospfd#show ip ospf virtual-links
Virtual Link VLINK0 to router 10.10.0.9 is up
 Transit area 0.0.0.1 via interface eth0
 Transmit Delay is 1 sec, State Point-To-Point,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in 00:00:02
 Adjacency state Full
Virtual Link VLINK1 to router 10.10.0.123 is down
 Transit area 0.0.0.1 via interface *
 Transmit Delay is 1 sec, State Down,
 Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
 Hello due in inactive
 Adjacency state Down
```

```
    DoNotAge LSA Allowed
```

If Hello-Suppression is enabled

```
    M1#sh ip os virtual-links
    Virtual Link VLINK0 to router 3.3.3.3 is up
      Transit area 0.0.0.1 via interface p8p1
      Hello suppression enabled
      DoNotAge LSA allowed
      Local address 15.1.1.1/32
      Remote address 15.1.1.2/32
      Transmit Delay is 1 sec, State Point-To-Point,
      Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
        Hello due in inactive
      No authentication
        Adjacency state Full
    M1#
```

Table 1-151 explains the fields for each virtual-links entry.

Table 1-151: show ip ospf virtual-links output details

Field	Description
Virtual Link	Virtual link name, the router ID to which it is connected, and the state of the link.
Transit area	Transit area ID, the interface it uses, and its instance ID – an Instance ID should default to 0. It is only necessary to assign a value other than 0 on those links that will contain multiple separate communities of OSPF routers.
Local address	The local IP address and subnet mask.
Remote address	The remote IP address and subnet mask.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 0 to 65535. The default is 1. The state is point-to-point.
Timer intervals configured	The configured values in seconds of the following timers: Hello, Dead, Wait, Retransmit.
Hello due in	A countdown timer that indicates when the next Hello packet should arrive.
Adjacency State	Whether the adjacency state is either up or down.

show ip protocols

Use this command to display OSPF process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols ospf
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This is an example of the output from the `show ip protocols` command:

```
#show ip protocols
Routing Protocol is "ospf 200"
  Invalid after 0 seconds, hold down 0, flushed after 0
  Outgoing update filter list for all interfaces is
 Redistributed kernel filtered by filter1
  Incoming update filter list for all interfaces is
  Redistributing: kernel
  Routing for Networks:
 192.30.30.0/24
 192.40.40.0/24
  Routing Information Sources:
 GatewayDistanceLast Update
  Distance: (default is 110)
 AddressMaskDistance List
```

Table 1-152 explains the fields for each ip protocol entry.

Table 1-152: show ip protocols output details

Field	Description
Routing Protocol is "ospf 200"	Specifies the routing protocol used.
Invalid after 0 seconds	Specifies the value of the invalid parameter.
Hold down 0	Specifies the current value of the hold-down parameter.
Flushed after 0	Specifies the time in seconds after which the individual routing information will be thrown (flushed) out.
Outgoing update	Specifies whether the outgoing filtering list has been set.

Table 1-152: show ip protocols output details

Field	Description
Incoming update	Specifies whether the incoming filtering list has been set.
Redistributing	Lists the protocol that is being redistributed.
Routing for Networks	Specifies the networks for which the routing process is currently injecting routes.
Routing Information Sources	Lists all the routing sources the IP Infusion software is using to build its routing table.

show ip route fast-reroute

Use this command to display routes with alternate next hops.

Command Syntax

```
show ip route fast-reroute
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip route fast-reroute
```

shutdown

Use the this command to temporarily shut down a protocol in the least disruptive manner and to notify its neighbors that it is going away.

Use the no parameter of this command.

Command Syntax

```
shutdown
no shutdown
```

Parameters

None

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#shutdown

#configure terminal
(config)#router ospf 100
(config-router)#no shutdown
```

snmp restart ospf

Use this command restart SNMP in OSPF

Command Syntax

```
snmp restart ospf
```

Parameter

None

Default

By default, SNMP resart is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart ospf
```

summary-address

Use this command to summarize or suppress external routes with the specified address range.

Use the no option with this command to disable summary address.

An address range is a pairing of an address and a mask that is almost the same as IP network number. For example, if the specified address range is 192.168.0.0/255.255.240.0, it matches 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This minimizes the size of the OSPF link state database.

Command Syntax

```
summary-address (A.B.C.D/M | A.B.C.D A.B.C.D) (not-advertise|tag <0-4294967295>|)
no summary-address (A.B.C.D/M | A.B.C.D A.B.C.D) (not-advertise|tag (<0-
  4294967295>|))
```

Parameters

`A.B.C.D/M`	The range of addresses given as IPv4 starting address and a mask.
`A.B.C.D`	IP summary prefix e.g. i.i.i.i
`A.B.C.D`	IP summary prefix mask e.g. m.m.m.m
`not-advertise`	Suppress routes that match the range.
`tag`	Tag value to use as a “match” value for controlling redistribution via route maps.
`<0-4294967295>`	Set a tag value.

Default

By default, tag value is 0

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/24 and assign a tag value of 3.

```
#configure terminal
(config)#router ospf 100
(config-router)#summary-address 172.16.0.0/16 tag 3
```

timers lsa arrival

This command sets the minimum interval to accept the same link-state advertisement (LSA) from OSPF neighbors.

Use the no form of this command to restore the default value.

Command Syntax

```
timers lsa arrival <0-600000>
no timers lsa arrival
```

Parameters

<0-600000>	The minimum delay in milliseconds between accepting the same LSA from neighbors.

Default

By default, Minimum LSA Arrival timer is 1 sec.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers lsa arrival 5000
```

timers spf exp

Use this command to set the Shortest-Path First (SPF) best-path schedule minimum and maximum delay between receiving a change to SPF calculation in milliseconds.

Use no parameter of this command to unset the SPF best-path schedule.

Command Syntax

```
timers spf exp <0-2147483647> <0-2147483647>
no timers spf exp
```

Parameters

<0-2147483647>	The minimum delay in milliseconds between receiving a change to SPF calculation.
<0-2147483647>	The maximum delay in milliseconds between receiving a change to SPF calculation.

Default

Default minimum delay: 500 milliseconds

Default maximum delay: 50000 milliseconds (50 seconds)

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers spf exp 300 300
```

timers throttle lsa

This command sets the rate-limiting intervals for OSPF link-state advertisement (LSA) generation.

Use the no form of this command to restore the default values.

Command Syntax

```
timers throttle lsa all <0-600000> <1-600000> <1-600000>
no timers throttle lsa all
```

Parameters

<0-600000>	Start interval: The minimum delay in milliseconds for the generation of LSAs. The first instance of LSA is always generated immediately upon a local OSPF topology change. The generation of the next LSA is not before the start interval.
<0-600000>	Hold interval: The hold time in milliseconds. This value is used to calculate the subsequent rate limiting times for LSA generation.
<0-600000>	Maximum interval: The maximum wait time in milliseconds between generation of the same LSA.

Defaults

Default start interval: 0 milliseconds

Default hold interval: 5000 milliseconds

Default maximum interval: 5000 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#timers throttle lsa all 200 10000 45000
```

CHAPTER 2 OSPFv2 Graceful Restart Commands

This chapter describes the OSPFv2 graceful restart commands.

capability restart

Use this command to enable OSPF graceful restart or restart signaling. If a router is not restart-enabled, it cannot enter graceful restart mode and act as a helper.

Use the no parameter with this command to disable the features.

Command Syntax

```
capability restart graceful
no capability restart graceful
```

Parameters

None

Default

By default, OSPF graceful restart or restart signaling is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100
(config-router)#capability restart graceful

(config)#router ospf 100
(config-router)#no capability restart graceful
```

debug ip ospf graceful-restart

Use this command to specify debugging option for OSPF graceful restart.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ip ospf graceful-restart (detail|terse|)
no debug ip ospf graceful-restart (detail|terse|)
```

Parameters

detail	Debug OSPF graceful restart detail information
terse	Debug OSPF graceful restart summary information

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ip ospf graceful-restart detail
```

ospf restart grace-period

Use this command to set the grace period for restarting the router.

If graceful restart is enabled, NSM is notified about the grace period. If the OSPF daemon unexpectedly shuts down, NSM sends this value to the OSPF daemon when it comes up again which uses this value to end the graceful state.

Use the no parameter with this command to revert to the default.

Command Syntax

```
ospf restart grace-period <1-1800>
no ospf restart grace-period
```

Parameters

<1-1800>	Gace period in seconds.

Default

The default grace period for restarting the OSPF router is 120 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ospf restart grace-period 250
```

ospf restart helper

Use this command to configure the helper behavior for graceful restart.

Use the no parameter with this command to revert to default.

Command Syntax

```
ospf restart helper {max-grace-period <1-1800>}
ospf restart helper never (router-id A.B.C.D|)
no ospf restart helper (never router-id (A.B.C.D | all) | max-grace-period|)
```

Parameters

<1-1800>	Help only if received grace-period is less than this value.
A.B.C.D	Router ID of neighbor to never to act as helper.
never	Prevent the neighbor from entering helper mode.
all	All neighbors to never to act as helper.

Default

By default, router behave as helper. To disable it as helper, `ospf restart helper never` command should be configured. `ospf restart helper max-grace-period` – Max-grace-period to function as helper. If not configured, value will be the grace-period in restarting node.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ospf restart helper never router-id 1.1.1.1

#configure terminal
(config)#no ospf restart helper never router-id all
```

restart ospf graceful

Use this command to restart OSPF gracefully.

After this command is executed, the router immediately shuts down. NSM is notified that OSPF has shut down gracefully. NSM preserves routes installed by OSPF until the grace period expires.

Command Syntax

```
restart ospf graceful (grace-period <1-1800>|)
```

Parameters

<1-1800>	Grace period in seconds.

Default

No default value is specified

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart ospf graceful grace-period 200
```

CHAPTER 3 OSPFv3 Commands

This chapter provides an alphabetized reference for each of the OSPFv3 commands. It includes the following commands:

- ipv6 ospf network
- ipv6 ospf priority
- ipv6 ospf retransmit-interval
- ipv6 ospf transmit-delay
- ipv6 router ospf
- ipv6 te-metric
- max-concurrent-dd
- passive-interface
- redistribute
- router-id
- router ipv6 ospf
- show debugging ipv6 ospf
- show ipv6 ospf
- show ipv6 ospf database
- show ipv6 ospf interface
- show ipv6 ospf neighbor
- show ipv6 ospf route
- show ipv6 route fast-reroute
- show ipv6 ospfv3 topology
- show ipv6 ospf virtual-links
- show ipv6 vrf
- snmp restart ospf6
- summary-address

abr-type

Use this command to set an OSPFv3 Area Border Router (ABR) type.

Use the `no` parameter with this command to revert the ABR type to the default setting (`cisco`).

Specifying the ABR type allows better functioning in a multi-vendor environment. The ABR types are:

- Cisco (RFC 3509): A router is considered an ABR if it has more than one area actively attached and one of them is the backbone area.
- IBM (RFC 3509): A router is considered an ABR if it has more than one area actively attached and the backbone area is configured. In this case the configured backbone need not be actively connected.
- Standard (RFC 2328): A router is considered an ABR if it has more than one area actively attached to it.

Command Syntax

```
abr-type (cisco|ibm|standard)
no abr-type (cisco|ibm|standard|)
```

Parameters

`cisco`	Specify an alternative ABR using Cisco implementation. This is the default ABR type.
`ibm`	Specify an alternative ABR using IBM implementation.
`standard`	Specify a standard ABR.

Default

By default, ABR type is Cisco

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#abr-type standard
```

address-family ipv4 unicast

Use this command to enter address family mode where you can configure IPv4 unicast addresses for OSPFv3, including:

- Summarizing intra-area IPv4 routes (area range command)
- Create a default external route (default-information originate command)
- Redistributing IPv4 routes (redistribute command)
- Summarizing IPv4 external routes (summary-address command)

RFC 5838 defines the range of instance IDs below to use for each address family in OSPFv3.

TABLE 2.

Instance ID#	Address Family
0 - 31	IPv6 unicast
64 - 95	IPv4 unicast

Multiple router processes can configured per interface, but only one instance per router per interface can be configured. Each instance ID creates a separate OSPFv3 instance with its own neighbor adjacencies, link state database, and SPF computation. A single IPv4 or IPv6 OSPFv3 process running multiple instances on the *same* interface is not supported.

To leave the address family mode and return to the configure mode, use the `exit-address-family` command.

Use the no form of this command to remove the address-family configuration.

Command Syntax

```
address-family ipv4 unicast
no address-family
```

Parameters

None

Default

By default, OSPFv3 supports only IPv6 unicast traffic.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#address-family ipv4 unicast
```

area default-cost

Use this command to specify the cost for default summary route sent into a stub area. If an area is configured as a stub, the OSPFv3 router originates one type-3 inter-area-prefix-LSA into the stub area. This command changes the metric for this LSA.

Use the no parameter with this command to remove the assigned default cost.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) default-cost (<0-16777215>)
no area (A.B.C.D|<0-4294967295>) default-cost (<0-16777215>|)
```

Parameters

A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
<0-16777215>	The advertised cost for the default summary route used for a stub or NSSA area.

Default

By default, advertised cost for the default summary route is 1.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 default-cost 10
```

area nssa

Use this command to set an area as a Not-So-Stubby-Area (NSSA). There are no external routes in an OSPF stub area, so you cannot redistribute from another protocol into a stub area. An NSSA allows external routes to be flooded within the area. These routes are then leaked into other areas. However, the external routes from other areas still do not enter the NSSA. You can configure an area to be a stub area or an NSSA, but not both.

This command simplifies administration when connecting a central site using OSPF to a remote site that is using a different routing protocol. You can extend OSPF to cover the remote connection by defining the area between the central router and the remote router as a NSSA.

Use the no form of this command to make an area a normal area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) nssa
area (A.B.C.D|<0-4294967295>) nssa {translator-role (candidate|always)|stability-
  interval <0-2147483647>|no-redistribution|default-information-originate (metric
  <0-16777214>|metric-type <1-2>|metric <0-16777214> metric-type <1-2>|metric-type
  <1-2> metric <0-16777214>|)|no-summary}
no area (A.B.C.D|<0-4294967295>) nssa
no area (A.B.C.D|<0-4294967295>) nssa {translator-role|stability-interval|no-
  redistribution|default-information-originate|no-summary}
```

Parameters

A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
translator-role	NSSA-ABR translator role:
candidate	Translate NSSA-LSA to Type-5 LSA if router is elected.
always	Always translate NSSA-LSA to Type-5 LSA.
stability-interval	Stability timer for a NSSA area. If an elected translator determines its services are no longer required, it continues to perform its duties for this time interval. This minimizes excess flushing of translated Type-7 LSAs and provides a more stable translator transition.
<0-2147483647>	Stability interval in seconds.
no-redistribution	Do not redistribute into the NSSA.
default-information-originate	Originate Type-7 default LSA into the NSSA.
metric	Specify metric for default routes.
<0-16777214>	Specify metric value.
metric-type	Specify metric type (see RFC 3101).

<1-2>	Specify metric type: 1: Type 1 external route 2: Type 2 external route
no-summary	Do not inject inter-area routes into the NSSA.
translate-candidate	Translate NSSA-LSA to Type-5 LSA if router is elected.
translate-always	Always translate NSSA-LSA to Type-5 LSA.

Default

By default, the nssa option value is candidate.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router ipv6 ospf
(config-router)#area 3 nssa translator-role candidate no-redistribution
default-information-originate metric 34 metric-type 2
```

area range

Use this command to configure the OSPF address range. This command summarizes intra-area routes for an area. The single summary route is then advertised to other areas by the Area Border Routers (ABRs). Routing information is condensed at area boundaries and outside the area. If the network numbers in an area are assigned in a way such that they are contiguous, the ABRs can be configured to advertise a summary route that covers all the individual networks within the area that fall into the specified range.

Use the no parameter with this command to remove the assigned area range.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) range X:X::X:X/M
area (A.B.C.D|<0-4294967295>) range A.B.C.D/M
area (A.B.C.D|<0-4294967295>) range X:X::X:X/M (advertise|not-advertise)
area (A.B.C.D|<0-4294967295>) range A.B.C.D/M (advertise|not-advertise)
no area (A.B.C.D|<0-4294967295>) range X:X::X:X/M
no area (A.B.C.D|<0-4294967295>) range A.B.C.D/M
```

Parameters

A.B.C.D	OSPF Area ID in IPv4 address format.
<0-4294967295>	OSPF Area ID as a decimal value.
X:X::X:X/M	The area IPv6 range prefix and length.
A.B.C.D/M	The area IPv4 range prefix and length.
advertise	Advertises this range.
not-advertise	Does not advertise this range.

Default

No default value is specified

Command Mode

Router mode

Router address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 range 2000::/3

#configure terminal
(config)#router ipv6 ospf 10
(config-router)#router-id 10.10.10.10
(config-router)#address-family ipv4 unicast
(config-router-af)#area 1 range 10.0.0.0/8
```

```
(config-router-af)#exit-address-family
```

area stub

Use this command to define an area as a stub area on all routers. There are two stub area router configuration commands: the `stub` and commands. In all routers attached to the stub area, configure the area by using the `stub` option of the area command. For an area border router (ABR) attached to the stub area, use the `area` command.

Use the `no` form of this command to make an area a normal area.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) stub
area (A.B.C.D|<0-4294967295>) stub no-summary
no area (A.B.C.D|<0-4294967295>) stub
no area (A.B.C.D|<0-4294967295>) stub no-summary
```

Parameters

`A.B.C.D`	OSPF Area ID in IPv4 address format.
`<0-4294967295>`	OSPF Area ID as a decimal value.
`no-summary`	Stops an ABR from sending summary link advertisements into the stub area.

Default

No stub area is defined.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 stub no-summary
```

area virtual-link

Use this command to configure a link between two backbone areas that are physically separated through other nonbackbone areas.

Use the no parameter with this command to remove the virtual link.

In OSPFv3, all non-backbone areas must be connected to a backbone area. If the connection to the backbone is lost, the virtual link repairs the connection.You can configure virtual links between any two backbone routers that have an interface to a common non-backbone area. The protocol treats these two routers joined by a virtual link as if they were connected by an unnumbered point-to-point network.

Configure the `hello-interval` to be the same for all routers attached to a common network. If the `hello-interval` is short, the router detects topological changes faster, but more routing traffic follows.

The `retransmit-interval` is the expected round-trip delay between any two routers in a network. Set the value to be greater than the expected round-trip delay to avoid needless retransmissions.

The `transmit-delay` is the time taken to transmit a link state update packet on the interface. Before transmission, the link state advertisements in the update packet are increased by this amount. Set the transmit-delay to be greater than zero. Also, take into account the transmission and propagation delays for the interface.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D (dead-interval|hello-
  interval|retransmit-interval|transmit-delay) <1-65535>
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D instance-id (<0-31>|<64-95>)
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D (dead-interval|hello-
  interval|retransmit-interval|transmit-delay)
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D instance-id
```

Parameters

`A.B.C.D`	OSPF Area ID in IP64 address format.
`<0-4294967295>`	OSPF Area ID as a decimal value.
`A.B.C.D`	Specify router ID associated with a virtual link neighbor.
`dead-interval`	The interval in seconds during which no packets are received and after which the router acknowledges a neighboring router as off-line.
`hello-interval`	The interval in seconds the router waits before it sends a hello packet.
`retransmit-interval`	The interval in seconds the router waits before it retransmits a packet.
`transmit-delay`	The interval in seconds the router waits before it transmits a packet.
`<1-65535>`	The timer interval.
`instance-id`	The OSPFv3 instance.
`<0-31>`	Interface instance ID for IPv6 unicast

`<64-95>`	Interface instance ID for IPv4 unicast.
`fall-over bfd`	Fall-over Bidirectional Forwarding Detection (BFD).

Default

Default hello interval:10 seconds.

Default dead interval:40 seconds.

Default retransmit interval: 5 seconds.

Default transmit delay: 1 second

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#area 1 virtual-link 10.10.11.50 hello 5 dead 10
(config-router)#area 1 virtual-link 10.10.11.50 instance-id 1
(config-router)#area 1 virtual-link 10.10.11.50 fall-over bfd
```

auto-cost reference bandwidth

Use this command to control how OSPFv3 calculates default metrics for the interface.

By default, OSPFv3 calculates the OSPFv3 metric for an interface by dividing the reference bandwidth by the interface bandwidth. The auto-cost command is used to differentiate high bandwidth links. For multiple links with high bandwidth, specify a larger reference bandwidth value to differentiate cost on those links.

Use the no form of this command to assign cost based only on the interface bandwidth.

Command Syntax

```
auto-cost reference-bandwidth <1-4294967>
no auto-cost reference-bandwidth
```

Parameters

<1-4294967>	The reference bandwidth in Mbps per second.

Default

By default, reference bandwidth is 100Mbps

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example changes the reference bandwidth to 1Gbps to change the Fast Ethernet interface cost from 1 to 10.

```
#configure terminal
(config)#router ipv6 ospf 1
(config-router)#auto-cost reference-bandwidth 1000

(config)#router ipv6 ospf 1
(config-router)#no auto-cost reference-bandwidth
```

capability cspf

Use this command to enable the CSPF (Constrained Shortest Path First) feature for an OSPFv2 or OSPFv3 instance.

Use the no parameter with this command to disable CSPF functionality for the OSPFv2 or OSPFv3 instance.

Command Syntax

```
capability cspf
no capability cspf
```

Parameters

None

Default

By default, capability cspf is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#no capability cspf
```

clear ipv6 ospf process

Use this command to clear and restart all OSPFv3 routing processes or a given OSPFv3 routing process.

Command Syntax

```
clear ipv6 ospf (WORD|) process
```

Parameters

WORD	OSPFv3 process tag.

Command Mode

Privileged Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ipv6 ospf Tag1 process
```

debug ipv6 ospf

Use this command to specify all debugging options for OSPFv3.

Use the no form of this command to disable the options.

Command Syntax

```
debug ipv6 ospf (all|bfd|events|ifsm|lsa|nfsm|nsm|packet|retransmission|rib|route|)

no debug ipv6 ospf
  (all|bfd|events|ifsm|lsa|nfsm|nsm|packet|retransmission|rib|route|)
undebug ipv6 ospf (all|bfd|events|ifsm|lsa|nfsm|nsm|packet|rib|route)
no debug all ipv6 ospf
undebug all ipv6 ospf
no debug all
undebug all
```

Parameters

`all`	Enables all debugging information.
`bfd`	Debug OSPFv3 Bidirectional Forwarding Detection. (see debug ipv6 ospf bfd)
`events`	Debug OSPFv3 events (see debug ipv6 ospf events).
`ifsm`	Debug OSPFv3 Interface State Machines (see debug ipv6 ospf ifsm).
`lsa`	Debug OSPFv3 Link State Advertisements (see debug ipv6 ospf lsa).
`nfsm`	Debug OSPFv3 Neighbor State Machines (see debug ipv6 ospf nfsm).
`nsm`	Debug OSPFv3 NSM information (see debug ipv6 ospf nsm).
`packet`	Debug OSPFv3 packets (see debug ipv6 ospf packet).
`retransmission`	Debug OSPFv3 retransmission information. (see debug ipv6 ospf retransmission)
`rib`	Debug OSPFv3 Routing Information Base.(see debug ipv6 ospf rib)
`route`	Debug OSPFv3 route information (see debug ipv6 ospf route).

Command Mode

Privileged Exec and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf all
```

debug ipv6 ospf bfd

Use this command to specify the debugging options for OSPFv3 Bidirectional Forwarding Detection

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf bfd
no debug ipv6 ospf bfd
undebug ipv6 ospf bfd
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf bfd
```

debug ipv6 ospf events

Use this command to display debug information related to OSPF internal events. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf events {(abr|asbr|os|router|vlink|nssa)|}
no debug ipv6 ospf events {(abr|asbr|os|router|vlink|nssa)|}
undebug ipv6 ospf events {(abr|asbr|os|router|vlink|nssa)|}
```

Parameters

`abr`	Debug ABR events
`asbr`	Debug ASBR events
`os`	Debug OS interaction events
`router`	Debug other router events
`vlink`	Debug virtual link events
`nssa`	Debug NSSA events

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ipv6 ospf events abr
#debug ipv6 ospf events asbr
```

debug ipv6 ospf ifsm

Use this command to specify debugging options for OSPFv3 Interface Finite State Machine (IFSM) troubleshooting.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf ifsm ({events|status|timers}|)
no debug ipv6 ospf ifsm ({events|status|timers}|)
undebug ipv6 ospf ifsm ({events|status|timers}|)
```

Parameters

events	Debug IFSM event information.
status	Debug IFSM status information.
timers	Debug IFSM timer information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf ifsm status
```

debug ipv6 ospf lsa

Use this command to specify the debugging options for OSPFv3 Link State Advertisements (LSAs).

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf lsa {(generate|flooding|install|maxage|refresh)|}
no debug ipv6 ospf lsa {(generate|flooding|install|maxage|refresh)|}
undebug ipv6 ospf lsa {(generate|flooding|install|maxage|refresh)|}
```

Parameters

`generate`	Debug LSA generation.
`flooding`	Debug LSA flooding.
`install`	Debug LSA installation.
`maxage`	Debug the maximum age processing.
`refresh`	Debug LSA refresh.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf lsa
```

debug ipv6 ospf nfsm

Use this command to specify debugging options for OSPFv3 Neighbor Finite State Machines (NFSMs).

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf nfsm {(events|status|timers)|}
no debug ipv6 ospf nfsm {(events|status|timers)|}
undebug ipv6 ospf nfsm {(events|status|timers)|}
```

Parameters

events	Debug NFSM event information.
status	Debug NFSM status information.
timers	Debug NFSM timer information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf nfsm events
#no debug ipv6 ospf nfsm timers
```

debug ipv6 ospf nsm

Use this command to specify the debugging options for OSPFv3 NSM information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf nsm {(interface|redistribute)|}
no debug ipv6 ospf nsm {(interface|redistribute)|}
undebug ipv6 ospf nsm {(interface|redistribute)|}
```

Parameters

`redistribute`	Debug redistribute.
`interface`	Debug the NSM interface.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf nsm interface
```

debug ipv6 ospf packet

Use this command to specify the packet debugging options for OSPFv3 information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)

no debug ipv6 ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|
  detail}|)
undebug ipv6 ospf packet ({hello|dd|ls-request|ls-update|ls-ack|send|recv|detail}|)
```

Parameters

`hello`	Debug OSPFv3 hello.
`dd`	Debug OSPFv3 database description.
`ls-request`	Debug OSPFv3 link state request.
`ls-update`	Debug OSPFv3 link state update.
`ls-ack`	Debug OSPFv3 link state acknowledgment.
`send`	Debug packets sent
`recv`	Debug packets received.
`detail`	Debug detail information.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf packet ls-request
```

debug ipv6 ospf retransmission

Use this command to specify the debugging options for OSPFv3 retransmission information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf retransmission
no debug ipv6 ospf retransmission
```

Parameters

None

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf retransmission
```

debug ipv6 ospf rib

Use this command to specify the debugging options for OSPFv3 RIB information.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf rib {(interface|redistribute)|}

no debug ipv6 ospf rib {(interface|redistribute)|}
undebug ipv6 ospf rib {(interface|redistribute)|}
```

Parameters

redistribute	Debug redistribute.
interface	Debug the NSM interface.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug ipv6 ospf rib interface
```

debug ipv6 ospf route

Use this command to specify which route calculation to debug. Use this command without parameters to turn on all the options.

Use the no parameter with this command to disable this function.

Command Syntax

```
debug ipv6 ospf route {(ase|ia|install|spf)|}
no debug ipv6 ospf route {(ase|ia|install|spf)|}
undebug ipv6 ospf route {(ase|ia|install|spf)|}
```

Parameters

`ase`	Debug external route calculations.
`ia`	Debug inter-area route calculations.
`install`	Debug the route installation.
`spf`	Debug the SPF calculation.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#no debug ipv6 ospf route
#debug ipv6 ospf route ia
```

default-information originate

Use this command to create a default external route into an OSPF routing domain.

The system acts like an Autonomous System Boundary Router (ASBR) when you use the `default-information originate` command to redistribute routes into an OSPF routing domain. An ASBR does not by default generate a default route into the OSPF routing domain.

When you give the `default-information originate` command, also specify a `route-map` to avoid a dependency on the default network in the routing table.

Use the `no` parameter with this command to disable this feature.

Command Syntax

```
default-information originate
default-information originate {metric <0-16777214>|metric-type (1|2)|route-map
  WORD|always}
no default-information originate
no default-information originate {metric|metric-type|route-map|always}
```

Parameters

`always`	Used to advertise the default route regardless of whether there is a default route.
`metric`	Sets the OSPF metric used in creating the default route.
`<0-16777214>`	Sets the OSPF metric used in creating the default route. The value used is specific to the protocol.
`metric-type`	The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).
`1`	Sets OSPF External Type 1 metric.
`2`	Sets OSPF External Type 2 metric (default).
`route-map`	Route map.
`WORD`	Specify the name of route map.

Default

Sets the OSPF metric used in creating the default route. The default metric value is 10. The value used is specific to the protocol. metric-type The external link type associated with the default route advertised into the OSPF routing domain (see RFC 3101).

By default, 2 sets OSPF External Type 2 metric

Command Mode

Router mode

Router address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#default-information originate always metric 23 metric-type 2
route-map myinfo

(config)#router ipv6 ospf
(config-router)#no default-information originate metric metric-type route-map
```

default-metric

Use this command to set a default metric for OSPF.

A default metric facilitates redistributing routes with incompatible metrics. If the metrics do not convert, the default metric provides an alternative. Use this command to use the same metric value for all redistributed routes. Use this command in conjunction with the redistribute command.

Use the no parameter with this command to return to the default state.

Command Syntax

```
default-metric <1-16777214>
no default-metric
no default-metric <1-16777214>
```

Parameter

<1-16777214>	Default metric value.

Default

Built-in, automatic metric translations, as appropriate for each routing protocol.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#default-metric 100
```

distance

Use this command to define OSPFv3 route administrative distances based on route type. This command sets the distance for an entire group of routes rather than a specific route that passes an access list.

The administrative distance rates the trustworthiness of a routing information source. A higher distance value means a lower trust rating. For example, an administrative distance of 254 means that the routing information source cannot be trusted and should be ignored.

Use the no form of this command to restore the default value.

Command Syntax

```
distance <1-254>
distance ospfv3 {intra-area <1-254>|inter-area <1-254>|external <1-254>}
no distance (<1-254>|)
no distance ospfv3 {intra-area |inter-area |external}
```

Parameters

`<1-254>`	Used alone, this parameter specifies a default administrative distance used when no other specification exists for a routing information source.
`intra-area`	Routes within an area.
`<1-254>`	Distance for all routes within an area
`inter-area`	Routes from one area to another area.
`<1-254>`	Distance for all routes from one area to another area.
`external`	Routes from other routing domains learned by redistribution.
`<1-254>`	Distance for routes from other routing domains learned by redistribution.

Default

By default, distance value for each type of route is 110

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ipv6 ospf 100
(config-router)#distance ospfv3 inter-area 20 intra-area 10 external 40
```

distribute-list

Use this command to filter networks in routing updates. This command redistributes other routing protocols into the OSPF routing table.

Use the no parameter with this command to disable this function.

Command Syntax

```
distribute-list WORD out ((kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-
  65535>|)))
distribute-list WORD in
no distribute-list WORD out ((kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-
  65535>|)))
no distribute-list WORD in
```

Parameters

WORD	Specify the name of the access list.
in	Filter incoming routing updates.
out	Filter outgoing routing updates.
kernel	Specify kernel routes.
connected	Specify connected routes.
static	Specify static routes.
rip	Specify RIP routes.
bgp	Specify BGP routes.
isis	Specify IS-IS routes.
ospf	Specify OSPF routes.
WORD	Specify the OSPF process tag. If not specified, redistribute OSPF process with tag "null".
<1-65535>	Specify OSPF process ID <1-65535>. If not specified, redistribute OSPF instance with process ID 0.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the distribution of BGP routing updates based on the access list list1 (network 172.10.0.0).

```
#configure terminal
(config)#access-list list1 permit 172.10.0.0/16
```

```
(config)#router ipv6 ospf 100
(config-router)#distribute-list list1 out bgp
(config-router)#redistribute bgp
```

enable db-summary-opt

Use this command to enable the database summary list optimization for OSPFv3.

When this feature is enabled, the database exchange process is optimized by removing the LSA from the database summary list for the neighbor if the LSA instance in the summary list is the same as or less recent than the LSA in the database description packet received from the neighbor.

Use the no form of the command to disable database summary list optimization.

Command Syntax

```
enable db-summary-opt
no enable db-summary-opt
```

Parameters

None

Default

By default, db summary opt is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#enable db-summary-opt
(config-router)#no enable db-summary-opt
```

exit-address-family

Use this command to exit address-family mode and return to router mode.

Command Syntax

```
exit-address-family
```

Parameters

None

Default

By default, exit address family is disabled

Command Mode

Router address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config) # router ipv6 ospf 10
(config-router) # router-id 10.10.10.10
(config-router) # address-family ipv4 unicast
(config-router-af) # area 1 range 10.0.0.0/8
(config-router-af) # exit-address-family
```

ipv6 ospf cost

Use this command to specify the link-cost described in LSAs.

The cost (or metric) of an interface in OSPF indicates the overhead required to send packets across a certain interface. The value is taken to describe Link State information, and used for route calculation.

Use the no parameter with this command to reset the cost to default.

Command Syntax

```
ipv6 ospf cost <1-65535>
ipv6 ospf cost <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf cost
no ipv6 ospf cost instance-id (<0-31>|<64-95>)
```

Parameters

cost	Specify the link-state metric.
<1-65535>	Specify the link-state metric.
instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, ipv6 cost value is 10.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf cost 20 instance-id 1
```

ipv6 ospf dead-interval

Use this command to set the amount of time that the router waits to receive an OSPF hello packet from the neighbor before declaring the neighbor down.

The dead interval is advertised in hello packets. OSPF compares the dead interval in a received packet to the dead interval configured for the receiving interface. If the intervals do not match, the hello packet is discarded.

Use the no parameter with this command to reset the interval to default.

Command Syntax

```
ipv6 ospf dead-interval <1-65535>
ipv6 ospf dead-interval <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf dead-interval
no ipv6 ospf dead-interval instance-id (<0-31>|<64-95>)
```

Parameters

`dead-interval`	Specify the interval.
`<1-65535>`	Specify the interval in seconds.
`instance-id`	Specify the instance.
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

By default, dead interval is 40 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf dead-interval 20
```

ipv6 ospf demand-circuit

Use this command to enable Hello Suppression and LSA Suppression sent on OSPFv3 interface

Note: Hello's and LSA's will be suppressed on Point-to-point and Point-to-multipoint links and only LSA's will be suppressed for Broadcast link

Use the no parameter with this command to disable Hello Suppression and LSA Suppression.

Command Syntax

```
ipv6 ospf demand-circuit (instance-id (<0-31>|<64-95>))
no ipv6 ospf demand-circuit  (instance-id (<0-31>|<64-95>))
```

Parameters

instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 ospf demand-circuit

(config-if)#no ipv6 ospf demand-circuit
```

ipv6 ospf display route single-line

Use this command to display the output of the show ipv6 ospf route command with each route entry in a single-line.

Use the no parameter with this command to display the output with each route entry in a multiple lines.

Command Syntax

```
ipv6 ospf display route single-line
no ipv6 ospf display route single-line
```

Parameters

None

Default

By default, show ipv6 ospf route displays routes in multiple lines

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf display route single-line
```

ipv6 ospf hello-interval

Use this command to specify the interval between `hello` packets.

The hello interval is advertised in the hello packets. An OSPF router compares the hello interval in a received packet to the interval configured for the receiving interface. If this interval does not match, the hello packet is discarded. A shorter hello interval ensures faster detection of topological changes, but results in more routing traffic.

Use the `no` parameter with this command to reset the interval to default.

Command Syntax

```
ipv6 ospf hello-interval <1-65535>
ipv6 ospf hello-interval <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf hello-interval
no ipv6 ospf hello-interval instance-id (<0-31>|<64-95>)
```

Parameters

`hello-interval`	Specify the interval.
`<1-65535>`	Specify the interval in seconds.
`instance-id`	Specify the instance.
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

By default, hello interval is 10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf hello-interval 5 instance-id 1
```

ipv6 ospf link-lsa-suppression

Use this command to enable or disable link LSA (type 8) suppression. A type 8 LSA gives information about link-local addresses and a list of IPv6 addresses on the link.

If enabled and the interface type is *not* broadcast or NBMA, the router does not send type 8 link LSAs. This implies that other routers on the link determine the router's next-hop address using a mechanism other than the type 8 link LSA. This feature is implicitly disabled if the interface type is broadcast or NBMA.

Command Syntax

```
ipv6 ospf link-lsa-suppression (enable|disable)
ipv6 ospf link-lsa-suppression (enable|disable) instance-id (<0-31>|<64-95>)
```

Parameters

`enable`	Enable type 8 link LSA suppression
`disable`	Disable type 8 link LSA suppression (default).
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

By default, type 8 link LSA suppression is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf link-lsa-suppression enable
```

ipv6 ospf mtu

Use this command to set MTU size for OSPFv3 to construct packets based on this value. Whenever OSPFv3 constructs packets, it uses interface MTU size as Maximum IP packet size. This command forces OSPFv3 to use the specified value overriding the actual interface MTU size.

Use the no parameter with this command to return to the default value.

Command syntax

```
ipv6 ospf mtu <1280-65535> instance-id (<0-31>|<64-95>)
no ipv6 ospf mtu instance-id (<0-31>|<64-95>)
```

Parameters

<1280-65535>	Interface MTU value from OSPFv3's perspective.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, OSPFv3 uses interface MTU derived from the kernel and Instance ID as 0 if not configured.

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth1
(config-if)#ipv6 ospf mtu 1287 instance-id 10
```

ipv6 ospf mtu-ignore

Use this command to configure OSPF so that it does not check the MTU size during DD (Database Description) exchange.

Use the no form of this command to make OSPF check the MTU size during DD exchange.

Command syntax

```
ipv6 ospf mtu-ignore
ipv6 ospf mtu-ignore instance-id (<0-31>|<64-95>)
no ipv6 ospf mtu-ignore
no ipv6 ospf mtu-ignore instance-id (<0-31>|<64-95>)
```

Parameters

<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, during the DD exchange process, OSPF checks the MTU size described in DD packets received from its neighbor. If the MTU size does not match the interface MTU, the neighbor adjacency is not established. Using this command makes OSPF ignore this check and allows establishing of adjacency regardless of MTU size in the DD packet.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth1
(config-if)#ipv6 ospf mtu-ignore
```

ipv6 ospf neighbor

Use this command to connect OSPFv3 routers to non-broadcast multi-access (NBMA) networks.

One neighbor entry must be included for each known NBMA neighbor. The neighbor address must be a link-local address.

Note: For point-to-multipoint interfaces, the `cost` parameter is the only applicable option.

Use the `no` parameter with this command to remove a configuration.

Command Syntax

```
ipv6 ospf neighbor X:X::X:X (instance-id (<0-31>|<64-95>)|)
ipv6 ospf neighbor X:X::X:X {cost <1-65535>} (instance-id (<0-31>|<64-95>)|)
ipv6 ospf neighbor X:X::X:X {poll-interval <0-4294967295>|priority <0-255>}
  (instance-id (<0-31>|<64-95>)|)
no ipv6 ospf neighbor X:X::X:X ({cost <1-65535>}|{poll-interval <0-
  4294967295>|priority <0-255>}|) (instance-id (<0-31>|<64-95>)|)
```

Parameters

`X:X::X:X`	Specify a neighbor IP address.
`instance-id`	Specify the instance.
`<0-255>`	Specify the instance ID.
`cost`	Cost of the interface. This parameter does not apply to NBMA networks.
`<1-65535>`	Cost of the interface.
`poll-interval`	Dead neighbor polling interval.
`<0-4294967295>`	Dead neighbor polling interval in seconds. It is recommended to set this value much higher than the hello interval.
`priority`	Specify a priority. This parameter does not apply to point-to-multipoint interfaces.
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

Default cost is 10.

Default poll interval is 120 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
```

```
(config)#interface eth0
(config-if)#ipv6 ospf neighbor 2000:500::1 cost 2 instance-id 3
```

ipv6 ospf network

Use this command to set an OSPFv3 network type.

Use the no option with this command to return to the default value.

Command Syntax

```
ipv6 ospf network (broadcast|non-broadcast|point-to-multipoint (non-
  broadcast|)|point-to-point) (instance-id (<0-31>|<64-95>)|)
no ipv6 ospf network (broadcast|non-broadcast|point-to-multipoint (non-
  broadcast|)|point-to-point) (instance-id (<0-31>|<64-95>)|)
```

Parameters

`broadcast`	Sets the network type to broadcast.
`non-broadcast`	Sets the network type to NBMA.
`point-to-multipoint`	Sets the network type to point-to-multipoint.
`non-broadcast`	Sets the network type to NBMA.
`point-to-point`	Sets the network type to point-to-point.
`instance-id`	Specify the instance.
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

By default, ipv6 ospf network is broadcast type

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to set the network to point-to-point type on the eth0 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf network point-to-point
```

ipv6 ospf priority

Use this command to set the router priority for determining the designated router (DR) for the network.

A router with the higher router priority becomes the DR. If the priority is the same for two routers, the router with the higher router ID takes precedence.

Only routers with a nonzero priority value are eligible to become the designated or backup designated router. Configure router priority for broadcast or NBMA networks only and not for point-to-point networks.

Use the no parameter with this command to reset the value to default.

Command Syntax

```
ipv6 ospf priority <0-255>
ipv6 ospf priority <0-255> instance-id (<0-31>|<64-95>)
no ipv6 ospf priority instance-id (<0-31>|<64-95>)
```

Parameters

priority	Specify the router priority of the interface.
<0-255>	Specify the router priority of the interface. The default is 1.
instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, priority is 1

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf priority 127
```

ipv6 ospf retransmit-interval

Use this command to set the interval between retransmission of Link State Update packets. This interval is also used to retransmit DD packets and Link State Request packets.

After sending an LSA to a neighbor, the router keeps the LSA on the LS-retransmission list until it receives an acknowledgement. If the router does not receive an acknowledgment from the neighbor during the retransmit interval, it sends the LSA to the neighbor again.

Use the no parameter with this command to reset the interval to the default value.

Command Syntax

```
ipv6 ospf retransmit-interval <1-1800>
ipv6 ospf retransmit-interval <1-1800> instance-id (<0-31>|<64-95>)
no ipv6 ospf retransmit-interval
no ipv6 ospf retransmit-interval instance-id (<0-31>|<64-95>)
```

Parameters

retransmit-interval	
	Specify the interval.
<1-1800>	Specify the interval in seconds.
instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, ipv6 ospf retransmit interval is 5 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf retransmit-interval 3
```

ipv6 ospf transmit-delay

Use this command to set the estimated time it takes to transmit a Link State Update packet over the interface. The transmit-delay value is added to the LS age of LSAs and is advertised through this interface whenever the LSAs are transmitted.

Use the no parameter with this command to reset the delay to the default value.

Command Syntax

```
ipv6 ospf transmit-delay <1-1800>
ipv6 ospf transmit-delay <1-1800> instance-id (<0-31>|<64-95>)
no ipv6 ospf transmit-delay
no ipv6 ospf transmit-delay instance-id (<0-31>|<64-95>)
```

Parameters

`transmit-delay`	Specify the time to transmit a link-state update.
`<1-1800>`	Specify the time in seconds to transmit a link-state update.
`instance-id`	Specify the instance.
`<0-31>`	Interface instance ID for IPv6 unicast
`<64-95>`	Interface instance ID for IPv4 unicast.

Default

By default, transmit delay is 1 second

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 ospf transmit-delay 2
```

ipv6 router ospf

Use this command to enable OSPFv3 routing on an interface.

Specify the process ID to configure multiple instances of OSPFv3. When running a single instance of OSPFv3, you do not need to specify a instance ID.

When OSPFv3 receives a packet, it checks if the instance ID in the packet matches the instance ID of the receiving interface.

Use the no parameter with this command to disable OSPFv3 routing on an interface.

Command Syntax

```
ipv6 router ospf area (A.B.C.D|<0-4294967295>)
ipv6 router ospf area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD
ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD instance-id (<0-31>|<64-95>)
ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>)
ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD
no ipv6 router ospf area (A.B.C.D|<0-4294967295>) tag WORD instance-id (<0-31>|<64-95>)
no ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>)
no ipv6 router ospf tag WORD area (A.B.C.D|<0-4294967295>) instance-id (<0-31>|<64-95>)
```

Parameters

area	OSPF Area ID in IPv4 address format.
A.B.C.D	OSPF area ID in IP address format.
<0-4294967295>	OSPF area ID as a decimal value.
instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.
tag	Tag value to use as a “match” value for controlling redistribution via route maps.
WORD	Set the tag value.

Default

By default, ipv6 router ospf is disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 router ospf area 1 tag Tag1 instance-id 1
```

ipv6 te-metric

Use this command to set the traffic engineering metric for an interface.

The traffic engineering metric is used in OSPF-TE Link State Advertisements. If the traffic engineering metric is not set, the ipv6 ospf cost value for an interface is used in OSPF-TE Link State Advertisements.

Use the no parameter with this command to unset the traffic engineering metric for this interface.

Command Syntax

```
ipv6 te-metric <1-65535>
ipv6 te-metric <1-65535> instance-id (<0-31>|<64-95>)
no ipv6 te-metric instance-id (<0-31>|<64-95>)
```

Parameters

te-metric	Specify the TE metric.
<1-65535>	Specify the TE metric value.
instance-id	Specify the instance.
<0-31>	Interface instance ID for IPv6 unicast
<64-95>	Interface instance ID for IPv4 unicast.

Default

By default, traffic engineering metric value is 0

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 te-metric 6
```

max-concurrent-dd

Use this command to limit the number of Database Descriptors (DD) that can be processed concurrently.

This command is useful when a router's performance is affected from simultaneously bringing up several OSPFv3 adjacencies. This command limits the maximum number of DD exchanges that can occur concurrently per OSPFv3 instance, thus allowing for all of the adjacencies to come up.

Use the no option with this command to remove the limit.

Command Syntax

```
max-concurrent-dd <1-65535>
no max-concurrent-dd
```

Parameters

`<1-65535>`	Specify the number of DD processes.

Default

By default, number of maximum concurrent DD processes is 5

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example set the `max-concurrent-dd` value to 4.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#max-concurrent-dd 4
```

passive-interface

Use this command to suppress sending Hello packets on all interfaces, or on a specified interface.

This command configures OSPFv3 on simplex Ethernet interfaces. Since a simplex interface represents only one network segment between two devices, configure the transmitting interface as a passive interface. This ensures that OSPFv3 does not send hello packets for the transmitting interface. Both the devices can see each other via the hello packet generated for the receiving interface.

Use the `no` form with this command to resume sending `hello` packets on all interfaces, or on a specified interface.

Command Syntax

```
passive-interface (IFNAME |)
no passive-interface (IFNAME |)
```

Parameters

`IFNAME`	Specify an interface name

Default

By default, passive interface is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#passive-interface eth0
```

redistribute

Use this command to import routes from other routing protocols, or from another OSPF instance, into OSPFv3 AS-external-LSAs.

OSPFv3 advertises routes learned from other routing protocols or from other OSPF instances, including static or connected routes. Each injected prefix is put into the AS-external-LSA with a specified metric and metric-type.

Use the no parameter with this command to stop redistribution.

Command Syntax

```
redistribute (kernel|connected|static|rip|bgp|isis|ospf (WORD|<1-65535>|)) {metric
  <0-16777214>|metric-type (1|2)|?route-map WORD|tag <0-4294967295>}
no redistribute(kernel|connected|static|rip|bgp|isis|ospf (WORD|))
```

Parameters

`kernel`	Specify kernel routes.
`connected`	Specify connected routes.
`static`	Specify static routes.
`rip`	Specify RIP routes.
`bgp`	Specify BGP routes.
`isis`	Specify IS-IS routes.
`ospf`	Specify OSPF routes.
`WORD`	Specify an OSPFv3 Process Tag. If not specified, redistribute OSPF process with tag "null".
`<1-65535>`	Specify an OSPF process identifier. If not specified, redistribute OSPF instance with process ID 0.
`metric`	Specify the external metric.
`<0-16777214>`	Specify the external metric.
`metric-type`	Specify the external metric-type (see RFC 3101):
`1`	Set OSPF External Type 1 metric.
`2`	Set OSPF External Type 2 metric.
`route-map`	Specify a route map reference.
`WORD`	Specify name of the route-map.
`tag`	Tag value to use as a “match” value for controlling redistribution via route maps
`<0-4294967295>`	Specify the route tag.

Default

By default, redistribute is disabled

Command Mode

Router mode

Router address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows redistribution of BGP routes into the OSPFv3 routing table, with the metric as 10.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#redistribute bgp metric 10 metric-type 1
```

The following example shows redistribution of static IPv4 routes into the OSPFv3 routing table.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#address-family ipv4 unicast
(config-router-af)#redistribute static
(config-router-af)#exit-address-family
```

router-id

Use this command to specify a router ID for the OSPFv3 process.

Configure each router with a unique router-id. In an OSPFv3 router process that has active neighbors, a new router-id is used at the next reload or when you start the OSPFv3 manually.

Use the no form of this command to force OSPFv3 to stop the routing functionality.

Command Syntax

```
router-id A.B.C.D
no router-id (A.B.C.D|)
```

Parameters

A.B.C.D	Specify the router ID in IPv4 address format.

Default

By default, router id is loop-back IP address of IP address with highest IP

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows a fixed router ID 43.3.3.3

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#router-id 43.3.3.3
```

router ipv6 ospf

Use this command to initiate OSPFv3 routing process and enter Router mode to configure OSPFv3 routing process. For making the OSPFv3 routing process functional, you must specify OSPFv3 process tag in router mode and enable OSPFv3 on at least one interface. OSPFv3 is only enabled on interfaces where OSPFv3 process tag matches the tag specified using ipv6 router ospf area command in Interface mode.

Use the no parameter with this command to remove OSPFv3 process.

Command Syntax

```
router ipv6 ospf
router ipv6 ospf WORD
router ipv6 vrf ospf WORD
no router ipv6 ospf
no router ipv6 ospf WORD
no router ipv6 vrf ospf WORD
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.
vrf	Enable an IPv6 VRF routing process

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf Tag1
(config-router)#
```

show debugging ipv6 ospf

Use this command to display the OSPFv3 debugging options.

Command Syntax

```
show debugging ipv6 ospf
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging ipv6 ospf

OSPFv3 debugging status:
 OSPFv3 all packet debugging is on
 OSPFv3 all NFSM debugging is on
#
```

show ipv6 ospf

Use this command to display global and area information about OSPFv3.

Command Syntax

```
show ipv6 ospf (WORD|)
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged Exec mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 ospf
Routing Process "OSPFv3 0" with ID 1.2.3.4
SPF schedule delay 5 secs, Hold time between SPFs 10 secs Minimum LSA interval
5 secs,
Minimum LSA arrival 1 secs Number of external LSA 3. Checksum Sum 0x2CD6F
Number of areas
in this router is 1
Area BACKBONE(0)
Number of interfaces in this area is 1
SPF algorithm executed 3 times
Number of LSA 4. Checksum Sum 0x2A6AC
```

Table 3-1 explains the fields for each ospf entry.

Table 3-1: show ipv6 ospf output details

Field	Description
Area	Number of areas in device, area addresses, and so on.
Interface attached to this area	The device interfaces attached to the area.
SPF algorithm executed is N	The number of times (N) the OSPF Shortest Path First (SPF) algorithm is executed within the area.
Number of Area scoped LSAs is N	Number of LSAs (N) with a scope of the specified area.
SPF last updated	The interval in seconds that the SPF algorithm was last executed within the area.
Router	Number of router LSAs in the area.
Hold time	Minimum hold time between consecutive SPF calculations.
Checksum	LSA header checksum.

show ipv6 ospf database

Use this command to display information in the OSPFv3 Link State database.

Command Syntax

```
show ipv6 ospf database
show ipv6 ospf database (self-originate|max-age|adv-router A.B.C.D|)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-
  external|link|intra-prefix|te|grace)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-
  external|link|intra-prefix|te|grace) (self-originate|adv-router A.B.C.D|)
show ipv6 ospf database (router|network|inter-prefix|inter-router|external|nssa-
  external|link|intra-prefix|te|grace) A.B.C.D (self-originate|adv-router A.B.C.D|)
show ipv6 ospf WORD database
show ipv6 ospf WORD database (router|network|inter-prefix|inter-
  router|external|nssa-external|link|intra-prefix|te|grace)
show ipv6 ospf WORD database (router|network|inter-prefix|inter-
  router|external|nssa-external|link|intra-prefix|te|grace) adv-router A.B.C.D
```

Parameters

`self-originate`	Self-originated link states
`max-age`	LSAs in MaxAge list
`adv-router`	Advertising router for Type 8 Link LSAs (Link State Advertisements):
`A.B.C.D`	Router ID of the advertising router.
`router`	Router LSAs.
`network`	Network LSAs.
`inter-prefix`	Inter-Area-Prefix LSAs.
`inter-router`	Inter-Area-Router LSAs.
`external`	AS external LSAs.
`nssa-external`	NSSA LSAs.
`link`	Link LSAs.
`intra-prefix`	Intra-Area-Prefix LSAs (Type 9) with prefixes for stub and transit networks
`te`	Intra-area TE LSAs.
`grace`	Grace LSAs.
`A.B.C.D`	Link state ID as an IP address.
`WORD`	Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged Exec mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example: adv-router Parameter

This example shows using the `adv-router` parameter:

```
#show ipv6 ospf database link adv-router 10.70.0.58
            OSPFv3 Router with ID (10.70.0.58) (Process 100)
                Link-LSA (Interface eth1)
  LS age: 492
  LS Type: Link-LSA
  Link State ID: 0.0.0.3
  Advertising Router: 10.70.0.58
  LS Seq Number: 0x80000001
  Checksum: 0xC2D6
  Length: 68
  Priority: 1
  Options: 0x000013 (-|R|-|-|E|V6)
  Link-Local Address: fe80::204:75ff:feaa:fedb
  Number of Prefixes: 2
    Prefix: 5f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
```

Header

```
OSPFv3 Router with ID (10.70.0.58) (Process 100)
Link-LSA (Interface eth1)
```

The router ID and OSPFv3 process tag of the local router.

Interface name of the router associated with this Link-LSA.

OSPFv3 Database Fields

Table 3-2 explains the fields for each database entry.

Table 3-2: OSPFv3 database fields

Field	Description
LS age	The length of time in seconds since the LSA was originated.
LS Type	The type of LSA
Link State ID	Interface identifier of the originating router.
Advertising router	The Router ID of the router advertising this LSA. On a transit network, this is always the Designated Router ID.
LS Seq Number	Sequence number of an LSA.
Checksum	LSA header checksum (excluding the LS age field).
Length	The length in bytes of the LSA (including the 20-byte header).
Priority	The router priority of the interface attaching the originating router of the link.

Table 3-2: OSPFv3 database fields

Field	Description
Options	Bits in network LSAs that originate on the link: DC-bit: Whether the router supports OSPF over Demand Circuits. R-bit: Whether the router is active. If this bit is clear, routes which transit the advertising node cannot be computed. N-bit: How the router handles Type 7 LSAs. MC-bit: Whether IP multicast packets are forwarded. E-bit: Whether AS-External-LSAs are flooded. This bit is set in all AS External LSAs and in all LSAs. originated in the backbone and non-stub areas. V6-bit: Whether to include the router/link in routing calculations.
Link-Local Address	The originating router's link-local interface address.
Number of Prefixes	The number of IPv6 prefixes associated to the link: Prefix: The global IPv6 prefix associated to this link. Prefix Options: Each prefix is advertised along with an 8-bit capabilities field.They serve as input for routing calculations allowing, for example, some prefixes to be ignored or marked as not re-advertisable.
Referenced LS Type	Identifies the Router-LSA or Network-LSA with which the IPv6 prefixes are associated: Type 0x2001: prefixes associated with Router-LSA Type 0x2002: prefixes associated with Network-LSA
Referenced Link State ID	Referenced LS Type 0x2001: this field is 0 Referenced LS Type 0x2002: the interface ID of the link's Designated Router.
Referenced Advertising Router	Referenced LS Type 0x2001: ID of the originating router. Referenced LS Type 0x2002: ID of the Designated Router Prefix: Referenced LS Type 0x2001: global IPv6 prefix associated with the router Referenced LS Type 0x2002: global IPv6 prefix associated with the transit link Prefix Options: Bits in network LSAs that originate on the link: DC: How the router handles demand circuits R: Whether the router is active. If this bit is clear, routes which transit the advertising node cannot be computed. N: How the router handles Type 7 LSAs MC: Whether IP multicast packets are forwarded E: Whether AS-External-LSAs are flooded V6: Whether to include the router/link in routing calculations Metric: The cost of this prefix.

Example: intra-prefix and adv-router Parameters

This example shows using the `adv-router` and `intra-prefix` parameters.

Note: The same information for OSPFv2 can be viewed in type 1 router LSAs and type 2 network LSAs. However, in OSPFv3 all addressing information has been removed from router LSAs and network LSAs, leading to the introduction of the Intra-Area-Prefix LSA. In a transit network, the Intra-Area-Prefix-LSA serves the same purpose as a network LSA and on a point-to-point or point-to-multipoint network serves the same purpose as a router LSA.

```
#show ipv6 ospf database intra-prefix adv-router 10.70.0.58
           OSPFv3 Router with ID (10.70.0.58) (Process 100)
```

```
               Intra-Area-Prefix-LSA (Area 0.0.0.0)
  LS age: 1435
  LS Type: Intra-Area-Prefix-LSA
  Link State ID: 0.0.0.2
  Advertising Router: 10.70.0.58
  LS Seq Number: 0x80000001
  Checksum: 0x1B4E
  Length: 56
  Number of Prefixes: 2
  Referenced LS Type: 0x2002
  Referenced Link State ID: 0.0.0.3
  Referenced Advertising Router: 10.70.0.58
    Prefix: 5f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
    Metric: 0
    Prefix: 6f00:1:2:10::/64
    Prefix Options: 0 (-|-|-|-)
    Metric: 0
```

Header

```
OSPFv3 Router with ID (10.70.0.58) (Process 100)
Intra-Area-Prefix-LSA (Area 0.0.0.0)
```

- The router ID and OSPFv3 process tag for the router.
- Intra-Area-Prefix-LSA has area flooding scope. This LSA belongs to Area 0.0.0.0.

show ipv6 ospf interface

Use this command to display OSPFv3 interface information.

Command Syntax

```
show ipv6 ospf interface
show ipv6 ospf interface IFNAME
```

Parameters

IFNAME	The name of the interface.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

This is a sample output from the `show ipv6 ospf interface` command displaying the OSPFv3 interface information:

```
#show ipv6 ospf interface
eth0 is up, line protocol is up
  Interface ID 3, Instance ID 0, Area 0.0.0.0
  IPv6 Link-Local Address fe80::248:54ff:fec0:f32d/10
 Router ID 1.2.3.4, Network Type BROADCAST, Cost: 10
 Transmit Delay is 1 sec, State Backup, Priority 1
 Designated Router (ID) 5.6.7.8
Interface Address fe80::203:47ff:fe4c:776e
 Backup Designated Router (ID) 1.2.3.4
Interface Address fe80::248:54ff:fec0:f32d
 Timer interval configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:01
 Neighbor Count is 1, Adjacent neighbor count is 1
```

If Hello Suppression is enabled

```
RTR_B#show ipv6 ospf interface
eth1 is up, line protocol is up
  Interface ID 3
  IPv6 Prefixes
    fe80::5054:ff:fef3:f166/64 (Link-Local Address)
    2001::2/64
  OSPFv3 Process (1), Area 0.0.0.0, Instance ID 66
    Router ID 2.2.2.2, Network Type P2MP-NBMA, Cost: 1, TE Metric: 1
    Reduce LSA Flooding
    Transmit Delay is 1 sec, State Point-To-Point, Priority 1
    Timer interval configured, Hello 30, Dead 120, Wait 120, Retransmit 5
      Hello due in 00:00:32
    Neighbor Count is 1, Adjacent neighbor count is 1
    Suppress hello for 1 neighbor(s)
```

```
        Hello received 2 sent 3, DD received 4 sent 6
        LS-Req received 1 sent 1, LS-Upd received 7 sent 4
        LS-Ack received 0 sent 3, Discarded 0
```

Table 3-3 explains the fields for each ospf interface entry.

Table 3-3: show ipv6 ospf interface output details

Field	Description
Interface Type and whether it is up or down.	Status of the interface type.
Line protocol	Status of the line protocol.
Interface ID	Interface for which information is displayed.
Instance ID	For running multiple instances of OSPFv3 on the router
Area	Area ID in A.B.C.D form
IPv6 Link-Local Address	link-local address is an IPv6 unicast address – cannot communicate to link-local addresses that are outside the directly connected network. In IPv6 (X:X::X:X/M) form.
Router ID	As stated – In A.B.C.D form.
Network Type	One of the following: 1. Ethernet is Broadcast 2. Serial p2p non-broadcast 3. NBMA – Non-Broadcast MultiAccess (NBMA) media
cost	The cost of sending packets over this interface – range is 1 to 65535.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 1 to 65535. The default is 1.
Priority	OSPFv3 router priority for the interface. The range is 0 to 255. A router with priority 0 can never become the designated router, the default is 1.
Designated Router (ID)	The ID number of the Designated Router (DR).
Interface Address	The IPV6 address of this device.
Backup Designated Router	The ID number or the Backup Designated Router (BDR).
Interface Address	The IPv6 address of the Backup Designated Router.
Timer interval configured	The timer values of the following instances: Hello, Dead, Wait, Retransmit.
Hello due in	The countdown for receiving the next Hello packet.
Neighbor Count is	Number of neighbor count.
Adjacent neighbor count is	Number of adjacent neighbor count.

show ipv6 ospf neighbor

Use this command to display information about an OSPFv3 neighbor.

Command Syntax

```
show ipv6 ospf neighbor
show ipv6 ospf WORD neighbor
show ipv6 ospf neighbor INTERFACE
show ipv6 ospf WORD neighbor INTERFACE
show ipv6 ospf neighbor INTERFACE detail
show ipv6 ospf WORD neighbor INTERFACE detail
show ipv6 ospf neighbor detail
show ipv6 ospf WORD neighbor detail
show ipv6 ospf neighbor A.B.C.D
show ipv6 ospf WORD neighbor A.B.C.D
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.
INTERFACE	Display the name of the Interface
A.B.C.D	Neighbor IP address.
detail	Details of neighbors

Command Mode

Privileged Exec mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This is a sample output from the show ipv6 ospf neighbor command displaying information about the OSPFv3 neighbor.

```
#show ipv6 ospf neighbor
OSPFv3 Process (*null*)
Neighbor ID Pri State Dead Time Interface Instance ID
5.6.7.8 1 Full/DR 00:00:38 eth0 0
```

If Hello Suppression is enabled

```
RTR_B#
RTR_B#show ipv6 ospf neighbor
OSPFv3 Process (1)
Neighbor ID     Pri   State           Dead Time   Interface  Instance ID
1.1.1.1           1   Full/ -         inactive    eth1       0
4.4.4.4           1   Full/DR         00:00:40    eth2       0
4.4.4.4           1   Full/ -         inactive    VLINK1     0
```

```
RTR_B#

RTR_B#
RTR_B#show ipv6 ospf neighbor detail
 Neighbor 1.1.1.1, interface address fe80::5054:ff:feb3:d3bc
    In the area 0.0.0.0 via interface eth1
    Neighbor priority is 1, State is Full, 7 state changes
    Hello is suppressed
    DR is 0.0.0.0 BDR is 0.0.0.0
    Options is 0x000133 (AF|*|*|DC|R|-|-|E|V6)
    Dead timer due in inactive
    Database Summary List 0
    Link State Request List 0
```

Table 3-4 explains the fields for each ospf neighbor entry.

Table 3-4: show ipv6 ospf neighbor output details

Field	Description
Neighbor	Router ID of the neighbor router.
interface address	IPv6 address of the neighbor's interface.
In the area	The neighbor router's area ID.
via interface	Neighbor router's interface name.
Neighbor Priority is	OSPFv3 router priority for the interface. The range is 0 to 255. A router with priority 0 can never become the designated router, the default is 1.
State	The Link State Address (LSA) of the neighbor, and there has been 7 state changes, and sending Hello packets is suppressed.
DR	Designated Router (DR) ID
BDR	Backup Designated Router (BDR) ID
Options is	The hexadecimal representation of the seven bits in the Options Field of Hello packets (see RFC 5340): • AF-bit – Address Family bit. • V6-bit – If this bit is clear, the router/link should be excluded from IPv6 routing calculations. • E-bit – This bit describes the way AS-external-LSAs are flooded. • N-bit – This bit indicates whether or not the router is attached to an NSSA. • R-bit – This bit (the `Router' bit) indicates whether the originator is an active router. If the router bit is clear, then routes that transit the advertising node cannot be computed. Clearing the router bit is appropriate for a multi-homed host that wants to participate in routing, but does not want to forward non-locally addressed packets. • DC-bit – This bit describes the router's handling of demand circuits, as specified in [DEMAND]. • *-bit – These bits are reserved for migration of OSPFv2 protocol extensions.

Table 3-4: show ipv6 ospf neighbor output details (Continued)

Field	Description
Dead timer due in	The countdown timer for marking neighbor connections dead. In this example, the Deat Timer has been deactivated.
Database Summary List	Describes routes to IPv6 address prefixes that belong to other areas.
Link State Request List	Sent or received when Link-State Request packets finds that parts of the Link State Database are out of date.
Timer interval configured	The set values for the following packet types: Hello, Dead, Wait, Retransmit.
Neighbor Count	The number of known neighbors.
Adjacent neighbor count	The number of directly adjacent neighbors.

show ipv6 ospf route

Use this command to display the IPv6 routing table for OSPFv3.

The routes can be displayed in two ways:

- Each routing entry in a single-line
- Each routing entry in multiple lines

By default, the routing table is displayed in the multi-line format. For a single line display, give the ipv6 ospf display route single-line command.

Command Syntax

```
show ipv6 ospf route
show ipv6 ospf WORD route
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is sample output in single-line format:

```
#show ipv6 ospf route
Destination Metric Next-hop
3ffe:1:1::/48 10 directly connected, eth0
3ffe:2:1::/48 10 directly connected, eth0
3ffe:2:2::/48 10 directly connected, eth0
3ffe:3:1::/48 10 directly connected, eth0
3ffe:3:2::/48 10 directly connected, eth0
3ffe:3:3::/48 10 directly connected, eth0
E2 3ffe:100:1::1/128 10/20 via fe80::203:47ff:fe4c:776e, eth0
E2 3ffe:100:2::1/128 10/20 via fe80::203:47ff:fe4c:776e, eth0
E2 3ffe:100:3::1/128 10/20 via fe80::203:47ff:fe4c:776e, eth0
IA 3ffe:101:1::/48 20 via fe80::203:47ff:fe4c:776e, eth0
IA 3ffe:101:2::/48 20 via fe80::203:47ff:fe4c:776e, eth0
IA 3ffe:101:3::/48 20 via fe80::203:47ff:fe4c:776e, eth0
```

The following is sample output in multi-line format:

```
#show ipv6 ospf route
Destination Metric
Next-hop Interface
3ffe:1:1::/48 10
-- eth0
3ffe:2:1::/48 10
-- eth0
3ffe:2:2::/48 10
```

```
-- eth0
3ffe:3:1::/48 10
-- eth0
3ffe:3:2::/48 10
-- eth0
3ffe:3:3::/48 10
-- eth0
E2 3ffe:100:1::1/128 10/20
fe80::203:47ff:fe4c:776e eth0
```

Table 3-5 explains the fields for each ospf route entry.

Table 3-5: show ipv6 ospf route output details

Field	Description
IP address	IP address of the remote network.
Metric	For OSPF the metric is cost, which indicates the best quality path to use to forward packets.
Next hop router IP address	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Outgoing interface name	Interface used to get to the next-hop address for this route.

show ipv6 route fast-reroute

Use this command to display loop-free alternate routes with alternate next hops.

Command Syntax

```
show ipv6 route fast-reroute
```

Parameters

None

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Usage

```
#show ipv6 route fast-reroute
```

show ipv6 ospfv3 topology

Use this command to display information about OSPFv3 topology for each area.

Command Syntax

```
show ipv6 ospfv3 topology
show ipv6 ospfv3 WORD topology
show ipv6 ospfv3 topology area (A.B.C.D|<0-4294967295>)
show ipv6 ospfv3 WORD topology area (A.B.C.D|<0-4294967295>)
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.
area	OSPFv3 area ID
A.B.C.D	OSPFv3 Area ID in IPv4 address format.
<0-4294967295>	OSPFv3 Area ID as a decimal value.

Command Mode

Privileged Exec mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 ospfv3 topology
OSPFv3 paths to Area (0.0.0.0) routers
Router ID Bits Metric Next-Hop Interface
1.2.3.4 --
5.6.7.8 E 10 5.6.7.8 eth0
```

Example

```
#show ipv6 ospfv3 topology

OSPFv3 paths to Area (0.0.0.0) routers
Router ID        Bits  Metric     Next-Hop            Interface
1.2.3.4                                             --
5.6.7.8          E     10         5.6.7.8             eth0
```

Table 3-6 explains the fields for each ospfv3 topology entry.

Table 3-6: show ipv6 ospfv3 topology output details

Field	Description
OSPFv3 path to Area	Area ID in IPv4 format.
Router ID	ID in IPv4 format,

Table 3-6: show ipv6 ospfv3 topology output details

Field	Description
Bits	Bits appended to packets: • V-bit Indicates whether the advertising router is an endpoint of a virtual link. • E-bit Indicates whether the advertising router is an Autonomous System Border Router (ASBR). • B-bit Indicates whether the advertising router is an Area Border Router (ABR). • W-bit When set, the router is a wild-card multicast receiver.
Metric	The value of ospfv3 metric.
Next-Hop	The next-hop identifier.
Interface	The interface name through which the virtual link extends.

show ipv6 ospf virtual-links

Use this command to display information about OSPFv3 virtual-links.

Command Syntax

```
show ipv6 ospf virtual-links
show ipv6 ospf WORD virtual-links
```

Parameters

WORD	Tag value to use as a “match” value for controlling redistribution via route maps.

Command Mode

Privileged Exec mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 5.6.7.8 is up
Transit area 0.0.0.1 via interface eth0, instance ID 0
Local address 3ffe:1234:1::1/128
Remote address 3ffe:5678:3::1/128
Transmit Delay is 1 sec, State Point-To-Point,
Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
Hello due in 00:00:01
Adjacency state Up
```

If Hello Suppression is enabled

```
RTR_B#show ipv6 ospf virtual-links
Virtual Link VLINK1 to router 4.4.4.4 is up
  Transit area 0.0.0.1 via interface eth2, instance ID 0
  Hello suppression Enabled
  DoNotAge LSA allowed
  Local address 2002::1/128
  Remote address 2002::2/128
  Transmit Delay is 1 sec, State Point-To-Point,
  Timer intervals configured, Hello 10, Dead 40, Wait 40, Retransmit 5
    Hello due in inactive
    Adajcency state Full
RTR_B#
RTR_B#
```

Table 3-7 explains the fields for each ospf virtual-links entry.

Table 3-7: show ipv6 ospf virtual-links output details

Field	Description
Virtual Link	Virtual link name, the router ID to which it is connected, and the state of the link.
Transit area	Transit area ID, the interface it uses, and its instance ID – an Instance ID should default to 0. It is only necessary to assign a value other than 0 on those links that will contain multiple separate communities of OSPF routers.
Local address	The local IPV6 address and subnet mask.
Remote address	The remote IPv6 address and subnet mask.
Transmit Delay	The delay, in seconds, between link-state transmits. This value must be the same for all nodes on the network. The range is 1 to 65535. The default is 1. The state is point-to-point.
Timer intervals configured	The configured values in seconds of the following timers: Hello, Dead, Wait, Retransmit.
Hello due in	A countdown timer that indicates when the next Hello packet should arrive.
Adjacency State	Whether the adjacency state is either up or down.

show ipv6 vrf

Use this command to list information about VRFs.

Command Syntax

```
show ipv6 vrf (WORD|)
```

Parameter

WORD	VPN Routing/Forwarding instance name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is a sample output of the `show ipv6 vrf` command displaying VRF information:

```
#show ipv6 vrf
Name             Interfaces

qa               eth0
you              eth1
myVRF            eth2
```

Table 3-8 explains the fields.

Table 3-8: show ipv6 vrf output details

Field	Description
Name	Name of the interface.
Interfaces	Type of an interface.

snmp restart ospf6

Use this command restart SNMP in OSPFv3

Command Syntax

```
snmp restart ospf6
```

Parameter

None

Default

By default, SNMP restart is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart ospf6
```

summary-address

Use this command to summarize or suppress external routes with the specified address range.

An address range is a pairing of a starting address and a mask that is almost the same as IP network number. For example:

- If the specified IPV6 address range is 2020:100:100:2000::/53, it matches 2020:100:100:2222::/64, 2020:100:100:2666::/64 and so on.
- If the specified IPV4 address range is 192.168.0.0/255.255.240.0, it matches 192.168.1.0/24, 192.168.4.0/22, 192.168.8.128/25 and so on.

Redistributing routes from other protocols into OSPF requires the router to advertise each route individually in an external LSA. Use this command to advertise one summary route for all redistributed routes covered by a specified network address and mask. This minimizes the size of the OSPF link state database.

Use the no form this command to remove summary addresses.

Command Syntax

```
summary-address X:X::X:X/M (not-advertise|(all-tag (<0-4294967295> ))| )
  (translate-tag (<0-4294967295>) | )
summary-address A.B.C.D/M (not-advertise|tag <0-4294967295>|)
no summary-address A.B.C.D/M
no summary-address X:X::X:X/M (not-advertise|tag (<0-4294967295>|))
no summary-address X:X::X:X/M (not-advertise|(all-tag (<0-4294967295> )) | )
  (translate-tag (<0-4294967295>)| )
no summary-address A.B.C.D/M (not-advertise|tag (<0-4294967295>|))
```

Parameters

`X:X::X:X/M`	The range of addresses given as IPv6 starting address and a mask.
`A.B.C.D/M`	The range of addresses given as IPv4 starting address and a mask.
`not-advertise`	Suppress routes that match the range.
`tag`	Tag value to use as a “match” value for controlling redistribution via route maps.
`<0-4294967295>`	Set a tag value. The default is 0.
`all-tag`	Set tag for all summarized type-5, translated type5 and type-7 LSA.
`translate-tag`	Set tag only for summarized translated type-5 LSA.

Default

By default, summary-address value is 0

Command Mode

Router mode

Router address-family mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example uses the `summary-address` command to aggregate external LSAs that match the network 172.16.0.0/24 and assign a tag value of 3.

```
#configure terminal
(config)#router ipv6 ospf
(config-router)#summary-address 2020:100:100:2000::/53 all-tag 3
```

CHAPTER 4 OSPFv3 Graceful Restart Commands

This chapter describes the OSPFv3 graceful restart commands.

capability restart

Use this command to enable OSPFv3 graceful restart capability. If a router is not restart-enabled, it cannot enter graceful restart mode and act as a helper.

Use the no parameter with this command to disable the feature.

Command Syntax

```
capability restart graceful
no capability restart
```

Parameter

None

Default

By default, capability restart graceful is enabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ipv6 ospf 100
(config-router)#capability restart graceful

(config)#router ipv6 ospf 100
(config-router)#no capability restart
```

ipv6 ospf restart grace-period

Use this command to enable the graceful restart feature and set the grace period for restarting the router.

If graceful restart is enabled, NSM is notified about the grace period. If the OSPF daemon unexpectedly shuts down, NSM sends this value to the OSPF daemon when it comes up again which uses this value to end the graceful state.

Use the no parameter with this command to revert to the default grace period.

Command Syntax

```
ipv6 ospf restart grace-period <1-1800>
no ipv6 ospf restart grace-period
```

Parameters

<1-1800>	Grace period in seconds.

Default

By default, grace period is 120 seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf restart grace-period 250
```

ipv6 ospf restart helper

Use this command to configure the helper behavior for graceful restart.

Use the no parameter with this command to revert to the default.

Command Syntax

```
ipv6 ospf restart helper {max-grace-period <1-1800>}
ipv6 ospf restart helper never (router-id A.B.C.D|)
no ipv6 ospf restart helper
no ipv6 ospf restart helper never
no ipv6 ospf restart helper {max-grace-period|never router-id (A.B.C.D|all)}
```

Parameters

`<1-1800>`	Help only if received grace-period is less than this value.
`A.B.C.D`	Router ID of neighbor to never to act as helper.
`never`	Prevent the neighbor from entering helper mode.

Default

By default, router behave as helper. To disable it as helper, `ospf restart helper never` command should be configured. `ospf restart helper max-grace-period` – Max-grace-period to function as helper. If not configured, value will be the grace-period in restarting node.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 ospf restart helper never router-id 1.1.1.1

#configure terminal
(config)#no ipv6 ospf restart helper never
```

restart ipv6 ospf graceful

Use this command to restart OSPFv3 gracefully.

After this command is executed, the router immediately shuts down. NSM is notified that OSPF has shut down gracefully. NSM preserves routes installed by OSPF until the grace period expires.

Command Syntax

```
restart ipv6 ospf graceful (grace-period <1-1800>|)
```

Parameters

<1-1800>	Grace period in seconds.

Default

By default, restart ipv6 ospf graceful is disabled

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#restart ipv6 ospf graceful grace-period 200
```

CHAPTER 5 OSPF VPN Commands

This chapter provides an alphabetized reference of the OSPF VPN commands. It includes the following commands:

capability vrf-lite

Use this command to enable the `vrf-lite` capability for an OSPF instance.

Use the no parameter with this command to disable the same for an OSPF instance.

Command Syntax

```
capability vrf-lite
no capability vrf-lite
```

Parameters

None

Default

By default, VRF lite capability for an OSPF instance is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf 100
(config-router)#capability vrf-lite
(config)#router ospf 100
(config-router)#no capability vrf-lite
```

router ospf vrf

Use this command to specify a VRF instance in OSPF. To use this command, you must first create a VRF Name in the NSM using the `ip vrf` command. Associate the same name with the OSPF instance using this command.

Command Syntax

```
router ospf <1-65535> WORD
```

Parameters

`<1-65535>`	Routing process ID; should be unique for each routing process.
`WORD`	Name of the VRF to associate with this OSPF instance.

Default

By default, router ospf vrf is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router ospf 100 myVRF
(config-router)#
```

domain-id

Use this command to specify the domain ID for a OSPF bound to VRF.

The routes sent from OSPF to the VPN cloud are sent along with the domain ID. In this way, the domain ID acts as an identification for the route received from each OSPF domain.

Use the no form of this command to remove a domain ID.

Command Syntax

```
domain-id ((A.B.C.D (secondary|)) | (type (type-as|type-as4|type-back-comp) value HEX_DATA (secondary|)))
no domain-id ((A.B.C.D (secondary|)) | (type (type-as|type-as4|type-back-comp) value HEX_DATA (secondary|)))
```

Parameters

A.B.C.D	Domain ID in IP address format.
secondary	Domain ID is secondary. If not specified the domain ID is primary.
type	Domain type:
type-as	AS format. Hexadecimal value is 0x0005.
type-as4	AS4 format. Hexadecimal value is 0x0205.
type-back-comp	Used for backward compatibility. Hexadecimal value is 0x8000.
value	Domain ID.
HEX_DATA	Domain ID in hexadecimal.
secondary	Domain ID is secondary. If not specified the domain ID is primary

Default

No domain ID is defined.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows configuring a primary domain ID in IP address format.

```
#configure terminal
(config)#router ospf 100 vrf
(config-router)#domain-id 12.12.12.12
```

The following example shows configuring a secondary domain ID in IP address format.

```
#configure terminal
(config)#router ospf 100 vrf
```

```
(config-router)#domain-id 13.13.13.13 secondary
```

The following example shows configuring a primary domain ID in AS type format.

```
#configure terminal
(config)#router ospf 100 vrf
(config-router)#domain-id type type-as value 123456abcdef
```

Intermediate System to Intermediate System Command Reference

Contents

This document contains these chapters:

CHAPTER 1 IS-IS Commands

This chapter describes the IS-IS commands:

- isis hello-interval
- isis hello-multiplier
- isis hello padding
- isis lsp-interval
- isis mesh-group
- isis metric
- isis network
- isis password
- isis priority
- isis retransmit-interval
- ispf
- isis wait-timer
- isis wide-metric
- isis tag
- is-type
- key chain
- key
- key-string
- lsp-gen-interval
- lsp-mtu
- lsp-refresh-interval
- max-area-address
- max-lsp-lifetime
- metric-style
- mpls traffic-eng
- mpls traffic-eng router-id
- net
- passive-interface
- prc-interval-exp
- redistribute
- redistribute isis
- redistribute isis WORD
- router isis
- send-lifetime
- snmp restart isis
- spf-interval-exp
- summary-address

accept-lifetime

Use this command to specify the time period during which the authentication on a key chain is received as valid.

Use the no parameter with this command to negate this command.

Command Syntax

```
accept-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
accept-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
accept-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
accept-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
accept-lifetime HH:MM:SS <1-31> MONTH <1993-2035> infinite
accept-lifetime HH:MM:SS MONTH <1-31> <1993-2035> infinite
accept-lifetime HH:MM:SS <1-31> MONTH <1993-2035> duration <1-2147483646>
accept-lifetime HH:MM:SS MONTH <1-31> <1993-2035> duration <1-2147483646>
no accept-lifetime
```

Parameters

HH:MM:SS	Specify the start time of accept-lifetime in hours, minutes and seconds.
<1-31>	Specify the day of the month to start.
MONTH	Specify the month of the year to start as the first three letters of the month, for example, Jan.
<1993-2035>	Specify the year to start.
HH:MM:SS	Specify the end time of accept-lifetime in hours, minutes and seconds.
<1-31>	Specify the day of the month to end.
MONTH	Specify the month of the year to end as the first three letters of the month, for example, Jan.
<1993-2035>	Specify the year to end.
duration	Indicate the duration parameter.
<1-2147483646>	Specify the actual end time duration of a key in seconds.
infinite	Specify the end time to never expire.

Default

By default, accept-lifetime command is disabled

Command Mode

Keychain-key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of accept-lifetime for key1 on the key chain named mychain.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#accept-lifetime 03:03:01 Dec 3 2004 04:04:02 Oct 6 2006
```

address-family ipv6

Use this command to enter 'address-family ipv6' mode, where users can configure IPv6 routing specific configuration.

Use the no parameter with this command to remove all configuration under 'address-family ipv6'.

Command Syntax

```
address-family ipv6 (unicast|)
no address-family ipv6 (unicast|)
```

Parameters

unicast	Specify unicast routing for IPv6.

Default

Unicast routing is not configured.

Command Mode

Router mode

Example

```
#configure terminal
(config)#router isis bb
(config-router)#address-family ipv6 unicast
```

adjacency-check

Use this command to check ISIS neighbor protocol support.

Use the no parameter with this command to uncheck ISIS neighbor protocol support.

Command Syntax

```
adjacency-check
no adjacency-check
```

Parameters

None

Default

By default, adjacency-check command is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis bb
(config-router)#adjacency-check

(config-router)#no adjacency-check
```

area-password

Use this command to set the authentication password for the Level-1 area and to set authentication on Level-1 sequence number PDUs. This command enables authentication when receiving and sending link-state and sequence number PDUs in Level-1 areas. The password must be the same for all the ISIS routers in the same area.

Use the no parameter with this command to clear the area password.

Command Syntax

```
area-password WORD
area-password WORD authenticate snp (send-only|validate)
no area-password
```

Parameters

WORD	Password string.
authenticate	Insert the password into Level-1 SNP PDUs.
snp	Sequence number PDUs.
send-only	Only insert the password into the Level-1 sequence number PDUs, but not check the password in sequence number PDUs that it receives. Use this keyword during a software upgrade to ease the transition.
validate	Insert the password into Level-1 sequence number PDUs and check the password in sequence number PDUs that it receives.

Default

By default, the area password is not configured

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis bb
(config-router)#area-password mypasswd

(config)#router isis bb
(config-router)#area-password myPass authenticate snp send-only

(config)#router isis bb
(config-router)#no area-password
```

authentication key-chain

Use this command to set the key chain to be used for authentication at the instance level. Authentication mode must be set to `md5` to configure the key chain. If no key chain is configured with the key-chain command, no key-chain authentication is performed.

Only one authentication key-chain is applied to an ISIS interface at a time. That is, issuing a second `isis authentication key-chain` command overrides the first `isis authentication key-chain` command. If neither the `level-1` nor the `level-2` keyword is configured, the chain applies to both levels. Authentication can be specified for an individual ISIS interface using the `isis authentication key-chain` command.

Use the `no` parameter with this command to unset the key chain used for authentication.

Command Syntax

```
authentication key-chain WORD (level-1|level-2|)
no authentication key-chain (level-1|level-2|)
```

Parameters

`WORD`	Specify the chain name (valid authentication keys).
`level-1`	Specify an authentication key-chain for level-1 PDUs.
`level-2`	Specify an authentication key-chain for level-2 PDUs.

Default

The key chain applies to the level(s) on which authentication mode is configured as MD5 if no level is specified.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis 1
(config-router)#authentication key-chain myKey level-1
```

authentication mode

Use this command to set the authentication mode at the instance level.

If clear-text authentication was configured using the `area-password` or `domain-password` commands, the `authentication mode` command overrides both of those commands (based on the level at which MD5 is configured). If the `authentication mode` command was used first, and subsequently an attempt is made to use the `area-password` or `domain-password` commands, the attempt fails. To configure clear-text authentication using the `area-password` or `domain-password` commands, first use the `no authentication mode` command.

The type of authentication and the level to which it applies can be specified for a single ISIS interface, rather than per ISIS instance, using the `isis authentication mode` command.

Use the `no` parameter with this command to unset the authentication mode.

Command Syntax

```
authentication mode {md5|text} (level-1|level-2|)
no authentication mode {md5|text} (level-1|level-2|)
```

Parameters

`md5`	Keyed message digest
`text`	Text mode
`level-1`	Specify an authentication key-chain for level-1 PDUs.
`level-2`	Specify an authentication key-chain for level-2 PDUs.

Default

The authentication mode is set to MD5 for both levels if no level is specified.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#authentication mode md5 level-1

(config-router)#no authentication mode md5 level-1
```

authentication send-only

Use this command to set the send-only option at the instance level.

Use this command before configuring the authentication mode and authentication key-chain, so that the implementation of authentication goes smoothly. That is, the routers will have more time for the keys to be configured on each router if authentication is inserted only on the packets being sent, not checked on packets being received. After all routers that must communicate are configured with this command, enable the authentication mode and key chain on each router. Then, specify the `no authentication send-only` command to disable the send-only feature.

If the `level-1-2` keyword is configured, the send-only feature applies to both levels.

Use the no parameter with this command to unset the send-only option.

Command Syntax

```
authentication send-only (level-1-only|level-2-only|level-1-2)
no authentication send-only
```

Parameters

`level-1-only`	Set send-only option for level-1 only.
`level-2-only`	Set send-only option for level-2 only.
`level-1-2`	Set send-only option for level-1-2

Default

By default, authentication send only is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis 1
(config-router)#authentication send-only level-1

(config-router)#no authentication send-only
```

bfd all-interfaces

Use this command to enable the Bidirectional Forwarding Detection (BFD) feature on the interfaces enabled with this ISIS instance.

This command sets BFD fall-over check for all the neighbors under specified process. To disable BFD checking on particular interface use `isis bfd disable` command at interface mode.

Use the no parameter with this command to disable BFD functionality for an ISIS instance.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

By default, the BFD feature is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis aa
(config-router)#bfd all-interfaces

(config-router)#no bfd all-interfaces
```

capability cspf

Use this command to enable the constrained shortest path first (CSPF) feature in the ISIS module. CSPF calculates optimum explicit route (ER), using Traffic Engineering Database and (TED) and pre-existing Label Switched Path (LSP). The resulting ER is used by a signaling protocol (RSVP-TE) to set up LSPs. Use the no parameter with this command to disable CSPF functionality for an ISIS instance.

Command Syntax

```
capability cspf
no capability cspf
```

Parameters

None

Default

If this command is not used, the CSPF feature is disabled.

Command Mode

Router mode

Example

```
(config)#router isis aa
(config-router)#capability cspf
```

clear clns neighbors

Use this command to clear CLNS neighbor adjacencies.

Command Syntax

```
clear clns neighbors
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>ena
#clear clns neighbors
```

clear clns is-neighbors

Use this command to clear IS neighbor adjacencies.

Command Syntax

```
clear clns is-neighbors System-ID
```

Parameters

`System-ID`	Neighbor system ID in XXXX.XXXX.XXXX format.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>enable
#clear clns is-neighbors 1111.1111.1111.1111
```

clear ip isis route

Use this command to clear IPv4 routes.

Command Syntax

```
clear ip isis (WORD|) route (redistribution|all)
```

Parameters

`WORD`	Name that identifies the IS-IS area.
`redistribution`	Clear IS-IS local redistribution routes.
`all`	Clear all of the IS-IS routing tables.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>ena
#clear ip isis route redistribution
```

clear isis adjacency

This command is used to remove the entries from the IS-IS adjacency database. Clears all adjacencies for the specified routing instance or specified interface or particular system ID.

Command Syntax

```
clear isis adjacency (*|IFNAME|system-id XXXX.XXXX.XXXX|) (vrf VRFNAME|)
```

Parameters

*	Clear all neighbors.
IFNAME	Interface name.
XXXX.XXXX.XXXX	Neighbor System-ID.
VRFNAME	VRF name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis adjacency *
```

clear isis counter

Use this command to clear system-wide IS-IS counters (IsisSystemCounterEntry in RFC 4444).

Command Syntax

```
clear isis counter
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis counter
```

clear isis interface counter

Use this command to clear interface counters. If you do not specify a parameter, then counters for all interfaces are cleared.

Command Syntax

```
clear isis interface counter (IFNAME|)
```

Parameters

IFNAME	Interface name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis interface counter
```

clear isis process

Use this command to restart ISIS processes. If you do not specify a parameter, then all ISIS processes are restarted.

Command Syntax

```
clear isis (WORD|) process
```

Parameters

WORD	Name that identifies the IS-IS area.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear isis process
```

debug isis

Use this command to turn on debugging for specified criteria. Debug commands enable to show some debugging information about specified criteria into file or terminal.

Use the no parameter to turn off debugging for specified criteria.

Command syntax

```
debug isis (all|)
debug isis (authentication|bfd|checksum|events|hello|mpls (interface IFNAME |
  System-ID|)|ifsm|local-updates|lsp|nfsm|nsm|pdu|protocol-errors|rib|spf)
no debug isis (all|)
no debug all
no debug all isis
undebug all
undebug isis (all|)
undebug all isis
no debug isis (authentication|bfd|checksum|events|hello|mpls (interface IFNAME |
  System-ID|)|ifsm|local-updates|lsp|nfsm|nsm|pdu|protocol-errors|rib|spf)
undebug isis (authentication|bfd|checksum|events|hello|mpls (interface IFNAME |
  System-ID|)|ifsm|local-updates|lsp|nfsm|nsm|pdu|protocol-errors|rib|spf)
```

Parameters

`all`	Enables all debugging.
`authentication`	Debugging for authentication.
`checksum`	Debugging for checksums.
`bfd`	Debugging for bidirectional forwarding detection.
`events`	Debugging for internal events.
`hello`	Debugging for hello processing.
`interface`	Interface.
`IFNAME`	Interface name.
`System-ID`	System identifier.
`ifsm`	Debugging for interface finite state machine.
`local-updates`	Debugging for local updates.
`lsp`	Debugging for link-state packet.
`nfsm`	Debugging for neighbor finite state machine.
`nsm`	Debugging for NSM messages.
`pdu`	Debugging for protocol data unit.
`protocol-errors`	Debugging for protocol errors.
`rib`	Debugging for RIB information.

`spf`	Debugging for shortest path first route calculation.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug isis pdu

#configure terminal
(config)#debug isis nsm
```

default-information originate

Use this command to originate reachability information to a default route into link-state packets.

There is no default information in a Level-2 domain by default, while a Level-1 router calculates a default to L1L2 route during SPF calculation. This command originates a default route into a Level-2 domain.

Use the no parameter with this command to withdraw reachability information to a default route from link-state packets.

Command Syntax

```
default-information originate (always| level-1|) (route-map WORD|)
no default-information originate (always| level-1|) (route-map WORD|)
```

Parameters

`originate`	Specify to distribute a default route
`always`	The default route is advertised even if there is no default route in the router's routing table.
`level-1`	Distribute in level-1.
`route-map`	Identifies the level into which the default route is to be announced and can specify other filtering options via a route map.

Default

There is no default information in Level-2 domain by default, while Level-1 router calculates default to L1L2 route during SPF calculation. This command enables to originate default route into Level-2 domain. As an added option, if the user wants to originate the default route in L1 LSP, the "level-1" parameter can be used as follows:

```
default-information originate level-1
```

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#default-information originate
(config-router)#exit
(config)#exit
```

distance (IPv4)

Use this command in router mode to set the administrative distance for all IPv4 routes or routes from a specific source.

Use the no parameter with this command to remove an administrative distance.

Command Syntax

```
distance <1-255> (System-ID (WORD|)|)
no distance (System-ID|)
```

Parameters

<1-255>	Distance range.
System-ID	Source ID in XXXX.XXXX.XXXX format.
WORD	Access-list name.

Default

By default, all options are turned off.

Command Mode

Router mode

Examples

The following example shows setting the administrative distance for all routes.

```
#configure terminal
(config)#router isis
(config-router)#distance 10
```

The following example shows setting the administrative distance for a specific route source.

```
#configure terminal
(config)#router isis
(config-router)#distance 40 0000.0000.0001
```

distance (IPv6)

Use this command in router mode to set the administrative distance for all IPv6 routes.

Use the no parameter with this command to remove an administrative distance.

Command Syntax

```
distance <1-255>
no distance
```

Parameters

<1-255>	Distance range.

Default

By default, all options are turned off.

Command Mode

Address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows setting the administrative distance for all routes.

```
#configure terminal
(config)#router isis
(config-router)#address-family ipv6
(config-router-af)#distance 14
```

domain-password

Use this command to set the authentication password for the Level-2 domain, and optionally, the authentication password on Level-2 sequence number PDUs.

Configuring this command to enable authentication when receiving and sending link state and sequence number PDUs in Level-2 domain. The domain password must be the same in the Level-2 domain.

Use the no parameter with this command to clear the domain password.

Command Syntax

```
domain-password WORD
domain-password WORD authenticate snp (send-only|validate)
no domain-password
```

Parameters

WORD	Password string.
authenticate	Inserts th password into Level-1 sequence number PDUs.
snp	sequence number PDUs.
send-only	Only inserts the password into the Level-1 sequence number PDUs, but does not check the password in sequence number PDUs that it receives. Use this keyword during a software upgrade to ease the transition.
validate	Inserts the password into the Level-1 sequence number PDUs and checks the password in sequence number PDUs received.

Default

By default, there is no domain password.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#domain-password mypasswd

(config)#router isis bb
(config-router)#domain-password myPass authenticate snp send-only

(config)#router isis bb
(config-router)#no domain-password
```

dynamic-hostname

Use this command to configure the hostname to advertise for an ISIS instance using the dynamic hostname exchange mechanism (RFC 2763) and system-ID-to-hostname translation. This command configures a hostname to use for the Dynamic Hostname Exchange Mechanism and System-ID to hostname translation. This is required to get accurate results when using the show isis database and a few other commands.

Use the no parameter to disable the Hostname configured.

Command Syntax

```
dynamic-hostname
hostname dynamic
dynamic-hostname area-tag
no dynamic-hostname
no hostname dynamic
```

Parameters

area-tag	Use the routing area tag as the hostname, not the router's global hostname.

Default

By default, the Dynamic Hostname Exchange Mechanism is disabled.

Command Mode

Router mode

Example

```
#configure terminal
(config)#router isis bb
(config-router)#dynamic-hostname area-tag
```

fast-reroute per-prefix

Use this command to enable Loop Free Alternate Fast Reroute (LFA FRR) for all prefixes or only those prefixes in a route map.

Use the no form of this command to disable LFA FRR.

Command Syntax

```
fast-reroute per-prefix (level-1|level-2) proto (ipv4) (all|route-map WORD)
 no fast-reroute per-prefix (level-1|level-2) proto (ipv4)
```

Parameters

`level-1`	Level 1 only.
`level-2`	Level 2 only.
`ipv4`	IPv4 address family only.
`all`	All prefixes.
`route-map`	Prefixes from a route map.
`WORD`	Route map name.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute per-prefix level-2 proto ipv4 all
(config-router)#fast-reroute per-prefix level-1 proto ipv4 route-map rmap1
(config-router)#no fast-reroute per-prefix level-2 proto ipv4
```

fast-reroute terminate-hold-on interval

Use this command to set the Loop Free Alternate Fast Reroute (LFA FRR) termination hold-on timer.

Use the no form of this command to set the termination hold-on timer to its default value (1000 milliseconds).

Command Syntax

```
fast-reroute terminate-hold-on interval <100-100000>
no fast-reroute terminate-hold-on interval
```

Parameters

`<100-100000>`	LFA FRR termination hold-on timer interval in milliseconds.

Default

1000 milliseconds

Command Mode

Router mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute terminate-hold-on interval 7000
(config-router)#no fast-reroute terminate-hold-on interval
```

fast-reroute tie-break

Use this command to set the tie-breaking policy for selecting a fast reroute repair path. You assign a priority to each type of repair path. The tie-breaker value is used to select an LFA FRR route when multiple LFA FRR routes are available for the same primary route.

Use the no form of this command to set the tie-break preference value for a protection type to its default value.

To set all types of repair paths to their default priorities, do not specify a repair path with the no form of this command.

Command Syntax

```
fast-reroute tie-break (level-1|level-2) proto (ipv4) (primary-path|interface-
  disjoint|node-protecting|broadcast-interface-disjoint|secondary-path|downstream-
  path) index <1-255>
no fast-reroute tie-break (level-1|level-2) proto (ipv4) (primary- path|interface-
  disjoint|node-protecting|broadcast-interface-disjoint|secondary-
  path|downstream-path)
```

Parameters

`level-1`	Level 1 only.
`level-2`	Level 2 only.
`ipv4`	IPv4 address family only.
`primary-path`	Use a path from the Equal-Cost Multipath Path (ECMP) set. An ECMP found during the primary shortest path first (SPF) repair might not be desirable in networks where traffic exceeds the capacity of any single link.
`interface-disjoint`	Link protecting: prefer a backup path that uses a different interface than the interface used to reach destination via the primary path.
`node-protecting`	Bypass the `primary-path` gateway router which might not protect the router that is the next hop in the primary path. This ensures complete traffic protection even if the primary next-hop router fails.
`broadcast-interface-disjoint`	Do not use the interface if connected to a broadcast network. Repair paths protect links when a repair path and a protected primary path use *different* next-hop interfaces. However, on broadcast interfaces, if the repair path is computed via the same interface as the primary path, but their next-hop gateways are different, the router is protected but the link might not be.
`secondary-path`	Prefer a non-ECMP backup path.
`downstream-path`	Prefer a backup path to the destination which satisfies the downstream condition where the path cost to reach the destination from the LFA next hop is less than the path cost to the destination from the self node via primary next hop: Distance_opt(N, D) < Distance_opt(S, D) This might result in lost traffic, but prevents looping.
`index`	Tie breaking index. A lower value has higher preference.

`<1-255>` Tie breaking index value.

Defaults

`primary-path`	20
`interface-disjoint`	60
`node-protecting`	30
`broadcast-interface-disjoint`	70
`secondary-path`	255
`downstream-path`	90

Command Mode

Router mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#router isis 100
(config-router)#fast-reroute tie-break level-2 proto ipv4 node-protecting
index 127
(config-router)#no fast-reroute tie-break level-1 proto ipv4
broadcastinterface-disjoint
```

ignore-lsp-errors

Use this command to ignore link-state packets (LSPs) with checksum errors. By default, ISIS validates the checksum for LSP and if the checksum has an error, the LSP is dropped. Giving this command says to ignore the LSP checksum error and treat it as if checksum is passed.

Use the no parameter to turn off this function.

Command Syntax

```
ignore-lsp-errors
no ignore-lsp-errors
```

Parameters

None

Default

By default, the LSP checksum is checked on receipt.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

In this sample, rtr1 does not drop LSP packets with bad checksum.

```
#configure terminal
(config)#router isis bb
(config-router)#ignore-lsp-errors
```

ip router isis

Use this command to enable ISIS IPv4 routing on the interface. This command is mandatory to ISIS configuration.

After giving this command, the router sends ISIS Hello with IP address TLV on this interface and IP reachability information TLV in link-state packets are updated.

Use the no parameter with this command to disable ISIS IPv4 routing on the interface. This action does not clear the ISIS database. To clear the database, unconfigure the ISIS routing instance.

Command Syntax

```
ip router isis (WORD|)
no ip router isis (WORD|)
```

Parameters

WORD	Name that identifies the IS-IS area. Specify an existing area name or a new area name.

Default

By default, IPv4 routing is disabled on the router.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip router isis bb
```

ipv6 router isis

Use this command to enable ISIS IPv6 routing on the interface. This command is mandatory to IPv6 ISIS configuration. Match the ISIS instance tag to one of existing instance's tags, or a new instance with the tag name should be initiated, otherwise routing will not run on this interface.

Configuring this command, the router sends ISIS Hello with IPv6 address TLV on this interface, and IPv6 reachability information TLV in the LSP will be updated.

Use the no parameter with this command to disable ISIS IPv6 routing on the interface.

Command Syntax

```
ipv6 router isis (WORD|)
no ipv6 router isis (WORD|)
```

Parameters

WORD	ISIS instance name.

Default

By default, IPv6 routing is disabled on the router.

Command Mode

Interface mode

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 router isis bb
```

isis authentication key-chain

Use this command to set the key chain to be used for authentication on the interface-related packets.

Authentication mode must be set to `md5` to configure the key chain. If no key chain is configured with the `key-chain` command, no key-chain authentication is performed. Only one authentication key-chain is applied to an ISIS interface at a time. That is, issuing a second `isis authentication key-chain` command overrides the first `isis authentication key-chain` command.

If neither the `level-1` nor `level-2` keyword is configured, the key chain applies to the level(s) on which the authentication mode is configured as `md5`. Authentication can be specified for an entire instance of ISIS, instead of at the interface level, by using the `authentication key-chain` command.

Use the `no` parameter with this command to unset the key chain used for authentication on the interface-related packets.

Command Syntax

```
isis authentication key-chain WORD (level-1|level-2|)
no isis authentication key-chain (level-1|level-2|)
```

Parameters

`WORD`	Chain name - valid authentication keys.
`level-1`	Specify an authentication key-chain for level-1 PDUs.
`level-2`	Specify an authentication key-chain for level-2 PDUs.

Default

By default, this option is disabled. The key chain applies to the level(s) on which authentication mode is configured as MD5 if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication key-chain myKey level-1
```

isis authentication mode md5

Use this command to set the MD5 authentication mode. If clear text authentication was configured using the `isis password` command, the `isis authentication mode` command overrides the `isis password` command. If the `isis authentication mode` command was used, then subsequently an attempt is made to use the `isis password` command, the attempt fails.

To configure clear text authentication using the `isis password` command, first use the `no isis authentication mode` command. The type of authentication and the level to which it applies can be specified for the entire ISIS instance, rather than per interface, using the `authentication mode` command.

Use the `no` parameter with this command to unset the MD5 authentication mode.

Command Syntax

```
isis authentication mode {md5|text} (level-1|level-2|)
no isis authentication mode {md5|text} (level-1|level-2|)
```

Parameters

`md5`	Keyed message digest
`text`	Text mode
`level-1`	Specify an authentication key-chain for level-1 PDUs.
`level-2`	Specify an authentication key-chain for level-2 PDUs.

Default

By default, this option is disabled. The authentication mode will be set to MD5 for both levels if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication mode md5 level-1
```

isis authentication send-only

Use this command to set the send-only option to the interface-related packets.

Use this command before configuring the ISIS authentication mode and ISIS authentication key-chain, so that the implementation of authentication goes smoothly. That is, the routers will have more time for the keys to be configured on each router if authentication is inserted only on the packets being sent, not checked on packets being received. After all routers that must communicate are configured with this command, enable the authentication mode and key chain on each router.

Use the no parameter with this command to unset the send-only option to the interface-related packets.

Command Syntax

```
isis authentication send-only (level-1-only|level-2-only|level-1-2)
no isis authentication send-only
```

Parameters

`level-1-only`	Set send-only option for level-1 only.
`level-2-only`	Set send-only option for level-2 only.
`level-1-2`	Set send-only option for level-1-2

Default

By default, this option is disabled. The send-only option applies to both levels if no level is specified.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis authentication send-only level-1-only
```

isis bfd

Use this command to enable/disable the BFD check on interface.

The `isis bfd` command allows a user to enable BFD on an interface. The `isis bfd disable` command disables BFD checking on an interface. However, the `no isis bfd` and `no isis bfd disable` commands both remove the enable/disable configuration, but do not disable/enable BFD.

The `bfd all-interfaces` command enables BFD on all interfaces attached to an instance then configuring. This command disables BFD configuration on a particular interface.

Command Syntax

```
isis bfd (disable|)
no isis bfd (disable|)
```

Parameters

`disable`	Specify to disable BFD.

Default

By default, bfd feature enable/disable is not configured.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis bfd disable
```

isis circuit-type

Use this command to set the circuit type for the interface.

If level-1 or level-2-only is specified in this command, ISIS sends only the specified level of PDUs. On the point-to-point interface, there is only one type of Hello packet, so in this case ISIS Hello will be sent regardless of circuit-type. If is-type is configured as level-1 or level-2 only, routing for this instance is performed for only the specified level. In this manner, only the particular level of PDU is sent on the interface.

Use the no parameter to reset circuit type to the default.

Command Syntax

```
isis circuit-type (level-1|level-1-2|level-2-only)
no isis circuit-type
```

Parameters

`level-1`	Specify that only Level-1 adjacencies are formed.
`level-1-2`	Specify that Level-1-2 adjacencies are formed.
`level-2-only`	Specify that only Level-2 adjacencies are formed.

Default

By default, the default circuit-type is level-1-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis circuit-type level-2-only
```

isis csnp-interval

Use this command to set CSNP (Complete sequence number PDU) interval in seconds.

Configuring this command changes the interval between two consecutive CSNP transmission. By default, CSNP is sent every 10 seconds only by LAN DIS. This parameter is only valid on broadcast interface, since periodic CSNP is only sent on broadcast interface, while CSNP on Point-to-Point interface is sent only when adjacency is initiated.

Use the `no` parameter with this command to reset CSNP interval to the default value.

Command Syntax

```
isis csnp-interval <1-65535> (level-1|level-2|)
no isis csnp-interval (level-1|level-2|)
```

Parameters

`<1-65535>`	Specify the CSNP interval in seconds.
`level-1`	Specify Level-1 CSNP.
`level-2`	Specify Level-2 CSNP.

Default

By default, ISIS uses 10 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis csnp-interval 20
```

isis fast-reroute per-prefix candidate disable

Use this command to prevent an interface from becoming an Loop Free Alternate Fast Reroute (LFA FRR) for a primary route.

Use the no form of this command to enable an interface to become an LFA FRR for a primary route.

Command Syntax

```
isis fast-reroute per-prefix candidate disable (level-1|level-2)
no isis fast-reroute per-prefix candidate disable (level-1|level-2)
```

Parameters

`level-1`	Level-1 only
`level-2`	Level-2 only

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis fast-reroute per-prefix candidate disable level-2
(config-if)#no isis fast-reroute per-prefix candidate disable level-2
```

isis hello-interval

Use this command to set the Hello interval in seconds. The Hello-interval is set with the hello-multiplier (see `isis hello-multiplier` command).

Configuring this command changes the time interval between two consecutive Hello transmissions. If a device receives its own LSP with a maximum sequence number, then it suspends ISIS for the hold interval. DIS sends Hello transmissions at three times the rate than non-DIS. If ISIS is elected as DIS on this interface, ISIS sends Hello every 3.3 seconds.

If `minimal` keyword is specified, Holding timer in Hello PDU is set to 1 second and Hello interval is calculated by dividing by the hello-multiplier. For example, if the hello-multiplier is configured as 4 and `hello-interval minimal` is the command used, an Hello PDU is sent every 250 milliseconds.

Use the `no` parameter to set the Hello interval to the default.

Command Syntax

```
isis hello-interval <1-65535> (level-1|level-2|)
isis hello-interval minimal (level-1-only|level-2-only|level-1-2)
no isis hello-interval (level-1|level-2|)
no isis hello-interval minimal
```

Parameters

`<1-65535>`	Specify the hello interval in seconds.
`minimal`	Specify the holding-time as 1 second.
`level-1`	Specify Level-1 CSNP.
`level-2`	Specify Level-2 CSNP.
`level-1-only`	Specify only Level-1 CSNP.
`level-2-only`	Specify only Level-2 CSNP.
`level-1-2`	Specify both Level-1 and Level-2 CSNP.

Default

By default, ISIS uses 10 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis hello-interval 5 level-1

(config-if)#isis hello-interval minimal level-1-only
```

isis hello-multiplier

Use this command to set multiplier for Hello holding time.

Changes Holding Timer in Hello PDU. Holding timer is calculated by “Hello-Interval” multiplied by this value. If `minimal` keyword is specified with the Hello-Interval, the holding timer is set to 1 second and the hello-interval is calculated by dividing 1 by this value.

Use the `no` parameter with this command to set multiplier to the default.

Command Syntax

```
isis hello-multiplier <2-100> (level-1|level-2|)
no isis hello-multiplier (level-1|level-2|)
```

Parameters

`<2-100>`	Specify a hello multiplier value.
`level-1`	Specify Level-1 hello.
`level-2`	Specify Level-2 hello.

Default

By default, ISIS uses 3 seconds for the multiplier value and the multiplier is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis hello-multiplier 4
```

isis hello padding

Use this command to enable IS-IS hello padding at the interface level.

Intermediate System-to-Intermediate System (IS-IS) hellos are padded to the full maximum transmission unit (MTU) size. The benefit of padding IS-IS hellos to the full MTU is that it allows for early detection of errors that result from transmission problems with large frames or errors that result from mismatched MTUs on adjacent interfaces.

Use the `no` parameter with this command to disable IS-IS hello padding.

Command Syntax

```
isis hello padding
no isis hello padding
```

Parameters

None

Default

By default, ISIS hello padding is enabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#isis hello padding

(config-if)#no isis hello padding
```

isis lsp-interval

Use this command to set the link-state packet (LSP) transmission interval.

Giving this command changes the minimum interval between two consecutive LSP transmission. When flooding or some other event triggers LSP transmission, the LSP is put in the interface queue and scheduled to send according to this interval. Two consecutive LSP transmissions are scheduled to have at least this interval.

Use the no parameter with this command to set LSP transmission interval to the default.

Command Syntax

```
isis lsp-interval <1-4294967295>
no isis lsp-interval
```

Parameters

`<1-4294967295>` LSP transmission interval in milliseconds.

Default

By default, ISIS uses 33 milliseconds for the interval.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis lsp-interval 100

(config-if)#no isis lsp-interval
```

isis mesh-group

Use this command to set Mesh Group ID on the current interface.

Use the no parameter to unset mesh group on the current interface.

Command Syntax

```
isis mesh-group <1-4294967295>
no isis mesh-group
```

Parameters

`<1-4294967295>` Specify a mesh group number

Default

By default, mesh groups are not enabled on this interface.

Command Mode

Interface mode

Examples

```
(config)#interface eth0
(config-if)#isis mesh-group 20

(config)#interface eth2
(config-if)#no isis mesh-group
```

isis metric

Use this command to set the default metric for the interface. The interface default metric is put into IP reachability information TLVs and in IS reachability information TLVs in link-state packets. The value is used for SPF calculation, and is applied when the metric-style is configured as “narrow”.

Use the no parameter with this command to set default metric to the default.

Command Syntax

```
isis metric <1-63> (level-1|level-2|)
no isis metric (level-1|level-2|)
```

Parameters

<1-63>	Default metric.
level-1	Default metric for level-1 circuit.
level-2	Default metric for level-2 circuit.

Default

By default, ISIS uses 10 for the metric value and the value is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis metric 20
```

isis network

Use this command to change a broadcast interface network type to a point-to-point network type.

Use the no parameter with this command to revert to the default setting of a broadcast interface network type.

Command Syntax

```
isis network (broadcast|point-to-point)
no isis network
```

Parameters

broadcast	Specify ISIS a broadcast multi-access network.
point-to-point	Specify ISIS a point-to-point network.

Default

By default, the network is set to a broadcast multi-access network type.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis network point-to-point
```

isis password

Use this command to set the authentication password of Hello PDU on the interface.

Use the no parameter to clear the password.

Command Syntax

```
isis password WORD (level-1|level-2|)
no isis password (level-1|level-2|)
```

Parameters

WORD	Specify a password string.
level-1	Specify a password for Level-1 hello PDUs.
level-2	Specify a password for Level-2 hello PDUs.

Default

By default, no password is configured; this applies to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis password mypassword level-1
```

isis priority

Use this command to set the priority for LAN DIS election. This command changes the priority value in LAN ISIS Hello PDUs. A lower priority value is less preferred in DIS election, and a higher priority value is more preferred.

Note: This command is not valid for Point-to-Point interface.

Use the no parameter to set priority to the default.

Command Syntax

```
isis priority <0-127> (level-1|level-2|)
no isis priority (level-1|level-2|)
```

Parameters

<0-127>	Priority value
level-1	Specify a password for Level-1 hello PDUs.
level-2	Specify a password for Level-2 hello PDUs.

Default

By default, ISIS uses 64 for the priority value, and the priority is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#isis priority 127
```

isis retransmit-interval

Use this command to set the link-state packet (LSP) retransmission interval.

Use the no parameter to set the interval to the default.

Command Syntax

```
isis retransmit-interval <1-65535>
no isis retransmit-interval
```

Parameters

<1-65535>	Interval for retransmission of the same LSP in seconds.

Default

By default, ISIS uses an interval of 5 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#isis retransmit-interval 10

(config-if)#no isis retransmit-interval
```

ispf

Use this command to enable incremental SPF for a routing process.

Use the no parameter to disable incremental SPF from a routing process.

Command Syntax

```
ispf (level-1|level-1-2|level-2-only)
no ispf
```

Parameters

level-1	Act as level-1 only IS.
level-1-2	Act as level-1-2 IS.
level-2-only	Act as level-2 only IS.

Default

By default, all levels are turned off.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#ispf level-1

(config)#router isis bb
(config-router)#no ispf
```

isis wait-timer

Use the isis wait-timer seconds command to configure the number of seconds the router will wait for adjacency information

Use the no parameter to set the wait-timer to the default.

Command Syntax

```
isis wait-timer <1-65535> (level-1|level-2|)
no isis wait-timer (level-1|level-2|)
```

Parameters

`level-1`	Act as level-1 only IS.
`level-2`	Act as level-2 only IS.

Default

By default, wait-timer will be 20 seconds (2 times the hello timer).

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#isis wait-timer 30

(config)#router isis bb
(config-router)#no isis wait-timer
```

isis wide-metric

Use this command to set wide metric for the interface.

Interface wide-metric is put into Extended IP reachability TLVs. Extended IS reachability TLVs and IPv6 rechability TLVs in LSPs. The value is used for SPF calculation. The value is applied when metric-style is configured as 'wide'.

Use the no parameter to set wide metric to the default.

Command Syntax

```
isis wide-metric <1-16777214> (level-1|level-2|)
no isis wide-metric (level-1|level-2|)
```

Parameters

<1-16777214>	Specify a wide metric.
level-1	Specify the wide metric for Level-1 circuit.
level-2	Specify the wide metric for Level-2 circuit.

Default

By default, ISIS uses 10 for the metric value and the metric is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

None.

Examples

```
#configure terminal
(config)#interface eth0
(config-router)#isis wide-metric 100

(config)#interface eth0
(config-router)#no isis wide-metric 100
```

isis tag

Use this command to sets the tag for link-state packets (LSPs) sent out advertising routes for networks directly connected to an interface.

If you do not specify a parameter, then the tag value is set for level-1-2 boundary.

Use the no parameter to unset the tag.

Command Syntax

```
isis tag <1-4294967295> (level-1|level-2|)
no isis tag (level-1|level-2|)
```

Parameters

`<1-4294967295>`	Tag value.
`level-1`	Specify the tag value for the level-1 boundary.
`level-2`	Specify the tag value for the level-2 boundary.

Command Mode

Interface mode

Examples

```
>ena
#con term
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#interface eth0
(config-if)#isis tag 500 level-1
```

is-type

Use this command to set the IS to the specified level of routing.

Changing `is-type` brings down, then brings up a particular level of routing. There is a limitation: Only one ISIS instance can run Level-2 routing (either Level-2 only IS, or Level-1-2 IS).

Use the `no` parameter to set the IS to the default.

Command Syntax

```
is-type (level-1|level-1-2|level-2-only)
no is-type
```

Parameters

`level-1`	Act as level-1 only IS.
`level-1-2`	Act as level-1-2 IS.
`level-2-only`	Act as level-2 only IS.

Default

By default, ISIS uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#is-type level-1

(config)#router isis bb
(config-router)#no is-type
```

key chain

Use this command to enter the key chain management mode and to configure a key chain with a key chain name. This command allows you to enter the keychain mode to specify keys on this key chain.

Command Syntax

```
key chain WORD
no key chain WORD
```

Parameters

WORD	Specify the name of the key chain to manage.

Default

By default, keychain mode is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the creation of a key chain named `mychain` and the change to keychain mode:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#
```

key

Use this command to manage, add or delete authentication keys in a key-chain. This command allows you to enter the keychain-key mode to set a password for the key.

Command Syntax

```
key <0-2147483647>
no key <0-2147483647>
```

Parameters

`<0-2147483647>` Specify a key identifier.

Default

By default, ISIS uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Keychain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures a key number 1 and shows the change to keychain-key command mode.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#
```

key-string

Use this command to define a password to be used by a key.

Use the no parameter with this command to disable this feature.

Command Syntax

```
key-string LINE
no key-string
```

Parameters

LINE	Specify a string of characters to be used as a password by the key.

Default

By default, password is not configured.

Command Mode

Keychain mode and Keychain-key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, the password for `key 1` in the key chain named `mychain` is set to `prime`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#key-string prime

(config-keychain)#key 1
(config-keychain-key)#no key-string
```

lsp-gen-interval

Use this command to set the minimum interval before regenerating the same link-state packet (LSP). The smaller the interval, the faster the convergence. However, this setting might cause more frequent flooding.

Use the `no` parameter with this command to set the interval to the default.

Command Syntax

```
lsp-gen-interval <1-120>
lsp-gen-interval (level-1|level-2) <1-120>
no lsp-gen-interval (level-1|level-2|)
```

Parameters

`<1-120>`	Minimum interval in seconds.
`level-1`	Interval for Level-1 IS.
`level-2`	Interval for Level-2 IS.

Default

By default, ISIS uses 30 seconds for the interval and the interval is applied to both level-1 and level-2.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-gen-interval 5
```

lsp-mtu

Use this command to set maximum transfer unit for link-state packets (LSPs).

Use the no parameter with this command to set the interval to the default.

Command Syntax

```
lsp-mtu (level-1|level-2|) <512-1492>
no lsp-mtu (level-1|level-2|)
```

Parameters

`<512-1492>`	MTU size
`level-1`	Size for Level-1 IS.
`level-2`	Size for Level-2 IS.

Default

By default, the MTU is 1492 bytes.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-mtu 555
```

lsp-refresh-interval

Use this command to set the link-state packet (LSP) refresh interval.

IP Infusion Inc. recommends making the `lsp-refresh-interval` smaller than the max-lsp-lifetime value.

Use the `no` parameter to set the interval to the default value.

Command Syntax

```
lsp-refresh-interval <1-65535>
no lsp-refresh-interval
```

Parameters

`<1-65535>`	Refresh interval in seconds.

Default

By default, the interval is 900 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#lsp-refresh-interval 600

(config)#router isis bb
(config-router)#no lsp-refresh-interval
```

max-area-address

Use this command to set the maximum number of ISIS areas that can be configured on this router with the `net` command. By default, ISIS permits a maximum of three areas that can be defined on a router.

Use the `no` parameter with this command to set the maximum number of ISIS areas to its default (3).

Command Syntax

```
max-area-address <3-254>
no max-area-address
```

Parameters

`<3-254>`	The maximum number of areas in the network.

Default

By default, the maximum number of areas is 3.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis net2
(config-router)#max-area-address 5
(config-router)#net 71.0001.0000.0000.0001.00
(config-router)#net 72.0001.0000.0000.0001.00
(config-router)#net 73.0001.0000.0000.0001.00
(config-router)#net 74.0001.0000.0000.0001.00
(config-router)#net 75.0001.0000.0000.0001.00
```

max-lsp-lifetime

Use this command to set the maximum link-state packet (LSP) lifetime. You must set `max-lsp-lifetime` greater than the lsp-refresh-interval interval.

Use the `no` parameter to set the lifetime to the default.

Command Syntax

```
max-lsp-lifetime <350-65535>
no max-lsp-lifetime
```

Parameters

`<350-65535>`	Maximum LSP lifetime in seconds.

Default

By default, max-lsp-lifetime is set to 1200 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#max-lsp-lifetime 1500

(config)#router isis bb
(config-router)#no max-lsp-lifetime
```

metric-style

Use this command to configure the ISIS metric style. Use the following table when changing the method of how TLV encodes and SPF calculates a decision:

Metric-style Command	Wide SPF	Wide TLV	Narrow SPF	Narrow TLV
narrow (default)	OFF	OFF	ON	OFF
narrow transition	ON	OFF	ON	ON
wide	ON	ON	OFF	OFF
wide transition	ON	ON	ON	OFF
transition	ON	ON	ON	ON

Where:

- Wide SPF: Uses wide TLVs for SPF calculation.
- Wide TLV: Encodes wide TLVs in the LSP.
- Narrow SPF: Uses narrow TLVs for SPF calculation.
- Narrow TLV: Encodes narrow TLVs in the LSP.

Use the no parameter to set the style to the default style, narrow.

Command Syntax

```
metric-style (narrow|wide|transition) (level-1|level-2|)
metric-style (narrow|wide) transition (level-1|level-2|)
no metric-style
```

Parameters

`narrow`	Specify the old style of TLVs with narrow metric.
`wide`	Specify the new style of TLVs to carry wider metric.
`transition`	Specify to send and accept both styles of TLVs during transition.
`level-1`	Specify the level-1 metric style.
`level-2`	Specify the level-2 metric style.
`transition`	Accept both styles of TLVs during transition

Default

By default, ISIS uses narrow metric style for level 1 and 2.

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#metric-style narrow transition
```

mpls traffic-eng

Use this command to configure MPLS Traffic Engineering feature for ISIS.

Use the no parameter to turn off the feature.

Note: Metric-style wide must be enabled before using this CLI.

Command Syntax

```
mpls traffic-eng (level-1|level-2)
no mpls traffic-eng (level-1|level-2)
```

Parameters

`level-1`	Specify the level-1 MPLS Traffic Engineering feature.
`level-2`	Specify the level-2 MPLS Traffic Engineering feature.

Default

If this command is not used, ISIS does not encode traffic engineering TLVs and Sub-TLVs.

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#metric-style wide
(config-router)#mpls traffic-eng level-1

(config)#router isis bb
(config-router)#no mpls traffic-eng level-1
```

mpls traffic-eng router-id

Use this command to configure the traffic engineering stable IP address for a system.

Use the no parameter to turn off the feature.

Command Syntax

```
mpls traffic-eng router-id A.B.C.D
no mpls traffic-eng router-id
```

Parameters

A.B.C.D	Specify the ISIS router-ID in an IP address format.

Default

If this command is not used, and traffic engineering is enabled, ISIS will use global router-id..

Command Mode

Router mode

Examples

```
(config)#router isis bb
(config-router)#mpls traffic-eng router-id 10.10.0.23

(config)#router isis bb
(config-router)#no mpls traffic-eng router-id
```

net

Use this command to add a Network Entity Title (NET) for the instance.

On a router running ISIS, a NET can be 8 to 20 bytes in length. The last byte is always the n-selector, and must be zero. The n-selector indicates no transport entity, and means that the packet is for the routing software of the system. The six bytes directly preceding the n-selector are the system ID. The system ID length is a fixed size and cannot be changed. The system ID must be unique throughout each area (Level 1) and throughout the backbone (Level 2).

The bytes preceding the system ID are the area ID, which can be from 1 - 13 bytes in length. By default, a maximum of three NETs per router are allowed with a different area ID but the system ID should be the same for all NETs. You can increase the number of area IDs per system ID with the `max-area-address` command.

Use the `no` parameter to remove the NET.

Command Syntax

```
net NET
no net NET
```

Parameters

`NET`	Specify a network entity title (NET) in 1 to 13 octets (that is, XX.XXXX. ... .XXXX.XX).

Default

By default, ISIS does not configure a NET and routing is not enabled for the interface.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis bb
(config-router)#net 49.0000.0001.0002.0003.00
```

passive-interface

Use this command to suppress routing updates on all interfaces or on a specified interface, which puts the interfaces into passive mode.

To advertise passive prefixes in LSP, an interface must be configured with ip router isis when using "passive-interface" command. If interface is not configured with isis instance "passive-interface IFNAME" command must be used to add that interface as passive. Enabling passive interface on an ISIS enabled interface disables ISIS routing updates on the interface and makes the interface passive.

Use the no parameter with this command to remove interfaces from passive mode

Command Syntax

```
passive-interface (IFNAME |)
no passive-interface (IFNAME |)
```

Parameters

IFNAME	Indicates an interface name. If this parameter is omitted, then all interfaces become passive or active.

Command Mode

Router mode

Examples

The following suppresses routing updates on a specified interface.

```
#configure terminal
(config)#router isis 100
(config-router)#passive-interface eth0
(config)#router isis 100
(config-router)#no passive-interface eth0
```

prc-interval-exp

Use this command to configure exponential back-off delay between PRC calculations.

Use the no parameter to disable any set exponential back-off delay between PRC calculations.

Command Syntax

```
prc-interval-exp
prc-interval-exp <0-2147483647> <0-2147483647>
no prc-interval-exp
```

Parameters

`<0-2147483647>`	Set the minimum delay between receiving a change to PRC calculation in milliseconds.
`<0-2147483647>`	Set the maximum delay between receiving a change to PRC calculation in milliseconds.

Default

By default, minimum delay is 500 milliseconds and maximum delay is 50 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#router isis
(config-router)#prc-interval-exp 100 10000

(config)#router isis
(config-router)#no prc-interval-exp
```

redistribute

Use this command to redistribute routes from another protocol into the ISIS routing table.

Use the no parameter to disable this function.

Command Syntax

```
redistribute (kernel|connected|static|rip|ospf|bgp) {metric <0-16777215>| metric-
  type (internal|external)|level-1|level-2|level-1-2|route-map WORD}
no redistribute (kernel|connected|static|rip|ospf|bgp)  {metric <0-16777215>|
  metric-type (internal|external)|level-1|level-2|level-1-2|route-map WORD}
```

Parameters

kernel	Redistribute kernel routes.
connected	Redistribute connected routes.
static	Redistribute static routes.
rip	Redistribute RIP routes.
ospf	Redistribute OSPF routes.
bgp	Redistribute BGP routes.
metric	Specify the metric for redistributed routes.
<0-16777215>	Specify the IS-IS default metric.
metric-type	Specify the IS-IS exterior metric type for redistributed routes:
internal	Set IS-IS internal metric type.
external	Set IS-IS external metric type.
level-1	Redistribute routes into level 1 only
level-2	Redistribute routes into level 2 only (default)
level-1-2	Redistribute routes into both levels.
route-map	Specify a Route map reference.
WORD	Specify name of the route-map.

Default

By default, redistribute command is disabled.

If no level parameter is specified, by default redistributed routes will be added in level-2 LSP. If is-type of an IS-IS instance is level-1, the level parameter must be set to level-1 for redistribute command to take effect and redistribute routes in L1 LSP.

Command Mode

For Ipv4: Router mode

For Ipv6: address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>ena
#con term
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router isis A
(config-router)#redistribute bgp metric 12
```

redistribute isis

Use this command to redistribute reachability information from one level to the other level. If an distribute-list name is given with this command for an access list that does not exist, the routes are still redistributed.

Use the no parameter with this command to stop redistribution.

Command Syntax

```
redistribute isis level-1 into level-2
redistribute isis level-2 into level-1
redistribute isis level-1 into level-2 distribute-list WORD
redistribute isis level-2 into level-1 distribute-list WORD
no redistribute isis level-1 into level-2
no redistribute isis level-2 into level-1
```

Parameters

`level-1`	Specify an inter-area route from level-1.
`level-2`	Specify an inter-area routes from level-2.
`into`	Specify a level from level-n into level-m.
`level-1`	Specify an inter-area route into level-1.
`level-2`	Specify an inter-area routes into level-2.
`distribute-list`	Indicate the distributed-list parameter.
`WORD`	Specify the actual selected route.

Default

By default, ISIS redistributes selected L1 routes into L2.

Command Mode

For Ipv4: Router mode

For Ipv6: address-family ipv6 mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#redistribute isis level-2 into level-1

(config)#router isis bb
(config-router)#redistribute isis level-2 into level-1 distribute-list new

(config)#router isis bb
(config-router)#no redistribute isis level-2 into level-1
```

redistribute isis WORD

Use this command to redistribute reachability information from one isis instance into another instance. Only one isis instance can be redistributed.

Use the `no` parameter with this command to stop redistribution.

Note: This command is not supported for address family IPv6.

Command Syntax

```
redistribute isis WORD {metric <0-16777215>| metric-type (internal|external)
  |level-1|level-2|level-1-2|route-map WORD}
```

```
no redistribute isis WORD {metric <0-16777215>| metric-type
  (internal|external)|level-1|level-2|level-1-2|route-map WORD}
```

Parameters

`WORD`	Specify an isis instance name or tag
`metric`	Specify the metric for redistributed routes.
`<0-16777215>`	Specify the IS-IS default metric.
`metric-type`	Specify the IS-IS exterior metric type for redistributed routes:
`internal`	Set IS-IS internal metric type.
`external`	Set IS-IS external metric type.
`level-1`	IS-IS Level-1 routes.
`level-2`	IS-IS Level-2 routes.
`level-1-2`	IS-IS Level-1 and Level-2 routes.
`route-map`	Specify a Route map reference.
`WORD`	Specify name of the route-map.

Default

By default, redistribute command is disabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
>ena
#con term
Enter configuration commands, one per line.  End with CNTL/Z.
(config)#router isis A
(config-router)#redistribute isis B metric 12
```

router isis

Use this command to initiate an ISIS routing instance. This command starts the ISIS routing instance and enters router configuration mode. Configure at least one NET to start routing. Also, enable a particular interface with the ip router isis command.

Use the no parameter with this command to remove an ISIS routing instance.

Command Syntax

```
router isis WORD
no router isis WORD
```

Parameters

WORD	Name that specifies an ISO routing instance tag.

Default

By default, ISIS routing instance is not configured.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router isis New
(config-router)#
```

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Use the no parameter with this command to negate this command.

Command Syntax

```
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> infinite
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> infinite
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> duration <1-2147483646>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> duration <1-2147483646>
no send-lifetime
```

Parameters

`HH:MM:SS`	Specify the start time of accept-lifetime in hours, minutes and seconds.
`<1-31>`	Specify the day of the month to start.
`MONTH`	Specify the month of the year to start as the first three letters of the month, for example, Jan.
`<1993-2035>`	Specify the year to start.
`HH:MM:SS`	Specify the end time of accept-lifetime in hours, minutes and seconds.
`<1-31>`	Specify the day of the month to end.
`MONTH`	Specify the month of the year to end as the first three letters of the month, for example, Jan.
`<1993-2035>`	Specify the year to end.
`duration`	Indicate the duration parameter.
`<1-2147483646>`	Specify the actual end time duration of a key in seconds.
`infinite`	Specify the end time to never expire.

Applicability

No default value is specified

Command Mode

Keychain-key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of `send-lifetime` for `key 1` on the key chain named `mychain`:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#send-lifetime 03:03:01 Jan 3 2004 04:04:02 Dec 6 2006
```

snmp restart isis

Use this command to restart SNMP in Intermediate System to Intermediate System (IS-IS)

Command Syntax

```
snmp restart isis
```

Parameters

None

Default

By default, snmp restart is not configured.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart isis
```

spf-interval-exp

Use this command to set the minimum and maximum hold intervals between Shortest Path First (SPF) calculations.

The `spf-interval-exp` command configures the minimum and maximum interval time between the receipt of a topology change and the calculation of the SPF.

Use the `no` parameter with this command to set the minimum and maximum hold intervals to the default.

Command Syntax

```
spf-interval-exp <0-2147483647> <0-2147483647>
spf-interval-exp (level-1|level-2) <0-2147483647> <0-2147483647>
no spf-interval-exp ((level-1|level-2)|)
```

Parameters

`<0-2147483647>`	Specify the minimum delay between receiving a change to the SPF calculation in milliseconds. The default SPF minimum hold-time interval value is 500 milliseconds.
`<0-2147483647>`	Specify the maximum delay between receiving a change to the SPF calculation in milliseconds. The default SPF maximum hold-time interval value is 50 seconds.
`level-1`	Specify an interval for Level-1 IS.
`level-2`	Specify an interval for Level-2 IS.

Default

By default, ISIS uses 500 milliseconds and 50,000 milliseconds for the minimum and maximum hold intervals, respectively. The values are applied to both level-1 and level-2 if the `level` parameter is omitted.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#spf-interval-exp level-1 600 60000

(config)#router isis bb
(config-router)#no spf-interval-exp level-1
```

summary-address

Use this command to configure Summary Address to summarize IPv4 reachability information.

Use the no parameter with this command to unconfigure the summary.

Command Syntax

```
summary-address A.B.C.D/M (level-1 |level-1-2 |level-2) (metric <1-63>|)
no summary-address A.B.C.D/M
```

Parameters

`A.B.C.D/M`	Specify the IPv4 prefix to be announced.
`level-1`	Specify the reachability information only for Level-1.
`level-1-2`	Specify the reachability information for both Level-1 and Level-2.
`level-2`	Specify the reachability information only for Level-2.
`metric`	Specify the metric for the summarized address.
`<1-63>`	Specify the metric. The default is 0.

Default

By default, ISIS does not configure the summary-address. Level must be configured along with summary-address. Metric is optional.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#router isis bb
(config-router)#summary-address 10.10.0.0/16 level-1-2 metric 3

(config)#router isis bb
(config-router)#no summary-address 10.10.0.0/16
```

CHAPTER 2 IS-IS Graceful Restart Commands

This chapter describes the IS-IS graceful restart commands:

capability restart graceful

Use this command to enable the graceful restart capability.

Use the no parameter with this command to negate this command.

Command Syntax

```
capability restart graceful
no capability restart graceful
```

Parameters

NA

Default

By default, graceful restart capability is enabled.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables the graceful restart capability on a router.

```
#configure terminal
(config)#router isis bb
(config-router)#capability restart graceful
```

isis restart grace-period

Use this command to configure the T3 timer, the time the restarting router retains the forwarding table.

Use the no parameter to use the default value.

Command Syntax

```
isis restart grace-period <1-65535>
no isis restart grace-period
```

Parameters

<1-65535>	Grace period in seconds.

Default

By default, ISIS uses 65535 for the period value, and the value is applied to both level-1 and level-2.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example enables and then disables a restart grace period at one second.

```
#configure terminal
(config)#isis restart grace-period 1

(config)#no isis restart grace-period
```

isis restart-hello-interval

Use this command to configure the T1 timer, interval of ISIS Hello packet with restart TLV.

Use the no parameter to use the default value.

Command Syntax

```
isis restart-hello-interval <1-65535> (level-1|level-2|)
no isis restart-hello-interval <1-65535> (level-1|level-2|)
no isis restart-hello-interval (level-1|level-2|)
```

Parameters

`<1-65535>`	Specify the number of seconds in the interval.
`level-1`	Specify the hello-interval for level-1 IIHs.
`level-2`	Specify the hello-interval for level-1 IIHs.

Default

By default, ISIS uses 3 seconds for the hello value, and the interval is applied to both level-1 and level-2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables a restart hello interval at 123 seconds for a level 1 interface.

```
#configure terminal
(config)#interface eth0
(config-if)#isis restart-hello-interval 123 level-1

(config-if)#no isis restart-hello-interval 123 level-1
```

isis restart helper

Use this command to configure the router's helper mode capability.

Use the no parameter to disable the helper mode for this router.

Command Syntax

```
isis restart helper
no isis restart helper
```

Parameters

None

Default

By default, most routers are not a restart helper router.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables ISIS restart helper.

```
#configure terminal
(config)#isis restart helper

(config)#no isis restart helper
```

isis restart suppress-adjacency

Use this command to enable ISIS to request that its adjacency be suppressed after the ISIS daemon process starts or restarts until the Link State Packet Database (LSPDB) synchronizes.

Use the no parameter to disable suppress-adjacency.

Command Syntax

```
isis restart suppress-adjacency
no isis restart suppress-adjacency
```

Parameters

None

Default

By default, ISIS does not request that its adjacency be suppressed after the ISIS daemon process starts or restarts.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables ISIS restart suppress adjacency.

```
#configure terminal
(config)#isis restart suppress-adjacency

(config)#no isis restart suppress-adjacency
```

restart isis graceful

Use this command to restart the ISIS router.

Command Syntax

```
restart isis graceful (grace-period <1-65535>|)
```

Parameters

<1-65535>	Grace period in seconds.

Default

By default, the ISIS router is not restarted gracefully. Default grace-period is 65535 seconds.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#restart isis graceful grace-period 60
```

restart-timer

Use this command to restart the ISIS T2 timer. When a node comes up after graceful restart, within this time, the LSPDB sync should be completed.

Use the no parameter with this command to negate this command.

Command Syntax

```
restart-timer <5-65535> (level-1|level-1-2|level-2|)
no restart-timer (level-1|level-1-2|level-2|)
no restart-timer <5-65535> (level-1|level-1-2|level-2|)
```

Parameters

<5-65535>	Restart time in seconds
level-1	Restart is only for Level-1.
level-1-2	Restart is for both Level-1 and Level-2.
level-2	Restart is only for Level-2.

Default

The default value is 60 seconds.

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example enables and then disables the restart timer at 555 seconds for a level 2 interface.

```
#configure terminal
(config)#router isis bb
(config-router)#restart-timer 555 level-2

(config)#router isis bb
(config-router)#no restart-timer 555 level-2
```

CHAPTER 3 IS-IS Show Commands

This chapter provides describes the IS-IS show commands:

show clns is-neighbors

Use this command to display IS neighbor adjacencies.

Command Syntax

```
show clns is-neighbors (detail|)
show clns WORD is-neighbors (detail|)
show clns is-neighbors IFNAME (detail|)
show clns WORD is-neighbors IFNAME (detail|)
```

Parameters

`detail`	Detailed information.
`WORD`	Information for a single IS-IS area.
`IFNAME`	Information for a single interface.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show clns is-neighbors detail
Tag abc: VRF : default
System Id      Interface   State  Type Priority  Circuit Id
0000.0000.0003 eth1        Up     L1   64        0000.0000.0003.01
L1 Adjacency ID: 1
L2 Adjacency ID: 2
Uptime: 00:12:31
Area Address(es): 52
IP Address(es): 11.11.11.2
Level-1 Protocols Supported: IPv4
Adjacency advertisement: Advertise
#
```

Table 3-9 explains the fields in the output.

Table 3-9: show clns is-neighbors output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
System Id	Uniquely identifies a system within an area.
Interface	Interface from which the system was learned.

Table 3-9: show clns is-neighbors output (Continued)

Field	Description
State	Adjacency state: Init: Router is an IS and is waiting for an IS-IS hello message. IS-IS regards the neighbor as not adjacent. Up: IS is considered reachable
Type	Type of adjacency: L1: Router adjacency for level 1 routing only L2: Router adjacency for level 2 only L1L2: Router adjacency for level 1 and level 2 routing
Priority	IS-IS priority that the respective neighbor is advertising. The highest priority neighbor is elected the designated IS-IS router for the interface.
Circuit Id	Number that the router uses to uniquely identify its IS-IS interface. When the interface is attached to a broadcast network, the Circuit ID is concatenated with System ID of the designated router for the interface.
Adjacency ID	Adjacency identifier.
Uptime	How long the adjacency has existed.
Area Addresses	Area addresses associated with the intermediate-system adjacencies.
IPv4/IPv6 address(es)	IP addresses of the ES or IS.
Protocols Supported	IPv4 and/or IPv6.
Adjacency advertisement	Restart: Suppress or Advertise.

show clns neighbors

Use this command to display ES and IS neighbor adjacencies.

Command Syntax

```
show clns neighbors (detail|)
show clns WORD neighbors (detail|)
show clns neighbors IFNAME (detail|)
show clns WORD neighbors IFNAME (detail|)
```

Parameters

`detail`	Detailed information for all interfaces.
`WORD`	Information for a single IS-IS area.
`IFNAME`	Information for a single interface.

Command Mode

Exec mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show clns neighbors detail

Tag abc: VRF : default
System Id      Interface   SNPA            State  Holdtime  Type Protocol
0000.0000.0003 eth1        0800.277b.411d  Up     6         L1   IS-IS
L1 Adjacency ID: 1
L2 Adjacency ID: 2
Uptime: 00:15:58
Area Address(es): 52
IP Address(es): 11.11.11.2
Level-1 Protocols Supported: IPv4
Adjacency advertisement: Advertise
#
```

Table 3-10 explains the fields in the output.

Table 3-10: show clns neighbors output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
System Id	Uniquely identifies a system within an area.
Interface	Interface from which the system was learned.

Table 3-10: show clns neighbors output (Continued)

Field	Description
SNPA	SubNetwork Point of Attachment (SNPA): MAC address of the next-hop.
State	Adjacency state: Init: Router is an IS and is waiting for an IS-IS hello message. IS-IS regards the neighbor as not adjacent. Up: ES or IS is considered reachable
Holdtime	Number of seconds before this adjacency entry times out.
Type	Type of adjacency: L1: Router adjacency for level 1 routing only L2: Router adjacency for level 2 only L1L2: Router adjacency for level 1 and level 2 routing
Protocol	Protocol through which the adjacency was learned.
Adjacency ID	Adjacency identifier.
Uptime	How long the adjacency has existed.
Area Addresses	Area addresses associated with the intermediate-system adjacencies.
IPv4/IPv6 address(es)	IP addresses of the ES or IS.
Topology	IPv4 and/or IPv6.
Protocols Supported	IPv4 and/or IPv6.
Adjacency advertisement	Restart: Suppress or Advertise.

show debugging isis

Use this command to display the status of the debugging of the ISIS system.

Command Syntax

```
show debugging isis
```

Parameters

None

Command Mode

Exec mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging isis
IS-IS debugging status:
IS-IS Interface FSM debugging is on
IS-IS Neighbor FSM debugging is on
IS-IS events debugging is on
IS-IS PDU debugging is on
IS-IS lsp debugging is on
IS-IS spf debugging is on
IS-IS NSM debugging is on
IS-IS Check-sum debugging is on
IS-IS Authentication debugging is on
IS-IS Protocol-error debugging is on
IS-IS Local Updates debugging is on
IS-IS Hello debugging is on
IS-IS BFD debugging is on
IS-IS MPLS debugging is on
IS-IS RIB debugging is on
#
```

show ip isis igp-shortcut-lsp

Use this command to display IS-IS shortcut MPLS label-switched paths (LSPs).

Command Syntax

```
show ip isis (WORD|) igp-shortcut-lsp
```

Parameters

WORD	Information for a single IS-IS area.

Command Mode

Exec mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip isis igp-shortcut-lsp
#
```

Table 3-11 explains the fields in the output.

Table 3-11: show ip isis igp-shortcut-lsp output

Field	Description
Tunnel-endpoint	Tunnel endpoint address.
Tunnel-id	Tunnel identifier.
Tunnel-metric	Tunnel metric.
active/inactive	Whether the tunnel is active or inactive.

show ip isis route

Use this command to display IS-IS routing table for IPv4.

Command Syntax

```
show ip isis (WORD|) route
```

Parameters

WORD	Information for a single IS-IS area.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip isis route
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
       ia - IS-IS inter area, D - discard, e - external metric
Tag xyz: VRF : default
          Destination         Metric      Next-Hop            Interface      Tag
L1        10.10.10.0/24       20          11.11.11.1          eth1           0
C         11.11.11.0/24       10          –                   eth1           0
#
```

Header

Each entry in this table has a code preceding it, indicating the source of the routing entry. Table 3-12 shows these codes.

Table 3-12 explains the fields in the output.

Table 3-12: route codes and modifiers

Code	Description
C	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols.
E	External.
L1	IS-IS level-1.
L2	IS-IS level-2.
ia	IS-IS inter area (leaked).

Table 3-12: route codes and modifiers (Continued)

Code	Description
D	Discard route. A device performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the router doing the summarization has a less specific route that points back to the sending router for the network.
e	External metric. Routes can be redistributed into IS-IS with either internal or external metrics (internal is the default). The metric type determines the base metric value of the redistributed routes. The value of an internal metric is lower than 64. The value of an external metric is 64-128.

Route Entry Fields

Table 3-13 shows the route entry fields.

Table 3-13: route entry fields

Field	Description
Code	As explained in Table 3-12.
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
Destination	IP address of the remote network.
Metric	ISIS metric used for SPF calculation (1-63). When a route is imported into the IS-IS network without a specified metric, IS-IS uses 10 for the metric value and the value is applied to both level-1 and level-2.
Next-Hop	This route is available through the next hop router located at this IP address. This identifies exactly where packets go when they match this route.
Interface	Interface used to get to the next-hop address for this route.
Tag	Name that identifies the IS-IS area.

show ip isis route igp-shortcut

Use this command to display the IS-IS IGP shortcut routing table.

Command Syntax

```
show ip isis (WORD|) route igp-shortcut
```

Parameters

WORD	Information for an IS-IS area.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip isis new_isis route igp-shortcut
Codes: C - connected, E - external, L1 - IS-IS level-1, L2 - IS-IS level-2
ia - IS-IS inter area, D - discard, e - external metric

Tag aa: VRF : default
     Destination         Metric      Tunnel-ID         Tunnel-End-Point
#
```

Header

Each entry in this table has a code preceding it, indicating the source of the routing entry. Table 3-14 shows these codes.

Table 3-14: Route codes and modifiers

Code	Description
C	Routes directly connected to the local device that were not distributed via IGP. The device inherently knows of these networks, so there is no need to learn about these from another device. Connected routes are preferred over routes for the same network learned from other routing protocols.
E	External.
L1	IS-IS level-1.
L2	IS-IS level-2.
ia	IS-IS inter area (leaked).

Table 3-14: Route codes and modifiers (Continued)

Code	Description
D	Discard route. A device performing summarization installs a discard route in its routing table for the summarized network range to prevent routing loops where portions of the summarized network range do not have a more specific route in the RIB. External and internal discard route entries are installed by default. During route summarization, routing loops can happen if data sent to a nonexisting network appears to be a part of the summary, and the router doing the summarization has a less specific route that points back to the sending router for the network.
e	External metric. Routes can be redistributed into IS-IS with either internal or external metrics (internal is the default). The metric type determines the base metric value of the redistributed routes. The value of an internal metric is lower than 64. The value of an external metric is 64-128.

Route Entry Fields

Table 3-15 shows the route entry fields.

Table 3-15: Route entry fields

Field	Description
Code	As explained in Table 3-12.
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
Destination	IP address.
Metric	Tunnel metric.
Tunnel-ID	Tunnel identifier.
Tunnel-End-Point	Tunnel endpoint address.

show ip protocols

Use this command to display IP process parameters and statistics.

Command Syntax

```
show ip protocols
show ip protocols isis
```

Parameters

None

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip protocols
Routing Protocol is "isis 1 "
Redistributing:
Area Address(es): 52
Distance : (default is 115)
#
```

Table 3-16 explains the output fields.

Table 3-16: show ip protocols output

Field	Description
Routing Protocol	“isis” and the name that identifies the IS-IS area.
Redistributing	Protocols being redistributed (such as RIP, OSPF, or BGP), including metric, metric type (internal or external), and route map.
redistribute isis	Whether redistributing IS-IS level-1 into level-2 and vice versa.
Area Address	Network address of the areas into which the routing process is injecting routes.
Distance: (default is 115)	Administrative distance.

show ip route fast-reroute

Use this command to display Loop Free Alternate Fast Reroute (LFA FRR) routes.

Command Syntax

```
show ip route fast-reroute
```

Parameters

None

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show ip route fast-reroute
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2 E1 - OSPF
external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area ,p -
stale info
* - candidate default

IP Route Table for VRF "default"
i L140.40.40.0/24 [115/10] via 10.10.10.142, eth1, 00:00:50
                           [FRR-NH] via 30.30.30.144, eth3

i L150.50.50.0/24 [115/15] via 20.20.20.143, eth2, 00:00:50
                           [FRR-NH] via 10.10.10.142, eth1

i L160.60.60.0/24 [115/15] via 10.10.10.142, eth1, 00:00:50
                           [FRR-NH] via 20.20.20.143, eth2
```

show ip isis route fast-reroute

Use this command to display Loop Free Alternate Fast Reroute (LFA FRR) route information and interfaces on which LFA FRR is disabled.

Command Syntax

```
show ip isis (WORD|) route fast-reroute
```

Parameters

`WORD` Routing area tag.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show ip route fast-reroute
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1, N2 - OSPF NSSA external type 2 E1 - OSPF external type
1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2, ia - IS-IS inter area ,p - stale info
* - candidate default

IP Route Table for VRF "default"
i L140.40.40.0/24 [115/10] via 10.10.10.142, eth1, 00:00:50
                          [FRR-NH] via 30.30.30.144, eth3

i L150.50.50.0/24 [115/15] via 20.20.20.143, eth2, 00:00:50
                          [FRR-NH] via 10.10.10.142, eth1

i L160.60.60.0/24 [115/15] via 10.10.10.142, eth1, 00:00:50
                          [FRR-NH] via 20.20.20.143, eth2
```

show ip isis lfa-config

Use this command to display the Loop Free Alternate Fast Reroute (LFA FRR) tie-break preferences for protection types and the termination hold-on timer.

Command Syntax

```
show ip isis (WORD|) lfa-config (level-1|level-2)
```

Parameters

`WORD` Routing area tag.

`level-1` Level 1 only.

`level-2` Level 2 only

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show ip isis lfa-config level-1

TIE-Breaker           Preference values
-----------------------------------------------
Primary Path:                 20
Link Protecting:              30
Node Protecting:              60
Broadcast Interface Disjoint: 70
Secondary Path:                0
Downstream Path:               0
```

Termination Hold On Interval : 1000 ms

show isis counter

Use this command to display the MIB variables used to construct routing tables for IP networks for IS-IS as defined in RFC 4444.

Command Syntax

```
show isis counter
```

Parameters

None

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis counter
Tag abc: VRF : default
IS-IS Level-1 isisSystemCounterEntry:
isisSysStatCorrLSPs: 0
isisSysStatAuthTypeFails: 0
isisSysStatAuthFails: 0
isisSysStatLSPDbaseOloads: 0
isisSysStatManAddrDropFromAreas: 0
isisSysStatAttmptToExMaxSeqNums: 0
isisSysStatSeqNumSkips: 0
isisSysStatOwnLSPPurges: 0
isisSysStatIDFieldLenMismatches: 0
isisSysStatMaxAreaAddrMismatches: 0
isisSysStatPartChanges: 0
isisSysStatSPFRuns: 7
isisSysStatPRCRuns: 0

IS-IS Level-2 isisSystemCounterEntry:
isisSysStatCorrLSPs: 0
isisSysStatAuthTypeFails: 0
isisSysStatAuthFails: 0
isisSysStatLSPDbaseOloads: 0
isisSysStatManAddrDropFromAreas: 0
isisSysStatAttmptToExMaxSeqNums: 0
isisSysStatSeqNumSkips: 0
isisSysStatOwnLSPPurges: 0
isisSysStatIDFieldLenMismatches: 0
isisSysStatMaxAreaAddrMismatches: 0
isisSysStatPartChanges: 0
isisSysStatSPFRuns: 3
isisSysStatPRCRuns: 0
#
```

show isis database

Use this command to display link-state database (LSDB) database information. The LSDB is the core of IS-IS routing. All link-state information advertised by neighbors in the same area is stored in the LSDB.

Command Syntax

```
show isis database
show isis database (detail|verbose)
show isis database (detail|verbose) WORD
show isis database (detail|verbose) WORD (l1|l2|level-1|level-2)
show isis database (detail|verbose) (l1|l2|level-1|level-2)
show isis database (detail|verbose) (l1|l2|level-1|level-2) WORD
show isis database WORD
show isis database WORD (l1|l2|level-1|level-2)
show isis database WORD (l1|l2|level-1|level-2) (detail|verbose)
show isis database WORD (detail|verbose)
show isis database WORD (detail|verbose) (l1|l2|level-1|level-2)
show isis database (l1|l2|level-1|level-2)
show isis database (l1|l2|level-1|level-2) (detail|verbose)
show isis database (l1|l2|level-1|level-2) (detail|verbose) WORD
show isis database (l1|l2|level-1|level-2) WORD
show isis database (l1|l2|level-1|level-2) WORD (detail|verbose)
```

Parameters

`detail`	Detailed information.
`verbose`	Verbose information.
`WORD`	Link-state packet (LSP) identifier in the form of XXXX.XXXX.XXXX.XX-XX.
`l1`	IS-IS level-1.
`l2`	IS-IS level-2.
`level-1`	IS-IS level-1.
`level-2`	IS-IS level-2.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis database detail
Area bb:
IS-IS Level-1 Link State Database:
```

```
LSPID                 LSP Seq Num  LSP Checksum  LSP Holdtime      ATT/P/OL
000F.0000.0001.00-00* 0x00000007   0xE15E        1188              1/0/0
  Area Address: 49.000F
  NLPID:        0xCC
  IP Address:   10.10.12.97
  Metric: 10         IP 10.10.12.0 255.255.255.0
  Metric: 10         IS 000F.0000.0001.02

  IP Address:   10.10.12.94
  Metric: 10         IP 10.10.12.0 255.255.255.0
  Metric: 10         IS 000F.0000.0001.02
#
```

Table 3-17 explains the output fields.

Table 3-17: show isis database output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
IS-IS Level-n Link State Database	Each IS-IS level has a section with Link-State Packet (LSP) information.
LSPID	Link-state packet identifier in the form of XXXX.XXXX.XXXX.XX-XX. The first six octets (“XXXX.XXXX.XXXX”) are the system identifier of the router that originated the LSP. The next octet is the pseudonode identifier: • When this octet is nonzero, the LSP describes links from a designated router (pseudonode) that creates and floods an LSP that describes all systems attached to the network. This mechanism is similar to a router link-state advertisement (LSA) in OSPF. • When this octet is zero, the LSP is from a nonpseudonode which describes the state of the originating router. The last octet is the LSP number. If the value is 0x00, the entire LSP was carried in one LSP. If there is more data than can fit in a single LSP, the LSP is divided into multiple LSP fragments and each fragment has a different LSP number. An asterisk (*) means the LSP originated on the system where the command was given.
LSP Seq Num	LSP sequence number.
LSP Checksum	LSP checksum.
LSP Holdtime	Amount of time the LSP remains valid (in seconds). An LSP hold time of zero means the LSP was purged and is being removed from the link-state database (LSDB) of all routers. The value indicates how long the purged LSP will stay in the LSDB before being completely removed.
ATT	Attached bit. A Level-2 IS indicates its attachment to other areas by setting its attached bit in its Level-1 LSP 0. In other words, this is only set for inter-area routes. Level 1-only routers and Level 1-2 routers that have lost connection to other Level 2 routers will use the attach bit to find the closest Level-2 router. They will point a default route to the closest Level-2 router.

Table 3-17: show isis database output

Field	Description
P	Partition repair. A Level-1 area can become partitioned; this bit means the partition can be repaired via use of Level-2 routes.
OL	Overload bit. Determines whether the IS is congested. When the overload-bit is set in an LSP, other routers will not use this router as a transit router during SPF calculation. Only packets for destinations directly connected to the overloaded router will be sent to this router.

This command also displays information about the IS-IS TLVs in Table 3-18 if present in an LSP. For more about the TLV information, search for “IS-IS TLV Codepoints” on the Interne, check ISO/IEC 10589:2002(E), or other standard mentioned in Table 3-18.

Table 3-18: IS-IS TLV Codepoints

IS-IS TLV Codepoint	Description	Standard
1	Area Addresses	ISO 10589
2	IIS Neighbors	ISO 10589
3	ES Neighbors	ISO 10589
10	Authentication	ISO 10589, RFC 6233
22	Extended IS reachability	RFC 5305
128	IP internal reachability	RFC 1195, RFC 5302
129	Protocols supported	RFC 1195
130	IP external reachability	RFC 1195, RFC 5302
132	IP interface address	RFC 1195
134	Traffic engineering router ID	RFC 5305
135	Extended IP reachability	RFC 5305
137	Host name	RFC 5301, RFC 6233
222	Multi IS reachability	RFC 5120
229	Multi topology	RFC 5120
232	IPv6 interface address	RFC 5308
235	Multi IPv4 reachability	RFC 5120
236	IPv6 reachability	RFC 5308
237	Multi IPv6 reachability	RFC 5120

show isis interface

Use this command to display detailed interface information.

Command Syntax

```
show isis interface
show isis interface IFNAME
show isis interface counter
```

Parameters

IFNAME	Interface name.
counter	Interface counters.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
>show isis interface
eth2 is up, line protocol is up
Routing Protocol: IS-IS (abc)
Network Type: Broadcast
Circuit Type: level-2
Local circuit ID: 0x01
Extended Local circuit ID: 0x00000004
Local SNPA: 0800.2731.a9a0
IP interface address:
10.10.10.1/24
IPv6 interface address:
fe80::a00:27ff:fe31:a9a0/64
Level-2 Metric: 10/10, Priority: 64, Circuit ID: 0000.0000.0001.01
Number of active level-2 adjacencies: 0
Level-2 LSP MTU: 1492
Next IS-IS LAN Level-2 Hello in 9 seconds
eth1 is up, line protocol is up
Routing Protocol: IS-IS (abc)
Network Type: Broadcast
Circuit Type: level-1
Local circuit ID: 0x02
Extended Local circuit ID: 0x00000003
Local SNPA: 0800.2714.e7f8
IP interface address:
11.11.11.1/24
IPv6 interface address:
fe80::a00:27ff:fe14:e7f8/64
Level-1 Metric: 10/10, Priority: 64, Circuit ID: 0000.0000.0003.01
Number of active level-1 adjacencies: 1
Level-1 LSP MTU: 1492
```

```
    Next IS-IS LAN Level-1 Hello in 5 seconds

    >show isis interface eth1
    eth1 is up, line protocol is up
    Routing Protocol: IS-IS ((null))
    Network Type: Broadcast
    Circuit Type: level-1
    Local circuit ID: 0x02
    Extended Local circuit ID: 0x00000003
    Local SNPA: 0800.27e3.0e64
    IP interface address:
    30.0.0.1/24
    IPv6 interface address:
    fe80::a00:27ff:fee3:e64/64
    LDP-ISIS Sync Configured
    Holddown timer = 100 seconds, Remaining time = 90 seconds
    Level-1 Metric: 63/16777214, Priority: 64, Circuit ID: 0000.0000.0001.02
    Number of active level-1 adjacencies: 1
    Level-1 LSP MTU: 1492
    Next IS-IS LAN Level-1 Hello in 1 seconds
```

Table 3-19 explains the output fields.

Table 3-19: show isis interface

Field	Description
IFNAME is up, line protocol is up/down	Whether the interface is up or down
Routing Protocol	“IS-IS” and the name that identifies the IS-IS instance.
Network Type	• Broadcast • Point-to-Point • Loopback
Circuit Type	Whether the interface is configured for: • Local routing: level-1 • Area routing: level 2 • Local and area routing: level-1-2
Local circuit ID	Local circuit identifier assigned when interface is created. Each IS-IS interface is assigned a circuit identifier to identify the interface within the link-state database. If the interface is attached to a multiaccess network, the circuit ID is concatenated with the system ID of the designated IS. This is called the pseudonode ID.
Extended Local circuit ID	Interface index.
Local SNPA	SubNetwork Point of Attachment: for broadcast networks, MAC address.
IP interface address	IPv4 addresses assigned to IS-IS interface.
IPv6 interface address	IPv6 addresses assigned to IS-IS interface.
LDP-ISIS Sync Configured	LDP IS-IS synchronization is enabled.

Table 3-19: show isis interface (Continued)

Field	Description
Holddown timer	Delay for notifications of LDP convergence to IS-IS
Remaining time	Remaining LDP convergence hold time in seconds.
Holddown timer not configured	The LDP convergence holddown timer has not been set.
Level-1 Metric	Interface metric value; used for SPF calculation.
Priority	Priority for designated IS election.
Circuit ID	Unique ID assigned to a circuit internally.
Number of active level-1 adjacencies	Number of adjacencies formed with a neighboring router.
Level-1 LSP MTU	Maximum transmission unit: maximum transmission size for a packet on this interface.
Level-2 Metric	Interface metric value; used for SPF calculation.
Priority	Priority for designated IS election.
Circuit ID	Unique ID assigned to a circuit internally.
Number of active level-2 adjacencies	Number of adjacencies formed with a neighboring router.
Level-2 LSP MTU	Maximum transmission unit: maximum transmission size for a packet on this interface.
Next IS-IS LAN Level-1 Hello	For broadcast networks, when the next IS hello will be sent on this interface.
Next IS-IS LAN Level-2 Hello	For broadcast networks, when the next IS hello will be sent on this interface.
Next IS-IS Hello in	For point-to-point networks, when the next IS hello will be sent on this interface.
Bandwidth	Traffic engineering: interface bandwidth.
Maximum reservable bandwidth	Traffic engineering: maximum reservable interface bandwidth.
Available bandwidth at priority	Traffic engineering: available interface bandwidth at priority.
Bidirectional Forwarding Detection is disabled/enabled/ configured	BFD state

show isis tag database

Use this command to display detailed link-state database information for an IS-IS routing area.

Command Syntax

```
show isis WORD database
show isis WORD database (detail|verbose)
show isis WORD database (detail|verbose) WORD
show isis WORD database (detail|verbose) WORD (l1|l2|level-1|level-2)
show isis WORD database (detail|verbose) (l1|l2|level-1|level-2)
show isis WORD database (detail|verbose) (l1|l2|level-1|level-2) WORD
show isis WORD database WORD
show isis WORD database WORD (l1|l2|level-1|level-2)
show isis WORD database WORD (l1|l2|level-1|level-2) (detail|verbose)
show isis WORD database WORD (detail|verbose)
show isis WORD database WORD (detail|verbose) (l1|l2|level-1|level-2)
show isis WORD database (l1|l2|level-1|level-2)
show isis WORD database (l1|l2|level-1|level-2) (detail|verbose)
show isis WORD database (l1|l2|level-1|level-2) (detail|verbose) WORD
show isis WORD database (l1|l2|level-1|level-2) WORD (detail|verbose)
show isis WORD database (l1|l2|level-1|level-2) WORD
```

Parameters

`WORD`	Name that identifies the IS-IS area.
`detail`	Detailed database information.
`verbose`	Verbose database information.
`WORD`	Link-state packet (LSP) identifier in the form of XXXX.XXXX.XXXX.XX-XX.
`l1`	IS-IS level-1 link state database.
`l2`	IS-IS level-2 link state database.
`level-1`	IS-IS level-1 link state database.
`level-2`	IS-IS level-2 link state database.

Command Mode

Exec mode, Privileged exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh isis abc database verbose
Tag abc: VRF : default
```

```
IS-IS Level-1 Link State Database:
LSPID                 LSP Seq Num  LSP Checksum  LSP Holdtime      ATT/P/OL
0000.0000.0001.00-00* 0x00000008   0xA076        1018              0/0/0
Area Address: 52
NLPID: 0xCC
IP Address: 11.11.11.1
Metric: 10 IS 0000.0000.0003.01
Metric: 10 IP 11.11.11.0 255.255.255.0
Metric: 10 IP 10.10.10.0 255.255.255.0
0000.0000.0003.00-00 0x00000007 0x1CB0 1029 0/0/0
Area Address: 52
NLPID: 0xCC
IP Address: 11.11.11.2

Metric: 10 IP 11.11.11.0 255.255.255.0
0000.0000.0003.01-00 0x00000005 0x0ACB 1000 0/0/0
Metric: 0 IS 0000.0000.0003.00
Metric: 0 IS 0000.0000.0001.00

IS-IS Level-2 Link State Database:
LSPID                 LSP Seq Num  LSP Checksum  LSP Holdtime      ATT/P/OL
0000.0000.0001.00-00* 0x00000007   0x7243        988               0/0/0
Area Address: 52
NLPID: 0xCC
IP Address: 11.11.11.1
Metric: 10 IP 11.11.11.0 255.255.255.0
Metric: 10 IP 10.10.10.0 255.255.255.0
```

See Table 3-17 and Table 3-18 for an explanation of the output of this command.

show isis topology

Use this command to display paths to Intermediate Systems.

Command Syntax

```
show isis topology (l1|l2|level-1|level-2|)
show isis WORD topology (l1|l2|level-1|level-2|)
```

Parameters

WORD	Display information for specified instance.
l1	Display the path to all level-1 routers in the area.
l2	Display the path to all level-2 routers in the domain.
level-1	Display the path to all level-1 routers in the area.
level-2	Display the path to all level-2 routers in the domain.

Command Mode

Exec mode, Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show isis topology

Tag abc: VRF : default
IS-IS paths to level-1 routers
System Id           Metric     Next-Hop            Interface   SNPA
000F.0000.0001      --
000F.0000.0002      10         000F.0000.0002      eth2        0006.5B0E.D27D

IS-IS paths to level-2 routers
System Id           Metric     Next-Hop            Interface   SNPA
0000.0000.0001      10         0000.0000.0001      eth2        0000.0CFA.F002
```

Table 3-20 explains the output fields.

Table 3-20: show isis topology output

Field	Description
Tag	Name that identifies the IS-IS area.
VRF	VRF name.
IS-IS paths to level-n routers	Each IS-IS level has a section with topology information.
System Id	Uniquely identifies a system within an area.
Metric	ISIS metric used for SPF calculation (1-63).

Table 3-20: show isis topology output

Field	Description
Next-Hop	This route is available through the next hop router located at this IP address.
Interface	Interface from which the system was learned.
SNPA	SubNetwork Point of Attachment (SNPA): MAC address of the device.

show running-config interface isis

Use this command to display the ISIS interface configuration.

Command Syntax

```
show running-config interface IFNAME isis
```

Parameters

IFNAME	Interface name.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show running-config interface eth0 isis
!
interface eth0
 isis tag 500 level-1
!
```

show running-config router isis

Use this command to display the ISIS router configuration.

Command Syntax

```
show running-config router isis
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config-router)#show running-config router isis
!
router isis
!
```

Unicast Routing Information Base Command Reference

Contents

This document contains this chapter:

CHAPTER 1 Unicast RIB Commands

This chapter describes the following unicast RIB commands:

clear ip route kernel

Use this command to clear stale IPv4 routes from the RIB (Routing Information Base) and FIB (Forwarding Information Base).

Command Syntax

```
clear ip route kernel
clear ip kernel route
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route kernel
```

clear ip route

Use this command to clear an all IPv4 routes or any specific prefix routes.

Command Syntax

```
clear ip route (*|A.B.C.D/M)
```

Parameters

*	Clears all routes
A.B.C.D/M	Prefix to be cleared

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route *
#clear ip route 1.1.1.0/24
```

clear ip route vrf NAME

Use this command to clear all IPv4 VRF route or any specific prefix VRF route of any particular VRF name.

Command Syntax

```
clear ip route vrf NAME (*|A.B.C.D/M)
```

Parameters

NAME	VPN Routing or Forwarding instance name
*	Clears all routes
A.B.C.D/M	Prefix to be cleared

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip route vrf myVRF *
```

debug rib

Use this command to debug the `ribd` process.

Use the `no` form of this command or the `undebug` command to stop debugging.

Command Syntax

```
debug rib (all|)
debug rib events
debug rib packet (recv|send|) (detail|)
debug rib nsm
debug rib bfd
debug rib monitor
debug ip routing (add-route|delete-route|mod-route|
no debug all
no debug rib (all|)
no debug all rib
no debug rib events
no debug rib packet (recv|send|) (detail|)
no debug rib nsm
no debug rib bfd
no debug rib monitor
no debug ip routing (add-route|delete-route|mod-route|)
undebug all
undebug rib (all|)
undebug all rib
undebug rib events
undebug rib packet (recv|send|) (detail|)
undebug rib nsm
undebug rib bfd
```

Parameters

`all`	All debugging functions
`events`	Events
`packet`	Packet events
`recv`	Received packets
`send`	Sent packets
`detail`	Detailed information
`nsm`	NSM events
`monitor`	Monitoring the kernel Netlink messages

`bfd`	BFD (Bidirectional Forwarding Detection) events
`ip routing`	IPv4 routing events
`add-route`	Add route events
`delete-route`	Delete route events
`mod-route`	Modify route events

Disabled

By default, debug command is disabled.

Command Mode

Privileged Exec mod

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug rib all
```

description

Use this command to assign a description to a Virtual Router instance.

Use the no parameter to remove a description.

Command Syntax

```
description LINE
no description
```

Parameters

LINE	Virtual Router description maximum 80 characters

Disabled

By default, description command is disabled

Command Mode

VR mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#virtual-router VR1
(config-vr)#description VR1 has been created for CLI testing
(config-vr)#exit

(config)#virtual-router VR1
(config-vr)#no description
(config-vr)#exit
```

fib retain

Use this command to set the retention time for stale routes in the Forwarding Information Base (FIB) when `ribd` restarts. The `ribd` process reads the FIB and treats previously self-installed routes as stale.

You can display stale routes by running the `show ip route database` command. All routes preceded by the symbol p are stale routes. When protocol modules restart, `ribd` overrides these stale routes with routes updated by the protocol modules.

Table 1-21 show the behavior of routes when `ribd` stops.

Table 1-21: FIB retention

Command	Behavior
`fib retain`	Does not clear routes from the FIB and retains stale routes for 60 seconds when restarted.
`fib retain forever`	Does not clear routes and retains stale routes forever.
`fib retain time <1-65535>`	Does not clear routes and retains stale routes for the specified seconds.
`no fib retain` (default)	Cleans up routes in the FIB, but retains stale routes for 60 seconds when restarted.

You can remove stale routes at any time with the clear ip route kernel command.

Use the `no` form of this command to revert to default; that is, do not retain routes in the FIB when `ribd` stops.

Command Syntax

```
fib retain (forever|time <1-65535>|)
no fib retain (forever|time <1-65535>|)
```

Parameters

`forever`	Retain FIB forever
`time`	Retain FIB for a time after `ribd` restarts
`<1-65535>`	Retention time in seconds; if you omit this value, the default is 60 seconds

Default

Routes are cleared from the FIB when `ribd` stops. However, when `ribd` restarts, stale routes are retained for 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#fib retain time 180
```

ip route

Use this command to create an IPv4 static route.

Use the no form of this command to delete a static route.

Command Syntax

```
ip route A.B.C.D/M (A.B.C.D|IFNAME)
ip route A.B.C.D A.B.C.D (A.B.C.D|IFNAME)
ip route A.B.C.D/M (A.B.C.D|IFNAME){<1-255>|tag <0-4294967295>|description WORD}
ip route A.B.C.D A.B.C.D (A.B.C.D|IFNAME){<1-255>|tag <0-4294967295>|description
  WORD}
ip route A.B.C.D/M IFNAME A.B.C.D
ip route vrf NAME A.B.C.D/M IFNAME
ip route vrf NAME A.B.C.D/M A.B.C.D IFNAME
ip route vrf NAME A.B.C.D/M A.B.C.D IFNAME global
ip route vrf NAME A.B.C.D/M IFNAME {<1-255>|tag <0-4294967295>|description WORD}
ip route vrf NAME A.B.C.D/M A.B.C.D IFNAME {<1-255>|tag <0-4294967295>|description
  WORD}
no ip route A.B.C.D/M (A.B.C.D|IFNAME|)
no ip route A.B.C.D A.B.C.D (A.B.C.D|IFNAME)
no ip route A.B.C.D/M (A.B.C.D|IFNAME){<1-255>|tag <0-4294967295>|description WORD}
no ip route A.B.C.D A.B.C.D (A.B.C.D|IFNAME){<1-255>|tag <0-4294967295>|description
  WORD}
no ip route vrf NAME A.B.C.D/M IFNAME
no ip route vrf NAME A.B.C.D/M A.B.C.D IFNAME
no ip route vrf NAME A.B.C.D/M IFNAME {<1-225>|tag <0-4294967295>|description WORD}
no ip route vrf NAME A.B.C.D/M A.B.C.D IFNAME {<1-255>|tag <0-
  4294967295>|description WORD}
```

Parameters

A.B.C.D/M	Subnet: IP destination prefix and a mask length
A.B.C.D A.B.C.D	Subnet: IP destination address and mask
A.B.C.D	Gateway nexthop IPv4 address
IFNAME	Gateway nexthop interface name
global	Global table lookup (to support inter-VRF static route leaking)
<1-255>	Administrative distance
description	Description of the static route maximum 80 character. For larger description use hypen (-) or underscore (_), as space is not supported.
tag	Tag used as a “match” value to control redistribution via route maps

<0-4294967295>	
	Tag value
vrf	VRF (Virtual Routing and Forwarding) instance
NAME	VRF name

Default

By default, no static IPv4 route is configured

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and was updated in OcNOS version 1.3.4 and OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ip route 192.168.3.0 255.255.255.0 2.2.2.2 128
(config)#ip route 1.1.1.0/24 eth0 32
(config)#ip route vrf new 1.1.1.1/1 1.1.1.1 eth1 description new tag 1
```

This example creates static routes in default VRF with the nexthops belonging to the Non default VRF.

```
(config)#ip route 20.1.1.0/24 ce0 30.1.1.3
#show ip route
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
O - OSPF, IA - OSPF inter area
N1 - OSPF NSSA external type 1,
N2 - OSPF NSSA external type 2
E1 - OSPF external type 1, E2 - OSPF external type 2
i - IS-IS, L1 - IS-IS level-1, L2 - IS-IS level-2,
ia - IS-IS inter area, E - EVPN,
v - vrf leaked
- candidate default
IP Route Table for VRF "default"
C 4.4.4.4/32 is directly connected, lo, 05:05:04
O 5.5.5.5/32 [110/2] via 40.1.1.5, xe0, 05:03:40
S v 20.1.1.0/24 [1/0] via 30.1.1.3, ce0, 00:00:24
C 40.1.1.0/24 is directly connected, xe0, 05:05:04
C 70.1.1.0/24 is directly connected, xe2, 05:05:04
O 80.1.1.0/24 [110/2] via 70.1.1.1, xe2, 02:54:01
S 90.1.1.0/24 [1/0] is directly connected, xe2, 00:02:40
C 127.0.0.0/8 is directly connected, lo, 05:16:21Gateway of last
resort is not set
```

This example creates VRF static routes with the nexthops belonging to the default VRF. The nexthop gateway address can be the IFNAME network address or any other IP address reachable via IFNAME.

```
#show ip route vrf
Codes: K - kernel, C - connected, S - static, R - RIP, B - BGP
       O - OSPF, IA - OSPF inter area

Gateway of last resort is not set
```

ip vrf

This command creates a VRF (Virtual Routing and Forwarding) RIB (Routing Information Base), assigns a VRF identifier, and switches to VRF mode.

Use the no parameter with command to remove a VRF RIB.

Command Syntax

```
ip vrf WORD
no ip vrf WORD
```

Parameter

WORD	VRF identifier

Default

By Default, ip vrf is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip vrf myVRF
(config-vrf)#
```

ipv6 route

Use this command to create an IPv6 static route.

Use the no form of this command to delete a static route

Note: IPv6 static route with Interface name alone as gateway next-hop is not supported.

Command Syntax

```
ipv6 route X:X::X:X/M (X:X::X:X|IFNAME) {<1-255>}
ipv6 route X:X::X:X/M X:X::X:X IFNAME {<1-255>}
ipv6 route vrf NAME X:X::X:X/M (X:X::X:X|IFNAME)
ipv6 route vrf NAME X:X::X:X/M X:X::X:X IFNAME
no ipv6 route X:X::X:X/M (X:X::X:X|IFNAME) {<1-255>}
no ipv6 route X:X::X:X/M X:X::X:X IFNAME {<1-255>}
no ipv6 route vrf NAME X:X::X:X/M (X:X::X:X|IFNAME)
no ipv6 route vrf NAME X:X::X:X/M X:X::X:X IFNAME
```

Parameter

`X:X::X:X/M`	Subnet: IPv6 destination prefix and a mask length
`X:X::X:X`	Gateway nexthop IPv6 address
`IFNAME`	Gateway nexthop interface name
`<1-255>`	Administrative distance
`vrf`	VRF (Virtual Routing and Forwarding) instance
`NAME`	VRF name

Default

By default, no static IPv6 route is configured

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 route 1234::/64 1000::1 128
(config)#ipv6 route 1235::/64 eth1 32
(config)#ipv6 route vrf vrf3 1236::/64 eth3
(config)#end
#show ipv6 route vrf all
IPv6 Routing Table
Codes: K - kernel route, C - connected, S - static, R - RIP, O - OSPF,
IA - OSPF inter area, E1 - OSPF external type 1,
E2 - OSPF external type 2, E - EVPN  N1 - OSPF NSSA external type 1,
```

```
N2 - OSPF NSSA external type 2, i - IS-IS, B - BGP

```

maximum-paths

Use this command to set the maximum number of paths to install in the FIB (Forwarding Information Base) for the ECMP (Equal-Cost MultiPath) feature.

Use the no parameter with this command to revert to default.

Note: If you change the number of paths from the default (8), you must save the running configuration and perform a reboot.

Command Syntax

```
maximum-paths <1-64>
no maximum-paths
```

Parameter

<1-64>	Maximum number of paths to install in the FIB

Default

By default, the maximum number of paths is 8.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#maximum-paths 5
```

max-fib-routes

Use this command to set the maximum number of FIB (Forwarding Information Base) routes including kernel, connected, and static routes.

Use the no parameter to remove this configuration.

Command Syntax

```
max-fib-routes <1-16384>
no max-fib-routes
```

Parameters

<1-16384>	Maximum number of FIB routes, including kernel, connected, and static routes

Default

By default, no FIB routes configured.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#max-fib-routes 12345

(config)#no max-fib-routes
```

max-static-routes

Use this command to set the maximum number of static routes.

Use the no parameter to disable this command.

Command Syntax

```
max-static-routes <1-4294967294>
no max-static-routes
```

Parameters

`<1-4294967294>` Maximum number of static routes

Default

By default, max static routes value is 4294967294

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#max-static-routes 123

(config)#no max-static-routes
```

show debugging rib

Use this command to display debug settings.

Command Syntax

```
show debugging rib
```

Parameters

None

Command Mode

Privileged Exec Mode and Exec Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging rib
```

snmp restart rib

Use this command to restart SNMP in Routing Information Base (RIB)

Command Syntax

```
snmp restart rib
```

Parameters

None

Default

By default, snmp restart command is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#config terminal
(config)#snmp restart rib
```

Two-Way Active Measurement Protocol Command Reference

Contents

This document contains these chapters and appendix:

CHAPTER 1 TWAMP Commands

This chapter describes the commands used to manage the Two-Way Active Measurement Protocol (TWAMP), including TWAMP light control, TWAMP light reflector, and TWAMP light sender.

twamp-light control

Use this command to initialize the TWAMP light Control or Sender Session.

Use the no form of this command to un-initialize and to remove the configured TWAMP light control configurations.

Command Syntax

```
twamp-light control
no twamp-light control
```

Parameters

NA

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#twamp-light control
```

control-admin-state

Use this command to enable or disable the TWAMP control sessions.

Command Syntax

```
control-admin-state (enable | disable)
```

Parameters

`enable`	Enable the TWAMP control session.
`disable`	Disable the TWAMP control session.

Default

disable

Command Mode

TWAMP light control mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
(config)#twamp-light control
(config-twamp-light-ctrl)#control-admin-state enable
```

test-session-name

Use this command to configure the TWAMP test sessions.

Use the no form of this command to un-configure or remove the configured TWAMP test sessions.

Command Syntax

```
test-session-name WORD sender-ip (X:X::X:X | A.B.C.D) (sender-port <1025-65535>|)
  (reflector-ip (X:X::X:X | A.B.C.D)) (reflector-port <1025-65535>|)
no test-session-name WORD
```

Parameters

WORD	TWAMP test session name.
X:X::X:X	TWAMP Sender or Reflector IP address in IPv6 format.
A.B.C.D	TWAMP Sender or Reflector IP address in IPv4 format.
<1025-65535>	TWAMP Sender or Reflector UDP port number.

Note: sender-port and reflector-port are optional parameters

Default

862 for sender-port and reflector-port

Command Mode

TWAMP light control mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

To Configure

```
(config)#twamp-light control
(config-twamp-light-ctrl)# test-session-name s1 sender-ip 10.0.0.1 sender-port
1234 reflector-ip 10.0.0.1 reflector-port 1234
```

To un-configure

```
(config)#twamp-light control
(config-twamp-light-ctrl)# no test-session-name s1
```

twamp-light reflector

Use this command to initialize the TWAMP reflector.

Use the no form of this command to un-initialize and to remove the configured TWAMP light refelctor configurations.

Command Syntax

```
twamp-light reflector
no twamp-light reflector
```

Parameters

NA

Command Mode

Configuration mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#twamp-light reflector
```

reflector-admin-state

Use this command to enable or disable the TWAMP reflector session.

Command Syntax

```
reflector-admin-state (enable | disable)
```

Parameters

`enable`	Enable the TWAMP reflector session.
`disable`	Disable the TWAMP reflector session.

Default

disable

Command Mode

TWAMP light reflector mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
(config)#twamp-light reflector
(config-twamp-light-ctrl)#reflector-admin-state enable
```

reflector ip

Use this command to configure the TWAMP light reflector session.

Command Syntax

```
reflector-ip (X:X::X:X | A.B.C.D) (reflector-port <1025-65535>|)
```

Parameters

`X:X::X:X`	TWAMP Reflector IP address in IPv6 format.
`A.B.C.D`	TWAMP Reflector IP address in IPv4 format.
`<1025-65535>`	TWAMP Reflector UDP port number.

Note: reflector-port is optional parameter

Default

862 for reflector-port

Command Mode

TWAMP light reflector mode (config-twamp-light-ctrl)

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
(config)#twamp-light reflector
(config-twamp-light-ref)#reflector-ip 10.0.0.1 reflector-port 1234
```

twamp start-test-session

Use this command to start the TWAMP test session.

Command Syntax

```
twamp start test-session WORD packet-count <1-65535> (interval <500-10000>|)
```

Parameters

WORD	TWAMP test session name.
<1-65535>	Number packed to send for test.
<500-10000>	Interval to send each packet in milliseconds.

Note: interval is optional parameters.

Default

1000 for interval

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#twamp start test-session s1 packet-count 10 interval 500
```

twamp stop-test-session

Use this command to stop the TWAMP test session.

Command Syntax

```
twamp stop test-session WORD
```

Parameters

WORD	TWAMP test session name.

Default

NA

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#twamp stop test-session s1
```

show twamp statistics

Use this command to display TWAMP test session.

Command Syntax

```
show twamp-statistics (WORD|)
```

Parameters

WORD	TWAMP test session name.

Note: WORD is optional parameter

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#show twamp statistics
=======================================
      TWAMP Test-Session Statistics
=======================================
  Test-Session Name        : s1
  Start Time               : 2019 Aug 05 08:40:12
  Elapsed time(milli sec)  : 4004

```
Average              : 2099
```

Table 1-22: show twamp statistics

Field	Description
Test-Session Name	TWAMP test session name
Start Time	TWAMP test start time
Elapsed time(milli sec)	Time taken to complete the test in milliseconds
Packets Sent	Number of packet sent
Packets Received	Number of packet received
Packet Loss(%)	Packet lost in percentage
Round Trip Delay(usec)	Round trip delay between TWAMP sender and reflector. Displayed Minimum, Maximum and Average round trip delay in micro-seconds
Forward Delay(usec)	Forward delay between TWAMP sender and reflector. Displayed Minimum, Maximum and Average forward delay in micro-seconds
Reverse Delay(usec)	Reverse delay between TWAMP reflector and sender. Displayed Minimum, Maximum and Average reverse delay in micro-seconds
Round Trip Delay Variation(usec)	Round trip delay variation between TWAMP sender and reflector. Displayed Minimum, Maximum and Average round trip delay variation in micro-seconds
Forward Delay Variation(usec)	Forward delay variation between TWAMP sender and reflector. Displayed Minimum, Maximum and Average forward delay variation in micro-seconds
Reverse Delay Variation(usec)	Reverse delay variation between TWAMP reflector and sender. Displayed Minimum, Maximum and Average reverse delay variation in micro-seconds

show running-config twamp

Use this command to display TWAMP running configuration alone.

Command Syntax

```
show running-config twamp
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

Reflector:

```
#show running-config twamp
twamp-light reflector
 reflector-admin-state enable
 reflector-ip 10.0.0.1 reflector-port 1234
```

Control or Sender:

```
#show running-config twamp
twamp-light control
 control-admin-state enable
 test-session-name s1 sender-ip 10.0.0.1 sender-port 1234 reflector-ip
10.0.0.1 reflector-port 1234
```

Layer 3 Subinterface Commands

Contents

This document contains these chapters and appendix:

CHAPTER 1 Layer 3 Subinterface Commands

This chapter describes the Layer 3 subinterface commands:

encapsulation

Use this command to configure encapsulation under a subinterface. Using this command, a Layer 3 subinterface can be configured as a port-vlan or stacked vlan. Before configuring the encapsulation on sub-interface, the operating state of the sub-interface is admin down. After configuring the encapsulation, the operating state of the sub-interface becomes up.

Command Syntax

```
encapsulation ((dot1q|dot1ad) VLAN_ID (inner-dot1q VLAN_ID|))
no encapsulation
```

Parameters

`dot1q`	IEEE 802.1Q VLAN-tagged packets
`dot1ad`	IEEE 802.1ad VLAN-tagged packets
`VLAN_ID`	First (outer) VLAN identifier on the subinterface <2-4094>
`inner-dot1q VLAN_ID`	Second (inner 802.1Q) VLAN identifier on the subinterface <2-4094>

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config-if)#interface xe9.1
(config-if)#encapsulation dot1q 10

(config-if)#interface xe9.2
(config-if)#encapsulation dot1q 20 inner-dot1q 20

(config-if)#interface xe9.3
(config-if)#encapsulation dot1ad 30

(config-if)#interface xe9.4
(config-if)#encapsulation dot1ad 40 inner-dot1q 40
```

interface IFNAME.SUBINTERFACE_ID

Use this command to configure a subinterface. A subinterface can only be created on a Layer 3 parent interface. Subinterfaces are supported for raw Ethernet interfaces as well as dynamic/static LAG interfaces. The number of subinterfaces supported is 2000 per parent port and a total of 4000 sub-interfaces per device. This command displays an error when the identifier of the subinterface is out of range.

Use no form of this command to unconfigure a sub-interface.

Command Syntax

```
interface IFNAME.SUBINTERFACE_ID
no interface IFNAME.SUBINTERFACE_ID
```

Parameters

IFNAME	Interface name, such as xe1, po1, or sa1
SUBINTERFACE_ID	Subinterface identifier <1-2000>

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
(config)#int xe1.5
(config-if)#exit
(config)#no interface xe1.5

(config)#int po1
(config-if)#exit
(config)#int po1.1
(config-if)#exit
(config)#no interface po1.1

(config)#int sa1
(config-if)#exit
(config)#int sa1.1
(config-if)#exit
(config)#no interface sa1.1
```

show interface IFNAME.SUBINTERFACE_ID

Use this command to display the details of the sub-interface.This command displays the information about the operating status, hardware address, VRF binding details, and input/output counters. This command can display details of the a sub-interface for a dynamic/static LAG as well.

Command Syntax

```
show interface IFNAME.SUBINTERFACE_ID
```

Parameters

IFNAME	Interface name, such as xe1, po1, or sa1
SUBINTERFACE_ID	Subinterface identifier <1-2000>

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show int xe1.1

SECTION 7 Multicast

Multicast Configuration Guide

Contents

This document contains these chapters and appendices:

CHAPTER 1 IGMP Configuration

This chapter describes how to configure Internet Group Management Protocol (IGMP).

The Internet Group Management Protocol (IGMP) is used by IP hosts to report their multicast group memberships to any immediately-neighboring multicast routers.

Using the information obtained through IGMP, the router maintains a list of multicast group on a per-interface basis. The routers that receive these IGMP packets send multicast data that they receive for requested groups out the network segment of the known receivers.

By default, when PIM is enabled on an interface, IGMP version 3 is enabled. IGMP can be enabled on an interface explicitly.

IGMP Versions

OcNOS supports IGMPv2 and IGMPv3, as well as IGMPv1 report reception. By default, OcNOS enables IGMPv3 when PIM is enabled on an interface.

IGMPv3 includes the following key changes from IGMPv2:

- Support for Source-Specific Multicast (SSM), which builds shortest path trees from each receiver to the source, through the following feature:
  - Host messages that can specify both the group and the source.
  - The multicast state that is maintained for groups and sources, not just for groups as in IGMPv2.
- Hosts no longer perform report suppression, which means that hosts always send IGMP membership reports when an IGMP query message is received.

IGMP Operation

IGMP works on the premise of three major packets exchange between IGMP enabled routers and hosts, interested in joining a particular group.

IGMP Query Operation

Once IGMP is enabled or pim is enabled (which enables igmpv3), on any interface it starts sending Query message, which is called general query to the all-hosts multicast group at 224.0.0.1 periodically to discover whether any hosts want to receive multicast data.

OcNOS elects a router as the IGMP querier on a subnet if it has the lowest IP address. As long as a router continues to receive query messages from a router with a lower IP address, it resets a timer that is based on its querier timeout value. If the querier timer of a router expires, it becomes the designated querier. If that router later receives a host query message from a router with a lower IP address, it drops its role as the designated querier and sets its querier timer again.

In the figure below Router-1 eth2 sends query every query-interval. Since Router1-eth2 IP address is less than Router-2 eth2, Router-1 eth2 becomes querier on the LAN.

IGMP Membership Report Operation

When a host receives a query from the local router it sends a Host Membership Report for all the multicast groups for which it wants to receive multicast traffic. This is called solicited membership report.

When a host joins a new group, the host immediately sends a Membership Report to inform a local router that it wants to receive multicast traffic for the group it has just joined without waiting to receive a Query. This is called unsolicited membership report.

In the figure below Host-1 and Host-2 sends membership reports to Router-1 eth2 for all the multicast groups for which they want to receive multicast traffic. Upon reception of membership report Router-1 maintains an IGMP group table containing multicast group-address, interface name on which it receives the report.

IGMP Leave Operation

When a multicast host leaves a group, a host that runs IGMPv2 or later sends an IGMP leave message. To check if this host is the last host to leave the group, the router sends an IGMP query (Called as Group-specific-query) message and starts a timer that you can configure called the last member query response interval. If no reports are received before the timer expires, the software removes the group state. The router continues to send multicast traffic for a group until its state is removed.

In the figure below Host-1 and Host-2 sends leave message to Router-1 eth2 for all the multicast groups for which they don’t want to receive multicast traffic. In response to leave message Router-1 eth2 sends an group-specific-query message before removing the multicast group address from the IGMP table.

Topology

The procedures in this section use the topology in Figure 1-69.

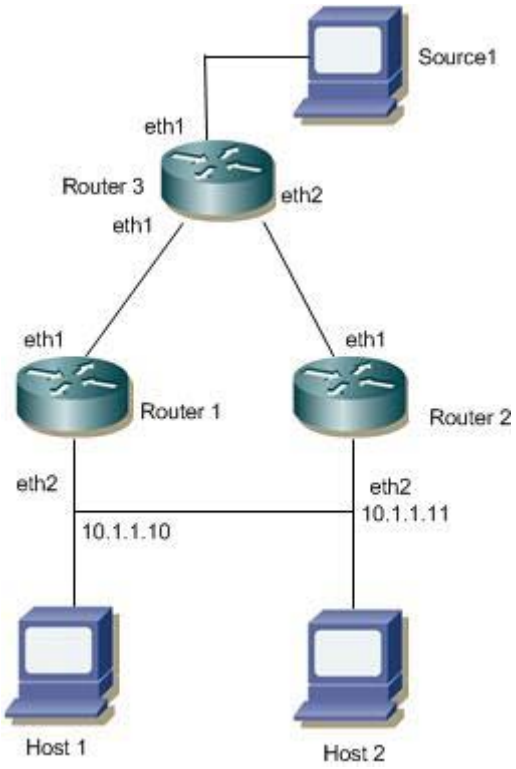

Figure 1-69: IGMP Topology

IGMP Configuration

The following example shows IGMP configuration on Router1.

Configuring IGMP Version

The configuration that follows shows how IGMP version can be configured.

`#configure terminal`	Enter configure mode.
`(config)#ip multicast-routing`	Enable IP multicast routing
`(config)#interface eth2`	Enter interface mode.
`(config-if)#ip address 10.1.1.10/24`	Assign IP address to an interface
`(config-if)#ip igmp version 2`	Enable IGMP version as v2.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit Configure mode.

Validation

Enter the commands listed in this section to confirm the previous configurations.

```
#show  running-config
!
no service password-encryption
```

```
!
hostname rtr1
!
ip multicast-routing
!
!
interface eth2
ip address 10.1.1.10/24
no shutdown
ip igmp version 2
```

Configuring IGMP Parameters

The configuration that follows shows how IGMP parameters can be configured.

`#configure terminal`	Enter configure mode.
`(config)#ip multicast-routing`	Enable IP multicast routing
`(config)#interface eth2`	Enter interface mode
`(config-if)#ip igmp access-group 1`	Configures a access-list policy to control the multicast groups that hosts on the subnet serviced by an interface can join.
`(config-if)#ip igmp immediate-leave group-list 1`	Enables the device to remove the group entry from the multicast routing table immediately upon receiving a leave message for the group.
`(config-if#ip igmp  join-group 224.1.1.1`	Statically binds a multicast group to the outgoing interface
`(config-if)# ip igmp  last-member-query-count 7`	Sets the query count used when the software starts up.
`(config-if)# ip igmp  last-member-query-interval 25500`	Sets the query interval used when the software starts up.
`(config-if)#ip igmp limit 100`	Configure Max Allowed State on this interface
`(config-if)#ip igmp querier-timeout 300`	Sets the querier timeout that the router uses when deciding to take over as the querier.
`(config-if)#ip igmp  query-interval 200`	Sets the frequency at which the router sends IGMP host query messages.
`(config-if)#ip igmp  query-max-response-time 150`	Sets the response time advertised in IGMP queries.
`(config-if)#ip igmp  ra-option`	Enable ra-option.
`(config-if)#ip igmp  robustness-variable 4`	Sets the robustness variable.
`(config-if)#ip igmp startup-query-count 4`	Sets the query count used when the router starts up.
`(config-if)# ip igmp startup-query-interval 50`	Sets the query interval used when the router starts up.
`(config-if)# ip igmp static-group 225.1.1.1`	Statically binds a multicast group to the outgoing interface.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit Configure mode.

Validation

Enter the commands listed in this section to confirm the previous configurations.

```
Rtr1#show  running-config
!
no service password-encryption
!
hostname rtr1
!
!
ip multicast-routing
!
!
interface eth2

IGMP Group Table after IGMPV2 Membership Report is received

IGMP group table is populated at router by virtue of either static join is configured on interface or dynamic report is being received on the interface.

The `show ip igmp group` command displays the IGMP group table. In this table, the following fields are defined.

Table 1-23: IGMP group table after IGMPV2 membership report

Group address	Displays the Multicast Group for which report is received.
Interface	Interface name on which Membership report is received.
Uptime	Duration since the report is received.
Expiry	Time frame in which the multicast group is going to expire.
Last Reporter	Host address from where the report is generated.

```
Rtr1#show  ip igmp groups
IGMP Connected Group Membership
Group Address    Interface      Uptime     Expires     State     Last Reporter
224.0.1.3            eth2       00:10:06   00:03:43    Active    10.1.1.52
224.1.1.1            eth2       01:54:53   static      Active    0.0.0.0
225.1.1.1            eth2       00:17:22   static      Active    0.0.0.0
```

```
Rtr1#show ip igmp groups detail
IGMP Connected Group Membership Details

Flags: (M - SSM Mapping, R - Remote, L - Local,
        SG - Static Group, SS - Static Source)
Interface:      eth2
Group:          224.0.1.3
Flags:          R
Uptime:         00:10:06
Group mode:     Exclude (Expires: 00:03:43)
State: Active
Last reporter:  10.1.1.52
Source list is empty

Flags: (M - SSM Mapping, R - Remote, L - Local,
        SG - Static Group, SS - Static Source)
Interface:      eth2
Group:          224.1.1.1
Flags:          L
Uptime:         01:54:59
Group mode:     Exclude (Static)
State: Active
Last reporter:  0.0.0.0
Source list is empty

Flags: (M - SSM Mapping, R - Remote, L - Local,
        SG - Static Group, SS - Static Source)
Interface:      eth2
Group:          225.1.1.1
```

```
Flags:          SG

Group mode:     Exclude (Static)
State: Active
Last reporter:  0.0.0.0
Source list is empty
```

IGMP Group Table after IGMPV3 Membership report is received

IGMP group table is populated at router by virtue of either static join is configured on interface or dynamic report is being received on the interface. Here IGMPV3 should be configured on the interface (by default IGMPv3 will be enabled if pim is configured on the interface).

The `show ip igmp group` command displays the IGMP group table. In this table, the following fields are defined.

Table 1-24: IGMP group table after IGMPV3 membership

Group address	Displays the Multicast Group for which report is received.
Interface	Interface name on which Membership report is received.
Uptime	Duration since the report is received.
Expiry	Time frame in which the multicast group is going to expire.
Last Reporter	Host address from where the report is generated.

```
rtr6#show  ip igmp  groups
IGMP Connected Group Membership
Group Address    Interface            Uptime   Expires  Last Reporter
224.0.1.3        eth2                 00:08:50 00:02:10 192.168.10.52
rtr6#show  ip igmp  groups detail
IGMP Connected Group Membership Details

Flags: (M - SSM Mapping, R - Remote, L - Local,
        SG - Static Group, SS - Static Source)
Interface:      eth2
Group:          224.0.1.3
Flags:          R
Uptime:         00:08:50
Group mode:     Exclude (Expires: 00:04:57)
Last reporter:  192.168.10.52
Group source list: (R - Remote, M - SSM Mapping, S - Static, L - Local)

Exclude Source List :
  Source Address  Uptime    v3 Exp    Fwd  Flags
  1.2.3.4         00:08:50  stopped   No   R

For IGMPV3 report source list specifies which source to be included or exclude
based on the membership report sent by the hosts.

In the above show command, Source address 1.2.3.4 is excluded to send
Multicast data  for group 224.0.1.3
```

CHAPTER 2 IGMP Proxy Configuration

In some simple tree topologies, it is not necessary to configure complex multicast routing protocols, such as PIM, on the boundary devices. It is sufficient to learn and proxy the group membership information and simply forward multicast packets based upon that information. Using IGMP forwarding (RFC 4605) to replicate multicast traffic on devices such as the edge boxes can greatly simplify the design and implementation of those devices. By not supporting more complicated multicast routing protocol such as Protocol Independent Multicast (PIM), it reduces not only the cost of the devices but also the operational overhead. Another advantage is that it makes the proxy devices independent of the multicast routing protocol used by the core network routers.

IGMP proxy can be used in such topologies instead of PIM. With IGMP proxy configured, the device serves as a proxy for the downstream hosts to send IGMP messages, maintain group memberships, and implement multicast forwarding based on the memberships. In this case, each boundary device configured with IGMP proxying is a host but no longer a PIM neighbor to the upstream device.

A device with IGMP proxy configured maintains a group membership database, which stores the group memberships on all the downstream interfaces. Each entry comprises the multicast address, filter mode, and source list. Such an entry is a collection of members in the same multicast group on each downstream interface.

A proxy device performs host functions on the upstream interface based on the database. It responds to queries according to the information in the database or sends join/leave messages when the database changes. On the other hand, the proxy device performs router functions on the downstream interfaces by participating in the querier election, sending queries, and maintaining memberships based on the reports.

Terminology

Following is a brief description of terms and concepts used to describe the IGMP Proxy:

Upstream interface

Also referred to as the proxy interface. A proxy interface is an interface on which IGMP proxy service is configured. It is in the direction toward the root of the multicast forwarding tree. An upstream interface acts as a host running IGMP; therefore, it is also called host interface.

Downstream interface

An interface that is running IGMP and in the direction contrary to the root of the multicast forwarding tree. A downstream interface acts as a router running IGMP; therefore, it is also called router interface.

Member State

State of the associated group address and interface.

- Idle - Interface has not yet responded to a group membership query or general query for this group.
- Delay - Interface has responded to the latest group membership query or general query for this group.

IGMP-Proxy Configuration Steps

This section provides the configuration steps for configuring IGMP Proxy and example for a relevant scenario.

- Enable IP multicast on each router (see Enabling IP Multicast Routing)
- Enable IGMP Proxy service on the upstream interface.
- Enable IGMP mroute configuration on the downstream interface.
- Enable IGMP proxy unsolicited report interval on the proxy interface. The proxy group membership reports are forwarded to the upstream router in this unsolicited report interval time. This is an optional parameter in which the default value of 1 sec is considered for forwarding proxy groups to upstream router.

Note: Configure IP addresses on all the interfaces used in the topology.

Unicast routing protocol should be configured in the PIM domain.

Topology

In this network topology, Router 1 acts as a proxying router to the upstream router Router 2 in which PIM domain is present. Also the source address is 172.31.1.52 and the group address is set to 224.0.1.3.

Note: Any PIM mode (PIM-SM,PIM-DM,PIM-SMDM) should be enabled on all the interfaces in the PIM domain.

Here in this example default value for unsolicited report interval is considered.

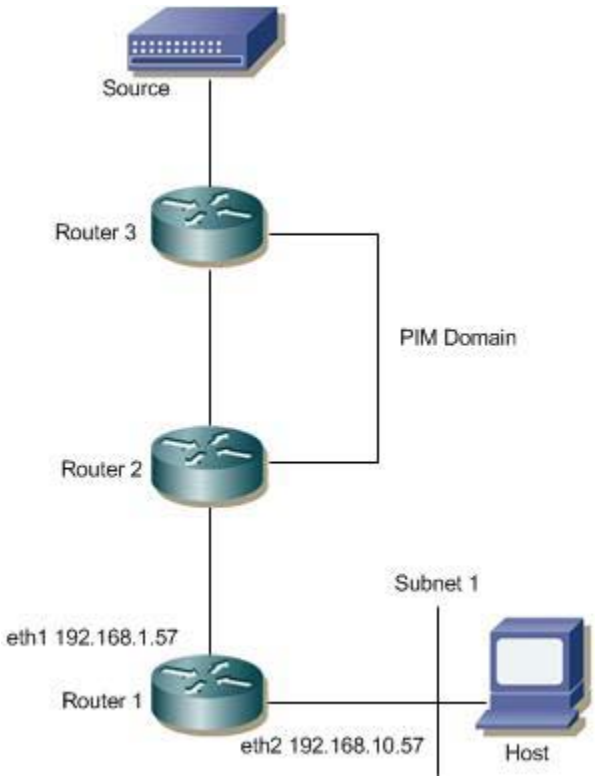

Figure 2-70: IGMP Proxy Topology

In this example, Routers 2 and 3 are running PIM and Router1 is the IGMP Proxying router.

- Host ends an IGMP membership report to Subnet 1.
- Downstream interface on Router1 received IGMP reports from host and updates the proxy interface.

- IGMP Proxying router (Router1) maintains the group membership information and forwards the received report to the upstream router (Router2).
- Source then sends a data packet for group.
- When the data packet reaches Router1, it forwards via the interface, eth2, because it has an IGMP join requested for Multicast traffic.

Enabling IP Multicast Routing

Enable IP multicast routing on all of the PIM routers inside the PIM domain:

`#configure terminal`	Enter Configure mode.
`(config)# ip multicast-routing`	Enable IP multicast routing.
`(config)#exit`	Exit Configure mode.

Enabling Proxy upstream interface

Enable IGMP proxy service on the interface in which the interface is in the direction toward the root of the multicast forwarding tree. In this example eth1 is the upstream interface which acts as an IGMP host.

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#ip address 192.168.1.57/24`	Assign IP address to an interface
`(config-if)#ip igmp proxy-service`	Enable IGMP proxy service on the upstream interface.
`(config-if)#exit`	Exit interface mode.
`(config)#exit`	Exit Configure mode.

Enabling Proxy downstream interface

Enable IGMP mroute proxy on the interface in which the interface is in the direction contrary to the root of the multicast forwarding tree. In this example eth2 is the downstream interface which is connected to receiver.

`#configure terminal`	Enter Configure mode.
`(config)#interface eth2`	Enter Interface mode
`(config-if)#ip address 192.168.10.57/24`	Assign IP address to an interface
`(config-if)#ip igmp mroute-proxy eth1`	Enable IGMP mroute proxy on the downstream interface and specify the upstream proxy interface name.
`(config-if)#exit`	Exit Interface mode.
`(config)#exit`	Exit Configure mode.

Validation

Here is the same configuration for IGMP Proxying router.

```
hostname Router1
!
interface lo
!!
ip multicast-routing
!
interface eth0
!
interface eth1
 ip address 192.168.1.57/24
 no shutdown
 ip igmp proxy-service
!
interface eth2
 ip address 192.168.10.57/24
 no shutdown
 ip igmp mroute-proxy eth1
!
```

IGMP proxy interface

The following output displays the IGMP Proxy interface information.

```
Router1#show ip igmp interface

Interface eth1 (Index 3)
 IGMP Enabled, Active, Version 3 (default), proxy-service
 IGMP host version 3
 Internet address is 192.168.1.57
 Unsolicited Report Interval is 1000 milliseconds

Interface eth2 (Index 4)
 IGMP Enabled, Active, Querier, Version 3 (default)
 IGMP mroute-proxy interface is eth1
 Internet address is 192.168.10.57
 IGMP interface has 1 group-record states
IGMP Interface statistics:
v1-reports: 0
v2-reports: 1, v2-leaves: 0
v3-reports: 0
IGMP query interval is 125 seconds
 IGMP Startup query interval is 31 seconds
 IGMP Startup query count is 2
 IGMP querier timeout is 255 seconds
 IGMP max query response time is 10 seconds
 Group Membership interval is 260 seconds
 IGMP Last member query count is 2
 Last member query response interval is 1000 milliseconds
```

IGMP proxy

The following output displays the IGMP proxy information.

```
Router1#show ip igmp proxy

Interface eth2 (Index 4)
Administrative status: enabled
```

```
Operational status: up
Upstream interface is eth1
Number of multicast groups: 1
```

IGMP proxy groups

The following output displays the IGMP proxy group membership information.

```
Router1#show ip igmp proxy groups

IGMP Connected Proxy Group Membership
Group Address    Interface            State     Member state
224.0.1.3        eth1                 Active    Delay
```

IP Multicast Routing Table

The `show ip mroute` command displays the IP multicast routing table.

```
Router1#show ip mroute

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
       B - BIDIR
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(172.31.1.52, 224.0.1.3), uptime 00:00:05
Owner IGMP-Proxy-Service, Flags: F
  Incoming interface: eth1
  Outgoing interface list:
    eth2 (1)
```

Enabling Unsolicited report interval

Enable IGMP proxy unsolicited report interval on the upstream interface. The proxy group membership reports are forwarded to the upstream router in this unsolicited report interval time.

`#configure terminal`	Enter Configure mode.
`(config)#interface eth1`	Enter Interface mode
`(config-if)#ip igmp proxy unsolicited-report-interval 20000`	Enable IGMP proxy unsolicited report interval value on the upstream interface.
`(config-if)#exit`	Exit Interface mode.
`(config)#exit`	Exit Configure mode.

Validation

Here is the same configuration for IGMP Proxying router.

```
hostname Router1
!
interface eth0
!
```

```
interface eth1
ip address 192.168.1.57/24
ip igmp proxy-service
ip igmp proxy unsolicited-report-interval 20000
!
interface eth2
ip address 192.168.10.57/24
ip igmp mroute-proxy eth1
!
interface lo
!
!
ip multicast-routing
!
```

IGMP proxy Unsolicited report interval

The following output displays the IGMP proxy unsolicited report interval information.

```
Router1#show ip igmp interface eth1

Interface eth1 (Index 3)
 IGMP Enabled, Active, Version 3 (default), proxy-service
 IGMP host version 3
 Internet address is 192.168.1.57
 Unsolicited Report Interval is 20000 milliseconds
```

IGMP proxy group with unsolicited report interval

The following output displays the IGMP proxy group membership information when the proxy unsolicited report interval is configured to specific value.

```
Router1#show ip igmp proxy groups

IGMP Connected Proxy Group Membership
Group Address    Interface            State     Member state
224.0.1.3        eth1                 Active    Idle
```

IP Multicast Routing Table

The `show ip mroute` command displays the IP multicast routing table.

```
Router1#show ip mroute

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
       B - BIDIR
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(172.31.1.52, 224.0.1.3), uptime 00:00:05
Owner IGMP-Proxy-Service, Flags: F
  Incoming interface: eth1
  Outgoing interface list:
    eth2 (1)
```

CHAPTER 3 PIM Sparse Mode Configuration

The Protocol Independent Multicasting-Sparse Mode (PIM-SM) is a multicast routing protocol designed to operate efficiently across Wide Area Networks (WANs) with sparsely distributed groups. It helps geographically dispersed network nodes to conserve bandwidth and reduce traffic by simultaneously delivering a single stream of information to multiple locations. PIM-SM uses the IP multicast model of receiver-initiated membership, supporting both shared and shortest-path trees, and uses soft-state mechanisms to adapt to changing network conditions. It relies on a topology-gathering protocol to populate a multicast routing table with routes.

Terminology

Following is a brief description of terms and concepts used to describe the PIM-SM protocol:

Rendezvous Point

A Rendezvous Point (RP) router is configured as the root of a non-source-specific distribution tree for a multicast group. Join messages from receivers for a group are sent towards the RP. Data from senders is sent to the RP so that receivers can discover who the senders are, and receive traffic destined for the group.

Multicast Routing Information Base

The Multicast Routing Information Base (MRIB) is a multicast topology table derived from the unicast routing table. In PIM-SM, the MRIB decides where to send Join/Prune messages. It also provides routing metrics for destination addresses. These metrics are used when sending and processing Assert messages.

Reverse Path Forwarding

Reverse Path Forwarding (RPF) is an optimized form of flooding, in which the router accepts a packet from `SourceA` through Interface `IF1`, only if `IF1` is the interface the router uses to reach `SourceA`. To determine if the interface is correct, it consults its unicast routing tables. The packet that arrives through interface `IF1` is forwarded because the routing table lists this interface as the shortest path. The router's unicast routing table determines the shortest path for the multicast packets. Because a router accepts a packet from only one neighbor, it floods the packet only once, meaning that (assuming point-to-point links) each packet is transmitted over each link, once in each direction.

Tree Information Base

The Tree Information Base (TIB) is a collection of states at a PIM router storing the state of all multicast distribution trees at that router. The TIB is created by receiving Join/Prune messages, Assert messages, and IGMP information from local hosts.

Upstream

Upstream indicates that traffic is going towards the root of the tree. The root of the tree might be either the Source or the RP.

Downstream

Downstream indicates that traffic is going away from the root of the tree. The root of tree might be either the Source or the RP.

Source-Based Trees

In Source-Based Trees, the forwarding paths are based on the shortest unicast path to the source. If the unicast routing metric used is `hop counts`, the branches of the multicast Source-Based Trees are minimum hop. If the metric used is `delay`, the branches are minimum delay. A corresponding multicast tree directly connects the source to all receivers for every multicast source. All traffic to the members of an associated group passes along the tree made for their source. Source-Based Trees have two entries with a list of outgoing interfaces -- the source address and the multicast group.

Shared Trees

Shared trees, or RP trees (RPT), rely on a central router called the Rendezvous Point (RP) that receives all traffic from the sources, and forwards that traffic to the receivers. There is a single tree for each multicast group, regardless of the number of sources. Only the routers on the tree know about the group, and information is sent only to interested receivers. With an RP, receivers have a place to join, even if no source exists. The shared tree is unidirectional, and information flows only from the RP to the receivers. If a host other than the RP has to send data on the tree, the data must first be tunneled to the RP, then multicast to the members. This means that even if a receiver is also a source, it can only use the tree to receive packets from the RP, and not to send packets to the RP (unless the source is located between the RP and the receivers).

Note: Not all hosts are receivers.

Bootstrap Router

When a new multicast sender starts sending data packets, or a new receiver starts sending Join messages towards the RP for that multicast group, the sender needs to know the next-hop router towards the RP. The bootstrap router (BSR) provides group-to-RP mapping information to all the PIM routers in a domain, allowing them to map to the correct RP address.

Data Flow from Source to Receivers in PIM-SM Network Domain

1. Sending out Hello Messages

   PIM routers periodically send Hello messages to discover neighboring PIM routers. Hello messages are multicast using the address, 224.0.0.13 (`ALL-PIM-ROUTERS` group). Routers do not send any acknowledgement that a Hello message was received. A `holdtime` value determines the length of time for which the information is valid. In PIM-SM, a downstream receiver must join a group before traffic is forwarded on the interface.

2. Electing a Designated Router

   In a multi-access network with multiple routers connected, one of the routers is selected to act as a designated router (DR) for a given period. The DR is responsible for sending Join/Prune messages to the RP for local members.

3. Determining the Rendezvous Point

   PIM-SM uses a BSR to originate bootstrap messages, and to disseminate RP information. The messages are multicast to the group on each link. If the BSR is not apparent, the routers flood the domain with advertisements.

The router with the highest priority (if priorities are same, the higher IP address applies) is selected to be the RP. Routers receive and store bootstrap messages originated by the BSR. When a DR gets a membership indication from IGMP for (or a data packet from) a directly connected host, for a group for which it has no entry, the designated router (DR) maps the group address to one of the candidate RPs that can service that group. The DR then sends a Join/Prune message towards that RP. In a small domain, the RP can also be configured statically.

4. Joining the Shared Tree

   To join a multicast group, a host sends an IGMP message to its upstream router, after which the router can accept multicast traffic for that group. The router sends a Join message to its upstream PIM neighbor in the direction of the RP. When a router receives a Join message from a downstream router, it checks to see if a state exists for the group in its multicast routing table. If a state already exists, the Join message has reached the shared tree, and the interface from which the message was received is entered in the Outgoing Interface list. If no state exists, an entry is created, the interface is entered in the Outgoing Interface list, and the Join message is again sent towards the RP.

5. Registering with the RP

   A DR can begin receiving traffic from a source without having a Source or a Group state for that source. In this case, the DR has no information on how to get multicast traffic to the RP through a tree. When the source DR receives the initial multicast packet, it encapsulates it in a Register message, and unicasts it to the RP for that group. The RP de-encapsulates each Register message, and forwards the extracted data packet to downstream members on the RPT. Once the path is established from the source to the RP, the DR begins sending traffic to the RP as standard IP multicast packets, as well as encapsulated within Register messages. The RP temporarily receives packets twice. When the RP detects the normal multicast packets, it sends a Register-Stop message to the source DR, meaning it should stop sending register packets.

6. Sending Register-Stop Messages

   When the RP begins receiving traffic from the source, both as Register messages and as unencapsulated IP packets, it sends a Register-Stop message to the DR. This notifies the DR that the traffic is now being received as standard IP multicast packets on the SPT. When the DR receives this message, it stops encapsulating traffic in Register messages.

7. Pruning the Interface

   Routers attached to receivers send Prune messages to the RP to disassociate the source from the RP. When an RP receives a Prune message, it no longer forwards traffic from the source indicated in the Prune message. If all members of a multicast group are pruned, the IGMP state of the DR is deleted, and the interface is removed from the Source and Group lists of the group.

8. Forwarding Multicast Packets

   PIM-SM routers forward multicast traffic onto all interfaces that lead to receivers that have explicitly joined a multicast group. Messages are sent to a group address in the local subnetwork, and have a Time to Live (TTL) of one (1). The router performs an RPF check, and forwards the packet. If a downstream router has sent a join to this router or is a member of this group, then traffic that arrives on the correct interface is sent to all outgoing interfaces that lead to downstream receivers.

PIM-SM Configuration

PIM-SM is a soft-state protocol. The required steps to configure PIM-SM are the following:

- Enable IP multicast on each PIM router (see Enabling IP Multicast Routing)
- Enable PIM-SM on the desired interfaces (see Enable PIM-SM on an Interface)
- Configure the RP statically (see Configuring Rendezvous Point Statically or dynamically (see Configure Rendezvous Point Dynamically Using Bootstrap Router Method) depending on which method you use)

All multicast group states are dynamically maintained as the result of IGMP `Report/Leave` and PIM `Join/Prune` messages.

This section provides the steps to configure the PIM-SM feature. Configuration steps and examples are used for two relevant scenarios.

Topology

The following figure displays the network topology used in these examples.

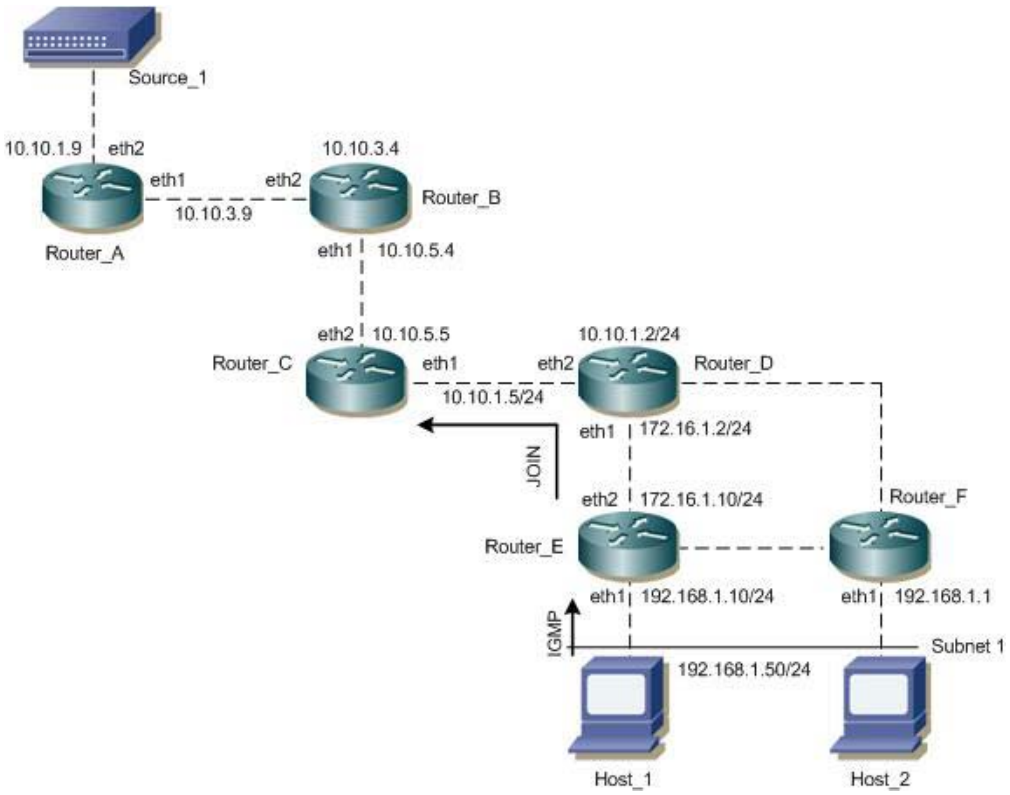

Figure 3-71: PIM-SM Topology

Enabling IP Multicast Routing

Enable IP multicast routing on all of the PIM routers inside the PIM domain:

Enable IP Multicast Routing

`#configure terminal`	Enter configure mode.
`(config)#ip multicast-routing`	Enable IP multicast routing.
`(config)#exit`	Exit Configure mode.

Enable PIM-SM on an Interface

Enable PIM-SM on all participating interfaces within each of routers inside the PIM domain on which you want to run PIM. In the following sample configuration, both eth1 and eth2 are enabled for PIM-SM on the router.

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Specify the interface (`eth1`) to be configured and Enter interface mode.
`(config-if)#ip address 10.10.12.11/24`	Configure the IP address for `eth1`.
`(config-if)#ip pim sparse-mode`	Enable PIM sparse mode on the interface.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth2`	Specify the interface (`eth2`) to be configured and Enter interface mode.
`(config-if)#ip address 10.10.13.11/24`	Configure the IP address for `eth2`.
`(config-if)#ip pim sparse-mode`	Enable PIM sparse mode on the interface.
`(config-if)#exit`	Exit interface mode.

Configuring Rendezvous Point Statically

Every PIM multicast group needs to be associated with the IP address of a Rendezvous Point (RP), which is a router that resides in a multicast network domain. The address of the RP is used as the root of a group-specific distribution tree. All nodes in the domain that want to receive traffic sent to the group are aware of the address of the RP. For all senders to reach all receivers within a group, all routers in the domain must be able to map to the RP address configured for the group. There can be several RPs configured in a network deploying PIM-SM, each serving a different group.

You can statically configure a RP by specifying the RP address with in every router in the PIM domain. The use of statically configured RPs is ideal for small network environments or ones that do not require many RPs and/or require changing the assignment of the RPs often. Changing the assignment of an RP requires the re-configuration of the RP address in all of the routers in the PIM domain.

In static RP configurations, RP failover is not available.

When configuring the RP statically, do the following:

- On every router, include the `ip pim rp-address A.B.C.D` statement even if a router does not have any source or group member attached to it
- Assign only one RP address for a multicast group in the PIM domain

Using the topology depicted in Figure 3-71, `Router_C` is the RP, and all routers are statically configured with RP information. Host_1 and Host_2 join group 224.0.1.3 for all the sources. They send the IGMP membership report to Subnet 1. Two routers are attached to Subnet 1, `Router_E` and `Router_F`; both have default DR priority on `eth1`.

Since Router_E has a higher IP address on interface eth1, it becomes the Designated Router, and is responsible for sending Join messages to the RP (Router_C).

Configure Static RP

#configure terminal	Enter configure mode.
(config)#ip pim rp-address 10.10.1.5	Statically configure an RP address for multicast groups.
(config)#exit	Exit Configure mode.

Here is the sample configuration for Router_D:

```
hostname Router_D
!
interface eth0
!
interface eth1
 ip pim sparse-mode
!
interface eth2
 ip pim sparse-mode
!
interface lo
!
!
ip multicast-routing

ip pim rp-address 10.10.1.5
!
```

Validation

Enter the commands listed in this section to confirm the previous configurations.

RP Details

At Router_D, the show ip pim rp mapping command shows that 10.10.1.5 is the RP for all multicast groups 224.0.0.0/4, and is statically configured. All other routers will have a similar output:

```
R-D#show ip pim rp mapping
PIM Group-to-RP Mappings
Override RP cnt: 0

Group(s): 224.0.0.0/4, Static
    RP: 10.10.1.5
         Uptime: 00:19:31
R-D#
```

Override RP cnt: 0At Router_D, use the show ip pim rp-hash command to display the selected RP for a specified group (224.0.1.3):

```
Router_D#show ip pim rp-hash 224.0.1.3
RP: 10.10.1.5
```

Interface Details

The `show ip pim interface` command displays the interface details for `Router_E`, and shows that `Router_E` is the Designated Router on `Subnet 1.`

```
Router_E#show ip pim interface
Address          Interface VIFindex Ver/   Nbr      DR    DR
                                    Mode   Count   Prior
192.168.1.10      eth1      0       v2/S   1         1     192.168.1.10
172.16.1.10       eth2      2       v2/S   1         1     172.16.1.10
```

IP Multicast Routing Table

Note: The multicast routing table displays for an RP router are different from other routers.

The `show ip pim mroute` command displays the IP multicast routing table. In this table, the following fields are defined:

```
R-E#show ip pim mroute
(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
FCR Entries: 0

(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 172.16.1.2
RPF idx: eth2
Upstream State: JOINED
 Local     i.............................
 Joined    .............................
 Asserted  .............................
FCR:

R-E#
```

At `Router_E`, `eth2` is the incoming interface of the (*, G) entry, and `eth1` is on the outgoing interface list of the (*, G) entry. This means that there is a group member through `eth1`, and the RP is reachable through `eth2`.

The 0 position on this 32-bit index is for `eth1` (as illustrated in the interface display above). The `j` on the 0 index indicates that the `Join` has come from `eth1`.

Since `Router_C` is the RP, and the root of this multicast tree, the `show ip pim mroute` command on `Router_C` shows `RPF nbr` as 0.0.0.0 and `RPF idx` as none.

```
R-C#show ip pim mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
FCR Entries: 0

(*, 224.0.1.3)
```

```
RP: 10.10.1.5
RPF nbr: 0.0.0.0
RPF idx: None
Upstream State: JOINED
 Local     ..............................
 Joined    j..............................
 Asserted  ..............................
FCR:

R-C#
```

Configure Rendezvous Point Dynamically Using Bootstrap Router Method

A static RP configuration works for a small, stable PIM network domain; however, it is not practical for a large and/or complex one. In such a network, if the RP fails or you have to change the assignment of the RP, you are required to reconfigure the static configurations on all PIM routers. Also, if you have several multicast groups mapped to several RPs, there are many repetitive configurations you are required to perform, which can be time consuming and laborious. Thus when it comes configuring RP in large and/or complex networking environments, configuring it dynamically is the best and most scalable method to use. Bootstrap router (BSR) configuration is one method of configuring the RP dynamically.

The BSR mechanism in a PIM domain uses the concept of a RP as a way for receivers to discover the sources that send to a particular multicast group. The BSR mechanism gives a way for a multicast router to learn the set of group-to-RP mappings required in order to function. The BSR's function is to broadcast the RP set to all routers in the domain.

Some of the PIM routers within a PIM domain are configured as Candidate-RPs (C-RPs). A subset of the C-RPs is eventually used as the actual RPs for the domain. An RP configured with a lower value in the priority field has a higher priority.

Some of the PIM routers in the domain are configured to be Candidate-BSRs (C-BSR). One C-BSR is selected to be the BSR for the domain, and all PIM routers in the domain learn the result of this election through Bootstrap messages (BSM). The C-BSR with highest value in the priority field is elected to be the BSR. The C-RPs then report their candidacies to the elected BSR, which chooses a subset of the C-RPs, and distributes corresponding group-to-RP mappings to all the routers in the domain using Bootstrap messages.

This section provides 2 examples to illustrate the BSR configuration for configuring RP dynamically.

Example 1

For this example, refer to Figure 1 for the topology.

To dynamically configure the RP, `Router_C` on `eth1` and `Router_D` on `eth1` are configured as a Candidate RP using the `ip pim rp-candidate` command. `Router_D` on `eth1` is also configured as the Candidate BSR. Since no other router has been configured as the candidate BSR, `Router_D` becomes the BSR router and is responsible for sending group-to-RP-mapping information to all other routers in this PIM domain.

The highest priority router (configured with lowest priority value) is chosen as the RP. If two or more routers have the same priority, a hash function in the BSR mechanism is used to choose the RP to ensure that all routers in the PIM-domain have the same RP for the same group.

To change the default priority of any candidate RP, use the `ip pim rp-candidate IFNAME PRIORITY` command. At `Router_D`, the `show ip pim rp mapping` command shows that `Router_C` is chosen as the RP for a specified group.

Configure RP Dynamically for Router C

`#configure terminal`	Enter configure mode.
`(config)#ip pim rp-candidate eth1 priority 2`	Give this router the candidate RP status using the IP address of the specified interface.

Configure RP Dynamically for Router D

`#configure terminal`	Enter configure mode.
`(config)#ip pim bsr-candidate eth1`	Give this router the candidate BSR status using the name of the interface.
`(config)#ip pim rp-candidate eth1 priority 2`	Give this router the candidate RP status using the IP address of the specified interface.

The following output displays the complete configuration at `Router_C` and `Router_D`:

```
Router_D#show running-config
!
interface eth0
!
interface eth1
 ip pim sparse-mode
!
interface eth2
 ip pim sparse-mode
!
interface lo
!
ip multicast-routing
ip pim bsr-candidate eth1
ip pim rp-candidate eth1 priority 2
!

Router_C#show running-config
interface eth0
!
interface eth1
 ip pim sparse-mode
!
interface eth2
 ip pim sparse-mode
!
interface lo
!
!
ip multicast-routing
ip pim rp-candidate eth1
```

Validation

This section provides the steps to verify the RP configuration.

PIM Group-to-RP Mappings

The `show ip pim rp mapping` command displays the group-to-RP mapping details and displays information about RP candidates. There are two RP candidates for the group range, 224.0.0.0/4. RP Candidate 10.10.1.5 has a default priority of 192, whereas, RP Candidate 172.16.1.2 has been configured to have a priority of 2. Since RP candidate 172.16.1.2 has a higher priority, it is selected as RP for the multicast group, 224.0.0.0/4.

```
R-D#show ip pim rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
  RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap, priority 2
         Uptime: 00:02:24, expires: 00:02:11
  RP: 10.10.1.5
    Info source: 10.10.1.5, via bootstrap, priority 2
         Uptime: 00:02:26, expires: 00:02:06
Override RP cnt: 0

Group(s): 224.0.0.0/4, Static
    RP: 10.10.1.5
         Uptime: 00:55:25
R-D#
```

RP Details

To display information about the RP router for a particular group, use the following command. This output displays that 172.16.1.2 has been chosen as the RP for the multicast group 224.0.1.3.

```
Router_D#show ip pim rp-hash 224.0.1.3
Group(s): 224.0.0.0/4
    RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap
```

After RP information reaches all PIM routers in the domain, various state machines maintain all routing states, as a result of Join/Prune from group membership. To display information on interface details and the multicast routing table, refer to the *Configuring Rendezvous Point Statically* section.

Example 2

To dynamically configure the RP, `Router_2` on `eth1` is configured as a Candidate RP using the `ip pim rp-candidate` command. Since no other router is configured as C-RP, `Router_2` becomes the RP. `Router_1` on `eth1` and `Router_2` on `eth1` are configured as the Candidate BSRs. Since `Router_1` has a higher priority value than `Router_2`, `Router_1` becomes the BSR router and is responsible for sending group-to-RP-mapping information to all other routers in this PIM domain.

Topology

For this example, refer to Figure 3-72 for the topology.

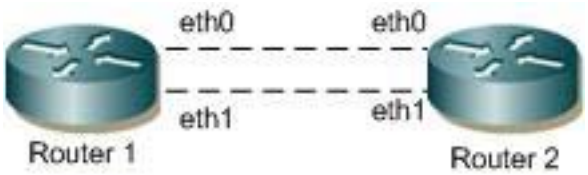

Figure 3-72: Boostrap Router Topology

Configuration

Router 1

`#configure terminal`	Enter configure mode.
`(config)#ip pim bsr-candidate eth1`	Configure `eth1` of Router 1 as C-BSR. The default priority is 64, so it is not necessary to designate a priority.
`(config)#exit`	Exit Configure mode.

Router 2

`#configure terminal`	Enter configure mode.
`(config)#ip pim bsr-candidate eth1 10 25`	Configure `eth1` of Router 2 as C-BSR with a hash mask length of 10, and a priority of 25.
`(config)#ip pim rp-candidate eth1 priority 0`	Configure interface `eth1` as C-RP with a priority of 0.
`(config)#exit`	Exit Configure mode.

Router 2 Unicast BSM

When the `ip pim unicast-bsm` command is configured on an interface that is a DR for a network, then that interface unicasts the stored copy of BSM to the new or rebooting router.

`#configure terminal`	Enter configure mode.
`(config)#interface eth1`	Enter interface mode for `eth1`.
`(config-if)#ip pim dr-priority 10`	Configure `eth1` as DR
`(config-if)#ip pim unicast-bsm`	Enable sending and receiving of Unicast BSM for backward compatibility.
`(config-if)#exit`	Exit interface mode.

Validation

1. Verify the C-BSR state on Router 1.

```
#show ip pim bsr-router
PIMv2 Bootstrap information
This system is the Bootstrap Router (BSR)
  BSR address: 20.0.1.21
  Uptime:      00:01:39, BSR Priority: 64, Hash mask length: 10
  Next bootstrap message in 00:00:53
```

```
  Role: Candidate BSR
  State: Elected BSR
```

2. Verify the C-BSR state on Router 2.

   The initial state of C-BSR is P-BSR before transitioning to C-BSR. The two states are illustrated in the sample outputs from the `show ip pim bsr-router` command below.

```
#show ip pim bsr-router
PIMv2 Bootstrap information
  BSR address: 20.0.1.21
  Uptime:      00:02:39, BSR Priority: 64, Hash mask length: 10
  Expires:     00:00:03
  Role: Candidate BSR
  State: Pending BSR

#show ip pim bsr-router
PIMv2 Bootstrap information
 BSR address: 20.0.1.21
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
Candidate RP: 20.0.1.11(eth2)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:02
    Backoff cnt 1

#show ip pim rp mapping
PIM Group-to-RP Mappings
Group(s): 224.0.0.0/4
  RP: 20.0.1.11
    Info source: 20.0.1.21, via bootstrap, priority 0
         Uptime: 00:02:17, expires: 00:02:26
Override RP cnt: 0
```

3. Verify RP-set information on E-BSR.

```
R1#show ip pim rp mapping
PIM Group-to-RP Mappings
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
  RP: 20.0.1.11

Anycast-RP Configuration

The Anycast-RP feature provides load balancing among active RPs and redundancy in a PIM-SM network domain. In a PM-SM configuration, only a single active RP for each multicast group within a domain is permitted. However, in an Anycast-RP configuration, this restriction is removed with the support of multiple active RPs for each group in a domain.

OcNOS supports Anycast-RP using the PIM implementation. In PIM Anycast-RP, Multicast Source Discovery Protocol (MSDP) is not employed to share information about active sources. Instead the Register mechanism in PIM is extended to provide this same function.

The following describes Anycast-RP in PIM-SM:

- A Unicast IP address is used as the RP address. The address is statically configured, and associated with all PIM routers throughout the domain.
- A set of routers in the domain is chosen to act as RPs for this RP address. These routers are called the Anycast-RP set.
- Each router in the Anycast-RP set is configured with a loopback address. The loopback address is configured on all RPs for the loopback interface, then configured as the RP address (static RP), and injected into OSPF using redistribute connected. The PIM-SM implementation uses only the first non-loopback address configured on the loopback interface. Therefore, it is important to be sure that the Anycast-RP address is configured with the first non-loopback address.
- Each router in the Anycast-RP set also needs a separate IP address, which is used for communication between the RPs.
- The RP address, or a prefix that includes the RP address, is injected into the unicast routing system inside the domain.
- Each router in the Anycast-RP set is configured with the addresses of all other routers in the Anycast-RP set. This must be consistently configured in all RPs in the set.

Topology

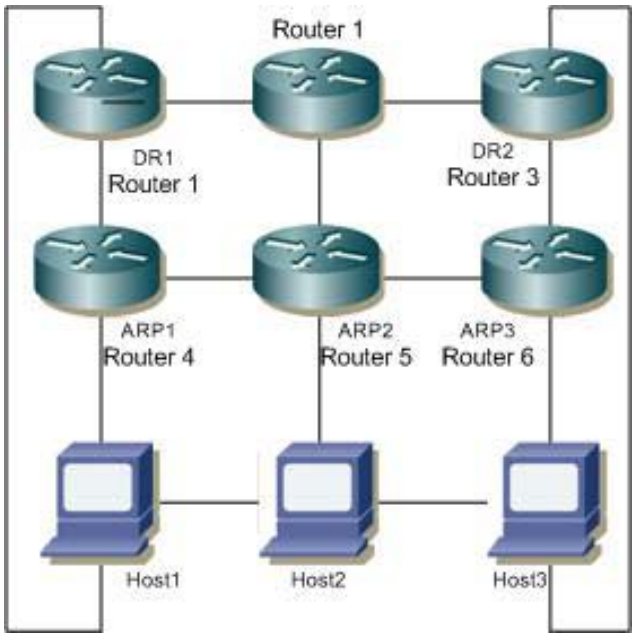

Figure 3-73: Anycast RP Topology

Host1 and Host3 act as hosts and sources for sending join and multicast data packets; Host2 acts as a host.

ARP1, ARP2 and ARP3

`#configure terminal`	Enter the Configure mode.
`(config)#interface lo`	Enter the loopback interface.
`(config)#ip address 1.1.1.152/32 secondary`	Configure the IP address for loopback
`(config)#exit`	Exit the Configure mode.
`(config)#ip pim rp-address 1.1.1.152`	Configure the static RP with the address of the loopback.
`(config)#ip pim anycast-rp 1.1.1.152 4.4.4.5`	Configure the member RP address. In this example, `4.4.4.5` is the member RP in ARP2. It is the address used for communication between all RPs.
`(config)#ip pim anycast-rp 1.1.1.152 7.7.7.1`	Configure the member RP address. In this example, `7.7.7.1` is the member RP in ARP3. It is the address used for communication between all RPs.
`(config)#ip pim anycast-rp 1.1.1.152 23.23.23.1`	Configure the member RP address. In this example, `23.23.23.1` is the member RP in ARP1. It is the address used for communication between all RPs.
`(config)#exit`	Exit the Configure mode.

Disable Anycast-RP

`#configure terminal`	Enter configure mode.
`(config)#no ip pim anycast-rp 1.1.1.152`	Disable Anycast-RP.
`(config)#no ip pim rp-address 1.1.1.152`	Disable static RP.
`(config)#exit`	Exit Configure mode.

Validation

1. Verify RP-mapping in ARP1.

```
#show ip pim rp mapping
      PIM Group-to-RP Mappings
      Override RP cnt: 0
      Anycast-RP 1.1.1.152 members:23.23.23.1
      Group(s): 224.0.0.0/4, Static
      RP: 1.1.1.152
        Uptime: 00:00:13s
```

2. Verify RP-mapping in ARP1 after disabling anycast-RP and RP-address.

```
ARP1#show ip pim rp mapping
PIM Group-to-RP Mappings
Override RP cnt: 0

Anycast-RP  1.1.1.152 members :
  4.4.4.5   7.7.7.1   23.23.23.1

Group(s): 224.0.0.0/4, Static
    RP: 1.1.1.152
         Uptime: 00:00:37
ARP1#
```

CHAPTER 4 PIM Dense Mode Configuration

Protocol Independent Multicast - Dense Mode (PIM-DM) is a data-driven multicast routing protocol that builds source-based multicast distribution trees that operate on the flood-and-prune principle. PIM-DM requires unicast-reachability information, but it does not depend on a specific unicast routing protocol.

Terminology

Following is a brief description of terms and concepts used to describe the PIM-DM protocol:

Reverse Path Forwarding

Reverse Path Forwarding (RPF) is an optimized form of flooding, in which the router accepts a packet from `SourceA` through Interface `IF1`, only when `IF1` is the interface the router would use in order to reach `SourceA`. It determines whether the interface is correct by consulting its unicast routing tables. The packet that arrives through interface `IF1` is forwarded because the routing table lists this interface as the shortest path to the network. The router's unicast routing table determines the shortest path for the multicast packets. Because a router accepts a packet from only one neighbor, it floods the packet only once, meaning that (assuming point-to-point links) each packet is transmitted over each link once in each direction.

Forwarding Multicast Packets

PIM-DM routers forward multicast traffic to all interfaces that lead to receivers that have explicitly joined a multicast group. Messages are sent to a group address in the local subnetwork. The router performs an RPF check, and forwards the packet. Traffic that arrives on the correct interface is sent to all outgoing interfaces that lead to downstream receivers, if the downstream router is a member of this group.

Upstream

Upstream traffic is traffic that is going towards the source.

Downstream

Downstream traffic is anything other than the upstream interface for that group.

Nexthop

PIM-DM does periodic lookups for prefixes to check router reachability. The nexthop lookup mechanism avoids periodic lookup. During start-up, PIM-DM notifies NSM (Network Services Manager) about the prefixes that pertain to them. NSM notifies the protocols if a better nexthop is available, or if a nexthop becomes unavailable. In this way, PIM-DM does not expend resources to do periodic lookups, because NSM is proactive in their maintenance.

Configuration

Configuring PIM-DM requires the following steps:

- Enable IP multicast on each PIM router (see Enabling IP Multicast Routing)

- Enable PIM-DM on the desired interfaces (see Enabling PIM-DM)

This section provides the configuration steps for configuring PIM-DM and examples for a relevant scenario.

Topology

In this network topology, the Source_1 address is 10.10.1.52 and the group address is set to 224.0.1.3.

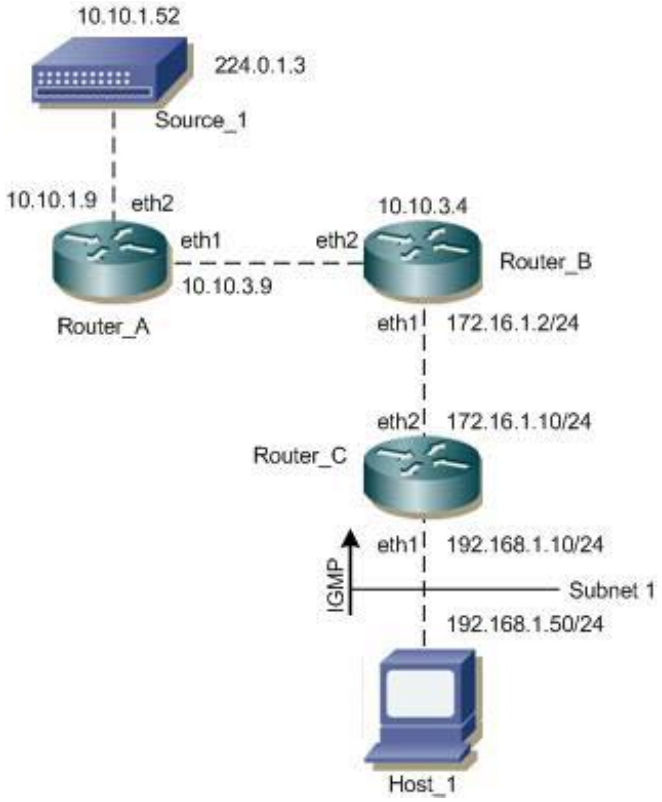

Figure 4-74: PIM-DM Configuration Topology

In this example, all routers are running PIM-DM.

1. Host_1 sends an IGMP membership report to Subnet 1.
2. After Router_C receives this report, it associates its receiving interface, `eth1`, with the group reported in the IGMP message, for example, group1.
3. Source_1 then sends a data packet for group1.
4. Every router creates an (S,G) entry in the multicast routing table.
5. When the data packet reaches `Router_C`, it forwards via the interface, `eth1`, because there is a local member on this interface for this group. `Router_C` has a downstream receiver, so it does not send a prune message to its upstream neighbor router, `Router_B`.

Enabling IP Multicast Routing

Enable IP multicast routing on all of the PIM routers inside the PIM domain:

#configure terminal	Enter Configure mode.
(config)#ip multicast-routing	Enable IP multicast routing.
(config)#exit	Exit Configure mode.

Enabling PIM-DM

Enable PIM-DM on all participating interfaces within each of routers inside the PIM domain on which you want to run PIM.

#configure terminal	Enter Configure mode.
(config)#interface eth1	Enter interface mode.
(config-if)#ip address 10.10.15.12/24	Configure the IP address for eth1.
(config-if)#ip pim dense-mode	Enable PIM dense mode on the interface.
(config-if)#exit	Exit interface mode.
(config)#interface eth2	Enter interface mode.
(config-if)#ip address 10.10.14.12/24	Configure the IP address for eth1.
(config-if)#ip pim dense-mode	Enable PIM dense mode on the interface.
(config-if)#exit	Exit interface mode.

The following is a sample configuration for Router_C:

```
hostname Router_C
!
interface eth0
!
interface eth1
 ip pim dense-mode
!
interface eth2
 ip pim dense-mode
!
interface lo
!
!
ip multicast-routing
!
```

Validation

The show ip pim interface command displays the interface details for Router_C.

```
Router_C#show ip pim interface
Address          Interface VIFindex Ver/   Nbr     DR
                                    Mode   Count   prior
192.168.1.10      eth1      0       v2/D   0        1
172.16.1.10       eth2      2       v2/D   1        1
```

The `show ip mroute` command displays the IP multicast routing table.

```
Router_C#show ip mroute
IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)
(10.10.1.52, 224.0.1.3), uptime 00:00:15
Owner PIM-DM, Flags: F
 Incoming interface: eth2
 Outgoing interface list:
    eth1 (1)
```

The `show ip pim mroute` displays the IP PIM-DM multicast routing table.

```
Router_C#show ip pim mroute
PIM-DM Multicast Routing Table
(10.10.1.52, 224.0.1.3)
 RPF Neighbor: 172.16.1.2, Nexthop: 172.16.1.2, eth2
 Upstream IF: eth2
    Upstream State: Forwarding
    Assert State: NoInfo
 Downstream IF List:
    eth1, in 'olist':
      Downstream State: NoInfo
      Assert State: NoInfo
```

CHAPTER 5 IGMP Snooping Configuration

This chapter describes how to configure Internet Group Management Protocol (IGMP) Snooping.

Note: Run the `switchport` command on each port to change to Layer-2 mode.

Without IGMP, Layer-2 switches handle IP multicast traffic in the same manner as broadcast traffic and forwards frames received on one interface to all other interfaces. This creates excessive traffic on the network, and affects network performance. IGMP Snooping allows switches to monitor network traffic, and determine hosts to receive multicast traffic. Only one membership report is relayed from a group, instead of a report from each host in the group. To achieve this, IGMP Snooping is enabled on the switches.

Topology

This example describes the configuration on switch S1. The eth1 interface is configured as a multicast router port.

Because IGMP Snooping is used in bridged LAN environments, router R1 does not require running IGMP Snooping, and can run any multicast protocol (such as PIM-SM). Thus, the configuration on R1 is not included in this example.

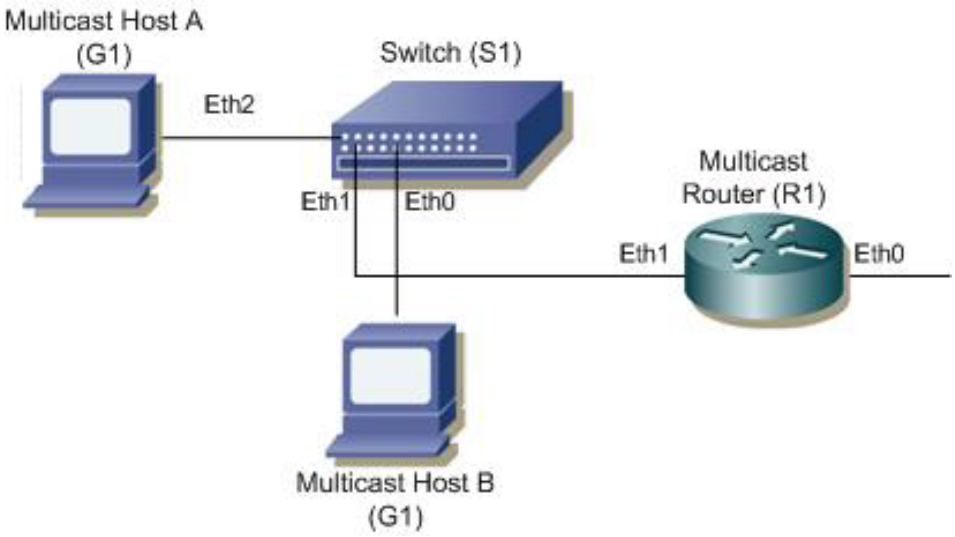

Figure 5-75: IGMP Snooping Topology

As a result of this configuration:

- The switch itself replies with membership report messages in response to queries received on interface eth1. However, if you do not enable report suppression on the switch, when it receives an IGMP Query message on eth1, it forwards it to both Host A and Host B. As a result, both hosts reply with a Membership report (as Layer-2 IGMP is running on the hosts).
- Because Host A and Host B are members of the same multicast group, the router is not notified when A leaves the group, because the group still has another member. When Host B leaves the group, the switch will send a Leave message to the Router with the destination address as 224.0.0.2 (All Router Destination Address).

Configuration

To enable IGMP Snooping on an interface:

1. Add a bridge to the spanning-tree table

2. Specify the interface to be configured
3. Associate the interface with bridge group
4. IGMP snooping will be enabled by default
5. Configure ports that are connected to routers as multicast router ports
6. By default, IGMP report suppression is enabled on the switch

S1

`#configure terminal`	Enter the `Configure` mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Add bridge `1` to the spanning-tree table.
`(config)#interface eth0`	Specify the interface `eth0` to be configured, and enter the `Interface` mode.
`(config-if)#shutdown`	Shut down the interface.
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate the interface `eth1` with bridge-group `1.`
`(config-if)#switchport mode access`	Configure the port as an access port.
`(config-if)#no shutdown`	Bring up the interface.
`(config-if)#exit`	Exit the `Interface` mode.
`(config)#interface eth1`	Specify interface `eth1` to be configured.
`(config-if)#shutdown`	Shut down the interface.
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate interface `eth1` with bridge-group `1`.
`(config-if)#switchport mode access`	Configure the port as an access port.
`(config-if)#no shutdown`	Bring up the interface.
`(config-if)#exit`	Exit the `Interface` mode.
`(config)#interface eth2`	Specify interface `eth2` to be configured.
`(config-if)#shutdown`	Shut down the interface.
`(config-if)#switchport`	Configure the interface as a switch port.
`(config-if)#bridge-group 1`	Associate interface `eth2` with bridge-group `1.`
`(config-if)#switchport mode access`	Configure the port as an access port.
`(config-if)#no shutdown`	Bring up the interface.
`(config-if)#exit`	Exit the `Interface` mode.
`(config)#interface vlan1.1`	Specify interface `vlan1.1` to be configured.
`(config-if)# igmp snooping mrouter interface eth1`	Configure this port as a multicast router port
`(config-if)#exit`	Exit the `Interface` mode

Validation

CHAPTER 6 MSDP Configuration

Multicast Source Discovery Protocol (MSDP) is used to exchange multicast source information between BGP-enabled PIM-SM domains. Using MSDP, routers in a PIM-SM domain can rely on their own RP to reach a source in a different PIM-SM domain.

Overview

MSDP routers in a PIM-SM domain have a MSDP peering relationship with MSDP peers in another domain using a TCP connection. MSDP peering is the first step towards exchanging inter-domain multicast source information using MSDP SA (Source-Active) messages.

When an RP in a PIM-SM domain first learns of a new sender (via PIM register messages), it constructs an SA message and sends it to its MSDP peers.

All RPs which intend to originate or receive SA messages must establish MSDP peering with other RPs, either directly or via an intermediate MSDP peer.

An SA message contains these fields:

- Source address of the data source
- Group address the data source sends to
- IP address of the RP

Each SA message received from a MSDP peer goes through an RPF check. The peer-RPF check compares the RP address carried in the SA message with the MSDP peer from which the message was received:

- If the MSDP peer receives an SA from a non-RPF peer towards the originating RP, it drops the message.
- Otherwise, it forwards the message to all its MSDP peers (except the one from which it received the SA message).

When an RP receives a new SA message from a peer in another domain, it checks if there are any receivers interested in the traffic. An RP checks for a (*, G) entry with a non-empty outgoing list. If the outgoing list is non-empty, the RP sends a (S,G) join towards the source.

Caching SA state

If a member joins a group soon after a SA message is received by the local RP, that member needs to wait until the next SA message to learn about the source. MSDP SA caching is done at MSDP peers to reduce join latency for new receivers. The SA cache is populated as soon an MSDP peer receives a SA message from its peer.

MSDP Mesh Group

MSDP Mesh groups are used inside a PIM-SM domain to ease RPF checking and SA forwarding within the domain. Any SA messages received from a peer in a mesh group are not forwarded to other peers in the same mesh group. This reduces SA message flooding and simplifies peer-RPF flooding.

MSDP Default Peer

An MSDP default peer is used when MSDP peers are not BGP peers. SA messages coming from a default peer do not go through an RPF check and are always accepted.

Configure PIM-SM

For the MSDP topology in Figure 6-76, you must enable PIM-SM on all the routers in both PIM domains and make RTR-1 a rendezvous point (RP) in Domain-1 and RTR-2 an RP in Domain-2. For the steps to configure PIM-SM and RPs, see Chapter 3, *PIM Sparse Mode Configuration*.

Configure MSDP

In the topology in Figure 6-76, an MSDP session is established between RTR-1 and RTR-2 in both domains. The following sample configuration on RTR-1 shows how to enable MSDP peering between RTR-1 and RTR-2.

Topology

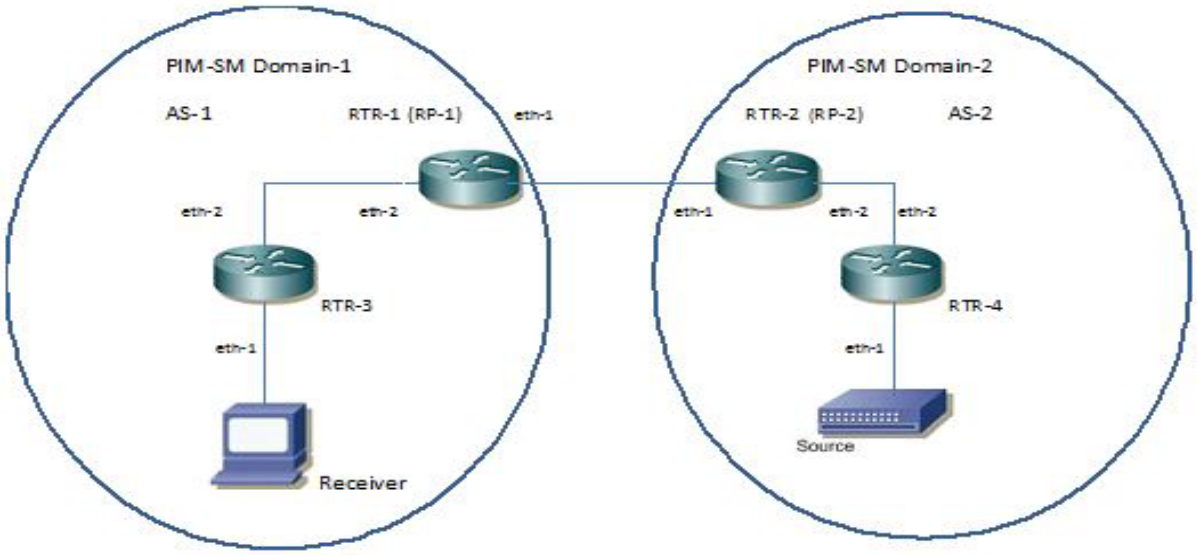

Figure 6-76: MSDP topology

IP addresses:

- RTR-1 eth1: 11.1.1.11
- RTR-1 eth2: 10.1.1.11
- RTR-2 eth1: 11.1.1.12
- RTR-2 eth2: 12.1.1.12
- RTR-4 eth1: 12.1.1.14
- RTR-4 eth2: 20.1.1.14

RTR-3 eth1: 13.1.1.13

RTR-3 eth2: 10.1.1.13

Source: 20.1.1.10

Multicast group: 224.1.1.1

RTR-1

`#configure terminal`	Enter configure mode.

`(config)#ip msdp peer 11.1.1.12`
--or--
`(config)#ip msdp peer 11.1.1.12 connect source eth1`
	Configure a MSDP peer.
	
	Use the connect-source option to specify the primary IP address of the interface to use as the source IP address of the MSDP TCP connection.

`(config)#ip msdp password myPass peer 11.1.1.12`	Configure an MSDP password for the peer. You must specify the same command at RTR-2. The password must match at both the routers.
`(config)#ip msdp default-peer 11.1.1.12`	Configure MSDP default peer.
`(config)#ip msdp mesh-group mesh1 11.1.1.12`	Configure MSDP mesh group.
`(config)#ip msdp originator-id eth2`	Configure MSDP originator identifier.
`(config)#exit`	Exit configure mode.

Validation

RTR-1

```
#show running-config

ip msdp peer 11.1.1.12
ip msdp default-peer 11.1.1.12
ip msdp mesh-group mesh1 11.1.1.12

line vty 0 39
 login
!
```

This command shows the MSDP peer information at RTR-1:

```
#show ip msdp peer
MSDP Peer 11.1.1.12
Connection status
 State: Up (Established)
 Keepalive sent: 1
 Keepalive received: 1
 Number of connect retries: 0
```

In the MSDP topology in Figure 6-76, when a source sends multicast traffic for group 224.1.1.1, RTR-4 (the DR) sends a register packet towards RTR-2 which is the RP in the domain. RTR-2 receives the register packet and sends an MSDP SA message to its MSDP peer (RTR-1). RTR-1 receives the SA message and creates an entry in the SA cache containing the source, group, and RP information.

This command at RTR-1 shows the SA information with source address, group address, and RP address:

```
#show ip msdp sa-cache
MSDP Source-Active Cache:
(20.1.1.11, 224.1.1.1), RP 10.1.1.11, RPF-Peer 11.1.1.12 Uptime  00:00:02 Exptime
00:03:28P
```

RTR-3 receives an IGMP join for group 224.1.1.1 and joins the shared tree path toward the RP (RTR-1).

When RTR-1 receives an SA message from RTR-2, because it has a receiver, it sends an (S,G) join towards the source. Now traffic from the source is received at RTR-1 via the shortest path tree formed between RTR-1 and the source. RTR-1 distributes traffic downstream towards the receiver.

This command shows the PIM state at RTR-1 upon receiving an SA message and joining towards the source:

```
#show ip pim mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0

```

```
Keepalive received: 2
```

CHAPTER 7 Bidirectional-PIM Configuration

Bidirectional PIM (BIDIR-PIM) is a variant of PIM Sparse-Mode (PIM-SM) that builds bidirectional shared trees connecting multicast sources and receivers as specified in RFC5015.

BIDIR-PIM dispenses with both encapsulation and source state by allowing packets to be natively forwarded from a source to the Rendezvous Point (RP) using shared tree state.

BIDIR-PIM uses the same tree for traffic from source towards RP and from RP to receivers.

Note: BIDIR-PIM with BSR is not supported in OcNOS 4.0.

Designated Forwarders (DF) Election

Bidirectional Shared-Trees violates current (*, G) RPF rules, as it accepts traffic from one Reverse Path Forwarding (RPF) interface only. To avoid forwarding multicast packet looping, bidir-PIM introduces a new mechanism called the designated forwarder (DF) election.

The designated forwarder (DF) election takes place for all PIM routers on every network segment and point-to-point link. The procedure selects one router as the DF for every RP of bidirectional groups. The designated forwarder is responsible for forwarding multicast packets received on that network.

PIM-SM Configuration

For the steps to configure PIM-SM refer to PIM Sparse Mode Configuration on page 2551.

Enabling BIDIR-PIM

`#configure terminal`	Enter Configure mode.
`(config)#ip pim bidir-enable`	Enable bidir-pim
`(config)#exit`	Exit Configure mode.

Configuring BIDIR Rendezvous Point Statically

Configuring Static BIDIR RP

`#configure terminal`	Enter configure mode.
`(config)#ip access-list standard ip1` `(config-ip-acl-std)#permit 224.0.0.0/24`	Configure the access list for multicast group.
`(config)#ip pim rp-address 10.10.1.5 ip1 bidir`	Statically configure an rp address for multicast groups.
`(config)#exit`	Exit configure mode.

Here is the sample configuration for Router_D:

```
hostname Router_D
!
       ip access-list standard ip1
        permit 224.0.0.0/24
      !
interface eth0
!
interface eth1
 ip pim sparse-mode
!
interface eth2
 ip pim sparse-mode
!
interface lo
!
!
ip multicast-routing
      ip multicast bidirectional enable
!
ip pim bidir-enable
ip pim rp-address 10.10.1.5 ip1 bidir
!
```

Validation

RP Details

At Router_D, the `show ip pim rp mapping` command shows that `10.10.1.5` is the RP for all multicast groups `22.0.0.0/4`, and is statically configured. All other routers will have a similar output:

```
Router_D#sh ip pim rp mapping
PIM Group-to-RP Mappings
Override RP cnt: 0
Group(s): 224.0.0.0/4, Static
    RP: 10.10.1.5 bidir
         Uptime: 00:01:45
```

At Router_D, use the `show ip pim rp-hash` command to display the selected RP for a specified group (224.0.1.3):

```
Router_D#show ip pim rp-hash 224.0.1.3
RP: 10.10.5.37
```

Interface Details

The `show ip pim interface` command displays the interface details for `Router_E`, and shows that `Router_E` is the Designated Router on `Subnet 1.`

```
Router_E#show ip pim interface
Address          Interface VIFindex Ver/   Nbr      DR    DR
                                    Mode   Count   Prior
192.168.1.10      eth1      0       v2/S   1         1     192.168.1.10
172.16.1.10       eth2      2       v2/S   1         1     172.16.1.10
```

IP Multicast Routing Table

Note: The multicast routing table displays for an RP router are different from other routers.

The `show ip pim mroute` command displays the IP multicast routing table. In this table, the following fields are defined:

`RPF nbr`	Displays the unicast next-hop to reach RP.
	and mask length.
`RPF idx`	Displays the incoming interface for this (*, G) state.
`RP`	Displays the IP address for the RP router
`B`	Displays the bidirectional pim mode
`The leading dots ....`	
	Stand for VIF index

```
Router_E#show ip pim mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)B
RP: 10.10.1.5
RPF nbr: 172.16.1.2
RPF idx: eth2
 Local     ..............................
 Joined    j.............................
```

At `Router_E`, `eth2` is the incoming interface of the (*, G) entry, and the RP is reachable through `eth2`. The ‘B’ flag indicates that it is in bidirectional pim mode.

Since `Router_C` is the RP, and the root of this multicast tree, the `show ip pim mroute` command on `Router_C` shows `RPF nbr` as 0.0.0.0 and `RPF idx` as none.

```
Router_C#show ip pim mroute
IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)B
RP: 10.10.1.5
RPF nbr: 0.0.0.0
RPF idx: None
 Local     ..............................
 Joined    j.............................

```

Configuring BIDIR-Neighbor Filter

This section shows how to configure a bidir-neighbor filter to specify which bidirectionally capable (bidir-capable) neighbors will participate in the designated forwarder (DF) election.

`#configure terminal`	Enter configure mode
`(config)# interface eth1`	Enter interface mode
`(config-if)# ip pim bidir-neighbor-filter Acl-name/acl-no`	Configure bidir-neighbor-filter at interface
`(config-if)# no ip pim bidir-neighbor-filter acl-name/acl-no`	Unconfigure bidir-neighbor-filter at interface

Validation

Enter the commands listed in this section to confirm the previous configurations.

```
rtr6#show ip pim neighbor
Neighbor        Interface          Uptime/Expires            Ver     DR
Address                                                           Priority/Mode
192.168.1.149   eth1               00:00:44/00:01:31         v2    1 / B
192.168.1.152   eth1               00:00:01/00:01:44         v2    1 / DR  ------
--?B Flag is removed

rtr6#show running-config interface eth1
!
interface eth1
 ip address 192.168.1.57/24
 no shutdown
 no snmp trap link-status
 ip ospf cost 10
 ip pim bidir-neighbor-filter 1
 ip pim sparse-mode
 lldp-agent
 no dcbx enable
 exit
```

Configuring BIDIR PIM Offer Message Interval Time

This section shows how to configure BIDIR PIM offer message interval time.

`#configure terminal`	Enter configure mode.

`(config)# ip pim bidir-offer-interval <1>`	Specify offer-interval in the range 1-20000
`(config-if)# no ip pim bidir-offer-interval`	Disable offer-interval

Validation

1. Verify the time set for offer message interval

```
(config)#ip pim  bidir-offer-interval 10

#show  running-config
!
no service password-encryption
!
debug nsm packet
debug ip pim events
debug ip pim mfc
debug ip pim packet
debug ip pim state
debug ip pim timer
debug ip pim mib
!
ip vrf management
!
mpls propagate-ttl
!
no ip icmp-broadcast
!
ip multicast-routing
ip multicast bidirectional enable
!
ip pim bidir-enable
ip pim bidir-offer-interval 10
ip pim rp-address 172.31.5.153 bi
```

2. Verify neighbor information in Bidirectional PIM mode with “B” flag associated

```
rtr6#show ip pim neighbor
Neighbor        Interface          Uptime/Expires            Ver     DR
Address                                                           Priority/Mode
192.168.1.149   eth1               00:38:36/00:01:39         v2    1 / B
192.168.1.152   eth1               00:37:53/00:01:22         v2    1 / DR B
rtr6#
```

3. Verify DF status per interface

```
rtr6#show ip pim interface df
Interface RP               DF Winner        Metric
eth1      172.31.5.153     192.168.1.152    20
eth2      172.31.5.153     192.168.10.57    30
rtr6#
rtr6#show ip pim interface eth1 df 172.31.5.153

 Designated Forwarder election for eth1, 192.168.1.57, RP 172.31.5.153
 State                          Non-DF (Lose)
```

```
 Offer count is                  0
 Current DF ip address           192.168.1.152
 Last winner metric preference   110
 Last winner metric              20
rtr6#
```

Configuring BIDIR PIM Offer Interval Limit

This section shows how to configure the Protocol Independent Multicast (PIM) bidirectionally capable number of unanswered offers before it changes as the designated forwarder (DF).

`#configure terminal`	Enter Configure mode.
`(config)# ip pim bidir-offer-limit <offer packet limit>`	Configure bidir-offer-limit
`(config-if)# no ip pim bidir-offer-limit`	Disable offer-limit

Validation

```
rtr6#show  running-config
!
no service password-encryption
!
hostname rtr6
!
!
debug nsm packet
!
ip vrf management
!
mpls propagate-ttl

ip pim bidir-offer-limit 5
ip pim register-rp-reachability
ip pim vrf management register-rp-reachability
!
```

CHAPTER 8 VRRP Aware PIM Configuration

VRRP Aware PIM is a redundancy mechanism for the Protocol Independent Multicast to interoperate with the Virtual Router Redundancy Protocol. It helps PIM to track VRRP state changes and to preserve multicast traffic upon failover. In order to ensure that the PIM DR is always able to forward PIM Join/Prune message towards RP, the VRRP master router becomes the PIM DR.

Topology

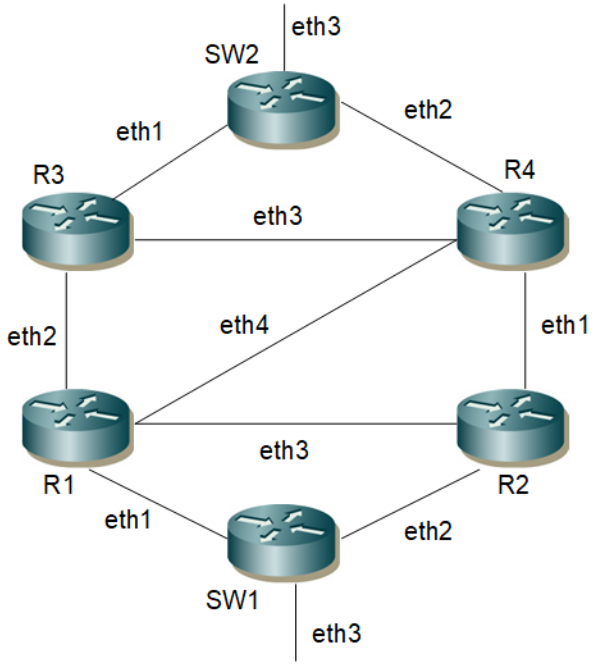

Figure 8-77: VRRP Aware PIM Topology

In the configs below IGMP host is towards SW1 and source is towards SW2.

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol ieee vlan-bridge`	Configure bridge as IEEE VLAN bridge
`SW1(config)#vlan 2 bridge 1 state enable`	Configure VLANs
`SW1(config)#interface eth1`	Enter interface mode.
`SW1(config-if)#switchport`	Configure eth1 as a layer 2 port.
`SW1(config-if)#bridge-group 1`	Associate bridge to an interface.
`SW1(config-if)#switchport mode trunk`	Configure port as a trunk.
`SW1(config-if)#switchport trunk allowed vlan add 2`	Allow VLAN 2 on the eth1 interface.
`SW1(config-if)#exit`	Exit interface mode.
`SW1(config)#interface eth2`	Enter interface mode.

SW1(config-if)#switchport	Configure eth2 as a layer 2 port.
SW1(config-if)#bridge-group 1	Associate bridge to an interface.
SW1(config-if)#switchport mode trunk	Configure port as a trunk.
SW1(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth2 interface.
SW1(config-if)#exit	Exit interface mode.
SW1(config)#interface eth3	Enter interface mode.
SW1(config-if)#switchport	Configure eth3 as a layer 2 port.
SW1(config-if)#bridge-group 1	Associate bridge to an interface.
SW1(config-if)#switchport mode trunk	Configure port as a trunk.
SW1(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth1 interface.
SW1(config-if)#exit	Exit interface mode.
SW1(config)#no igmp snooping	Disable IGMP snooping
SW1(config)#exit	Exit configure mode

R1

R1#configure terminal	Enter configure mode.
R1(config)#bridge 1 protocol ieee vlan-bridge	Configure bridge as IEEE VLAN bridge
R1(config)#vlan 2 bridge 1 state enable	Configure VLANs
R1(config)#ip multicast-routing	Configure multicast routing on R1
R1(config)#ip pim rp-address 1.1.1.4	Statically configure RP address for multicast groups.
R1(config)#interface lo	Enter interface mode.
R1(config-if)#ip address 1.1.1.1/32	Configure the IP address of the interface.
R1(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R1(config-if)#exit	Exit interface mode.
R1(config)#interface eth1	Enter interface mode.
R1(config-if)#switchport	Configure eth3 as a Layer 2 port.
R1(config-if)#bridge-group 1	Associate bridge to an interface.
R1(config-if)#switchport mode trunk	Configure port as a trunk.
R1(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth1 interface.
R1(config-if)#exit	Exit interface mode.
R1(config)#interface vlan1.2	Enter interface mode.
R1(config-if)#ip address 100.1.1.1/24	Configure the IP address of the interface.
R1(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R1(config-if)#ip pim redundancy 1 vrrp dr-priority 101	Configure VRRP aware PIM command with dr-priority and VRRP instance
R1(config)#interface eth2	Enter interface mode.
R1(config-if)#ip address 20.1.1.1/24	Configure the IP address of the interface.
R1(config-if)#ip pim sparse-mode	Configure PIM as sparse mode

R1(config)#interface eth3	Enter interface mode.
R1(config-if)#ip address 29.1.1.1/24	Configure the IP address of the interface.
R1(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R1(config-if)#exit	Exit interface mode.
R1(config)#interface eth4	Enter interface mode.
R1(config-if)#ip address 5.1.1.1/24	Configure the IP address of the interface.
R1(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R1(config-if)#exit	Exit interface mode.
R1(config)#router ospf 1	Set the routing process ID.
R1(config-router)#network 1.1.1.1/32 area 0.0.0.0	Configure OSPF network in area 0
R1(config-router)#ospf router-id 1.1.1.1	Configure OSPF router-ID
R1(config-router)#network 20.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R1(config-router)#network 29.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R1(config-router)#network 5.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0
R1(config-router)#exit	Exit router mode.
R1(config)#router vrrp 1 vlan1.2	Create a VRRP instance for interface VLAN1.2
R1(config-router)#virtual-ip 100.1.1.1	Set the virtual IP address for the VRRP session
R1(config-router)#enable	Enable the VRRP session on the router.

R2

R2#configure terminal	Enter configure mode.
R2(config)#bridge 1 protocol ieee vlan-bridge	Configure bridge as IEEE VLAN bridge
R2(config)#vlan 2 bridge 1 state enable	Configure VLANs
R2(config)#ip multicast-routing	Configure multicast routing on R2
R2(config)#ip pim rp-address 1.1.1.4	Statically configure RP address for multicast groups.
R2(config)#interface lo	Enter interface mode.
R2(config-if)#ip address 1.1.1.2/32	Configure the IP address of the interface.
R2(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R2(config-if)#exit	Exit interface mode.
R2(config)#interface eth1	Enter interface mode.
R2(config-if)#ip address 50.1.1.2/24	Configure the IP address of the interface.
R2(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R2(config)#interface eth2	Enter interface mode.
R2(config-if)#switchport	Configure eth3 as a Layer 2 port.
R2(config-if)#bridge-group 1	Associate bridge to an interface.
R2(config-if)#switchport mode trunk	Configure port as a trunk.

`R2(config-if)#switchport trunk allowed vlan add 2`	Allow VLAN 2 on the eth1 interface.
`R2(config)#interface eth3`	Enter interface mode.
`R2(config-if)#ip address 29.1.1.2/24`	Configure the IP address of the interface.
`R2(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#interface vlan1.2`	Enter interface mode.
`R2(config-if)#ip address 100.1.1.2/24`	Configure the IP address of the interface.
`R2(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R2(config-if)#ip pim redundancy 1 vrrp dr-priority 101`	Configure VRRP aware PIM command with dr-priority and VRRP instance
`R2(config)#router ospf 1`	Set the routing process ID .
`R2(config-router)#ospf router-id 1.1.1.2`	Configure OSPF router-ID
`R2(config-router)#network 1.1.1.2/32 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)#network 29.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)#network 50.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R2(config-router)#exit`	Exit router mode.
`R2(config)#router vrrp 1 vlan1.2`	Create a VRRP instance for interface VLAN1.2
`R2(config-router)#virtual-ip 100.1.1.1`	Set the virtual IP address for the VRRP session
`R2(config-router)#enable`	Enable the VRRP session on the router.
`R2(config-router)#exit`	Exit router mode.

R3

`R3#configure terminal`	Enter configure mode.
`R3(config)#bridge 1 protocol ieee vlan-bridge`	Configure bridge as IEEE VLAN bridge
`R3(config)#vlan 2 bridge 1 state enable`	Configure VLANs
`R3(config)#ip multicast-routing`	Configure multicast routing on R3
`R3(config)#ip pim rp-address 1.1.1.4`	Statically configure RP address for multicast groups.
`R3(config)#interface lo`	Enter interface mode.
`R3(config-if)#ip address 1.1.1.3/32`	Configure the IP address of the interface.
`R3(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R3(config-if)#exit`	Exit interface mode.
`R3(config)#interface eth1`	Enter interface mode.
`R3(config-if)#switchport`	Configure eth3 as a Layer 2 port.
`R3(config-if)#bridge-group 1`	Associate bridge to an interface.
`R3(config-if)#switchport mode trunk`	Configure port as a trunk.
`R3(config-if)#switchport trunk allowed vlan add 2`	Allow VLAN 2 on the eth1 interface.
`R3(config)#interface eth2`	Enter interface mode.

R3(config-if)#ip address 20.1.1.2/24	Configure the IP address of the interface.
R3(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R3(config)#interface eth3	Enter interface mode.
R3(config-if)#ip address 45.1.1.2/24	Configure the IP address of the interface.
R3(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R3(config-if)#exit	Exit interface mode.
R3(config)#interface vlan1.2	Enter interface mode.
R3(config-if)#ip address 200.1.1.2/24	Configure the IP address of the interface.
R3(config-if)#ip pim sparse-mode	Configure PIM as sparse mode.
R3(config-if)#exit	Exit interface mode.
R3(config)#router ospf 1	Set the routing process ID.
R3(config-router)#ospf router-id 1.1.1.3	Configuring OSPF router-ID.
R3(config-router)#network 1.1.1.3/32 area 0.0.0.0	Configure OSPF network in area 0.
R3(config-router)#network 200.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0.
R3(config-router)#network 20.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0.
R3(config-router)#network 45.1.1.0/24 area 0.0.0.0	Configure OSPF network in area 0.
R3(config-router)#exit	Exit router mode.

R4

R4#configure terminal	Enter configure mode.
R4(config)#bridge 1 protocol ieee vlan-bridge	Configure bridge as IEEE VLAN bridge
R4(config)#vlan 2 bridge 1 state enable	Configure VLANs
R4(config)#ip multicast-routing	Configure multicast routing on R4
R4(config)#ip pim rp-address 1.1.1.4	statically configure RP address for multicast groups.
R4(config)#interface lo	Enter interface mode.
R4(config-if)#ip address 1.1.1.4/32	Configure the IP address of the interface.
R4(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R4(config-if)#exit	Exit interface mode.
R4(config)#interface eth1	Enter interface mode.
R4(config-if)#ip address 50.1.1.1/24	Configure the IP address of the interface.
R4(config-if)#ip pim sparse-mode	Configure PIM as sparse mode
R4(config)#interface eth2	Enter interface mode.
R4(config-if)#switchport	Configure eth3 as a Layer 2 port.
R4(config-if)#bridge-group 1	Associate bridge to an interface.
R4(config-if)#switchport mode trunk	Configure port as a trunk.
R4(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth1 interface.

`R4(config)#interface eth3`	Enter interface mode.
`R4(config-if)#ip address 45.1.1.1/24`	Configure the IP address of the interface.
`R4(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#interface eth4`	Enter interface mode.
`R4(config-if)#ip address 5.1.1.2/24`	Configure the IP address of the interface.
`R4(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#interface vlan1.2`	Enter interface mode.
`R4(config-if)#ip address 200.1.1.1/24`	Configure the IP address of the interface.
`R4(config-if)#ip pim sparse-mode`	Configure PIM as sparse mode
`R4(config-if)#exit`	Exit interface mode.
`R4(config)#router ospf 1`	Set the routing process ID .
`R4(config-router)#ospf router-id 1.1.1.4`	Configuring OSPF router-ID
`R4(config-router)#network 1.1.1.4/32 area 0.0.0.0`	Configure OSPF network in area 0
`R4(config-router)#network 200.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R4(config-router)#network 45.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R4(config-router)#network 50.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R4(config-router)#network 5.1.1.0/24 area 0.0.0.0`	Configure OSPF network in area 0
`R4(config-router)#exit`	Exit router mode.

SW2

`SW2#configure terminal`	Enter configure mode.
`SW2(config)#bridge 1 protocol ieee vlan-bridge`	Configure bridge as IEEE VLAN bridge
`SW2(config)#vlan 2 bridge 1 state enable`	Configure VLANs
`SW2(config)#interface eth1`	Enter interface mode.
`SW2(config-if)#switchport`	Configure eth1 as a Layer 2 port.
`SW2(config-if)#bridge-group 1`	Associate bridge to an interface.
`SW2(config-if)#switchport mode trunk`	Configure port as a trunk.
`SW2(config-if)#switchport trunk allowed vlan add 2`	Allow VLAN 2 on the eth1 interface.
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#interface eth2`	Enter interface mode.
`SW2(config-if)#switchport`	Configure eth2 as a Layer 2 port.
`SW2(config-if)#bridge-group 1`	Associate bridge to an interface.
`SW2(config-if)#switchport mode trunk`	Configure port as a trunk.

SW2(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth2 interface.
SW2(config-if)#exit	Exit interface mode.
SW2(config)#interface eth3	Enter interface mode.
SW2(config-if)#switchport	Configure eth3 as a Layer 2 port.
SW2(config-if)#bridge-group 1	Associate bridge to an interface.
SW2(config-if)#switchport mode trunk	Configure port as a trunk.
SW2(config-if)#switchport trunk allowed vlan add 2	Allow VLAN 2 on the eth1 interface.
SW2(config-if)#exit	Exit interface mode.
SW2(config)#exit	Exit configure mode

Validation

Verify that PIM DR is the same node as VRRP Master.

Validation 1

```
R1#show  ip ospf  neighbor

Total number of full neighbors: 3
OSPF process 1 VRF(default):
Neighbor ID     Pri   State           Dead Time   Address         Interface           Instance ID
1.1.1.5           1   Full/DR          00:00:31    5.1.1.2         eth4                  0
1.1.1.3           1   Full/DR          00:00:36    10.2.3.2        eth3                0
1.1.1.4           1   Full/DR          00:00:35    10.2.4.2        eth2                0

Multicast Routing Information Base Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Multicast Commands

OcNOS multicast protocol modules work with the Multicast Routing Information Base (MRIB).

clear ip mroute

Use this command to delete entries from the IP multicast routing table. This command clears the multicast route entries in the multicast route table and removes the entries from the multicast forwarder. MRIB sends a clear message to the multicast protocols. Each multicast protocol has its own clear multicast route command. The protocol-specific clear command clears multicast routes from the protocol and clears the routes from the MRIB.

Command Syntax

```
clear ip mroute *
clear ip mroute A.B.C.D
clear ip mroute A.B.C.D A.B.C.D
clear ip mroute statistics *
clear ip mroute statistics A.B.C.D
clear ip mroute statistics A.B.C.D A.B.C.D
clear ip mroute A.B.C.D pim sparse-mode
clear ip mroute A.B.C.D A.B.C.D pim (dense mode| sparse-mode)
clear ip mroute (vrf NAME|) *
clear ip mroute (vrf NAME|) A.B.C.D
clear ip mroute (vrf NAME|) A.B.C.D A.B.C.D
clear ip mroute (vrf NAME|) statistics *
clear ip mroute (vrf NAME|) statistics A.B.C.D
clear ip mroute (vrf NAME|) statistics A.B.C.D A.B.C.D
clear ip mroute (vrf Name|) A.B.C.D pim sparse-mode
clear ip mroute (vrf Name|) A.B.C.D A.B.C.D pim (dense-mode | sparse-mode)
```

Parameters

`*`	All multicast routes.
`A.B.C.D`	Group IP address.
`A.B.C.D`	Source IP address.
`vrf`	VRF name.
`statistics`	Multicast route statistics.
`dense-mode`	Dense Mode (PIM-DM).
`sparse-mode`	sparse Mode (PIM-SM)

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip mroute vrf VRF_A 225.1.1.1 3.3.3.3
```

debug ip mrib

Use this command to set debug options for IPv4 multicast.

Use the no parameter with this command to disable debugging IPv4 multicast.

Command Syntax

```
debug ip mrib (all|event|vif|mrt|stats|fib-msg|register-msg|nsm-msg|mrib-msg|mtrace|mtrace-detail)
debug ip mrib (vrf NAME|)(all|event|vif|mrt|stats|fib-msg|register-msg|nsm-msg|mrib-msg|mtrace|mtrace-detail)
no debug ip mrib (all|event|vif|mrt|stats|fib-msg|register-msg|nsm-msg|mrib-msg|mtrace|mtrace-detail)
no debug ip mrib (vrf NAME|) ((all|event|vif|mrt|stats|fib-msg|register-msg|nsm-msg|mrib-msg|mtrace|mtrace-detail)
```

Parameters

all	Enable all IPv4 multicast debugging.
event	Enable debugging of multicast events.
fib-msg	Enable debugging of multicast FIB messages
mrib-msg	Enable debugging of multicast MRIB messages
mrt	Enable debugging of multicast route
mtrace	Enable debugging of multicast traceroute
mtrace-detail	Enable detailed debugging of multicast traceroute messages
nsm-msg	Enable debugging of multicast NSM messages
register-msg	Enable debugging of multicast PIM Register messages
stats	Enable debugging of multicast statistics.
vif	Enable debugging of multicast interface
vrf	Specify the VRF name

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ip mrib all
```

ip multicast route-limit

Use this command to limit the number of multicast routes that can be added to a multicast routing table. It generates an error message when the limit is exceeded. If the threshold parameter is set, a threshold warning message is generated when this threshold is exceeded and the message continues to occur until the number of mroutes reaches the limit set by the limit argument.

Note: The mroute warning threshold must not exceed the mroute limit.

Use the no parameter with this command to disable this configuration.

Command Syntax

```
ip multicast route-limit <1-2147483647>
ip multicast route-limit <1-2147483647> <1-2147483647>
ip multicast (vrf NAME|) route-limit <1-2147483647>
ip multicast (vrf NAME|) route-limit <1-2147483647> <1-2147483647>
no ip multicast route-limit
no ip multicast (vrf NAME|) route-limit
```

Parameters

`vrf`	VRF name
`<1-2147483647>`	Number of routes
`<1-2147483647>`	Threshold at which to generate a warning message

Default

The default limit and threshold value is 2147483647.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip multicast route-limit 34 24
```

ip multicast ttl-threshold

Use this command to configure the time-to-live (TTL) threshold of packets being forwarded out of an interface. Only multicast packets with a TTL value greater than the threshold are forwarded out of the interface.

Use the no parameter with this command to return to the default TTL threshold.

Command Syntax

```
ip multicast ttl-threshold <1-255>
no ip multicast ttl-threshold
```

Parameters

<1-255>	The time-to-live threshold.

Default

The default TTL value is 1.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip multicast ttl-threshold 34
```

ip multicast-routing

Use this command to turn on/off multicast routing on the router; when turned off, the multicast protocol daemon remains present, but does not perform multicast functions. When multicast routing is enabled, the MRIB re-creates tunnels, and starts processing any VIF addition/deletion requests, MRT addition/deletion requests, and any multicast forwarding events.

Use the no parameter with this command to disable this function. When the no parameter is used, the MRIB releases all VIFs and tunnels, cleans up MRTs, stops IGMPv2 operation and stops relaying multicast forwarder events to multicast protocols.

Command Syntax

```
ip multicast-routing
ip multicast-routing (vrf NAME|)
no ip multicast-routing
no ip multicast-routing (vrf NAME|)
```

Parameter

vrf	Specify the VRF name.

Default

By default, multicast routing is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip multicast-routing
```

ip multicast bidirectional enable

Data Plane may require specific resource allocations for enabling multipoint to multipoint (bidirectional) multicast data forwarding. To configure data plane for such resource allocation use this command.

Prepend no to the same command to revert this configuration.

Command Syntax

```
ip multicast bidirectional enable
no ip multicast bidirectional enable
```

Parameters

None

Default

By default, bidirectional forwarding is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config) # ip multicast bidirectional enable
```

show debugging ip mrib

Use this command to display IPv4 multicast debugging information.

Command Syntax

```
show debugging ip mrib
show debugging ip mrib (vrf NAME|)
```

Parameters

`vrf`	Display routes from a VPN Routing/Forwarding instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following is a sample output of the `show debugging ip mrib` command.

```
#show debugging ip mrib
Debugging status:
  MRIBv4 event debugging is on
  MRIBv4 VIF debugging is on
  MRIBv4 route debugging is on
  MRIBv4 route statistics debugging is on
  MRIBv4 FIB message debugging is on
  MRIBv4 PIM Register message debugging is on
  MRIBv4 NSM IPC message debugging is on
  MRIBv4 MRIB IPC message debugging is on
  MRIBv4 traceroute debugging is on
  MRIBv4 traceroute detailed debugging is on
#
```

show ip mroute

Use this command to display the IP multicast routing (mroute) table. The routing table is based on the pairing of Source Addresses with their respective Destination Multicast Group Address (S, G).

Command Syntax

```
show ip mroute (dense|sparse|) (count|summary|)
show ip mroute A.B.C.D (dense|sparse|)(count|summary|)
show ip mroute A.B.C.D A.B.C.D (dense|sparse|) (count|summary|)
show ip mroute (vrf NAME|) (dense|sparse|) (count|summary|)
show ip mroute (vrf NAME|) A.B.C.D (dense|sparse|) (count|summary|)
show ip mroute (vrf NAME|) A.B.C.D A.B.C.D (dense|sparse|) (count|summary|)
```

Parameters

`A.B.C.D`	Source or Group IP address.
`count`	Route and packet count data.
`summary`	Provide abbreviated display.
`dense`	Show dense multicast routes.
`sparse`	Show sparse multicast routes.
`vrf`	Specify the VRF name.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following is a sample output of this command displaying the IP multicast routing table, with and without specifying the group and source IP address:

```
rtr6#show ip mroute

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
       B - BIDIR
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(172.31.1.52, 224.0.0.13), uptime 00:09:39
Owner PIM, Flags: F
  Incoming interface: eth1
  Outgoing interface list:
    eth2 (1)
```

The following is a sample output of this command displaying the packet count from the IP multicast routing table:

```
#show ip mroute count

IP Multicast Statistics
Total 1 routes using 132 bytes memory
Route limit/Route threshold: 2147483647/2147483647
Total NOCACHE/WRONGVIF/WHOLEPKT recv from fwd: 1/0/0
Total NOCACHE/WRONGVIF/WHOLEPKT sent to clients: 1/0/0
Immediate/Timed stat updates sent to clients: 0/0
Reg ACK recv/Reg NACK recv/Reg pkt sent: 0/0/0
Next stats poll: 00:01:10

Forwarding Counts: Pkt count/Byte count, Other Counts: Wrong If pkts
Fwd msg counts: WRONGVIF/WHOLEPKT recv
Client msg counts: WRONGVIF/WHOLEPKT/Imm Stat/Timed Stat sent
Reg pkt counts: Reg ACK recv/Reg NACK recv/Reg pkt sent

(10.10.1.52, 224.0.1.3), Forwarding: 2/19456, Other: 0
  Fwd msg: 0/0, Client msg: 0/0/0/0,  Reg: 0/0/0
```

The following is a sample output for this command displaying the IP multicast routing table in an abbreviated form:

```
#show ip mroute summary

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(10.10.1.52, 224.0.0.13), 00:01:32/00:03:20, PIM-SM, Flags: TF
```

The following is a sample output for this command displaying the IP multicast routing table for Bidirectional routes:

```
#show ip mroute

IP Multicast Routing Table
Flags: I - Immediate Stat, T - Timed Stat, F - Forwarder installed
       B - BIDIR
Timers: Uptime/Stat Expiry
Interface State: Interface (TTL)

(*, 225.0.0.0)/24, uptime 00:01:53
Owner PIM, Flags: FB
RPA ID: 4
Outgoing interface list:
vlan1.10 (1)

(*, 225.0.0.1)/32, uptime 00:00:20
Owner PIM, Flags: FB
RPA ID: 4
Outgoing interface list:
vlan1.10 (1)
vlan1.20 (1)
```

Table 1-25: Mroute pointers

Pointers	Description
I	Immediate statistics
T	Timed statistics
F	Forwarder installed
B	Bidirectional
Timers	• Uptime – route uptime. • Statistics Expiry –The time the routing table waits before updating statistics.
Interface State	Interface Time to Live (TTL)

Table 1-26: Show ip mroute output

Entry	Description
(a.d.c.d, 224.x.x.x)	Source Address paired with its Destination Multicast Group Address
uptime	As stated.
Owner	The owner is derived from the multicast group notable address (IANA). In the example above, the owner is specified as PIM because it is using the IANA address: 224.0.0.13. Other owners can be OSPF (224.0.0.5), IS-IS (224.0.0.19–21), and so on.
Flags	The flags associated with this mroute table entry.
Incoming interface	The name of the in coming interface (eth1, xe5/2, etc.).
Outgoing interface list	A numbered list of the outgoing interfaces

Table 1-27: Show ip mroute statistics received and sent

Entry	Description
NOCACHE	Number of No Cache messages received.
WRONGVIF	The Virtual Host Interface (VIF) enables the router to send and receive IP multicast packets on several different interfaces at once. This is the count of wrong VIFs received.
WHOLEPKT	When a source is multicasting a large volume data and the PIM router does not know about the particular Rendezvous Point (RP(G)), the PIM process will constantly receive WHOLEPKT notification from the kernel – this shows the count of such notifications.

show ip mvif

Use this command to display the MRIB VIF table entries.

The Virtual Host Interface (VIF) used in Pragmatic General Multicast (PGM) or “Reliable Multicast.” The VIF enables the router to send and receive IP multicast packets on several different interfaces at once, as dictated by the multicast routing tables on the router.

Command Syntax

```
show ip mvif
show ip mvif IFNAME
show ip mvif (vrf NAME|)
show ip mvif (vrf NAME|) IFNAME
```

Parameters

IFNAME	Specify the interface name.
vrf	Specify the VRF name.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following are sample outputs of this command displaying the contents for the MRIB VIF table, both with and without the interface parameter specified:

```
#show ip mvif
Interface    Vif   Owner    TTL  Local            Remote           Uptime
             Idx   Module        Address          Address
wm0          0     PIM-SM   1    192.168.1.53     0.0.0.0          00:04:26
Register     1               1    192.168.1.53     0.0.0.0          00:04:26
wm1          2     PIM-SM   1    192.168.10.53    0.0.0.0          00:04:25
#show ip mvif wm0
Interface   Vif   Owner    TTL  Local            Remote           Uptime
            Idx   Module        Address          Address
wm0         0     PIM-SM   1    192.168.1.53     0.0.0.0          00:05:17
```

Table 1-28: Show ip mvif output

Entries	Description
Interface	The name of the interface.
Vif Idx	The VIF Index – the numbering of the entries in the MRIB table.
Owner	What multicast protocol is being used for an entry. For example, PIM-SM (PIM Sparce Mode).

Table 1-28: Show ip mvif output (Continued)

Entries	Description
TTL	Time to Live for the entry.
Local Address	AS stated.
Remote Address	As stated.
Uptime	How long the multicast interface has been operating.

show ip multicast rpa

Bidirectional (multipoint to multipoint) multicast forwarding uses a list of incoming interfaces. These interface list is created for each bidirectional RP. Such an entity is identified with an id number. When a bidirectional route object is programmed, this id would be used to indicate it'sits incoming interface list. This command outputs this entity list. Use this command to display the MRIB rpa details.

Command Syntax

show ip multicast rpa

Parameters

None

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced in before OcNOS version 4.0.

Example

```
#show ip multicast rpa

IP Multicast bidir rpa
2.2.2.2:1 uptime 00:23:16
  Incoming interface list:
      vlan1.50 (3)
      vlan1.30 (0)
      vlan1.40 (2)
```

snmp restart mribd

Use this command to restart SNMP in Multicast Routing Information Base (MRIB)

Command Syntax

```
snmp restart mribd
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart mribd
```

CHAPTER 2 Layer 3 IGMP Multicast Commands

This chapter describes the commands for Internet Group Management Protocol (IGMP) including the IGMP proxy service.

For IGMP multicast snooping commands, see Chapter 3, *Layer 2 IGMP Snooping Multicast Commands*.

clear ip igmp

Use this command to clear all IGMP local-memberships on all interfaces. This command applies to interfaces configured for IGMP Layer-3 multicast protocols, or IGMP Proxy.

Command Syntax

```
clear ip igmp
clear ip igmp group *
clear ip igmp group A.B.C.D
clear ip igmp group A.B.C.D IFNAME
clear ip igmp interface IFNAME
clear ip igmp (vrf NAME|)
clear ip igmp (vrf NAME|) group *
clear ip igmp (vrf NAME|) group A.B.C.D
clear ip igmp (vrf NAME|) group A.B.C.D IFNAME
clear ip igmp (vrf NAME|) interface IFNAME
```

Parameters

`*`	Clears all groups on all interfaces.
`A.B.C.D`	Specify the group address's local-membership to be cleared from all interfaces.
`interface`	Specify an interface. All groups learned from this interface are deleted.
`IFNAME`	Specify name of the interface.
`vrf`	Specify the VRF name.
`group`	Deletes IGMP group cache entries.
`interface`	Specify name of the interface; all groups learned from this interface are deleted.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear ip igmp
#clear ip igmp group *
#clear ip igmp group 224.1.1.1
#clear ip igmp interface eth1
#clear ip igmp vrf VRF_A
#clear ip igmp vrf new group *
#clear ip igmp vrf new interface eth1
```

debug ip igmp

Use this command to enable debugging of all IGMP, or a specific component of IGMP. This command applies to interfaces configured for IGMP Layer-3 multicast protocols.

Use the no parameter with this command to disable all IGMP debugging, or select a specific IGMP component.

Command Syntax

```
debug ip igmp all
debug ip igmp decode
debug ip igmp encode
debug ip igmp events
debug ip igmp fsm
debug ip igmp tib
debug ip igmp (vrf NAME|) all
debug ip igmp (vrf NAME|) decode
debug ip igmp (vrf NAME|) encode
debug ip igmp (vrf NAME|) events
debug ip igmp (vrf NAME|) fsm
debug ip igmp (vrf NAME|) tib
no debug ip igmp all
no debug ip igmp decode
no debug ip igmp encode
no debug ip igmp events
no debug ip igmp fsm
no debug ip igmp tib
no debug ip igmp (vrf NAME|) all
no debug ip igmp (vrf NAME|) decode
no debug ip igmp (vrf NAME|) encode
no debug ip igmp (vrf NAME|) events
no debug ip igmp (vrf NAME|) fsm
no debug ip igmp (vrf NAME|) tib
```

Parameters

`all`	Debug all IGMP.
`decode`	Debug IGMP decoding.
`encode`	Debug IGMP encoding.
`events`	Debug IGMP events.
`fsm`	Debug IGMP Finite State Machine (FSM).
`tib`	Debug IGMP Tree Information Base (TIB).

`vrf`	Debug VPN Routing/Forwarding instance.

Command Mode

Privileged Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ip igmp all
```

ip igmp

Use this command to enable the IGMP operation on an interface. This command enables IGMP operation in stand-alone mode, and can be used to learn local-membership information prior to enabling a multicast routing protocol on the interface. This command will has no effect on interfaces configured for IGMP proxy.

Use the no parameter with this command to return all IGMP related configuration to the default (including IGMP proxy service).

Command Syntax

```
ip igmp
no ip igmp
```

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp
```

ip igmp access-group

Use this command to control the multicast local-membership groups learned on an interface. This command applies to interfaces configured for IGMP Layer-3 multicast protocols, IGMP proxy.

Use the no parameter with this command to disable this access control.

Command Syntax

```
ip igmp access-group WORD
no ip igmp access-group WORD
```

Parameters

WORD	Standard IP access-list name.

Default

No access list configured

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

In the following example, hosts serviced by Ethernet interface 0 can only join the group 225.2.2.2:

```
#configure terminal
(config)#access-list 1 permit 225.2.2.2 0.0.0.0
(config)#interface eth1
(config-if)#ip igmp access-group xyz
(config-if)#exit
```

ip igmp immediate-leave

In IGMP version 2, use this command to minimize the leave latency of IGMP memberships. This command is used when only one receiver host is connected to each interface. This command applies to interfaces configured for IGMP Layer-3 multicast protocols, IGMP Proxy.

To disable this feature, use the no parameter with this command.

Command Syntax

```
ip igmp immediate-leave group-list WORD
no ip igmp immediate-leave
```

Parameters

group-list	Standard access-list name or number that defines multicast groups in which the immediate leave feature is enabled.
WORD	Standard IP access-list name.

Default

Disabled

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to enable the immediate-leave feature on an interface for a specific range of multicast groups. In this example, the router assumes that the group access-list consists of groups that have only one host membership at a time per interface:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp immediate-leave group-list xyz
(config-if)#exit
(config)#access-list 34 permit 225.192.20.0 0.0.0.255
```

ip igmp join-group

Use this command to configure a join multicast group.

Use the no parameter with this command to delete group membership entry.

Command Syntax

```
ip igmp join-group A.B.C.D {(source (A.B.C.D)|)}
no ip igmp join-group A.B.C.D {(source (A.B.C.D)|)}
```

Parameters

A.B.C.D	Standard IP multicast group address to be configured as a group member.
source	Static source to be joined.
A.B.C.D	Standard IP source address to be configured as a source from where multicast packets originate.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp join-group 225.1.1.1 source 1.1.1.2

(config-if)#no ip igmp join-group 225.1.1.1 source 1.1.1.2
```

ip igmp last-member-query-count

Use this command to set the last-member query-count value. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the no parameter with this command to return to the default value on an interface.

Command Syntax

```
ip igmp last-member-query-count <2-7>
no ip igmp last-member-query-count
```

Parameter

<2-7>	Specify the last member query count value.

Default

The default last member query count value is 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp last-member-query-count 3
```

ip igmp last-member-query-interval

Use this command to configure the frequency at which the router sends IGMP group-specific host query messages. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the no parameter with this command to set this frequency to the default value.

Command Syntax

```
ip igmp last-member-query-interval <1000-25500>
no ip igmp last-member-query-interval
```

Parameter

<1000-25500>	Frequency (in milliseconds) at which IGMP group-specific host query messages are sent.

Default

1000 milliseconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example changes the IGMP group-specific host query message interval to 2 seconds:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp last-member-query-interval 2000
```

ip igmp limit

Use this command to set the maximum number of group membership states, at either the router level or at the interface level. Once the specified number of group memberships is reached, all further local-memberships are ignored. Optionally, an exception access-list can be configured to specify the group-address(es) to be excluded from being subject to the limit.

This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy. The limit applies, individually, to each of its constituent interfaces.

Use the `no` parameter with this command to unset the limit and any specified exception access-list.

Command Syntax

```
ip igmp limit (<1-2097152> (except WORD |)
ip igmp (vrf NAME) limit(<1-2097152> (except WORD |)
no ip igmp limit
no ip igmp (vrf NAME|) limit
```

Parameters

`vrf`	Specify the VRF name.
`<1-2097152>`	Maximum number of group membership states.
`except`	Number or name that defines multicast groups that are exempted from being subject to configured limit.
`WORD`	Standard IP access-list name.

Command Mode

Configure mode and Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures an IGMP limit of 100 group-membership states across all interfaces on which IGMP is enabled, and excludes group 224.1.1.1 from this limitation:

```
#configure terminal
(config)#access-list 1 permit 224.1.1.1 0.0.0.0
(config)#ip igmp limit 100 except xyz
```

The following example configures an IGMP limit of 100 group-membership states on eth1:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp limit 100
```

ip igmp mroute-proxy

Use this command to specify the IGMP Proxy service (upstream host-side) interface with which to be associated. IGMP router-side protocol operation is enabled only when the specified upstream proxy-service interface is functional.

Note: This command should not be used when configuring interfaces enabled for IGMP in association with a multicast routing protocol, otherwise the behavior will be undefined.

Use the no parameter with this command to remove the association with the proxy-service interface.

Command Syntax

```
ip igmp mroute-proxy IFNAME
no ip igmp mroute-proxy
```

Parameter

IFNAME	Specify an interface name.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example configures the eth1 interface as the upstream proxy-service interface for the downstream router-side interface, eth1.

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp mroute-proxy eth1
```

ip igmp offlink

Use this command to configure off-link for IGMP.

Use the no parameter with this command to remove this configuration.

Command Syntax

```
ip igmp offlink
no ip igmp offlink
```

Parameter

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp offlink

(config-if)#no ip igmp offlink
```

ip igmp proxy-service

Use this command to designate an interface to be the IGMP proxy-service (upstream host-side) interface, thus enabling IGMP host-side protocol operation on this interface. All associated downstream router-side interfaces will have their memberships consolidated on this interface, according to IGMP host-side functionality.

Note: This command should not be used when configuring interfaces enabled for IGMP in association with a multicast-routing protocol, otherwise the behavior will be undefined.

Use the no parameter with this command to remove the designation of the interface as an upstream proxy-service interface.

Command Syntax

```
ip igmp proxy-service
no ip igmp proxy-service
```

Parameter

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example designates the eth1 interface as the upstream proxy-service interface.

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp proxy-service
```

ip igmp proxy unsolicited-report-interval

Use this command to set an unsolicited report interval for an interface designated as an IGMP proxy (upstream host-side).

Use the no parameter with this command to remove the unsolicited report interval from the interface.

Command Syntax

```
ip igmp proxy unsolicited-report-interval <1000-25500>
no ip igmp proxy unsolicited-report-interval
```

Parameter

<1000-25500>	Specify an unsolicited report interval value in milliseconds.

Default

1000 milliseconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp proxy unsolicited-report-interval 1234

(config-if)#no ip igmp proxy unsolicited-report-interval
```

ip igmp querier-timeout

Use this command to set the timeout period before the router takes over as the querier for the interface after the previous querier has stopped querying. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

To restore the default value, use the no parameter with this command.

Command Syntax

```
ip igmp querier-timeout <60-300>
no ip igmp querier-timeout
```

Parameter

<60-300>	Number of seconds that the router waits after the previous querier has stopped querying before it takes over as the querier.

Default

255 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example configures the router to wait 120 seconds from the time it received the last query before it takes over as the querier for the interface:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp querier-timeout 120
```

ip igmp query-interval

Use this command to set the frequency of sending IGMP host query messages. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

To return to the default frequency, use the no parameter with this command.

Note: Querier timeout changes by changing query interval.

Command Syntax

```
ip igmp query-interval <1-18000>
no ip igmp query-interval
```

Parameter

<1-18000>	Frequency (in seconds) at which IGMP host query messages are sent.

Default

Default query interval is 125 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example changes the frequency of sending IGMP host-query messages to 2 minutes:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp query-interval 120
```

ip igmp query-max-response-time

Use this command to set the maximum response time advertised in IGMP queries. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the no parameter with this command to restore the default value.

Command Syntax

```
ip igmp query-max-response-time <1-240>
no ip igmp query-max-response-time
```

Parameter

<1-240>	Maximum response time (in seconds) advertised in IGMP queries.

Default

10 seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example configures a maximum response time of 8 seconds:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp query-max-response-time 8
```

ip igmp ra-option

Use this command to configure strict RA (Router Advertisement) validation for IGMP.

Use the no parameter with this command to restore the default value.

Command Syntax

```
ip igmp ra-option
no ip igmp ra-option
```

Parameter

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example configures a maximum response time of 8 seconds:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp ra-option

(config-if)#no ip igmp ra-option
```

ip igmp robustness-variable

Use this command to set the robustness variable value on an interface. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

To return to the default value on an interface, use the no parameter with this command.

Command Syntax

```
ip igmp robustness-variable <2-7>
no ip igmp robustness-variable
```

Parameter

<2-7>	Specify the robustness variable value.

Default

Default robustness variable value is 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface 0
(config-if)#ip igmp robustness-variable 3
```

ip igmp ssm-map enable

Use this command to enable SSM mapping on the router. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the `no` parameter with this command to disable SSM mapping.

Command Syntax

```
ip igmp ssm-map enable
ip igmp (vrf NAME|) ssm-map enable
no ip igmp ssm-map enable
no ip igmp (vrf NAME|) ssm-map enable
```

Parameter

`vrf`	Specify the VRF name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to configure SSM mapping on the router.

```
#configure terminal
(config)#ip igmp ssm-map enable
```

ip igmp ssm-map static

Use this command to specify the static mode of defining SSM mapping. SSM mapping statically assigns sources to IGMPv1 and IGMPv2 groups to translate such (*,G) groups' memberships to (S,G) memberships for use with PIM-SSM. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the `no` parameter with this command to remove the SSM map association.

Command Syntax

```
ip igmp ssm-map static WORD A.B.C.D
ip igmp (vrf NAME|) ssm-map static WORD A.B.C.D
no ip igmp (vrf NAME|) ssm-map static WORD A.B.C.D
no ip igmp ssm-map static WORD A.B.C.D
```

Parameters

`vrf`	Specify the VRF name.
`WORD`	Standard IP access-list name.
`A.B.C.D`	Source address to use for static map group.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

This example shows how to configure an SSM static mapping for group-address 224.1.1.1

Note: `access-list` can only be a `permit` type `access-list`

```
#configure terminal
(config)# ip igmp ssm-map static xyz 1.2.3.4
(config)# access-list 1 permit 224.1.1.1 0.0.0.255
```

ip igmp static-group

Use this command to statically configure group membership entries on an interface. To statically add only a group membership, do not specify any parameters. This command applies to IGMP operation on a specific interface to statically add group and/or source records; on a VLAN interface to statically add group and/or source records.

Use the no parameter with this command to delete static group membership entries.

Command Syntax

```
ip igmp static-group A.B.C.D (source (A.B.C.D|ssm-map)|)
no ip igmp static-group A.B.C.D (source (A.B.C.D|ssm-map)|)
```

Parameters

A.B.C.D	Standard IP Multicast group address to be configured as a static group member.
source	Static source to be joined.
A.B.C.D	Standard IP source address to be configured as a static source from where multicast packets originate.
ssm-map	Mode of defining SSM mapping. SSM mapping statically assigns sources to IGMPv1 and IGMPv2 groups to translate these (*, G) groups' memberships to (S, G) memberships for use with PIM-SSM.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following examples show how to statically add group and/or source records for IGMP:

```
#configure terminal
(config)#interface eth1
(config-if)#ip igmp static-group 226.1.2.3

#configure terminal
(config)#interface eth1
(config-if)#ip igmp static-group 226.1.2.4 source 1.2.3.4

#configure terminal
(config)#interface eth1
(config-if)#ip igmp static-group 226.1.2.5 source ssm-map
```

ip igmp startup-query-count

Use this command to set a startup query count for IGMP.

Use the no parameter with this command to return to the default version.

Command Syntax

```
ip igmp startup-query-count <2-10>
no ip igmp startup-query-count
```

Parameters

<2-10>	Specify a startup query count value.

Default

The default value 2.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface 0
(config-if)#ip igmp startup-query-count 2

(config-if)#no ip igmp startup-query-count
```

ip igmp startup-query-interval

Use this command to set a query interval value for IGMP.

Use the no parameter with this command to return to the default version.

Command Syntax

```
ip igmp startup-query-interval <1-18000>
no ip igmp startup-query-interval
```

Parameters

<1-18000>	Specify a startup query interval value in seconds.

Default

The default value 31 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface 0
(config-if)#ip igmp startup-query-interval 1

(config-if)#no ip igmp startup-query-interval
```

ip igmp version

Use this command to set the current IGMP protocol version on an interface. This command applies to interfaces configured for IGMP Layer-3 multicast protocols and IGMP Proxy.

Use the no parameter with this command to return to the default version.

Command Syntax

```
ip igmp version <1-3>
no ip igmp version
```

Parameters

<1-3>	Specify IGMP protocol version number.

Default

The default IGMP protocol version number is 3.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface 0
(config-if)#ip igmp version 2
```

show debugging ip igmp

Use this command to display the status of the debugging of the IGMP system, or a specific VRF in the IGMP system.

Command Syntax

```
show debugging ip igmp
show debugging ip igmp (vrf NAME|)
```

Parameters

`vrf`	Specify the VRF name.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging ip igmp
 IGMP Debugging status:
 IGMP Decoder debugging is on
 IGMP Encoder debugging is on
 IGMP Events debugging is on
 IGMP FSM debugging is on
 IGMP Tree-Info-Base (TIB) debugging is on
```

show ip igmp groups

Use this command to display the multicast groups with receivers connected to the router and learned through IGMP.

Command Syntax

```
show ip igmp groups (detail|)
show ip igmp groups A.B.C.D (detail|)
show ip igmp groups IFNAME (detail|)
show ip igmp groups IFNAME A.B.C.D (detail|)
show ip igmp (vrf NAME|) groups (detail|)
show ip igmp (vrf NAME|) groups A.B.C.D (detail|)
show ip igmp (vrf NAME|) groups IFNAME (detail|)
show ip igmp (vrf NAME|) groups IFNAME A.B.C.D (detail|)
```

Parameters

`vrf`	Specify the VRF name.
`A.B.C.D`	Address of multicast group.
`IFNAME`	Name of the interface.
`detail`	IGMPv3 source information.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following command displays local-membership information for all interfaces:

```
rtr1#show ip igmp groups detail
IGMP Connected Group Membership Details

Flags: (M - SSM Mapping, R - Remote, L - Local,
SG - Static Group, SS - Static Source)
Interface:      eth1
Group:          224.1.1.1
Flags:          L
Uptime:         00:00:04
Group mode:     Exclude (Expires: 00:04:15, Static)
Last reporter:   3.3.3.3
Group source list: (R - Remote, M - SSM Mapping, S - Static, L - Local)
Include Source List :
 Source Address Uptime    v3 Exp    Fwd Flags
 2.2.2.2         00:00:04 stopped   Yes L
```

Table 2-29 shows the flags codes displayed at the start of a group entry.

Table 2-29: Flags

Flag	Meaning
M	Source Specific Multicast
R	Remote multicast
L	Local multicast
SG	Static Group
SS	Static Source

Table 2-30 explains the output fields.

Table 2-30: show ip igmp groups output

Entry	Description
Interface	The interface on which multicast is operating.
Group	The Multicast group, identified by a multicast IP address.
Flags	Flag on this interface – in this case, the flag indicates that the multicast is Local. See Table 2-29.
Uptime	The amount of time that the multicast connection has been up.
Group mode	The group mode is determined by interactions between IGMP router database entries, which is beyond the scope of this document. For a detailed description of these interactions, see RFC 3376.
Last reporter	The IPv4 address of the last host to send multicast information.
Group source list	A list of flags that indicate the state of the multicast connections. See Table 2-29.
Include Source List	A table containing parameters about the multicast session: • Source Address – The IP address of the Source(s) connected to the multicast hosts. • Uptime – The multicast session's uptime. • v3 Exp – Tells whether IGMPv3 Explicit Tracking is running or not. • Fwd – Whether IGMP information is being forwarded by this device. • Flags – See Table 2-29.

show ip igmp interface

Use this command to display the state of IGMP, IGMP Proxy service for a specified interface, or all interfaces.

Command Syntax

```
show ip igmp interface (IFNAME|)
show ip igmp (vrf NAME|) interface (IFNAME|)
```

Parameters

`vrf`	Specify the VRF name.
`interface`	Specify the interface parameter.
`IFNAME`	Specify the name of the interface.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command displays the IGMP interface status on all interfaces enabled for IGMP.

```
#show ip igmp interface
Interface vlan1.1 (Index 4294967295)
IGMP Active, Non-Querier, Version 3 (default)
IGMP querying router is 0.0.0.0
IGMP query interval is 125 seconds
IGMP querier timeout is 255 seconds
IGMP max query response time is 10 seconds
Last member query response interval is 1000 milliseconds
Group Membership interval is 260 seconds|
#
```

Table 2-31 explains the output fields.

Table 2-31: show ip igmp interface

Entry	Description
Interface	Interface type and number
IGMP Active	IGMP status – whether Active or Inactive; whether this interface is a querier; IGMP version (v1, v2, or v3).
IGMP querying router	IP address of the designated router for this LAN segment.
IGMP query interval	Interval at which the Cisco IOS software sends Protocol Independent Multicast (PIM) router query messages.
IGMP querier timeout	An interval of time that the software uses when deciding to take over as the querier.

Table 2-31: show ip igmp interface (Continued)

Entry	Description
IGMP max query response time	An interval of time that is advertised as the maximum response time that is advertised in IGMP queries.
Last member query response interval	This interval is the maximum amount of time between query messages that the querier will wait before sending messages that indicate that the multicast session has ended.
Group Membership interval	A group membership interval timer is maintained for each dynamic multicast group added to a downstream interface in the table. The timer is refreshed when a membership report for a multicast group is received. If the timer expires, the multicast group is removed from the table.

show ip igmp proxy

Use this command to display the state of IGMP Proxy services for a specified interface or for all interfaces.

Command Syntax

```
show ip igmp proxy groups (detail|)
show ip igmp proxy groups A.B.C.D (detail|)
show ip igmp proxy groups IFNAME (detail|)
show ip igmp proxy groups IFNAME A.B.C.D (detail|)
show ip igmp (vrf NAME|) proxy groups (detail|)
show ip igmp (vrf NAME|) proxy groups A.B.C.D (detail|)
show ip igmp (vrf NAME|) proxy groups IFNAME (detail|)
show ip igmp (vrf NAME|) proxy groups IFNAME A.B.C.D (detail|)
```

Parameters

`vrf`	Specify the VRF name.
`groups`	IGMP proxy group membership information.
`A.B.C.D`	Address of multicast group.
`IFNAME`	The name of the VLAN interface.
`detail`	IGMPv3 source information

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip igmp proxy

Interface eth2 (Index 4)
Administrative status: enabled
Operational status: up
Upstream interface is eth1
Number of multicast groups: 1

#show ip igmp proxy groups

IGMP Connected Proxy Group Membership
Group Address    Interface            State     Member state
224.0.1.3        eth1                 Active    Delay
```

Table 2-32 explains the output fields.

Table 2-32: show ip igmp proxy output

Entry	Description
Interface	Interface and Index of the interface.
Administrative status	Depends on the interface states – Enabled only if both host and downstream interfaces are up. Otherwise, Disabled if only one interface is up.
Operational status	Depends on Administrative status – either Up or Down depending on Administrative status of corresponding interfaces.
Upstream interface	As stated.
Number of multicast groups	The number of multicast groups supported by this proxy.

Table 2-33 explains the output fields.

Table 2-33: show ip igmp proxy groups output

Entry	Description
Group Address	Multicast address associated with each group.
Interface	Interface name, such as eth1, xe3/1, etc..
State	The state of the proxy group – can be either Active or Inactive.
Member state	The state of the proxy group member – can be either Idle or Delay, Idle is the default state.

show ip igmp ssm-map

Use this command to display IGMP SSM-map data.

Command Syntax

```
show ip igmp ssm-map
show ip igmp ssm-map A.B.C.D
show ip igmp (vrf NAME|) ssm-map
show ip igmp (vrf NAME|) ssm-map A.B.C.D
```

Parameters

`vrf`	Specify the VRF name.
`A.B.C.D`	Address of multicast group.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ip igmp ssm-map
SSM Mapping : Enabled
Database    : Static mappings configured
```

CHAPTER 3 Layer 2 IGMP Snooping Multicast Commands

This chapter describes commands for Internet Group Management Protocol (IGMP) multicast snooping.

igmp snooping

Use this command to enable IGMP Snooping. When this command is given in the Configure mode, IGMP snooping is enabled at switch level on all the vlans in switch. When this command is given at the VLAN interface level, IGMP Snooping is enabled for that VLAN.

Note: IGMP Snooping can be only enabled/disabled on VLAN interfaces.

Use the no parameter with this command to globally disable IGMP Snooping, or for the specified interface.

Command Syntax

```
igmp snooping
no igmp snooping
```

Parameter

None

Default

IGMP Snooping is enabled.

Command Mode

Interface mode for VLAN interface

Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#igmp snooping
(config)#interface vlan1.1
(config-if)#igmp snooping
```

igmp snooping fast-leave

Use this command to enable IGMP Snooping fast-leave processing. Fast-leave processing is analogous to immediate-leave processing; the IGMP group-membership is removed as soon as an IGMP leave group message is received without sending out a group-specific query.

Use the no parameter with this command to disable fast-leave processing.

Command Syntax

```
igmp snooping fast-leave
no igmp snooping fast-leave
```

Parameters

None

Default

IGMP Snooping fast-leave processing is disabled.

Command Mode

Interface mode for VLAN interface

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows how to enable fast-leave processing on a VLAN.

```
#configure terminal
(config)#interface vlan1.1
(config-if)#igmp snooping fast-leave
```

igmp snooping mrouter

Use this command to statically configure the specified VLAN constituent interface as a multicast router interface for IGMP Snooping in that VLAN.

Use the no parameter with this command to remove the static configuration of the interface as a multicast router interface.

Command Syntax

```
igmp snooping mrouter interface IFNAME
no igmp snooping mrouter interface IFNAME
```

Parameter

IFNAME	Specify the name of the interface.

Default

IGMP Snooping mrouter processing is disabled.

Command Mode

Interface mode for VLAN interface.

Applicability

This command was introduced before OcNOS version 1.3.

Example

This example shows interface fe8 statically configured to be a multicast router interface.

```
#configure terminal
(config)#interface vlan1.1
(config-if)#igmp snooping mrouter interface fe8
```

igmp snooping querier

Use this command to enable IGMP snooping querier functionality on a VLAN when IGMP is not enabled on the particular VLAN. When enabled, the IGMP Snooping querier sends out periodic IGMP queries for all interfaces on that VLAN.

The IGMP Snooping querier uses the 0.0.0.0 source IP address, because it only masquerades as a proxy IGMP querier for faster network convergence. It does not start, or automatically cease, the IGMP Querier operation if it detects query message(s) from a multicast router. It restarts as the IGMP Snooping querier if no queries are seen within the other querier interval.

Use the `no` parameter with this command to disable IGMP querier configuration.

Command Syntax

```
igmp snooping querier
no igmp snooping querier
```

Default

By default, Querier is disabled

Parameters

None

Command Mode

Interface mode for VLAN interface.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface vlan1.1
(config-if)#igmp snooping querier
```

igmp snooping report-suppression

Use this command to enable report suppression for IGMP version 1, 2 and 3 reports.

Use the no parameter with this command to disable report suppression.

Note: IGMP snooping report suppression is not supported on Qumran devices.

Command Syntax

```
igmp snooping report-suppression
no igmp snooping report-suppression
```

Default

By default, report suppression is enabled on x86.

Parameters

None

Command Mode

Interface mode for VLAN interface.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface vlan1.1
(config-if)#igmp snooping report-suppression
```

igmp snooping static-group

Use this command to statically configure group membership entries on an interface

Use the no parameter with this command to disable report suppression.

Command Syntax

```
igmp snooping static-group A.B.C.D interface IFNAME
no igmp snooping static-group A.B.C.D interface IFNAME
igmp snooping static-group A.B.C.D source A.B.C.D interface IFNAME
no igmp snooping static-group A.B.C.D source A.B.C.D interface IFNAME
```

Parameters

IFNAME	Specify the name of the interface.
A.B.C.D	Specify the IP address In case of static-group, Multicast Address to be Joined. In case of source, Source Address to be Joined.

Command Mode

Interface mode for VLAN interface.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#conf t
(config)#interface vlan1.1
(config-if)#igmp snooping static-group 230.0.0.1 interface xe2
(config-if)#igmp snooping static-group 230.0.0.1 source 10.10.10.10 interface
xe1
(config-if)#exit
(config)#exit
```

show igmp snooping interface

Use this command to know querier, fast-leave, report-suppression is enabled/disabled on that particular interface.

Command Syntax

```
show igmp snooping interface IFNAME
```

Parameters

IFNAME	Specify the name of the interface.

Command Mode

Exec and Privileged Exec mode

Default

By default, report suppression is disabled on Qumran devices.

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command displays the multicast router interfaces.

```
#show igmp snooping interface
Global IGMP Snooping information
IGMP Snooping Enabled
IGMPv1/v2 Report suppression Enabled
IGMPv3 Report suppression Enabled
IGMP Snooping information for vlan1.1
IGMP Snooping enabled
Snooping Querier none
IGMP Snooping other querier timeout is 255 seconds
Group Membership interval is 260 seconds
IGMPv2 fast-leave is disabled
IGMPv1/v2 Report suppression disabled
IGMPv3 Report suppression disabled
Router port detection using IGMP Queries
Number of router-ports: 0
Number of Groups: 0
Number of v1-reports: 0
Number of v2-reports: 0
Number of v2-leaves: 0
Number of v3-reports: 0
Active Ports:
xe5/1
IGMP Snooping information for vlan1.2
IGMP Snooping enabled
Snooping Querier enabled, address 0.0.0.0, Version 3
Querier interval: 125 seconds
Querier Last member query interval: 1000 milliseconds

IGMP Snooping information for vlan1.2
```

```
IGMP Snooping enabled
Snooping Querier enabled, address 0.0.0.0, Version 3
Querier interval: 125 seconds
Querier Last member query interval: 1000 milliseconds
IGMP Snooping maximum query response time is 10 seconds
IGMP Snooping Startup query interval is 31 seconds
Querier robustness: 2
IGMP Snooping other querier timeout is 255 seconds
Group Membership interval is 260 seconds
IGMPv2 fast-leave is disabled
IGMPv1/v2 Report suppression disabled
IGMPv3 Report suppression disabled
Router port detection using IGMP Queries
Number of router-ports: 0
Number of Groups: 0
Number of v1-reports: 0
Number of v2-reports: 0
Number of v2-leaves: 0
Number of v3-reports: 0
Active Ports:
xe5/1
```

show igmp snooping groups

Use this command to display the multicast groups learnt through snooping or statically configured.

Command Syntax

```
show igmp snooping groups
show igmp snooping groups details
show igmp snooping groups A.B.C.D
show igmp snooping groups A.B.C.D detail
show igmp snooping groups IFNAME
show igmp snooping groups IFNAME A.B.C.D
show igmp snooping groups IFNAME A.B.C.D detail
show igmp snooping groups IFNAME detail
```

Parameters

A.B.C.D	Specify multicast group address.
IFNAME	Specify the name of the interface.
detail	IGMPv3 source information.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
      #show igmp snooping groups
      IGMP Snooping Group Membership
      Group source list: (R - Remote, S - Static)
      Vlan   Group/Source Address    Interface      Flags   Uptime     Expires  Last
Reporter   Version
      200   230.0.0.1             xe1          S     00:02:07   static   0.0.0.0
V3
      #show igmp snooping groups detail
      IGMP Snooping Group Membership Details
      Flags: (R - Remote, S - Static)

      Interface:      xe1
      Group:          230.0.0.1
      Flags:          S
      Uptime:         00:02:08
      Group mode:     Exclude (Static)
      Last reporter:  0.0.0.0
      Source list is empty

      #show igmp snooping groups 230.0.0.1
```

```
      IGMP Snooping Group Membership
      Group source list: (R - Remote, S - Static)
      Vlan   Group/Source Address    Interface      Flags   Uptime     Expires  Last
Reporter   Version

      Last reporter:  0.0.0.0
      Source list is empty
```

Table 3-34: Show igmp snooping groups

Entries	Description
Interface	The interface (port) on the multicast router that is marked as taking place in the multicast.
Group	The multicast group identified by an IPv4 address.
Flags	S - Member is statically configured, R - Member is learned from the network.
Uptime	How long the member has been a part of the group.
Group mode	As stated.

Table 3-34: Show igmp snooping groups (Continued)

Entries	Description
Last reporter	In IGMPv3, a host can send a membership report that includes a list of source addresses. When the host sends a membership report in INCLUDE mode, the host is interested in group multicast traffic only from those sources in the source address list. If host sends a membership report in EXCLUDE mode, the host is interested in group multicast traffic from any source except the sources in the source address list. A host can also send an EXCLUDE report in which the source-list parameter is empty, which is known as an EXCLUDE NULL report. An EXCLUDE NULL report indicates that the host wants to join the multicast group and receive packets from all sources.
Vlan	VLAN number ID.
Group/Source Address	Multicast group and source addresses.
Interface	The interface (port) on the multicast router that is marked as taking place in the multicast.
Flags	S - Member is statically configured, R - Member is learned from the network.
Uptime	How long the member has been a part of the group.
Expires	Either by a timeout (IGMPv1) or by checking whether the member is still a part of the multicast (IGMPv2 or v3). Can also be statically configured.
Last Reporter	Indicates that the host wants to join a particular multicast group.
Version	IGMP version (v1, v2, or v3).

show igmp snooping mrouter

Use this command to display the multicast router interfaces, both configured and learned, in a VLAN.

Command Syntax

```
show igmp snooping mrouter IFNAME
```

Parameters

IFNAME	Specify the name of the interface.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command displays the multicast router interfaces in VLAN 1.1.

```
#show igmp snooping mrouter vlan1.1
VLAN    Interface             IP-address    Expires
1         xe1(static)
```

show igmp snooping statistics

Use this command to display IGMP Snooping statistics data.

Command Syntax

```
show igmp snooping statistics interface IFNAME
```

Parameters

IFNAME	Specify the name of the interface.

Command Mode

Exec and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show igmp snooping statistics interface vlan1.1
IGMP Snooping statistics for vlan1.1
Group Count            :  1
IGMPv1 reports received  :  0
IGMPv2 reports received   :  0
IGMPv2 leaves received   :  0
IGMPv3 reports received   :  0
IGMPv1 query warnings  :  0
IGMPv2 query warnings  :  0
IGMPv3 query warnings  :  0
```

CHAPTER 4 Layer 2 MLD Snooping Commands

This chapter describes the Layer 2 Multicast Listener Discovery (MLD) Snooping commands:

clear mld snooping group

Use this command to clear mld snooping groups.

Command Syntax

```
clear mld snooping group *
clear mld snooping group X.X.X.X (IFNAME|)
```

Parameters

*	Displays all groups
IFNAME	The name of the VLAN interface
X:X::X:X	Source address to use for static map group

Default

By default, mld snooping report suppression is disabled on Qumran devices.

Report suppression does not apply to MLDv2, so it is turned off by default for MLDv1 reports.

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#clear mld snooping group *
```

mld snooping

Use this command to enable MLD snooping. When this command is given in configure mode, MLD snooping is enabled at the switch level. When this command is given at the VLAN interface level, MLD snooping is enabled for that VLAN.

Use the no parameter with this command to globally disable MLD Snooping, or for the specified interface.

Command Syntax

```
mld snooping
no mld snooping
```

Parameters

None

Default

By default, MLD Snooping is enabled.

Command Mode

Configure mode and Interface mode for VLAN interface.

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

The following example shows the setting of accept-lifetime for key1 on the key chain named mychain.

```
#configure terminal
(config)#mld snooping
(config)#interface vlan1.100
(config-if)#mld snooping
```

mld snooping fast-leave

Use this command to enable MLD snooping fast-leave processing. MLD group-membership is removed, as soon as an MLD leave group message is received without sending out a group-specific query.

Use the no parameter with this command to disable fast-leave processing.

Command Syntax

```
mld snooping fast-leave
no mld snooping fast-leave
```

Parameters

None

Default

By default, MLD Snooping fast-leave processing is disabled.

Command Mode

Interface mode for VLAN interface

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface vlan1.100
(config-if)#mld snooping fast-leave
(config-if)#exit
```

mld snooping mrouter

Use this command to statically configure the specified VLAN constituent interface as a multicast router interface for MLD snooping in that VLAN.

Use the no parameter with this command to remove the static configuration of the interface as a multicast router interface.

Command Syntax

```
mld snooping mrouter interface IFNAME
no mld snooping mrouter interface IFNAME
```

Parameters

IFNAME	Specify the name of the interface.

Default

N/A

Command Mode

Interface mode for VLAN interface

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface vlan1.100
(config-if)#mld snooping mrouter interface eth1
(config-if)#exit
```

mld snooping querier

Use this command to enable MLD querier operation on a subnet (VLAN) when no multicast routing protocol is configured in the subnet (VLAN). When enabled, the MLD snooping querier sends out periodic MLD queries for all interfaces on that VLAN.

The MLD snooping querier uses the 0.0.0.0 source IP address, because it masquerades as a proxy MLD querier for faster network convergence. It does not start or automatically cease the MLD querier operation if it detects a query message from a multicast router. It restarts as MLD snooping querier if no queries are seen within another querier interval.

Note: This command can only be configured on VLAN interfaces.

Use the no parameter with this command to disable MLD querier configuration.

Command Syntax

```
mld snooping querier
no mld snooping querier
```

Parameters

None

Default

By default, MLD snooping querier is disabled.

Command Mode

Interface mode for VLAN interface

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#configure terminal
(config)#interface vlan1.100
(config-if)#mld snooping querier
(config-if)#exit
```

mld snooping report-suppression

Use this command to enable report suppression for MLD version 1.

Use the no parameter to disable report suppression.

Note: MLD Snooping command can only be configured on VLAN interfaces. MLD snooping report suppression is supported on x86 and not supported on Qumran devices.

Command Syntax

```
mld snooping report-suppression
no mld snooping report-suppression
```

Parameters

None

Default

By default, MLD snooping report suppression is enabled on x86.

Command Mode

Interface mode for VLAN interface

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface vlan1.100
(config-if)#mld snooping report-suppression
(config-if)#exit
```

show debugging mld snooping

Use this command to display debugging information for MLD.

Command Syntax

```
show debugging mld snooping
```

Parameters

None

Default

N/A

Command Mode

Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#show debugging mld snooping
MLD Snooping Debugging status:
  MLD Snooping Decoder debugging is on
  MLD Snooping Encoder debugging is on
  MLD Snooping Events debugging is on
  MLD Snooping FSM debugging is on
  MLD Snooping Tree-Info-Base (TIB) debugging is on
```

show mld snooping mrouter

Use this command to display the multicast router interfaces, both configured and learned, in a VLAN.

Command Syntax

```
show mld snooping mrouter (IFNAME|)
```

Parameters

IFNAME	The name of the VLAN interface

Default

None

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#show mld snooping mrouter vlan1.100
VLAN      Interface       IP-address                  Expires
100       eth3(dynamic)   fe80::a00:27ff:fe6f:5bc1   00:02:16

#show mld snooping mrouter
VLAN      Interface         IP-address                      Expires
400       eth4(static)      --                              --
100       eth1(dynamic)     fe80::a00:27ff:fe27:9856        00:02:19
200       eth2(dynamic)     fe80::a00:27ff:fe32:7951        00:02:45
300       eth3(dynamic)     fe80::a00:27ff:feff:f063        00:01:51
```

show mld snooping statistics

Use this command to display MLD snooping statistics data.

Command Syntax

```
show mld snooping statistics
show mld snooping statistics (interface IFNAME|)
show mld snooping statistics (count)
```

Parameters

IFNAME	The name of the VLAN interface
Count	Consolidated group statistics

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#show mld snooping statistics
MLD Snooping statistics for vlan1.300
 Group Count            :  2
 MLDv1 reports received :  0
 MLDv2 reports received :  2
 MLDv1 leaves received  :  0
 MLDv1 query warnings   :  0
 MLDv2 query warnings   :  0

#show mld snooping statistics count
MLD Snooping consolidated statistics
Total number of groups              :  2
Total MLDv1 reports received        :  0
Total MLDv2 reports received        :  4
Total MLDv1 leaves received         :  2
Total MLDv1 query warnings          :  0
Total MLDv2 query warnings          :  0

#show mld snooping statistics interface vlan1.100
MLD Snooping statistics for vlan1.100
 Group Count                          :  0
 MLDv1 reports received               :  0
 MLDv2 reports received               :  2
 MLDv1 leaves received                :  1
 MLDv1 query warnings                 :  0
 MLDv2 query warnings                 :  0
```

show mld snooping groups

Use this command to display MLD snooping groups.

Command Syntax

```
show mld snooping groups
show mld snooping groups (IFNAME|)
show mld snooping groups (IFNAME|) detail
show mld snooping groups X.X.X.X
show mld snooping groups X.X.X.X detail.
```

Parameters

`IFNAME`	The name of the VLAN interface
`X:X::X:X`	Address of multicast group
`detail`	MLDv2 source information

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#sh mld snooping groups detail
MLD Connected Group Membership Details for eth3
Interface:      eth3
Group:          ff1e::10
Uptime:         00:00:10
Group mode:     Include ()
Last reporter:  fe80::a00:27ff:febb:5235
Group source list: (R - Remote, M - SSM Mapping, S - Static )
Source Address   Uptime             v2 Exp       Fwd    Flags
3000::10         00:00:10           00:04:09   Yes       R
```

show mld snooping interface

Use this command to know querier, fast-leave, report-suppression is enabled/disabled on that particular interface.

Command Syntax

```
show mld snooping interface (IFNAME|)
```

Parameters

IFNAME	Name of the interface.

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Example

```
#sh mld snooping interface vlan1.100
 MLD Snooping information for vlan1.100 (Index 9)
 MLD Snooping is globally enabled
 MLD Snooping is enabled on this interface
 MLD Active, Non-Querier,
 Internet address is fe80::a00:27ff:fe8d:e47a
 MLD querying router is :
 MLD query interval is 125 seconds
 MLD querier timeout is 255 seconds
 MLD max query response time is 10 seconds
 Last member query response interval is 1000 milliseconds
 Group Membership interval is 260 seconds
 MLD Snooping fast-leave is not enabled
 MLD Snooping querier is not enabled
 MLD Snooping report suppression is disabled
 Number of Groups: 0
 Number of v1-reports: 0
 Number of v1-leaves: 0
 Number of v2-reports: 0
 Active Ports:
  eth2
```

Protocol Independent Multicasting Command Reference

Contents

This document contains these chapters:

CHAPTER 1 PIMv4 Commands

The chapter includes the commands that support the Protocol-Independent Multicast (PIM).

- ip pim propagation-delay
- ip pim register-rate-limit
- ip pim register-rp-reachability
- ip pim register-source
- ip pim register-suppression
- ip pim router-id
- ip pim rp-address
- ip pim rp-candidate
- ip pim rp-register-kat
- ip pim spt-threshold
- ip pim ssm
- ip pim state-refresh origination-interval
- ip pim unicast-bsm
- show debugging ip pim
- show debugging pim
- show ip msdp peer
- show ip msdp sa-cache
- show ip pim interface
- show ip pim interface df
- show ip pim mroute
- show ip pim neighbor
- show ip pim nexthop
- show ip pim bsr-router
- show ip pim local-members
- show ip pim rp-hash
- show ip pim rp mapping
- snmp restart pim
- undebug all ip pim

clear ip mroute

Use this command to delete all multicast route table entries and all multicast routes at the PIM protocol level.

Command Syntax

```
clear ip mroute *
clear ip mroute * pim (dense-mode|sparse-mode)
clear ip mroute A.B.C.D
clear ip mroute A.B.C.D A.B.C.D
clear ip mroute A.B.C.D A.B.C.D pim (dense-mode|sparse-mode)
clear ip mroute A.B.C.D pim sparse-mode
clear ip mroute statistics *
clear ip mroute statistics A.B.C.D
clear ip mroute statistics A.B.C.D A.B.C.D
clear ip mroute (vrf NAME|) *
clear ip mroute (vrf NAME|) * pim (dense-mode|sparse-mode)
clear ip mroute (vrf NAME|) A.B.C.D
clear ip mroute (vrf NAME|) A.B.C.D A.B.C.D
clear ip mroute (vrf NAME|) A.B.C.D A.B.C.D pim (dense-mode|sparse-mode)
clear ip mroute (vrf NAME|) A.B.C.D pim sparse-mode
clear ip mroute (vrf NAME|) statistics *
clear ip mroute (vrf NAME|) statistics A.B.C.D
clear ip mroute (vrf NAME|) statistics A.B.C.D A.B.C.D
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`*`	Delete all multicast routes
`pim`	Protocol Independent Multicast (PIM)
`A.B.C.D`	Clears group IP address
`A.B.C.D`	Clears source IP address
`dense-mode`	Clears multicast rout table for PIM dense-mode
`sparse-mode`	Clears multicast route table for PIM sparse mode
`statistics`	Clears multicast route statistics

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip mroute * pim sparse-mode
#clear ip mroute 224.2.2.2 4.4.4.4 pim sparse-mode
```

clear ip msdp peer

Use this command to clear the TCP connection to a Multicast Source Discovery Protocol (MSDP) peer.

This command closes the TCP connection to the peer, resets all the MSDP peer statistics, and clears the input and output queues to and from the MSDP peer.

Command Syntax

```
clear ip msdp peer (A.B.C.D|)
clear ip msdp (vrf NAME|) peer (A.B.C.D|)
```

Parameters

A.B.C.D	IPv4 address of peer
NAME	Name of the VPN routing/forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#clear ip msdp peer 192.168.1.26
```

clear ip msdp sa-cache

Use this command to clear Multicast Source Discovery Protocol (MSDP) Source-Active (SA) cache entries.

Command Syntax

```
clear ip msdp sa-cache (A.B.C.D |)
clear ip msdp (vrf NAME|) sa-cache (A.B.C.D |)
```

Parameters

A.B.C.D	Multicast group address; if not specified, all SA cache entries are cleared
NAME	Name of the VPN routing/forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#clear ip msdp sa-cache 225.25.25.1
```

clear ip pim sparse-mode

Use this command to clear all rendezvous point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Command Syntax

```
clear ip pim sparse-mode bsr rp-set *
clear ip pim (vrf NAME|) sparse-mode bsr rp-set *
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`rp-set`	PIMv2 bootstrap router RP set
`bsr`	PIMv2 Bootstrap Router
`*`	Clear all RP sets

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ip pim sparse-mode bsr rp-set *
```

debug ip pim

Use this command to enable debugging for PIM.

Use the no option with this command to deactivate debugging for PIM.

Command Syntax

```
debug ip pim (all|events|mfc|mib|mtrace|msdp|nexthop|nsm|packet|state|timer)
debug ip pim (vrf
  NAME|)(all|events|mfc|mib|mtrace|msdp|nexthop|nsm|packet|state|timer)
no debug ip pim (all|events|mfc|mib|mtrace|msdp|nexthop|nsm|packet|state|timer)
no debug ip pim (vrf NAME|) (all|events|mfc|mib|mtrace|msdp|nexthop|nsm|packet
  |state|timer)
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`all`	Enable debugging for all PIM events
`events`	Enable debugging for general configuration, VRF context
`mfc`	Enable debugging for MFC updates
`mib`	Enable debugging for MIB entries
`mtrace`	Enable debugging for MTRACE messages
`msdp`	Enable debugging for MSDP
`nexthop`	Enable debugging for Reverse Path Forwarding (RPF) neighbor nexthop cache handling
`nsm`	Enable debugging for NSM
`packet`	Enable debugging for PIM packets
`state`	Enable debugging for PIM states
`timer`	Enable debugging for PIM timers

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug ip pim all
```

debug ip pim packet

Use this command to activate debugging of incoming or outgoing PIM packets.

Use the no option with this command to deactivate debugging of incoming or outgoing PIM packets.

Command Syntax

```
debug ip pim packet
debug ip pim packet in
debug ip pim packet out
debug ip pim (vrf NAME|) packet
debug ip pim (vrf NAME|) packet in
debug ip pim (vrf NAME|) packet out
no debug ip pim packet
no debug ip pim packet in
no debug ip pim packet out
no debug ip pim (vrf NAME|) packet
no debug ip pim (vrf NAME|) packet in
no debug ip pim (vrf NAME|) packet out
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
in	Debug incoming packets
out	Debug outgoing packets

Default

By default, all debug options are disabled.

Command Mode

Configure and Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ip pim packet in
```

debug pim all

Use this command to enable debugging of all PIM events.

Use the no option with this command to disable debugging for PIM.

Command Syntax

```
debug pim all
debug pim (vrf NAME|) all
no debug pim all
no debug pim (vrf NAME|) all
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug pim all
```

debug ip pim timer assert

Use this command to enable debugging of the PIM assert timers.

Use the no option with this command to disable debugging for PIM assert timers.

Command Syntax

```
debug ip pim timer assert
debug ip pim timer assert at
debug ip pim (vrf NAME|) timer assert
debug ip pim (vrf NAME|) timer assert at
no debug ip pim timer assert
no debug ip pim timer assert at
no debug ip pim (vrf NAME|) timer assert
no debug ip pim (vrf NAME|) timer assert at
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
at	Use this option to turn on or off debugging of the PIM Assert Timer

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ip pim timer assert at
```

debug ip pim timer bsr

Use this command to enable debugging of PIM BSR time.

Use the no option with this command to disable debugging of the PIM BSR timer.

Command Syntax

```
debug ip pim timer bsr
debug ip pim timer bsr bst
debug ip pim timer bsr crp
debug ip pim (vrf NAME|) timer bsr
debug ip pim (vrf NAME|) timer bsr bst
debug ip pim (vrf NAME|) timer bsr crp
no debug ip pim timer bsr
no debug ip pim timer bsr bst
no debug ip pim timer bsr crp
no debug ip pim (vrf NAME|) timer bsr
no debug ip pim (vrf NAME|) timer bsr bst
no debug ip pim (vrf NAME|) timer bsr crp
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`bst`	Turn on or turn off the bootstrap debugging timer
`crp`	Turn on or turn off the Candidate-RP debugging timer

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ip pim timer bsr bst
```

debug ip pim timer hello

Use this command to enable debugging of various PIM Hello timers.

Use the no option with this command to disable debugging of the PIM Hello timers.

Command Syntax

```
debug ip pim timer hello
debug ip pim timer hello ht
debug ip pim timer hello nlt
debug ip pim timer hello tht
debug ip pim (vrf NAME|) timer hello
debug ip pim (vrf NAME|) timer hello ht
debug ip pim (vrf NAME|) timer hello nlt
debug ip pim (vrf NAME|) timer hello tht
no debug ip pim timer hello
no debug ip pim timer hello ht
no debug ip pim timer hello nlt
no debug ip pim timer hello tht
no debug ip pim (vrf NAME|) timer hello
no debug ip pim (vrf NAME|) timer hello ht
no debug ip pim (vrf NAME|) timer hello nlt
no debug ip pim (vrf NAME|) timer hello tht
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
ht	Turn on or turn off the PIM Hello debugging timer (ht)
nlt	Turn on or turn off the PIM Neighbor Liveliness debugging timer (nlt)
tht	Turn on or turn off the Triggered Hello Timer (tht)

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
```

```
(config)#debug ip pim timer hello ht
```

debug ip pim timer joinprune

Use this command to enable debugging of various PIM JoinPrune timers.

Use the no option with this command to disable the debugging of the PIM JoinPrune timers.

Command Syntax

```
debug ip pim timer joinprune
debug ip pim timer joinprune et
debug ip pim timer joinprune kat
debug ip pim timer joinprune jt
debug ip pim timer joinprune ot
debug ip pim timer joinprune ppt
debug ip pim (vrf NAME|) timer joinprune
debug ip pim (vrf NAME|) timer joinprune et
debug ip pim (vrf NAME|) timer joinprune kat
debug ip pim (vrf NAME|) timer joinprune jt
debug ip pim (vrf NAME|) timer joinprune ot
debug ip pim (vrf NAME|) timer joinprune ppt
no debug ip pim timer joinprune
no debug ip pim timer joinprune et
no debug ip pim timer joinprune kat
no debug ip pim timer joinprune jt
no debug ip pim timer joinprune ot
no debug ip pim timer joinprune ppt
no debug ip pim (vrf NAME|) timer joinprune
no debug ip pim (vrf NAME|) timer joinprune et
no debug ip pim (vrf NAME|) timer joinprune kat
no debug ip pim (vrf NAME|) timer joinprune jt
no debug ip pim (vrf NAME|) timer joinprune ot
no debug ip pim (vrf NAME|) timer joinprune ppt
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`et`	Turn on or turn off the PIM JoinPrune expiry timer (et)
`jt`	Turn on or turn off the PIM JoinPrune upstream Join Timer (jt)
`kat`	Turn on or turn off the PIM JoinPrune Keep Alive timer (kat)
`ot`	Turn on or turn off the PIM JoinPrune Upstream Override Timer (ot)
`ppt`	Turn on or turn off the PIM JoinPrune PrunePending Timer ((ppt)

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ip pim timer joinprune et
```

debug ip pim timer register

Use this command to enable the PIM register timer's debugging.

Use the no option with this command to disable the PIM register timer's debugging.

Command Syntax

```
debug ip pim timer register
debug ip pim timer register rst
debug ip pim (vrf NAME|) timer register
debug ip pim (vrf NAME|) timer register rst
no debug ip pim timer register
no debug ip pim timer register rst
no debug ip pim (vrf NAME|) timer register
no debug ip pim (vrf NAME|) timer register rst
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`rst`	Turn on or turn off the PIM Register Stop Timer (rst)

Default

By default, all debug options are disabled.

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ip pim timer register
```

ip msdp default-peer

Use this command to set a Multicast Source Discovery Protocol (MSDP) peer from which to accept Source-Active (SA) messages.

You can have multiple active default peers:

- When you enter multiple `ip msdp default-peer` commands *with* a `prefix-list` keyword, all the default peers are used at the same time for different RP prefixes. This form is typically used in a service provider cloud that connects stub site clouds.
- When you enter multiple `ip msdp default-peer` commands *without* a `prefix-list` keyword, a single active peer accepts all SA messages. If that peer fails, the next configured default peer accepts all SA messages. This form is typically used at a stub site.

Use the `no` option with this command to stop accepting SA messages from a peer.

Command Syntax

```
ip msdp default-peer A.B.C.D (prefix-list WORD|)
ip msdp (vrf NAME|) default-peer A.B.C.D (prefix-list WORD|)
no ip msdp default-peer A.B.C.D
no ip msdp (vrf NAME|) default-peer A.B.C.D
```

Parameters

`A.B.C.D`	IPv4 address of a previously configured MSDP peer
`prefix-list`	Make this the default peer only for an access list of rendezvous points (RPs):
`WORD`	Access list name
`NAME`	Name of the VPN routing/forwarding instance

Default

The IPv4 multicast forwarding is disabled by default

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ip msdp default-peer 192.168.1.26 prefix-list xyz
```

ip msdp mesh-group

Use this command to add a Multicast Source Discovery Protocol (MSDP) peer to a mesh group.

You can set up multiple mesh groups on the same device and multiple peers per mesh group.

Use the no option with this command to remove a peer from a mesh group.

Command Syntax

```
ip msdp mesh-group WORD A.B.C.D
ip msdp (vrf NAME|) mesh-group WORD A.B.C.D
no ip msdp mesh-group WORD A.B.C.D
no ip msdp (vrf NAME|) mesh-group WORD A.B.C.D
```

Parameters

WORD	Name of the mesh group
A.B.C.D	IPv4 address of peer
NAME	Name of the VPN routing/forwarding instance

Default

The IPv4 multicast forwarding is disabled by default

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ip msdp mesh-group mg-1 192.168.1.26
```

ip msdp originator-id

Use this command to allow a Multicast Source Discovery Protocol (MSDP) speaker that originates a Source-Active (SA) message to use the IP address of an interface as a rendezvous point (RP) address in the SA message.

By default, OcNOS uses the RP address of the device.

Use the no option with this command to use the RP address of the device in SA messages.

Command Syntax

```
ip msdp originator-id IFNAME
ip msdp (vrf NAME|) originator-id IFNAME
no ip msdp originator-id IFNAME
no ip msdp (vrf NAME|) originator-id IFNAME
```

Parameters

IFNAME	Use the IP address of this interface as an RP address in SA messages
NAME	Name of the VPN routing/forwarding instance

Default

The RP address is used as the originator ID.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ip msdp originator-id eth2
```

ip msdp password

Use this command to set an MD5-shared password key used for authenticating a Multicast Source Discovery Protocol (MSDP) peer. By default, no MD5 password is enabled.

Use the no option with this command to remove a password.

Command Syntax

```
ip msdp password WORD peer A.B.C.D
ip msdp (vrf NAME|) password WORD peer A.B.C.D
no ip msdp password WORD peer A.B.C.D
no ip msdp (vrf NAME|) password WORD peer A.B.C.D
```

Parameters

WORD	Password
A.B.C.D	IPv4 address of peer
NAME	Name of the VPN routing/forwarding instance

Default

The MD5 password authentication for TCP connections between MSDP peer is disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ip msdp password S#m*u104!! peer 192.168.1.26
```

ip msdp peer

Use this command to configure an Multicast Source Discovery Protocol (MSDP) peer relationship.

Use the no option with this command to remove a peer relationship.

Command Syntax

```
ip msdp peer A.B.C.D ((connect-source (IFNAME))|)
ip msdp (vrf NAME|) peer A.B.C.D ((connect-source (IFNAME))|)
ip msdp peer A.B.C.D connect-source A.B.C.D
ip msdp (vrf Name|) peer A.B.C.D connect-source A.B.C.D
no ip msdp peer A.B.C.D
no ip msdp (vrf NAME|) peer A.B.C.D
```

Parameters

A.B.C.D	IP address of the potential peer
A.B.C.D	IP address of local peer
IFNAME	Use the primary address of this interface for the TCP connection with the peer
NAME	Name of the VPN routing/forwarding instance

Default

By default, all ip msdp options are disabled.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ip msdp peer 192.168.1.26 connect-source eth2
```

ip pim accept-register

Use this command to configure the ability to filter out multicast sources specified by the given access-list at the RP, so that the RP will accept/refuse to perform the Register mechanism for the packets sent by the specified sources. By default, the RP accepts Register packets from all multicast sources.

Use the no option with this command to revert to default.

Command Syntax

```
ip pim accept-register list WORD
ip pim (vrf NAME|) accept-register list WORD
no ip pim accept-register
no ip pim (vrf NAME|) accept-register
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
WORD	Name of a standard access list

Default

By default, all ip pim options are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim accept-register list xyz

(config)#no ip pim accept-register
```

ip pim anycast-rp

Use this command to configure the Anycast RP in the RP set.

Use the no option with this command to remove the configuration.

Command Syntax

```
ip pim anycast-rp A.B.C.D A.B.C.D
ip pim (vrf NAME|) anycast-rp A.B.C.D A.B.C.D
no ip pim anycast-rp A.B.C.D
no ip pim anycast-rp A.B.C.D A.B.C.D
no ip pim (vrf NAME|) anycast-rp A.B.C.D
no ip pim (vrf NAME|) anycast-rp A.B.C.D A.B.C.D
```

Parameters

`vrf`	The VPN routing/forwarding instance.
`NAME`	Specify the name of the VPN routing/forwarding instance.
`A.B.C.D`	Unicast IP address of the Anycast RP set. An Anycast RP set is a collection of RPs in the same domain.
`A.B.C.D`	Destination IP address where Register messages are copied and sent. A Member RP is an individual RP member in the Anycast RP set.

Default

By default, all ip pim options are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to configure the Anycast RP in the RP set.

```
#configure terminal
(config)#ip pim anycast-rp 1.1.1.1 10.10.10.10
```

The following example shows how to remove the configuration.

```
#configure terminal
(config)#no ip pim anycast-rp 1.1.1.1 10.10.10.10
```

ip pim bidir-enable

Use this command to enable Bidirectional PIM.

Use the no option with this command to disable Bidirectional PIM.

Command Syntax

```
ip pim bidir-enable
no ip pim bidir-enable
```

Parameters

None

Default

By default, bidirectional pim is disabled.

Command Mode

Global mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#ip pim bidir-enable

#configure terminal
(config)#no ip pim bidir-enable
```

ip pim bidir-offer-interval

Use this command to configure the bidirectional pim designated forwarder (DF) election offer message interval time. Time interval default unit is seconds.

Use the no command to revert the offer interval period configuration to the default value.

Command Syntax

```
ip pim bidir-offer-interval <1-20000> (msec|)
no ip pim bidir-offer-interval
```

Parameters

msec	Specify interval time in milliseconds

Default

The default value for interval time is 100 ms.

Command Mode

Global mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#ip pim bidir-offer-interval 123 msec
(config)#no ip pim bidir-offer-interval
```

ip pim bidir-offer-limit

Use this command to configure the number of unanswered offers before the device changes the interface state to the designated forwarder (DF) Winner

Use the no command to reset the offer limit to its default

Command Syntax

```
ip pim bidir-offer-limit <4-100>
no ip pim bidir-offer-limit
```

Parameters

<4-100>	Specify the limit of unanswered offers.

Default

The default value is three unanswered offers.

Command Mode

Global mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
#configure terminal
(config)#ip pim bidir-offer-limit 50
(config)#no ip pim bidir-offer-limit
```

ip pim bsr-border

Use this command to prevent bootstrap router (BSR) messages from being sent or received through an interface.

When this command is configured on an interface, no PIM Version 2 BSR messages are sent or received through the interface. Use this command to configure an interface bordering another PIM domain to avoid the exchange of BSR messages between the two domains. BSR messages should not be exchanged between different domains, because routers in one domain may elect rendezvous points (RPs) in the other domain, resulting in a protocol malfunction or loss of isolation between the domains.

Note: This command does not set up multicast boundaries. It only sets up a PIM domain BSR message border.

Use the no option with this command to remove the BSR border configuration.

Command Syntax

```
ip pim bsr-border
no ip pim bsr-border
```

Default

By default, the ip pim bsr-border is disabled.

Parameters

None

Default

Bootstrap router border configuration is disabled by default.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures the interface to be the PIM domain border:

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim bsr-border

(config)#interface eth0
(config-if)#no ip pim bsr-border
```

ip pim bsr-candidate

Use this command to give the router the candidate BSR status using the specified IP address of the interface.

Use the no option with this command to disable this function.

Command Syntax

```
ip pim bsr-candidate IFNAME
ip pim bsr-candidate IFNAME <0-32>
ip pim bsr-candidate IFNAME <0-32> <0-255>
ip pim (vrf NAME|) bsr-candidate IFNAME
ip pim (vrf NAME|) bsr-candidate IFNAME <0-32>
ip pim (vrf NAME|) bsr-candidate IFNAME <0-32> <0-255>
no ip pim bsr-candidate (IFNAME|)
no ip pim (vrf NAME|) bsr-candidate (IFNAME|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
IFNAME	Specify the name of the interface
<0-32>	Specify a hash mask length for RP selection
<0-255>	Specify a priority for a BSR candidate

Default

The router is not configured to announce itself as a candidate BSR.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim bsr-candidate eth0 20 30
```

ip pim cisco-register-checksum

Use this command to configure the option to calculate the register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to revert to the default settings.

Command Syntax

```
ip pim cisco-register-checksum
ip pim cisco-register-checksum group-list WORD
ip pim (vrf NAME|) cisco-register-checksum
ip pim (vrf NAME|) cisco-register-checksum group-list WORD
no ip pim cisco-register-checksum
no ip pim cisco-register-checksum group-list WORD
no ip pim (vrf NAME|) cisco-register-checksum
no ip pim (vrf NAME|) cisco-register-checksum group-list WORD
```

Parameters

`vrf`	The VPN routing/forwarding instance.
`NAME`	Specify the name of the VPN routing/forwarding instance.
`group-list`	Use this parameter to configure the option to calculate the register checksum over the whole packet on multicast groups specified by the access-list.
`WORD`	IP named standard access list.

Default

This command is disabled by default. By default, Register Checksum is calculated only over the header.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim cisco-register-checksum

#configure terminal
(config)#ip pim cisco-register-checksum group-list xyz
(config)#ip access-list 34 permit 224.0.1.3
```

ip pim

Use this command to enable PIM dense-mode or sparse-mode on the current interface.

Use the `no` option with this command to disable PIM dense-mode or sparse-mode or sparse-dense-mode on the interface.

Command Syntax

```
ip pim (dense-mode|sparse-mode)
no ip pim (dense-mode|sparse-mode)
```

Parameters

`dense-mode`	Enable PIM dense-mode operation
`sparse-mode`	Enable PIM sparse-mode

Default

By default, the ip pim option is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim dense-mode

(config)#interface eth0
(config-if)#no ip pim dense-mode

(config)#interface eth0
(config-if)#ip pim sparse-mode

(config-if)#no ip pim sparse-mode
```

ip pim passive

Use this command to enable or disable passive mode operation for local members on the interface. Passive mode essentially stops PIM transactions on the interface, allowing only the Internet Group Management Protocol (IGMP) mechanism to be active.

Use the no option with this command to disable the passive mode.

Command Syntax

```
ip pim (dense-mode|sparse-mode) passive
no ip pim (dense-mode|sparse-mode) passive
```

Parameters

`dense-mode`	Enable passive operation for PIM dense-mode
`sparse-mode`	Enable passive operation for PIM sparse-mode

Default

By default, the ip pim option is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim dense-mode passive

(config)#interface eth0
(config-if)#no ip pim dense-mode passive

#configure terminal
(config)#interface eth0
(config-if)#ip pim sparse-mode passive

(config)#interface eth0
(config-if)#no ip pim sparse-mode passive
```

ip pim dr-priority

Use this command to set the designated router's priority value.

Use the no option with this command to remove the priority from the DR.

Command Syntax

```
ip pim dr-priority <0-4294967294>
no ip pim dr-priority (<0-4294967294>|)
```

Parameter

`<0-4294967294>` Valid range of values for DR priority, with a higher value resulting in a higher preference

Default

The default DR priority value is 1.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim dr-priority 11234

(config)#interface eth0
(config-if)#no ip pim dr-priority 11234
```

ip pim exclude-genid

Use this command to exclude the GenID (generated ID) option from Hello packets sent by the PIM module on an interface. This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to restore PIM to its default setting.

Command Syntax

```
ip pim exclude-genid
no ip pim exclude-genid
```

Parameters

None

Default

By default, the ip pim exclude-genid command is disabled.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Default

By default, this command is disabled; that is, the GenID option is included.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim exclude-genid

(config)#interface eth0
(config-if)#no ip pim exclude-genid
```

ip pim hello-holdtime

Use this command to configure a hello holdtime other than the default(`3.5 * hello_interval` seconds).

When configuring `hello-holdtime`, if the configured value is less than the current `hello_interval`, it is refused.

When removing a configured `hello_holdtime`, the value is reset to (`3.5 *` current `hello_interval`) value.

Every time the hello_interval is updated, the hello-holdtime is also updated according to rules below:

If the hello_holdtime is not configured, or if the hello_holdtime is configured, but is less than the current hello_interval value, it is modified to (3.5 * hello_interval). Otherwise, the configured value is maintained.

Use the `no` option with this command to remove the configured hello-holdtime.

Command Syntax

```
ip pim hello-holdtime <1-65535>
no ip pim hello-holdtime
```

Parameter

`<1-65535>`	Range of values for hello-holdtime, in seconds

Default

The default hello-holdtime is 105 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim hello-holdtime 123

(config)#interface eth0
(config-if)#no ip pim hello-holdtime
```

ip pim hello-interval

Use this command to configure a hello interval value other than the default. When a hello-interval is configured and hello-holdtime is not configured, or when the hello-holdtime value configured is less than the new hello-interval value, the holdtime value is modified to (3.5 * hello_interval). Otherwise, the hello-holdtime value is the configured value.

Use the no option with this command to reset the hello-interval to its default value.

Command Syntax

```
ip pim hello-interval <1-18724>
no ip pim hello-interval
```

Parameter

<1-18724>	Range of values for the hello-interval. No fractional values are allowed in seconds.

Default

The default value for hello-interval is 30 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim hello-interval 123

(config)#interface eth0
(config-if)#no ip pim hello-interval
```

ip pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection. This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to remove this setting.

Command Syntax

```
ip pim ignore-rp-set-priority
ip pim (vrf NAME|) ignore-rp-set-priority
no ip pim ignore-rp-set-priority
no ip pim (vrf NAME|) ignore-rp-set-priority
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Default

By default, all ip pim options are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim ignore-rp-set-priority

#configure terminal
(config)#no ip pim ignore-rp-set-priority
```

ip pim jp-timer

Use this command to set a PIM join/prune timer.

Use the no option with this command to remove the join/prune timer.

Command Syntax

```
ip pim jp-timer <1-65535>
ip pim (vrf NAME|) jp-timer <1-65535>
no ip pim jp-timer
no ip pim jp-timer <1-65535>
no ip pim (vrf NAME|) jp-timer
no ip pim (vrf NAME|) jp-timer <1-65535>
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
<1-65535>	Range of values for the Join/Prune timer, in seconds

Default

The ip pim jp-timer default value is 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim jp-timer 234

#configure terminal
(config)#no ip pim jp-timer 234
```

ip pim neighbor-filter

Use this command to enable filtering of neighbors on the interface. When configuring a neighbor filter, PIM either not establish adjacency with neighbor or terminates adjacency with existing neighbors, when denied by filtering access list.

Use the no option with this command to disable filtering of neighbors on the interface.

Command Syntax

```
ip pim neighbor-filter WORD
no ip pim neighbor-filter WORD
```

Parameters

WORD	Name of an IP standard access list

Default

By default, the ip pim option is disabled.

Command Mode

Interface mode

Default

This command is disabled by default there is no filtering.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim neighbor-filter xyz
(config-if)#exit
(config)#ip access-list deny 192.168.1.53
(config)#ip access-list permit any
```

ip pim propagation-delay

Use this command to configure a propagation delay value for PIM.

Use the no option with this command to return the propagation delay to its default value.

Command Syntax

```
ip pim propagation-delay <0-32767>
no ip pim propagation-delay
```

Parameter

<0-32767>	Range of values for propagation delay, in milliseconds

Default

The default propagation delay is 500 milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim propagation-delay 1000

(config)#interface eth0
(config-if)#no ip pim propagation-delay
```

ip pim register-rate-limit

Use this command to configure the rate of Register packets sent by this designated router (DR), in number of packets per second.

Use the no option to remove the register-rate-limit configuration.

Note: The configured rate is per (S,G) state, and is not a system-wide rate.

Command Syntax

```
ip pim register-rate-limit <1-65535>
ip pim (vrf NAME|) register-rate-limit <1-65535>
no ip pim register-rate-limit <1-65535|>
no ip pim (vrf NAME|) register-rate-limit <1-65535|>
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`<1-65535>`	Range of values for packets to send per second

Default

No rate limit is set for PIM-SM register packets.

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim register-rate-limit 3444

#configure terminal
(config)#no ip pim register-rate-limit
```

ip pim register-rp-reachability

Use this command to enable the RP reachability check for PIM Registers at the DR.

Use the no option to reset to disable the RP reachability check for PIM Registers at the DR.

Note: “ip pim register-rp-reachability” is default configuration and it would not be shown in running-configuration, even if admin configures it. If admin does "no" command of this configuration, it would be shown in running-configuration.

Command Syntax

```
ip pim register-rp-reachability
ip pim (vrf NAME|) register-rp-reachability
no ip pim register-rp-reachability
no ip pim (vrf NAME|) register-rp-reachability
```

Parameter

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance

Default

The default setting is checking for rendezvous point reachability,

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim register-rp-reachability
```

ip pim register-source

Use this command to configure the source address of Register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the no option to remove the source address of register packets sent by this DR, and reset it to use the default source address, that is, the address of the RPF interface toward the source host.

The configured address must be a reachable address so the RP can send corresponding Register-Stop messages in response. This address is usually the loopback interface address, but can also be other physical addresses. The address must be advertised by unicast routing protocols on the DR.

Note: The interface configured does not require PIM to be enabled.

Command Syntax

```
ip pim register-source A.B.C.D
ip pim register-source IFNAME
ip pim (vrf NAME|) register-source A.B.C.D
ip pim (vrf NAME|) register-source IFNAME
no ip pim register-source (A.B.C.D|)
no ip pim register-source (IFNAME|)
no ip pim (vrf NAME|) register-source (A.B.C.D|)
no ip pim (vrf NAME|) register-source (IFNAME|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
A.B.C.D	The IP address to use as the source of the register packets
IFNAME	The name of the interface to use as the source of the register packets

Default

By default, the IP address of the outgoing interface of the DR leading toward the RP is used as the IP source address of a register message.

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim register-source 3.3.3.2
```

ip pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default value of 60 seconds. Configuring this value modifies register-suppression time at the DR; configuring this value at the RP modifies the RP-keepalive-period value if the `ip pim rp-register-kat` command is not used.

Use the no option to remove the register-suppression setting.

Command Syntax

```
ip pim register-suppression <1-65535>
ip pim (vrf NAME|) register-suppression <1-65535>
no ip pim register-suppression
no ip pim (vrf NAME|) register-suppression
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`<1-65535>`	Range of values for register suppression time in seconds

Default

By default, the ip pim option is disabled.

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim register-suppression 555

#configure terminal
(config)#no ip pim register-suppression
```

ip pim router-id

Use this command to configure PIM router-ID to uniquely identify the router.By default, PIM registers for the NSM router-id service. This command will override the router-id received from NSM.

Use the `no` option with this command to unconfigure PIM router-ID. This will make PIM fall back to the NSM router-id

Command Syntax

```
ip pim (vrf NAME|) router-id A.B.C.D
no ip pim (vrf NAME|) router-id A.B.C.D
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`A.B.C.D`	Specify the Router ID

Default

By default, the ip pim option is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim router-id 1.1.1.1

(config)#no ip pim router-id 1.1.1.1
```

ip pim rp-address

Use this command to statically configure Rendezvous Point (RP) address for multicast groups.

Use the no option to remove the RP address.

OcNOS PIM supports multiple static RPs. It also supports static-RP and Bootsrtrap Router (BSR) mechanism simultaneously. The following list states the correct usage of this command:

- If RP-address configured through BSR and RP-address configured statically are both available for a group range, the RP-address configured through BSR is chosen over statically configured RP-address.
- One static-RP can be configured for multiple group ranges using Access Lists. However, configuring multiple static RPs (using `ip pim rp-address` command) with the same RP address is not allowed. The static-RP can either be configured for the whole multicast group range `224/4` (without ACL) or for specific group ranges (using ACL). For example, configuring `ip pim rp-address 1.2.3.4` will configure static-RP 1.2.3.4 for the default group range `224/4`. Configuring `ip pim rp-address 5.6.7.8 grp-list` will configure static-RP `5.6.7.8` for all the group ranges represented by `Permit` filters in `grp-list` ACL.
- If multiple static-RPs are available for a group range, then one with the highest IP address is chosen.
- Only `permit` filters in ACL are considered as valid group ranges. The default `Permit` filter `0.0.0.0/0` is converted to default multicast filter `224/4`.
- When selecting static-RPs for a group range, the first element, with the static-RP with highest IP address, is chosen.
- Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the `ip pim rp-address` command without the `override` keyword. Commands with the `override` keyword take precedence over dynamically learned mappings.

Command Syntax

```
ip pim rp-address A.B.C.D (override|)
ip pim rp-address A.B.C.D WORD (override|)
ip pim rp-address A.B.C.D WORD (bidir|)
ip pim (vrf NAME|) rp-address A.B.C.D (override|)
ip pim (vrf NAME|) rp-address A.B.C.D WORD (override|)
ip pim (vrf NAME|) rp-address A.B.C.D WORD (bidir|)
no ip pim rp-address A.B.C.D
no ip pim rp-address A.B.C.D WORD
no ip pim (vrf NAME|) rp-address A.B.C.D
no ip pim (vrf NAME|) rp-address A.B.C.D WORD
```

Parameters

`Bidir`	Bidirectional RP address
`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`WORD`	Standard Access-list name
`override`	Static RP overrides dynamically-learned RP

Default

No PIM static group-to-RP mappings are configured.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#ip pim rp-address 3.3.3.3 xyz
(config)#ip pim rp-address 2.2.2.2 ip1 bidir
```

ip pim rp-candidate

Use this command to give the router a candidate RP status using the IP address of the specified interface.

Use the no option along with this command to remove the settings.

Command Syntax

```
ip pim rp-candidate IFNAME (bidir|) ((group-list WORD)|) (interval <0-16383>|)
  (priority <0-255>|)
ip pim (vrf NAME) rp-candidate IFNAME (bidir|) ((group-list WORD)|) (interval <0-
  16383>|) (priority <0-255>|)
no ip pim rp-candidate (IFNAME|)
no ip pim (vrf NAME) rp-candidate (IFNAME|)
```

Parameters

`vrf NAME`	The VPN routing/forwarding instance
`IFNAME`	Specify an interface name
`WORD`	A named standard access list
`group-list`	Group Ranges for this C-RP
`interval`	C-RP advertisement interval
`priority`	Candidate-RP priority
`<0-16383>`	Range of values for candidate-RP advertisement interval, in seconds
`<0-255>`	Range of values for priority of an RP candidate

Default

The ip pim rp-candidate default priority is 192 and interval is 60 seconds.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim rp-candidate eth0

(config)#no ip pim rp-candidate eth0
```

ip pim rp-register-kat

Use this command to configure a Keepalive Timer (KAT) value for (S,G) states at RP to monitor PIM register packets, overriding the generic KAT timer value.

Use the no option to remove this configuration.

Command Syntax

```
ip pim rp-register-kat <1-65535>
ip pim (vrf NAME|) rp-register-kat <1-65535>
no ip pim rp-register-kat
no ip pim (vrf NAME|) rp-register-kat
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
<1-65535>	Range of values for a KAT time in seconds

Default

The ip pim rp-register-kat default is 60 seconds.

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ip pim rp-register-kat 3454

(config)#no ip pim rp-register-kat
```

ip pim spt-threshold

Use this command to turn on the ability of the last-hop PIM router to switch to SPT.

Use the no option with this command to turn off the ability of the last-hop PIM router to switch to SPT.

Note: This option is binary, meaning that the switching to SPT happens either at the receiving of the first data packet or not at all. It is not rate-based.

Command Syntax

```
ip pim spt-threshold
ip pim spt-threshold group-list WORD
ip pim (vrf NAME|) spt-threshold
ip pim (vrf NAME|) spt-threshold group-list WORD
no ip pim spt-threshold
no ip pim spt-threshold group-list WORD
no ip pim (vrf NAME|) spt-threshold
no ip pim (vrf NAME|) spt-threshold group-list WORD
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`group-list`	Enable the ability for the last-hop PIM router to switch to SPT for multicast group addresses indicated by the given access-list
`WORD`	A named standard access list

Default

When this command is not used, the PIM leaf router joins the shortest path tree immediately after the first packet arrives from a new source.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ip pim spt-threshold

#configure terminal
(config)#ip pim spt-threshold group-list LIST1
(config)#ip access-list permit 224.0.1.3

#configure terminal
(config)#no ip pim spt-threshold
```

ip pim ssm

Use this command to configure Source Specific Multicast (SSM) and define the range of multicast IP addresses. The keyword `default` defines the SSM range as 232/8. To define an SSM range other than the default, specify an access-list.

When an SSM range of IP multicast addresses is defined with this command, the no (*,G) or (S,G,rpt) state is initiated for groups in the SSM range.

The messages corresponding to these states are not accepted and originate in the SSM range.

Use the `no` form of this command to disable the SSM range.

Command Syntax

```
ip pim ssm default
ip pim ssm range WORD
ip pim (vrf NAME|) ssm default
ip pim (vrf NAME|) ssm range WORD
no ip pim ssm
no ip pim (vrf NAME|) ssm
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`default`	This keyword defines the 232/8 group range for SSM
`range`	Define an access-list for group range to use for SSM
`WORD`	A named standard access list

Default

By default, all ip pim options are disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows how to configure SSM service for the IP address range defined by access list 10:

```
#configure terminal
(config)#access-list 10 permit 225.1.1.1
(config)#ip pim ssm range xyz
```

ip pim state-refresh origination-interval

Use this command to configure a PIM-DM State-Refresh origination interval other than the default value. The origination interval is the number of seconds between PIM-DM State Refresh control messages.

Use the no option with this command to return the origination interval to its default value.

Command Syntax

```
ip pim state-refresh origination-interval <1-100>
no ip pim state-refresh origination-interval
```

Parameter

<1-100>	Range of values for state-refresh origination interval, in seconds

Note: No fractional values are allowed for the interval time.

Default

The default state-refresh origination interval is 60 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim state-refresh origination-interval 65

(config)#interface eth0
(config-if)#no ip pim state-refresh origination-interval
```

ip pim unicast-bsm

Use this command to enable support for sending and receiving unicast Bootstrap Messages (BSM) on an interface. This command supports backward-compatibility with older versions of the Bootstrap Router specification, which specifies unicast BSM to refresh the state of new or restarting neighbors.

Use the no option with this command to disable unicast bootstrap messaging on an interface.

Command Syntax

```
ip pim unicast-bsm
no ip pim unicast-bsm
```

Parameters

None

Default

Unicast bootstrap messaging is disabled by default.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ip pim unicast-bsm

(config)#interface eth0
(config-if)#no ip pim unicast-bsm
```

show debugging ip pim

Use this command to display the debug status for the PIM process.

Command Syntax

```
show debugging ip pim
show debugging ip pim (vrf NAME|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show debugging ip pim
 PIM Debugging status:
 PIM event debugging is on
 PIM MFC debugging is on
 PIM state debugging is on
 PIM incoming packet debugging is on
 PIM outgoing packet debugging is on
 PIM Hello HT timer debugging is on
 PIM Hello NLT timer debugging is on
 PIM Hello THT timer debugging is on
 PIM Join/Prune JT timer debugging is on
 PIM Join/Prune ET timer debugging is on
 PIM Join/Prune PPT timer debugging is on
 PIM Join/Prune KAT timer debugging is on
 PIM Join/Prune OT timer debugging is on
 PIM Assert AT timer debugging is on
 PIM Register RST timer debugging is on
 PIM Bootstrap BST timer debugging is on
 PIM Bootstrap CRP timer debugging is on
 PIM mib debugging is on
 PIM nexthop debugging is on
 PIM mtrace debugging is on
 PIM NSM debugging is on
 PIM MSDP debugging is on
```

show debugging pim

Use this command to display the status of debugging for PIM.

Command Syntax

```
show debugging pim
```

Parameters

None

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

This command displays one of several status:

```
#show debugging pim
PIM Debugging status:
  PIM event debugging is on
  PIM MFC debugging is on
  PIM state debugging is on
  PIM incoming packet debugging is on
  PIM outgoing packet debugging is on
  PIM Hello HT timer debugging is on
  PIM Hello NLT timer debugging is on
  PIM Hello THT timer debugging is on
  PIM Join/Prune JT timer debugging is on
  PIM Join/Prune ET timer debugging is on
  PIM Join/Prune PPT timer debugging is on
  PIM Join/Prune KAT timer debugging is on
  PIM Join/Prune OT timer debugging is on
  PIM Assert AT timer debugging is on
  PIM Register RST timer debugging is on
  PIM Bootstrap BST timer debugging is on
  PIM Bootstrap CRP timer debugging is on
  PIM mib debugging is on
  PIM nexthop debugging is on
  PIM mtrace debugging is on
  PIM NSM debugging is on
  PIM MSDP debugging is on
```

show ip msdp peer

Use this command to display information about a Multicast Source Discovery Protocol (MSDP) peer.

Command Syntax

```
show ip msdp peer (A.B.C.D|)
show ip msdp (vrf NAME|) peer (A.B.C.D|)
```

Parameters

A.B.C.D	IPv4 address of peer
NAME	Name of the VPN routing/forwarding instance

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ip msdp peer

MSDP Peer 11.1.1.12
Connection status
 State: Up (Established)
 Keepalive sent: 1
 Keepalive received: 1
 Number of connect retries: 0
```

Table 1-35: show ip msdp peer output

Entry	Description
MSDP Peer	IP address of the peer
Connection status	State – Up, Down, Invalid, Disabled, Inactive, Listening, Connecting, Established, or Maximum. Keepalive sent – Keepalive messages sent to peer. Keepalive received – Keepalive messages received from the peer. number of connect retries – Number of peer connect retries.

show ip msdp sa-cache

Use this command to display the (S,G) state learned from Multicast Source Discovery Protocol (MSDP) peers.

You can specify zero, one, or two addresses:

- If you do not specify any address, the entire Source-Active (SA) cache is displayed.
- If you specify only a unicast address it is treated as a source; if you specify only a multicast address it is treated as a group. In either case, entries corresponding to that address are displayed.
- If you specify two addresses, an (S, G) entry corresponding to those addresses is displayed; one address must be unicast and the other address must be multicast.

Command Syntax

```
show ip msdp sa-cache
show ip msdp sa-cache details
show ip msdp sa-cache A.B.C.D
show ip msdp sa-cache A.B.C.D A.B.C.D
show ip msdp (vrf NAME|) sa-cache
show ip msdp (vrf NAME|) sa-cache details
show ip msdp (vrf NAME|) sa-cache A.B.C.D
show ip msdp (vrf NAME|) sa-cache A.B.C.D A.B.C.D
```

Parameters

`A.B.C.D`	Source and/or group IP address
`details`	Detailed sa-cache information
`NAME`	Name of the VPN routing/forwarding instance

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ip msdp sa-cache
MSDP Source-Active Cache:
(20.1.1.11, 224.1.1.1), RP 10.1.1.11, RPF-Peer 11.1.1.12 Uptime  00:00:02
Exptime  00:03:28P
```

Table 1-36: show ip msdp sa-cache output

Entry	Description
MSDP Source-Active Cache	• (S,G) address pair – Source address, multicast address • RP – Reverse Path address • RRF-Peer – Reverse Path Forwarding address • Uptime – as stated • Exptime – Time until entry timeout

show ip pim interface

Use this command to display PIM interface information.

Command Syntax

```
show ip pim interface
show ip pim interface detail
show ip pim (vrf NAME|) interface
show ip pim (vrf NAME|) interface detail
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
detail	Display detailed information about a PIM interface

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
Router_E#show ip pim interface
Address         Interface  VIFindex Ver/   Nbr      DR      DR
                                    Mode   Count   Prior
192.168.1.10      eth1      0       v2/S   1         1     192.168.1.10
172.16.1.10       eth2      2       v2/S   1         1     172.16.1.10
```

The output for PIM ECMP Redirect is as below:

```
rtr6#show  ip pim  interface detail
eth1 (vif 0):
  Address 192.168.10.57, DR 192.168.10.57
  Hello period 30 seconds, Next Hello in 18 seconds
  Triggered Hello period 5 seconds
  Propagation delay is 1000 milli-seconds
  Interface ID: Router-ID:1.1.1.57 Local-ID 3
  Neighbors:
   192.168.10.52

eth2 (vif 2):
  Address 192.168.1.57, DR 192.168.1.152
  Hello period 30 seconds, Next Hello in 20 seconds
  Triggered Hello period 5 seconds
  Propagation delay is 1000 milli-seconds
  Interface ID: Router-ID:1.1.1.57 Local-ID 4
  ECMP REDIRECT, bundle : ecmpbundle, status :  allowed
  Neighbors:
```

```
192.168.1.149
192.168.1.150
192.168.1.152
```

Table 1-37: Show ip pim interface output

Entry	Description
Address	IP address of the interface
Interface	Interface name (eth1, xe3, ge4/1, etc.).
VIFindex	The index number of the Virtual Host Interface (vif).
Ver/Mode	PIM version (either v1, v2, or v3) / PIM Mode – Either S (sparse mode) or D (dense mode).
Nbr Count	Neighbor Count.
DR Prior	Designated Router Priority.
DR	Address of the Designated Router.
Hello Period	Routing devices send hello messages at a fixed interval on all PIM-enabled interfaces. By using hello messages, routing devices advertise their existence as PIM routing devices on the subnet.
Next Hello	When the interval counts down to 0, the routing device sends another hello message, and the timer is reset. A routing device that receives no response from a neighbor in 3.5 times the interval value drops the neighbor.
Propagation Delay	Vif Hello LAN Delay – propagation delay in milliseconds.
ECMP Redirect, bundle	An ECMP bundle is a set of PIM-enabled interfaces on a router, where all interfaces belonging to the same bundle share the same routing metric. The next hops for the ECMP are all one hop away. There can be one or more ECMP bundles on any router, while one individual interface can only belong to a single bundle. ECMP bundles are created on a router via configuration.
Neighbors	A list of the addresses of PIM multicast neighbors.

show ip pim interface df

Use this command to display Bidirectional-PIM Designated Forwarder(DF) election status.

Command Syntax

```
show ip pim interface (IFNAME|) df (A.B.C.D|)
```

Parameters

IFNAME	Name of the interface

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS version 4.0.

Examples

```
Router# show ip pim interface df

Interface RP          DF Winner   Metric
eth1      10.10.0.2   10.4.0.2    0
          10.10.0.3   10.4.0.3    0
          10.10.0.5   10.4.0.4    409600
eth2      10.10.0.2   10.5.0.2    0

Router# show ip pim interface eth1 df 10.10.0.3

Designated Forwarder election for eth1, 10.4.0.2, RP 10.10.0.3
   State Non-DF
   Offer count is 0
   Current DF ip address 10.4.0.3
   Last winner metric preference 0
   Last winner metric 0
```

show ip pim mroute

Use this command to display information in the IP PIM multicast routing table.

Command Syntax

```
show ip pim mroute (detail|)
show ip pim mroute A.B.C.D (detail|)
show ip pim mroute A.B.C.D A.B.C.D (detail|)
show ip pim (vrf NAME|) mroute (detail|)
show ip pim (vrf NAME|) mroute A.B.C.D (detail|)
show ip pim (vrf NAME|) mroute A.B.C.D A.B.C.D (detail|)
```

Parameter

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`A.B.C.D`	Display all entries for this group IP address
`A.B.C.D`	Display all entries for this source IP address

Note: A group IP address and a source IP address cannot be simultaneously

`detail`	Display detailed PIM multicast routing table information

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip pim mroute

IP Multicast Routing Table

(*,*,RP) Entries: 0
(*,G) Entries: 1
(S,G) Entries: 0
(S,G,rpt) Entries: 0
(*, 224.0.1.3)
RP: 10.10.1.5
RPF nbr: 172.16.1.2
RPF idx: eth2
Upstream State: JOINED
 Local     ..............................
 Joined    j..............................
 Asserted  ..............................
 Outgoing  o..............................
```

Table 1-38: Show ip pim mroute output

Entry	Description
(*, *, RP) Entries:	Source, Group, Rendezvous Point Include entries.
(*, G) Entries:	PIM Include entries
(S, G) Entries:	PIM Include entries (Source, Group)
(S, G, rpt) Entries:	The RPT is the path between the RP and receivers (hosts) in a multicast group. The RPT is built by means of a PIM join message from a receiver's DR.
RP:	Rendezvous Point
RPF nbr:	Reverse Path Forwarding neighbor.
RPF idx:	Reverse Path Forwarding index.
Upstream State:	As stated.

show ip pim neighbor

Use this command to display PIM neighbor information.

Command Syntax

```
show ip pim neighbor (detail|)
show ip pim neighbor IFNAME (detail|)
show ip pim neighbor IFNAME A.B.C.D (detail|)
show ip pim (vrf NAME|) neighbor (detail|)
show ip pim (vrf NAME|) neighbor IFNAME (detail|)
show ip pim (vrf NAME|) neighbor IFNAME A.B.C.D (default|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
IFNAME	Name of the interface
A.B.C.D	IPv4 address of the neighbor interface
detail	Display detailed information for a PIM neighbor

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip pim neighbor
Neighbor      Interface    Uptime/Expires     Ver          DR
Address                                                Priority/Mode
10.10.14.11    eth3       00:14:30/00:01:45    v2         1 / DR
```

The validation command to view PIM ECMP Redirect is as below:

```
rtr6#show  ip pim  neighbor detail
Nbr 192.168.10.52 (eth1)
Expires in 83 seconds, uptime 00:21:52
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 1048865461,

Nbr 192.168.1.149 (eth2)
Expires in 99 seconds, uptime 00:22:06
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 2102076842,
Interface ID: Router-ID: 1.1.1.149 Local-ID: 4,
ECMP REDIRECT enabled
```

```
Nbr 192.168.1.150 (eth2)
Expires in 77 seconds, uptime 00:22:02
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 1306457151,
Interface ID: Router-ID: 1.1.1.153 Local-ID: 4,
ECMP REDIRECT enabled

Nbr 192.168.1.152 (eth2), DR
Expires in 86 seconds, uptime 00:22:06
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 170629600,
Interface ID: Router-ID: 1.1.1.152 Local-ID: 4,
ECMP REDIRECT enabled
```

Table 1-39: Show ip pim neighbor output

Entry	Description
Neighbor	Neighbor IP address
Interface	Name of the interface (eth1, xe3, xe5/1 etc.).
Uptime/Expires	Neighbor’s uptime / time until uptime expires and starts sending hello messages.
Ver	PIM version (version1 =v1, version2 - v2, version3 = v3).
DR Priority/mode	Priority and Mode of neighbor as Designated Router.
Nbr	NEighbor IP address and interface name (eth1, xe3, xe5/1 etc.).
Expires in	Time before the Hello timer expires and must retransmit.
uptime	Neighbor uptime.
Holdtime:	Before an interface goes down or changes primary IP address, a Hello message with a zero HoldTime should be sent immediately (with the old IP address if the IP address changed). This will cause PIM neighbors to remove this neighbor (or its old IP address) immediately. After an interface has changed its IP address, it MUST send a Hello message with its new IP address. If an interface changes one of its secondary IP addresses, a Hello message with an updated Address_List option and a non-zero HoldTime should be sent immediately. This will cause PIM neighbors to update this neighbor's list of secondary addresses immediately.
T-bit:	RPT-bit is a 1-bit value. The RPT-bit is set to 1 for Assert(*,G) messages and 0 for Assert(S,G) messages.

Table 1-39: Show ip pim neighbor output

Entry	Description
Lan delay:	In addition to the information recorded for the DR Election, the following per neighbor information is obtained from the LAN Prune Delay Hello option: In addition to the information recorded for the DR Election, the following per neighbor information is obtained from the LAN Prune Delay Hello option: neighbor.lan_prune_delay_present A flag indicating if the LAN Prune Delay option was present in the Hello message. neighbor.tracking_support A flag storing the value of the T bit in the LAN Prune Delay option if it is present in the Hello message. This indicates the neighbor's capability to disable Join message suppression. neighbor.propagation_delay The Propagation Delay field of the LAN Prune Delay option (if present) in the Hello message. neighbor.override_interval The Override_Interval field of the LAN Prune Delay option (if present) in the Hello message. The additional state described above is deleted along with the DR neighbor state when the neighbor timeout expires.
Override interval:	Hello Override Interval
DR priority:	The DR_Priority Option allows a network administrator to give preference to a particular router in the DR election process by giving it a numerically larger DR Priority.The DR_Priority Option SHOULD be included in every Hello message, even if no DR Priority is explicitly configured on that interface. This is necessary because priority-based DR election is only enabled when all neighbors on an interface advertise that they are capable of using the DR_Priority Option. The default priority is 1.
Gen ID:	Generation Identifier, used to detect reboots.
Interface ID:	As stated.
Router-ID:	As stated.
Local-ID:	As stated.
ECMP REDIRECT	Whether ECMP Redirect is enabled or disabled.

show ip pim nexthop

Displays the nexthop information from NSM as used by PIM.

Command Syntax

```
show ip pim nexthop
show ip pim (vrf NAME|) nexthop
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip pim nexthop
```

show ip pim bsr-router

Use this command to show the bootstrap router PIMv2 address.

Command Syntax

```
show ip pim bsr-router
show ip pim (vrf NAME|) bsr-router
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ip pim bsr-router
PIMv2 Bootstrap information
  BSR address: 10.10.11.35 (?)
  Uptime:      00:00:38, BSR Priority: 0, Hash mask length: 10
  Expires:     00:01:32
  Role: Non-candidate BSR
  State: Accept Preferred

#show ip pim bsr-router
PIMv2 Bootstrap information
 BSR address: 20.0.1.21
 Uptime:      00:40:20, BSR Priority: 64, Hash mask length: 10
 Expires:     00:02:07
 Role: Candidate BSR
 State: Candidate BSR
```

Table 1-40: Show ip pim bsr-router output

Entry	Description
BSR address	Bootstrap Router’s IP address.
Uptime	As stated
BSR Priority	BSR election priority; can be set manually, but default is 64.
Hash mask length	As stated.
Expires	Group-to-C-RP mapping Expiry Timer.

Table 1-40: Show ip pim bsr-router output (Continued)

Entry	Description
Role	Specifies whether the BSR is the Candidate BSR or a Non-candidate BSR
State	• The current state of a Candidate BSR, one of the following: Candidate-BSR, Pending-BSR, or Elected-BSR. • The current state of a Non-candidate BSR, one of the following: Accept Any or Accept Preferred.

show ip pim local-members

Use this command to display information about local membership for PIM interfaces.

Command Syntax

```
show ip pim local-members
show ip pim local-members IFNAME
show ip pim (vrf NAME|) local-members
show ip pim (vrf NAME|) local-members IFNAME
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
IFNAME	Display local membership for an interface name

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip pim vrf q local-members p8p1
PIM Local membership information

p8p1:
  (*, 233.5.5.5) : Include
  (*, 233.7.7.7) : Include
```

Table 1-41: Show ip pim local-members output

Entry	Description
NAME:	Interface name
(*,G)	The local members in the form (Source/Group). Shows state – either Include or Exclude.

show ip pim rp-hash

Use this command to display the rendezvous point (RP) to chose based on the group selected.

Command Syntax

```
show ip pim rp-hash A.B.C.D
show ip pim (vrf NAME|) rp-hash A.B.C.D
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
A.B.C.D	Specify a group address

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

A.B.C.D in command refers to the group address to be hashed.

```
#show ip pim rp-hash 224.0.1.3
Group(s): 224.0.0.0/4
    RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap
```

Table 1-42: Show ip PIM rp-hash output

Entry	Description
Group(s)	The group address to be hashed.
RP	Rendezvous Point
Info source	The address and identity from which this information was received. In the example above, it was learned from the bootstrap router.

show ip pim rp mapping

Use this command to show group-to-RP (rendezvous point) mappings, and the RP set.

Command Syntax

```
show ip pim rp mapping
show ip pim (vrf NAME|) rp mapping
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ip pim rp mapping
This system is the Bootstrap Router (v2)
Group(s): 224.0.0.0/4
 RP: 10.10.1.5
    Info source: 172.16.1.2, via bootstrap, priority 192
         Uptime: 00:00:13, expires: 00:02:29
 RP: 172.16.1.2
    Info source: 172.16.1.2, via bootstrap, priority 2
         Uptime: 00:34:42, expires: 00:01:49
```

Table 1-43: Show ip PIM rp mapping output

Entry	Description
Identity declaration	This system is the Bootstrap Router (PIM version number v1, v2. or, v3) or not the Bootstrap Router.
Group(s):	The Multicast address of this multicast Group.
RP	Addresses of the Rendezvous Points.
Info source:	Address of the info source, whether it was learned from the Bootstrap Router, and the configured priority.

snmp restart pim

Use this command to restart SNMP in (PIM).

Note: This command restarts IPv4 PIM daemon

Command Syntax

```
snmp restart pim
```

Parameters

None

Default

By default, the snmp restart pim is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart pim
```

undebug all ip pim

Use this command to disable all PIM debugging from Configure mode.

Command Syntax

```
undebug all ip pim
undebug (vrf NAME|) all ip pim
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#undebug all ip pim
```

CHAPTER 2 PIMv6 Commands

This chapter describes the commands for Protocol-Independent Multicast (PIM).

- ipv6 pim rp-candidate
- ipv6 pim rp-register-kat
- ipv6 pim spt-threshold
- ipv6 pim ssm
- ipv6 pim state-refresh origination-interval
- ipv6 pim unicast-bsm
- show debugging ipv6 pim
- show ipv6 pim interface
- show ipv6 pim mroute
- show ipv6 pim neighbor
- show ipv6 pim nexthop
- show ipv6 pim bsr-router
- show ipv6 pim local-members
- show ipv6 pim rp-hash
- show ipv6 pim rp mapping
- undebug all ipv6 pim

clear ipv6 mroute

Use this command to delete all multicast route table entries and all multicast routes at the PIM protocol level.

Command Syntax

```
clear ipv6 mroute *
clear ipv6 mroute * pim (dense-mode|sparse-mode)
clear ipv6 mroute X:X::X:X
clear ipv6 mroute X:X::X:X X:X::X:X
clear ipv6 mroute X:X::X:X X:X::X:X pim (dense-mode|sparse-mode)
clear ipv6 mroute X:X::X:X pim sparse-mode
clear ipv6 mroute statistics *
clear ipv6 mroute statistics X:X::X:X
clear ipv6 mroute statistics X:X::X:X X:X::X:X
clear ipv6 mroute (vrf NAME|) *
clear ipv6 mroute (vrf NAME|) * pim (dense-mode|sparse-mode)
clear ipv6 mroute (vrf NAME|) X:X::X:X
clear ipv6 mroute (vrf NAME|) X:X::X:X X:X::X:X
clear ipv6 mroute (vrf NAME|) X:X::X:X X:X::X:X pim (dense-mode|sparse-mode)
clear ipv6 mroute (vrf NAME|) X:X::X:X pim sparse-mode
clear ipv6 mroute (vrf NAME|) statistics *
clear ipv6 mroute (vrf NAME|) statistics X:X::X:X
clear ipv6 mroute (vrf NAME|) statistics X:X::X:X X:X::X:X
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`*`	Delete all multicast routes
`statistics`	Clears multicast route statistics
`X:X::X:X`	Clears group IP address
`X:X::X:X`	Clears source IP address
`dense-mode`	Clear multicast rout table for PIM dense-mode
`sparse-mode`	Clear multicast route table for PIM sparse mode

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 mroute * pim sparse-mode
#clear ipv6 mroute 3ffe::24:3 ff00::3 pim sparse-mode
```

clear ipv6 pim sparse-mode bsr

Use this command to clear all rendezvous point (RP) sets learned through the PIMv2 Bootstrap Router (BSR).

Command Syntax

```
clear ipv6 pim sparse-mode bsr rp-set *
clear ipv6 pim (vrf NAME|) sparse-mode bsr rp-set *
```

Parameters

`rp-set`	PIMv2 bootstrap router RP set
`*`	Clear all RP sets
`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear ipv6 pim sparse-mode bsr rp-set *
```

debug ipv6 pim

Use this command to enable debugging for PIM.

Use the no option with this command to deactivate debugging for PIM.

Command Syntax

```
debug ipv6 pim (all|events|mfc|mib|mtrace|nexthop|nsm|packet|state|timer)
debug ipv6 pim (vrf NAME|) (all|events|mfc|mib|mtrace|nexthop|nsm|packet|state
  |timer)
no debug ipv6 pim (all|events|mfc|mib|mtracenexthop|nsm|packet|state|timer)
no debug ipv6 pim (vrf NAME|) (all|events|mfc|mib|mtracenexthop|nsm|packet
  |state|timer)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
all	Enable debugging for all PIM events
events	Enable debugging for general configuration, Virtual Routing (VR), and VRF context
mfc	Enable debugging for MFC updates
mib	Enable debugging for MIB entries
mtrace	Enable debugging for MTRACE messages
nexthop	Enable debugging for Reverse Path Forwarding (RPF) neighbor nexthop cache handling
nsm	Enable debugging for NSM
packet	Enable debugging for PIM packets
state	Enable debugging for PIM states
timer	Enable debugging for PIM timers

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#debug ipv6 pim state
```

debug ipv6 pim packet

Use this command to activate debugging of incoming or outgoing PIM packets.

Use the no option with this command to deactivate debugging of incoming or outgoing PIM packets.

Command Syntax

```
debug ipv6 pim packet
debug ipv6 pim packet in
debug ipv6 pim packet out
debug ipv6 pim (vrf NAME|) packet
debug ipv6 pim (vrf NAME|) packet in
debug ipv6 pim (vrf NAME|) packet out
no debug ipv6 pim packet
no debug ipv6 pim packet in
no debug ipv6 pim packet out
no debug ipv6 pim (vrf NAME|) packet
no debug ipv6 pim (vrf NAME|) packet in
no debug ipv6 pim (vrf NAME|) packet out
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
in	Debug incoming packets
out	Debug outgoing packets

Command Mode

Configure and Privileged Exec modes

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ipv6 pim packet in
```

debug ipv6 pim timer assert

Use this command to enable debugging of the PIM assert timers.

Use the no option with this command to disable debugging for PIM assert timers.

Command Syntax

```
debug ipv6 pim timer assert
debug ipv6 pim timer assert at
debug ipv6 pim (vrf NAME|) timer assert
debug ipv6 pim (vrf NAME|) timer assert at
no debug ipv6 pim timer assert
no debug ipv6 pim timer assert at
no debug ipv6 pim (vrf NAME|) timer assert
no debug ipv6 pim (vrf NAME|) timer assert at
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`at`	Use this option to turn on or turn off debugging of the PIM Assert Timer

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ipv6 pim timer assert at
```

debug ipv6 pim timer bsr

Use this command to enable debugging of the PIM BSR time.

Use the no option with this command to disable debugging of the PIM BSR timer.

Command Syntax

```
debug ipv6 pim timer bsr
debug ipv6 pim timer bsr bst
debug ipv6 pim timer bsr crp
debug ipv6 pim (vrf NAME|) timer bsr
debug ipv6 pim (vrf NAME|) timer bsr bst
debug ipv6 pim (vrf NAME|) timer bsr crp
no debug ipv6 pim timer bsr
no debug ipv6 pim timer bsr bst
no debug ipv6 pim timer bsr crp
no debug ipv6 pim (vrf NAME|) timer bsr
no debug ipv6 pim (vrf NAME|) timer bsr bst
no debug ipv6 pim (vrf NAME|) timer bsr crp
```

Parameters

bst	Turn on or turn off the bootstrap debugging timer
crp	Turn on or turn off the Candidate-RP debugging timer
vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ipv6 pim timer bsr bst
```

debug ipv6 pim timer hello

Use this command to enable debugging of various PIM Hello timers.

Use the no option with this command to disable debugging of the PIM Hello timers.

Command Syntax

```
debug ipv6 pim timer hello
debug ipv6 pim timer hello ht
debug ipv6 pim timer hello nlt
debug ipv6 pim timer hello tht
debug ipv6 pim (vrf NAME|) timer hello
debug ipv6 pim (vrf NAME|) timer hello ht
debug ipv6 pim (vrf NAME|) timer hello nlt
debug ipv6 pim (vrf NAME|) timer hello tht
no debug ipv6 pim timer hello
no debug ipv6 pim timer hello ht
no debug ipv6 pim timer hello nlt
no debug ipv6 pim timer hello tht
no debug ipv6 pim (vrf NAME|) timer hello
no debug ipv6 pim (vrf NAME|) timer hello ht
no debug ipv6 pim (vrf NAME|) timer hello nlt
no debug ipv6 pim (vrf NAME|) timer hello tht
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`ht`	Turn on or turn off the PIM Hello debugging timer (ht)
`nlt`	Turn on or turn off the PIM Neighbor Liveliness debugging timer (nlt)
`tht`	Turn on or turn off the Triggered Hello Timer (tht)

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ipv6 pim timer hello ht
```

debug ipv6 pim timer joinprune

Use this command to enable debugging of various PIM JoinPrune timers.

Use the no option with this command to disable the debugging of the PIM JoinPrune timers.

Command Syntax

```
debug ipv6 pim timer joinprune
debug ipv6 pim timer joinprune et
debug ipv6 pim timer joinprune kat
debug ipv6 pim timer joinprune jt
debug ipv6 pim timer joinprune ot
debug ipv6 pim timer joinprune ppt
debug ipv6 pim (vrf NAME|) timer joinprune
debug ipv6 pim (vrf NAME|) timer joinprune et
debug ipv6 pim (vrf NAME|) timer joinprune kat
debug ipv6 pim (vrf NAME|) timer joinprune jt
debug ipv6 pim (vrf NAME|) timer joinprune ot
debug ipv6 pim (vrf NAME|) timer joinprune ppt
no debug ipv6 pim timer joinprune
no debug ipv6 pim timer joinprune et
no debug ipv6 pim timer joinprune kat
no debug ipv6 pim timer joinprune jt
no debug ipv6 pim timer joinprune ot
no debug ipv6 pim timer joinprune ppt
no debug ipv6 pim (vrf NAME|) timer joinprune
no debug ipv6 pim (vrf NAME|) timer joinprune et
no debug ipv6 pim (vrf NAME|) timer joinprune kat
no debug ipv6 pim (vrf NAME|) timer joinprune jt
no debug ipv6 pim (vrf NAME|) timer joinprune ot
no debug ipv6 pim (vrf NAME|) timer joinprune ppt
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
et	Turn on or turn off the PIM JoinPrune expiry timer (et)
jt	Turn on or turn off the PIM JoinPrune upstream Join Timer (jt)
kat	Turn on or turn off the PIM JoinPrune Keep Alive timer (kat)
ot	Turn on or turn off the PIM JoinPrune Upstream Override Timer (ot)
ppt	Turn on or turn off the f PIM JoinPrune PrunePending Timer ((ppt)

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ipv6 pim timer joinprune et
```

debug ipv6 pim timer register

Use this command to enable debugging of the PIM register timer.

Use the no option with this command to disable debugging of the PIM register timer.

Command Syntax

```
debug ipv6 pim timer register
debug ipv6 pim timer register rst
debug ipv6 pim (vrf NAME|) timer register
debug ipv6 pim (vrf NAME|) timer register rst
no debug ipv6 pim timer register
no debug ipv6 pim timer register rst
no debug ipv6 pim (vrf NAME|) timer register
no debug ipv6 pim (vrf NAME|) timer register rst
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
rst	Turn on or turn off the PIM Register Stop Timer (rst)

Command Mode

Exec mode, Privileged Exec mode, and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#debug ipv6 pim timer register
```

ipv6 pim accept-register

Use this command to configure the ability to filter out multicast sources specified by the given access-list at the RP, so that the RP will accept/refuse to perform the Register mechanism for the packets sent by the specified sources. By default, the RP accepts Register packets from all multicast sources.

Use the no option with this command to revert to default.

Command Syntax

```
ipv6 pim accept-register list (<100-199>|<2000-2699>|WORD)
ipv6 pim (vrf NAME|) accept-register list (<100-199>|<2000-2699>|WORD)
no ipv6 pim accept-register
no ipv6 pim (vrf NAME|) accept-register
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`<100-199>`	An IP extended access-list value
`<2000-2699>`	An IP extended access-list value in the expanded range
`WORD`	Name of a standard access list

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim accept-register list 121

(config)#no ipv6 pim accept-register
```

ipv6 pim anycast-rp

Use this command to configure an Anycast-RP in the RP set.

Use the no option with this command to remove the Anycast-RP configuration.

Command Syntax

```
ipv6 pim anycast-rp X:X::X:X X:X::X:X
ipv6 pim (vrf NAME|) anycast-rp X:X::X:X X:X::X:X
no ipv6 pim anycast-rp X:X::X:X
no ipv6 pim anycast-rp X:X::X:X X:X::X:X
no ipv6 pim (vrf NAME|) anycast-rp X:X::X:X
no ipv6 pim (vrf NAME|) anycast-rp X:X::X:X X:X::X:X
```

Parameters

`vrf`	The VPN routing/forwarding instance.
`NAME`	Specify the name of the VPN routing/forwarding instance.
`X:X::X:X`	Unicast IPv6 address of the Anycast RP set. An Anycast RP set is a collection of RPs in the same domain.
`X:X::X:X`	Destination IPv6 address where Register messages are copied and sent. A Member RP is an individual RP member in the Anycast RP set.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows how to configure the Anycast RP in the RP set.

```
#configure terminal
(config)#ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

The following example shows how to remove the configuration.

```
#configure terminal
(config)#no ipv6 pim anycast-rp 2:2::2:2 20:20::20:20
```

ipv6 pim bind ecmp-bundle

Use this command to bind interfaces to an ECMP Bundles.

Use the no option with this command to unbind the interfaces from an ECMP Bundles

Command Syntax

```
ipv6 pim bind ecmp-bundle WORD
no ipv6 pim bind ecmp-bundle WORD
```

Parameter

WORD	ECMP bundle name

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 pim bind ecmp-bundle ebund1

(config-if)#no ipv6 pim bind ecmp-bundle ebund1
```

ipv6 pim bsr-border

Use this command to prevent bootstrap router (BSR) messages from being sent or received through an interface.

When this command is configured on an interface, no PIM Version 2 BSR messages are sent or received through the interface. Use this command to configure an interface bordering another PIM domain to avoid the exchange of BSR messages between the two domains. BSR messages should not be exchanged between different domains because routers in one domain may elect rendezvous points (RPs) in the other domain, resulting in a protocol malfunction or loss of isolation between the domains.

Use the `no` option with this command to remove the BSR border configuration.

Note: This command does not set up multicast boundaries. It only sets up a PIM domain BSR message border.

Command Syntax

```
ipv6 pim bsr-border
no ipv6 pim bsr-border
```

Parameters

None

Default

Bootstrap router border configuration is disabled by default.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures the interface to be the PIM domain border:

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim bsr-border

(config)#interface eth0
(config-if)#no ipv6 pim bsr-border
```

ipv6 pim bsr-candidate

Use this command to give the router the candidate BSR status using the name the interface.

Use the no option with this command to disable this function.

Note: This command does not set up multicast boundaries. It only sets up a PIM domain BSR message candidate

Command Syntax

```
ipv6 pim bsr-candidate IFNAME
ipv6 pim bsr-candidate IFNAME <0-32>
ipv6 pim bsr-candidate IFNAME <0-32> <0-255>
ipv6 pim (vrf NAME|) bsr-candidate IFNAME
ipv6 pim (vrf NAME|) bsr-candidate IFNAME <0-32>
ipv6 pim (vrf NAME|) bsr-candidate IFNAME <0-32> <0-255>
no ipv6 pim bsr-candidate (IFNAME|)
no ipv6 pim (vrf NAME|) bsr-candidate (IFNAME|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
IFNAME	Specify the name of the interface
<0-32>	Specify a hash mask length for RP selection
<0-255>	Specify a priority for a BSR candidate

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim bsr-candidate eth0 20 30
```

ipv6 pim cisco-register-checksum

Use this command to configure the option to calculate the register checksum over the whole packet. This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to revert to the default settings.

Command Syntax

```
ipv6 pim cisco-register-checksum
ipv6 pim cisco-register-checksum group-list (<1-99>|<1300-1999>|WORD)
ipv6 pim (vrf NAME|) cisco-register-checksum
ipv6 pim (vrf NAME|) cisco-register-checksum group-list (<1-99>|<1300-1999>|WORD)
no ipv6 pim cisco-register-checksum
no ipv6 pim cisco-register-checksum group-list (<1-99>|<1300-1999>|WORD)
no ipv6 pim (vrf NAME|) cisco-register-checksum
no ipv6 pim (vrf NAME|) cisco-register-checksum group-list (<1-99>|<1300-
  1999>|WORD)
```

Parameters

vrf	The VPN routing/forwarding instance.
NAME	Specify the name of the VPN routing/forwarding instance.
group-list	Use this parameter to configure the option to calculate the register checksum over the whole packet on multicast groups specified by the access-list.
<1-99>	Specify an IP standard access-list.
<1300-1999>	Specify an IP access-list (expanded range).
WORD	IP named standard access list.

Default

This command is disabled by default. By default, Register Checksum is calculated only over the header.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim cisco-register-checksum

(config)#ipv6 pim cisco-register-checksum group-list G1
(config)#ipv6 access-list filter permit ff1e:10/128
```

ipv6 pim crp-cisco-prefix

Use this command to turn on or turn the Candidate-RP debugging timerworking with Cisco BSR.

Use the no form of this command to turn off the Candidate-RP debugging timerworking with Cisco BSR.

Command Syntax

```
ipv6 pim crp-cisco-prefix
no ipv6 pim crp-cisco-prefix
```

Parameters

`crp-cisco-prefix`

Candidate-RP debugging timerworking with Cisco BSR.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim crp-cisco-prefix

(config)#noipv6 pim crp-cisco-prefix
```

ipv6 pim

Use this command to enable IPv6 PIM dense-mode or sparse-mode or sparse-dense-mode on the current interface.

Use the no option with this command to disable IPv6 PIM dense-mode or sparse-mode or sparse-dense-mode on the interface.

Command Syntax

```
ipv6 pim (dense-mode|sparse-mode|sparse-dense-mode)
no ipv6 pim (dense-mode|sparse-mode|sparse-dense-mode)
```

Parameters

dense-mode	Enable IPv6 PIM dense-mode operation
sparse-mode	Enable IPv6 PIM sparse-mode operation
sparse-dense-mode	Enable IPv6 PIM sparse-dense-mode operation

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim dense-mode

(config)#interface eth0
(config-if)#no ipv6 pim dense-mode

(config)#interface eth0
(config-if)#ipv6 pim sparse-dense-mode

(config-if)#no ipv6 pim sparse-dense-mode
```

ipv6 pim passive

Use this command to enable or disable passive mode operation for local members on the interface. Passive mode essentially stops PIM transactions on the interface, allowing only the Internet Group Management Protocol (IGMP) mechanism to be active.

Use the no option with this command to disable the passive mode.

Command Syntax

```
ipv6 pim (dense-mode|sparse-mode) passive
no ipv6 pim (dense-mode|sparse-mode) passive
```

Parameters

`dense-mode`	Enable passive operation for PIM dense-mode
`sparse-mode`	Enable passive operation for PIM sparse-mode

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim dense-mode passive

(config)#interface eth0
(config-if)#no ipv6 pim dense-mode passive

#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim sparse-mode passive

(config)#interface eth0
(config-if)#no ipv6 pim sparse-mode passive
```

ipv6 pim dense-group

Use this command to force a particular group to always follow dense mode irrespective of whether RP mapping is available in SM-DM mode.

Use the no option with this command to delete the group-address and follow SM-DM rules.

Command Syntax

```
ipv6 pim dense-group A.B.C.D
ipv6 pim (vrf NAME|) dense-group A.B.C.D
no ipv6 pim dense-group A.B.C.D
no ipv6 pim (vrf NAME|) dense-group A.B.C.D
```

Parameter

A.B.C.D	Specify IP address
NAME	Specify the name of the VRF

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 pim dense-group 1ffe:11::11:11

(config-if)# no ip pim dense-group 1ffe:1::11:11
```

ipv6 pim dr-priority

Use this command to set the designated router's priority value.

Use the no option with this command to remove the priority from the DR.

Command Syntax

```
ipv6 pim dr-priority <0-4294967294>
no ipv6 pim dr-priority (<0-4294967294>|)
```

Parameter

`<0-4294967294>` Valid range of values for DR priority, with a higher value resulting in a higher preference

Default

The default DR priority value is 1.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim dr-priority 11234

(config)#interface eth0
(config-if)#no ipv6 pim dr-priority 11234
```

ipv6 pim ecmp-bundle

Use this command to create an ECMP bundle.

Use the no option with this command to delete an ECMP bundle.

Command Syntax

```
ipv6 pim ecmp-bundle WORD
ipv6 pim (vrf NAME|) ecmp-bundle WORD
ipv6 pim ecmp-bundle WORD
no ipv6 pim (vrf NAME|) ecmp-bundle WORD
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
WORD	ECMP bundle name

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim exmp-bundle ebund1

(config)#no ipv6 pim ecmp-bundle ebund1
```

ipv6 pim rp embedded

Use this command to embed the PIM Rendezvous Point.

Use the no option with this command to remove the Rendezvous Point.

Command Syntax

```
ipv6 pim rp embedded
no ipv6 pim rp embedded
```

Parameter

embedded	Embed the Rendezvous Point

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim rp embedded

(config)#no ipv6 pim rp embedded
```

ipv6 pim exclude-genid

Use this command to exclude the GenID (generated ID) option from Hello packets sent by the PIM module on an interface.This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to restore PIM its default setting.

Command Syntax

```
ipv6 pim exclude-genid
no ipv6 pim exclude-genid
```

Parameters

None

Default

By default, this command is disabled; that is, the GenID option is included.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim exclude-genid

(config)#interface eth0
(config-if)#no ipv6 pim exclude-genid
```

ipv6 pim hello-holdtime

Use this command to configure a hello holdtime other than the default(`3.5 * hello_interval` seconds).

When configuring `hello-holdtime`, if the configured value is less than the current `hello_interval`, it is refused.

When removing a configured `hello_holdtime`, the value is reset to (`3.5 *` current `hello_interval`) value.

Every time the hello_interval is updated, the hello-holdtime is also updated according to rules below:

If the hello_holdtime is not configured, or if the hello_holdtime is configured, but is less than the current hello_interval value, it is modified to (3.5 * hello_interval). Otherwise, the configured value is maintained.

Use the no option with this command to remove the configured hello-holdtime.

Command Syntax

```
ipv6 pim hello-holdtime <1-65535>
no ipv6 pim hello-holdtime
```

Parameter

`<1-65535>`	Range of values for hello-holdtime, in seconds

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface fxp0
(config-if)#ipv6 pim hello-holdtime 123

(config)#interface fxp0
(config-if)#no ipv6 pim hello-holdtime
```

ipv6 pim hello-interval

Use this command to configure a hello interval value other than the default. When a hello-interval is configured and hello-holdtime is not configured, or when the hello-holdtime value configured is less than the new hello-interval value, the holdtime value is modified to (3.5 * hello_interval). Otherwise, the hello-holdtime value is the configured value.

Use the no option with this command to reset the hello-interval to its default value.

Command Syntax

```
ipv6 pim hello-interval <1-65535>
no ipv6 pim hello-interval
```

Parameter

<1-65535>	Range of values for the hello-interval

Note: No fractional values are allowed.

Default

The default value for hello-interval is 30 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim hello-interval 123

(config)#interface eth0
(config-if)#no ipv6 pim hello-interval
```

ipv6 pim ignore-rp-set-priority

Use this command to ignore the RP-SET priority value, and use only the hashing mechanism for RP selection. This command is used to inter-operate with older Cisco IOS versions.

Use the no option with this command to remove this setting.

Command Syntax

```
ipv6 pim ignore-rp-set-priority
ipv6 pim (vrf NAME|) ignore-rp-set-priority
no ipv6 pim ignore-rp-set-priority
no ipv6 pim (vrf NAME|) ignore-rp-set-priority
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim ignore-rp-set-priority

#configure terminal
(config)#no ipv6 pim ignore-rp-set-priority
```

ipv6 pim jp-timer

Use this command to set a PIM join/prune timer.

Use the no option with this command to remove the join/prune timer.

Command Syntax

```
ipv6 pim jp-timer <1-65535>
ipv6 pim (vrf NAME|) jp-timer <1-65535>
no ipv6 pim jp-timer
no ipv6 pim jp-timer <1-65535>
no ipv6 pim (vrf NAME|) jp-timer
no ipv6 pim (vrf NAME|) jp-timer <1-65535>
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
<1-65535>	Range of values for the Join/Prune timer, in seconds

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim jp-timer 234

#configure terminal
(config)#no ipv6 pim jp-timer 234
```

ipv6 pim neighbor-filter

Use this command to enable filtering of neighbors on the interface.

When configuring a neighbor filter and when denied by filtering access list, PIM either does not establish adjacency with a neighbor or terminates adjacency with existing neighbors.

Use the no option with this command to disable filtering of neighbors on the interface.

Command Syntax

```
ipv6 pim neighbor-filter (<1-99>|WORD)
no ipv6 pim neighbor-filter (<1-99>|WORD)
```

Parameters

<1-99>	An IP standard access-list number
WORD	Name of an IP standard access list

Command Mode

Interface mode

Default

This command is disabled; by default, there is no filtering.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
(config)#interface fxp0
(config-if)#ipv6 pim neighbor-filter F1
(config-if)#exit
(config)#ipv6 access-list filter deny fe80:20e:cff:fe01:facc
(config)#ipv6 access-list filter permit any
```

ipv6 pim propagation-delay

Use this command to configure the propagation delay value.

Use the no option with this command to return the propagation delay to its default value.

Command Syntax

```
ipv6 pim propagation-delay <1000-5000>
no ipv6 pim propagation-delay
```

Parameter

<1000-5000>	Range of values for propagation delay, in milliseconds

Default

The default propagation delay is 500 milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim propagation-delay 1000

(config)#interface eth0
(config-if)#no ipv6 pim propagation-delay
```

ipv6 pim register-rate-limit

Use this command to configure the rate of Register packets sent by this designated router (DR), in number of packets per second.

Use the no option to remove the register-rate-limit configuration.

Note: The configured rate is per (S,G) state, and is not a system-wide rate.

Command Syntax

```
ipv6 pim register-rate-limit <1-65535>
ipv6 pim (vrf NAME|) register-rate-limit <1-65535>
no ipv6 pim register-rate-limit
no ipv6 pim (vrf NAME|) register-rate-limit
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
<1-65535>	Range of values for packets to send per second

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim register-rate-limit 3444

#configure terminal
(config)#no ipv6 pim register-rate-limit
```

ipv6 pim register-rp-reachability

Use this command to enable the RP reachability check for PIM Registers at the DR.

Use the no option to reset to the default state.

Command Syntax

```
ipv6 pim register-rp-reachability
ipv6 pim (vrf NAME|) register-rp-reachability
no ipv6 pim register-rp-reachability
no ipv6 pim (vrf NAME|) register-rp-reachability
```

Parameter

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance

Command Mode

Configure mode

Default

The default setting is no checking for rendezvous point reachability,

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim register-rp-reachability
```

ipv6 pim register-source

Use this command to configure the source address of Register packets sent by this DR, overriding the default source address, which is the address of the RPF interface toward the source host.

Use the no option to remove the source address of register packets sent by this DR, and reset it to use the default source address, that is, the address of the RPF interface toward the source host.

The configured address must be a reachable address so the RP can send corresponding Register-Stop messages in response. This address is usually the loopback interface address, but can also be other physical addresses. The address must be advertised by unicast routing protocols on the DR.

Note: The interface configured does not require PIM to be enabled.

Command Syntax

```
ipv6 pim register-source IFNAME
ipv6 pim register-source X:X::X:X
ipv6 pim (vrf NAME|) register-source IFNAME
ipv6 pim (vrf NAME|) register-source X:X::X:X
no ipv6 pim register-source
no ipv6 pim (vrf NAME|) register-source
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
X:X::X:X	The IP address to be used as the source of the register packets
IFNAME	The name of the interface to be used as the source of the register packets

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim register-source 3ffe:406::1

#configure terminal
(config)#no ipv6 pim register-source
```

ipv6 pim register-suppression

Use this command to configure the register-suppression time, in seconds, overriding the default value of 60 seconds. Configuring this value modifies register-suppression time at the DR; configuring this value at the RP modifies the RP-keepalive-period value if the `ipv6 pim rp-register-kat` command is not used.

Use the no option to remove the register-suppression setting.

Command Syntax

```
ipv6 pim register-suppression <1-65535>
ipv6 pim (vrf NAME|) register-suppression <1-65535>
no ipv6 pim register-suppression
no ipv6 pim (vrf NAME|) register-suppression
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`<1-65535>`	Register suppression time, in seconds

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim register-suppression 555

#configure terminal
(config)#no ipv6 pim register-suppression
```

ipv6 pim router-id

Use this command to configure PIM router-ID to uniquely identify the router.By default, PIM registers for the NSM router-id service. This command will override the router-id received from NSM.

Use the `no` option with this command to unconfigure PIM router-ID. This will make PIM fall back to the NSM router-id

Command Syntax

```
ipv6 pim (vrf NAME|) router-id A.B.C.D
no ipv6 pim (vrf NAME|) router-id A.B.C.D
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`A.B.C.D`	Specify the Router ID

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim router-id 1.1.1.1

(config)#no ipv6 pim router-id 1.1.1.1
```

ipv6 pim rp-address

Use this command to statically configure an RP address for multicast groups.

Use the `no` option to remove the RP address.

OcNOS PIMv6 supports multiple static RPs. It also supports usage of static-RP and BSR mechanism simultaneously. The following list states the correct usage of this command:

- To support embedded RP, the router configured as the RP must use a configured access-list that permits the embedded RP group ranges derived from the embedded RP address. If embedded RP support is available, only the RP must be statically configured as the RP for the embedded RP ranges – no additional configuration is required on other PIMv6 routers. The other routers will discover the RP address from the IPv6 group address. For these routers to select a static RP instead of the embedded RP, the specific embedded RP group range must be configured in the access list of the static RP, and embedded RP support must be disabled.
- If RP-address configured through BSR and RP-address configured statically are both available for a group range, the RP-address configured through BSR is chosen over statically configured RP-address.
- A single static-RP can be configured for multiple group ranges using Access Lists. However, configuring multiple static RPs (using `ipv6 pim rp-address` command) with the same RP address is not allowed. The static-RP can be configured either for the whole multicast group range `ff00::/8` (without ACL) or for specific group ranges (using ACL).

  For example, configuring `ipv6 pim rp-address 3ffe:10:10:5::153` will configure static-RP `3ffe:10:10:5::153` for the default group range `ff00::/8`. Configuring `ipv6 pim rp-address 3ffe:20:20:5::153 grp-list` will configure static-RP `3ffe:20:20:5::153` for all the group ranges represented by `permit` filters in `grp-list` ACL.
- If multiple static-RPs are available for a group range, then one with the highest IP address is chosen.
- Only `permit` filters in ACL are considered as valid group ranges. The default `permit` filter `::/0` is converted to default multicast filter `ff00::/8`.
- When selecting static-RPs for a group range, the first element, with static-RP with the highest IP address is chosen.
- Group mode and RP address mappings learned through BSR take precedence over mappings statistically defined by the `ipv6 pim rp-address` command without the `override` keyword. Commands with the `override` keyword take precedence over dynamically learned mappings.

Command Syntax

```
ipv6 pim rp-address X:X::X:X (override|)
ipv6 pim rp-address X:X::X:X (<1-99>|<1300-1999>|WORD)(override|)
ipv6 pim (vrf NAME|) rp-address X:X::X:X (override|)
ipv6 pim (vrf NAME|) rp-address X:X::X:X (<1-99>|<1300-1999>|WORD)(override|)
no ipv6 pim rp-address X:X::X:X
no ipv6 pim rp-address X:X::X:X (<1-99>|<1300-1999>|WORD)
no ipv6 pim (vrf NAME|) rp-address X:X::X:X
no ipv6 pim (vrf NAME|) rp-address X:X::X:X (<1-99>|<1300-1999>|WORD)
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance

X:X::X:X	IPv6 address for the RP
<1-99>	An IP Standard access-list
<1300-1999>	An IP Standard access-list (expanded range)
WORD	Access-list name
override	Static RP overrides dynamically-learned RP

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim rp-address 30:30:5::153 4

#configure terminal
(config)#no ipv6 pim rp-address 30:30:5::153 4
```

ipv6 pim rp-candidate

Use this command to give the router a candidate RP status using the IPv6 address of the specified interface.

Additionally, the groups specified will operate in PIM sparse mode; group-list specifies the standard IP access list number or name that defines the group prefixes that are advertised in association with the RP address.

Use the no option along with this command to remove the settings.

Command Syntax

```
ipv6 pim (vrf NAME) rp-candidate IFNAME(group-list(<1-99>|WORD))|)(interval <1-
  16383>|) (priority <0-255>|)
no ipv6 pim (vrf NAME) rp-candidate (IFNAME|)
```

Parameters

vrf NAME	The VPN routing/forwarding instance
IFNAME	Specify an interface name
<1-99>	An IP Standard access-list
WORD	A named standard access list
<0-16383>	Range of values for candidate-RP advertisement interval, in seconds
<0-255>	Range of values for priority of an RP candidate

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim rp-candidate eth3

(config)#no ipv6 pim rp-candidate eth3
```

ipv6 pim rp-register-kat

Use this command to configure a Keepalive Timer (KAT) value for (S,G) states at RP to monitor PIM register packets, overriding the generic KAT timer value.

Use the no option to remove this configuration.

Command Syntax

```
ipv6 pim rp-register-kat <1-65535>
ipv6 pim (vrf NAME|) rp-register-kat <1-65535>
no ipv6 pim rp-register-kat
no ipv6 pim (vrf NAME|) rp-register-kat
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
<1-65535>	Range of values for a KAT time in seconds

Command mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#ipv6 pim rp-register-kat 3454

(config)#no ipv6 pim rp-register-kat
```

ipv6 pim spt-threshold

Use this command to configure an SPT (System Posture Token) threshold.

Use the no option with this command to remove a configured SPT threshold.

Note: This option is binary, meaning that switching to SPT happens either the first data packet is received, or not at all. It is not rate-based.

Command Syntax

```
ipv6 pim spt-threshold
ipv6 pim spt-threshold group-list (<1-99>|<1300-1999>|WORD)
ipv6 pim (vrf NAME|) spt-threshold
ipv6 pim (vrf NAME|) spt-threshold group-list (<1-99>|<1300-1999>|WORD)
no ipv6 pim spt-threshold
no ipv6 pim spt-threshold group-list (<1-99>|<1300-1999>|WORD)
no ipv6 pim (vrf NAME|) spt-threshold
no ipv6 pim (vrf NAME|) spt-threshold group-list (<1-99>|<1300-1999>|WORD)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
group-list	Enable the ability for the last-hop PIM router to switch to SPT for multicast group addresses indicated by the given access-list
<1-99>	An IP Standard access-list
<1300-1999>	An IP Standard access-list (expanded range)
WORD	A named standard access list

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#ipv6 pim spt-threshold group-list LIST1

#configure terminal
(config)#no ipv6 pim spt-threshold
```

ipv6 pim ssm

Use this command to configure Source Specific Multicast (SSM), and define a range of IP multicast addresses. The `default` keyword defines the SSM range as ff3x::/32. To define a SSM range other than the default, specify an access-list.

When an SSM range of IP multicast addresses is defined with this command, the no (*,G) or (S,G,rpt) state is initiated for groups in the SSM range.

The messages corresponding to these states are not accepted or originated in the SSM range.

Use the `no` form of this command to disable the SSM range.

Command Syntax

```
ipv6 pim ssm default
ipv6 pim ssm range (<1-99>|WORD)
ipv6 pim (vrf NAME|) ssm default
ipv6 pim (vrf NAME|) ssm range (<1-99>|WORD)
no ipv6 pim ssm
no ipv6 pim (vrf NAME|) ssm
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`default`	Defines the FF3x::/32 group range for SSM
`range`	Define an access-list for group range to use for SSM
`<1-99>`	Range of values for a standard access-list
`WORD`	A named standard access list

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following example shows how to configure SSM service for the IP address range defined by access list 10:

```
#configure terminal
(config)#access-list 10 permit 225.1.1.1
(config)#ipv6 pim ssm range 4
```

ipv6 pim state-refresh origination-interval

Use this command to configure a PIM State-Refresh origination interval other than the default value. The origination interval is the number of seconds between PIM State Refresh control messages.

Use the no option with this command to return the origination interval to its default value.

Command Syntax

```
ipv6 pim state-refresh origination-interval <1-100>
no ipv6 pim state-refresh origination-interval
```

Parameter

<1-100>	Range of values for state-refresh origination interval, in seconds

Note: No fractional values are allowed for the interval time.

Default

The default state-refresh origination interval is 60 seconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim state-refresh origination-interval 65

(config)#interface eth0
(config-if)#no ipv6 pim state-refresh origination-interval
```

ipv6 pim unicast-bsm

Use this command to enable support for sending and receiving unicast Bootstrap Messages (BSM) on an interface. This command supports backward-compatibility with older versions of the Bootstrap Router specification, which specifies unicast BSM to refresh the state of new or restarting neighbors.

Use the no option with this command to disable unicast bootstrap messaging on an interface.

Command Syntax

```
ipv6 pim unicast-bsm
no ipv6 pim unicast-bsm
```

Parameters

None

Default

Unicast bootstrap messaging is disabled by default.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#ipv6 pim unicast-bsm

(config)#interface eth0
(config-if)#no ipv6 pim unicast-bsm
```

show debugging ipv6 pim

Use this command to display the debug status for the IPv6 PIM process.

Command Syntax

```
show debugging ipv6 pim
show debugging ipv6 pim (vrf NAME|)
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
# show debugging ipv6 pim
PIMv6 Debugging status:
  PIMv6 event debugging is on
  PIMv6 MFC debugging is on
  PIMv6 state debugging is on
  PIMv6 incoming packet debugging is on
  PIMv6 outgoing packet debugging is on
  PIMv6 Hello HT timer debugging is on
  PIMv6 Hello NLT timer debugging is on
  PIMv6 Hello THT timer debugging is on
  PIMv6 Join/Prune JT timer debugging is on
  PIMv6 Join/Prune ET timer debugging is on
  PIMv6 Join/Prune PPT timer debugging is on
  PIMv6 Join/Prune KAT timer debugging is on
  PIMv6 Join/Prune OT timer debugging is on
  PIMv6 Assert AT timer debugging is on
  PIMv6 Register RST timer debugging is on
  PIMv6 Bootstrap BST timer debugging is on
  PIMv6 Bootstrap CRP timer debugging is on
  PIMv6 mib debugging is on
  PIMv6 nexthop debugging is on
  PIMv6 mtrace debugging is on
  PIMv6 NSM debugging is on
  PIMv6 MSDP debugging is on
```

show ipv6 pim interface

Use this command to display information about interfaces configured for PIM.

Command Syntax

```
show ipv6 pim interface
show ipv6 pim interface detail
show ipv6 pim (vrf NAME|) interface
show ipv6 pim (vrf NAME|) interface detail
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`detail`	Display detailed information about a PIM interface

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show  ipv6  pim interface detail
eth1 (vif 0):
  Address fe80::5054:ff:fe14:857, DR fe80::5054:ff:fe14:857
  Hello period 30 seconds, Next Hello in 20 seconds
  Triggered Hello period 5 seconds
  Propagation delay is 1000 milli-seconds
  Interface ID: Router-ID:1.1.1.1 Local-ID 3
  Secondary addresses:
   3ffe:192:168:10::53
  Neighbors:

eth2 (vif 2):
  Address fe80::5054:ff:fe52:219e, DR fe80::5054:ff:fe63:c0ae
  Hello period 30 seconds, Next Hello in 20 seconds
  Triggered Hello period 5 seconds
  Propagation delay is 1000 milli-seconds
  Interface ID: Router-ID:1.1.1.1 Local-ID 4
  ECMP REDIRECT, bundle : bundle1, status :  allowed
  Secondary addresses:
   3ffe:192:168:1::53
  Neighbors:
   fe80::5054:ff:fe21:5e56
   fe80::5054:ff:fe29:f7f3
   fe80::5054:ff:fe63:c0ae
```

Table 2-44 explains the fields for each pim entry.

Table 2-44: show ipv6 pim interface detail

Entry	Description
Interface name	As stated
Address	The IPv6 address of the interface.
DR	The IPv6 address of the Designated Router (DR).
Hello period	When PIM is enabled on an interface or a router first starts, the Hello Timer of that interface is set to a random value between 0 and Triggered_Hello_Delay. This prevents synchronization of Hello messages if multiple routers are powered on simultaneously. After the initial randomized interval, Hello messages MUST be sent every Hello_Period seconds. The Hello Timer should not be reset except when it expires.
Next Hello	The time period before the next Hello is sent.
Triggered Hello period	A per-interface Hello Timer (HT(I)) is used to trigger sending Hello messages on each active interface. When PIM is enabled on an interface or a router first starts, the Hello Timer of that interface is set to a random value between 0 and Triggered_Hello_Delay.
Propagation delay	The Propagation Delay field of the LAN Prune Delay option (if present) in the Hello message.
ECMP REDIRECT	Whether Equal-Cost Multiple-Path (ECMP) is allowed and on which bundle.
Secondary address	As stated.
Neighbors	The IPv6 addresses of known Multicast neighbors.

show ipv6 pim mroute

Use this command to display information the IPv6 multicast routing table, or the IPv6 multicast routing table based on the specified address or addresses.

Command Syntax

```
show ipv6 pim mroute (detail|)
show ipv6 pim mroute X:X::X:X (detail|)
show ipv6 pim mroute X:X::X:X X:X::X:X (detail|)
show ipv6 pim (vrf NAME|) mroute (detail|)
show ipv6 pim (vrf NAME|) mroute X:X::X:X (detail|)
show ipv6 pim (vrf NAME|) mroute X:X::X:X X:X::X:X (detail|)
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
X:X::X:X	Display all entries for this group IPv6 address
X:X::X:X	Display all entries for this source IPv6 address
detail	Display detailed PIM multicast routing table information

Note: A group IP address and a source IP address cannot be used simultaneously.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 pim mroute

IPv6 Multicast Routing Table

```

Table 2-45 explains the fields for each pim entry.

Table 2-45: show ipv6 pim mroute

Entries	Description
(*,*,RP) Entries	Optional (*,*,RP) (RFC 4601), PIM Multicast Border Router feature and authentication using IPsec that lack sufficient deployment experience. this is obsoleted by RFC 7761.
(*,G) Entries	A wild card Group entry for all sources within group G.
(S,G) Entries	Source Specific to a Group. IGMPv3 permits a receiver to join a group and specify that it only wants to receive traffic for a group if that traffic comes from a particular source.
(S, G, rpt) Entries	Source Specific to a Group and Rendezvous Point Tree entries.
RP	Rendezvous Point address

Table 2-45: (Continued)show ipv6 pim mroute

Entries	Description
RPF nbr	“Reverse Path Forwarding Neighbor” address. The RPF Neighbor of a router with respect to an address is the neighbor that the MRIB indicates should be used to forward packets to that address.
RPF idx	RPF interface (RP) is the interface the MRIB indicates would be used to route packets to the RP, except at the RP when it is the decapsulation interface (the “virtual” interface on which Register packets are received).
SPT bit	The SPT bit is used to indicate whether forwarding is taking place on the (S,G) Shortest Path Tree (SPT) or on the (*,G) tree.
Upstream State	The state of the a particular entry. States are: Local, Joined, Pruned Not Pruned, Asserted, or Outgoing.
KAT timer running	Keep Alive Timer.
Source	The Source address.

show ipv6 pim neighbor

Use this command to display IPv6 PIM neighbor information.

Command Syntax

```
show ipv6 pim neighbor (detail|)
show ipv6 pim neighbor IFNAME (detail|)
show ipv6 pim neighbor IFNAME X:X::X:X (detail|)
show ipv6 pim (vrf NAME|) neighbor (detail|)
show ipv6 pim (vrf NAME|) neighbor IFNAME (detail|)
show ipv6 pim (vrf NAME|) neighbor IFNAME X:X::X:X (detail|)
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`IFNAME`	Name of the interface
`X:X::X:X`	IPv6 address of the neighbor interface
`detail`	Display detailed information for a PIM neighbor

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#show ipv6 pim neighbor detail
rtr6# show  ipv6  pim  neighbor  detail
Nbr fe80::5054:ff:fe21:5e56 (eth2)
Expires in 83 seconds, uptime 01:37:14
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 321289676,
Interface ID: Router-ID: 4.4.4.4 Local-ID: 4,
ECMP REDIRECT enabled
Secondary addresses:
  3ffe:192:168:1::150

Nbr fe80::5054:ff:fe29:f7f3 (eth2)
Expires in 79 seconds, uptime 01:37:15
Holdtime: 105 secs, T-bit: off, Lan delay: 1, Override interval: 3
DR priority: 1, Gen ID: 847253139,
Interface ID: Router-ID: 2.2.2.2 Local-ID: 4,
ECMP REDIRECT enabled
Secondary addresses:
  3ffe:192:168:1::149
```

Table 2-46 explains the fields for each pim entry.

Table 2-46: show ipv6 pim Neighbor

Entry	Description
Interface name	As stated
Address	The IPv6 address of the interface.
DR	The IPv6 address of the Designated Router (DR).
Hello period	When PIM is enabled on an interface or a router first starts, the Hello Timer of that interface is set to a random value between 0 and Triggered_Hello_Delay. This prevents synchronization of Hello messages if multiple routers are powered on simultaneously. After the initial randomized interval, Hello messages MUST be sent every Hello_Period seconds. The Hello Timer should not be reset except when it expires.
Next Hello	The time period before the next Hello is sent.
Triggered Hello period	A per-interface Hello Timer (HT(I)) is used to trigger sending Hello messages on each active interface. When PIM is enabled on an interface or a router first starts, the Hello Timer of that interface is set to a random value between 0 and Triggered_Hello_Delay.
Propagation delay	The Propagation Delay field of the LAN Prune Delay option (if present) in the Hello message.
ECMP REDIRECT	Whether Equal-Cost Multiple-Path (ECMP) is allowed and on which bundle.
Secondary address	As stated.

show ipv6 pim nexthop

Use this command to display the nexthop information from NSM as used by IPv6 PIM.

Command Syntax

```
show ipv6 pim nexthop
show ipv6 pim (vrf NAME|) nexthop
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 pim nexthop

Flags: N = New, R = RP, S = Source, U = Unreachable
Destination           Type  Nexthop Nexthop Nexthop  Nexthop Metric    Pref
Refcnt
                            Num     Addr    Ifindex  Name
_____________________________________________________________________________
_______
2001:db8:10:5::153    .RS.  1       fe80::20e:cff:fe01:facc  2     30  110
1
```

show ipv6 pim bsr-router

Use this command to show the bootstrap router v2 address.

Command Syntax

```
show ipv6 pim bsr-router
show ipv6 pim (vrf NAME|) bsr-router
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 pim bsr-router
  PIMv2 Bootstrap information
  This system is the Bootstrap Router (BSR)
    BSR address: 3ffe:b00:c18:1::10
    Uptime:      00:37:12, BSR Priority: 64, Hash mask length: 10
    Next bootstrap message in 00:00:04
    Role: Candidate BSR
    State: Elected BSR
    Candidate RP: fe80::5054:ff:fe21:5e56(eth1)
    Advertisement interval 60 seconds
    Next C-RP advertisement in 00:00:27
```

Table 2-47 explains the fields for each pim entry.

Table 2-47: show ipv6 pim bsr-router

Entry	Description
BSR address	Address of the Bootstrap router (BSR).
Uptime	As Stated.
BSR Priority	The current priority of the BSR (this is configurable).
Hash mask length	For Rendezvous Point (RP) addresses in the matching group-range-to-RP mappings, compute a value — Value(G,M,C(i))= (1103515245 * ((1103515245 * (G&M)+12345) XOR C(i)) + 12345) mod 2^31 where C(i) is the RP address and M is a hash-mask.
Next bootstrap message	Time until next boostrap message.
Role	AS stated..

Table 2-47: show ipv6 pim bsr-router

Entry	Description
State	As stated..
Candidate RP	Address of the rendezvous point (RP).
Advertisement interval	As stated.
Next C-RP advertisement	Time before the next Candidate RP is advertised.

show ipv6 pim local-members

Use this command to display information about local membership for PIM interfaces.

Command Syntax

```
show ipv6 pim local-members
show ipv6 pim local-members IFNAME
show ipv6 pim (vrf NAME|) local-members
show ipv6 pim (vrf NAME|) local-members IFNAME
```

Parameters

`vrf`	The VPN routing/forwarding instance
`NAME`	Specify the name of the VPN routing/forwarding instance
`IFNAME`	Display neighbors for an interface name

Command Mode

Privileged Exec and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 pim local-members
PIM Local membership information

eth1:
  (*, ff05::2) : Include

eth2:
  (*, ff05::2) : Include
  (*, ff1e::10) : Include
#
```

Table 2-48 explains the fields for each pim entry.

Table 2-48: show ipv6 pim local-members output

Entries	Description
Port	Port name
(*, G)	State that maintains the Rendezvous Point for the Group (G).

show ipv6 pim rp-hash

Use this command to display the rendezvous point (RP) based on the group selected.

Command Syntax

```
show ipv6 pim rp-hash X:X::X:X
show ipv6 pim (vrf NAME|) rp-hash X:X::X:X
```

Parameters

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance
X:X::X:X	Specify a group address

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show ipv6 pim rp-hash ff1e::10
    RP: 3ffe:192:168:1::57
    Info source: 3ffe:192:168:1::57, via bootstrap
#
```

Table 2-49 explains the fields for each pim entry.

Table 2-49: show ipv6 pim rp-hash

Entries	Description
RP	Address of the Rendezvous Point
Info source	Address of the information source. In this case the information comes from the Bootstrap router.

show ipv6 pim rp mapping

Use this command to display the mappings for the PIM group to the active rendezvous points.

Command Syntax

```
show ipv6 pim rp mapping
show ipv6 pim (vrf NAME|) rp mapping
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh ipv6 pim rp mapping
PIM Group-to-RP Mappings
Override RP cnt: 0

Group(s): ff00::/8, Static
    RP: aab1:23::1
         Uptime: 00:05:44
    RP: a121:33::1
         Uptime: 00:00:29
    RP: 3ffe:172:31:12::2
         Uptime: 00:14:54
Embedded RP Groups:
```

undebug all ipv6 pim

Use this command to disable all PIM debugging.

Command Syntax

```
undebug all ipv6 pim
undebug (vrf NAME|) all ipv6 pim
```

Parameter

vrf	The VPN routing/forwarding instance
NAME	Specify the name of the VPN routing/forwarding instance

Command Mode

Privileged Exec mode and Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#undebug all ipv6 pim
```

SECTION 8

Carrier Ethernet

Carrier Ethernet Configuration Guide

Contents

This document contains these chapters and appendices:

CHAPTER 1 Link Layer Discovery Protocol Configuration

This chapter contains a complete sample Link Layer Discovery Protocol (LLDP) configuration.

LLDP is a neighbor discovery protocol that defines a method for network access devices using Ethernet connectivity to advertise themselves to other devices on the same physical LAN, and then to store information about the network. It allows a device to learn higher-layer management reachability and connection endpoint information from adjacent devices. Using LLDP, a network device is able to advertise its identity, its capabilities and its media-specific configuration, as well as learn the same information from other connected devices.

Note: The `lldp-agent` command is not supported for SVLAN, VLAN, and loop-back interfaces.

Topology

Figure 1-78 displays a sample LLDP topology.

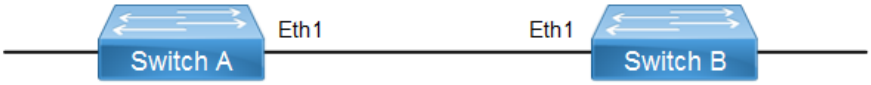

Figure 1-78: LLDP Topology

Interface Mode TLV

Default Agent

All configuration commands in the table below should be followed for each switch.

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Configure an IEEE VLAN-aware bridge.
`(config)#vlan database`	Enter VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1 state enable`	Configure a VLAN and add it to the bridge.
`(config-vlan)#exit`	Exit the VLAN configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Set switching characteristics on the port.
`(config-if)#bridge-group 1`	Associate the interface to the bridge.
`(config-if)#lldp-agent`	Enter into the default agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#set lldp chassis-id-tlv ip-address`	Configure the subtype for chassis-id TLV
`(if-lldp-agent)#set lldp port-id-tlv mac-address`	Configure the subtype for port-id TLV
`(if-lldp-agent)#lldp tlv basic-mgmt port-description select`	Enable the `port-description TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt system-name select`	Enable the `system-name TLV` to be transmitted on the port

`(if-lldp-agent)#lldp tlv basic-mgmt system-capabilities select`	Enable the `system-capabilities TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt system-description select`	Enable the `system-description TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt management-address select`	Enable the `management-address TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-vlanid select`	Enable the `VLAN-id TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vlan-name select`	Enable the `VLAN-NAME TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-ptcl-vlanid select`	Enable the `Port and Protocol VLAN id TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific ptcl-identity select`	Enable the `Protocol Identity TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vid-digest select`	Enable the `VID Usage Digest TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific mgmt-vid select`	Enable the `Management VID TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific link-agg select`	Enable the `Link Aggregation TLV` to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific mac-phy select`	Enable the MAC/PHY Configuration/Status TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific max-mtu-size select`	Enable the Maximum Frame Size TLV to be transmitted on the port
`(if-lldp-agent)#set lldp timer msg-fast-tx 5`	Defines the time interval during fast transmission periods
`(if-lldp-agent)#set lldp tx-fast-init 6`	Defines the number of LLDPDUs that are transmitted during a fast transmission period
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#exit`	Exit interface mode.

Validation

1. Verify the LLDP configurations in the local switch

```
#show running-config lldp
!
interface eth1
lldp-agent
  set lldp enable txrx
  set lldp chassis-id-tlv ip-address
  set lldp port-id-tlv mac-address
  lldp tlv basic-mgmt port-description select
  lldp tlv basic-mgmt system-name select
  lldp tlv basic-mgmt system-description select
  lldp tlv basic-mgmt system-capabilities select
  lldp tlv basic-mgmt management-address select
  lldp tlv ieee-8021-org-specific port-vlanid select
  lldp tlv ieee-8021-org-specific port-ptcl-vlanid select
  lldp tlv ieee-8021-org-specific vlan-name select
  lldp tlv ieee-8021-org-specific ptcl-identity select
  lldp tlv ieee-8021-org-specific vid-digest select
```

```
  lldp tlv ieee-8021-org-specific mgmt-vid select
  lldp tlv ieee-8021-org-specific link-agg select
  lldp tlv ieee-8023-org-specific mac-phy select
  lldp tlv ieee-8023-org-specific max-mtu-size select
  set lldp timer msg-fast-tx 5
  set lldp tx-fast-init 6
!
```

2. Verify the LLDP port statistics

```
#show lldp interface eth1 nearest-bridge

Agent Mode                    : Nearest bridge
 Enable (tx/rx)               : Y/Y
 Message fast transmit time   : 5
 Message transmit interval    : 30
 Reinitialisation delay       : 2
 MED Enabled                  : N
  Device Type                 : Not Defined
 Traffic statistics           :
  Total frames transmitted    : 4
  Total entries aged          : 0
  Total frames received       : 3
  Total error frames received: 0
  Total frames discarded      : 0
  Total discarded TLVs        : 0
  Total unrecognised TLVs     : 0
```

Customer Bridge

All configuration commands in the table below should be followed for each switch.

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Configure an IEEE VLAN-aware bridge.
`(config)#vlan database`	Enter VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1 state enable`	Configure a VLAN and add it to the bridge.
`(config-vlan)#exit`	Exit the VLAN configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Set switching characteristics on the port.
`(config-if)#bridge-group 1`	Associate the interface to the bridge.
`(config-if)#lldp-agent customer-bridge`	Enter into the Customer Bridge agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#set lldp chassis-id-tlv ip-address`	Configure the subtype for chassis-id TLV
`(if-lldp-agent)#set lldp port-id-tlv mac-address`	Configure the subtype for port-id TLV
`(if-lldp-agent)#lldp tlv basic-mgmt port-description select`	Enable the port-description TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv basic-mgmt system-name select`	Enable the system-name TLV to be transmitted on the port.

`(if-lldp-agent)#lldp tlv basic-mgmt system-capabilities select`	Enable the system-capabilities TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv basic-mgmt system-description select`	Enable the system-description TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv basic-mgmt management-address select`	Enable the management-address TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-vlanid select`	Enable the VLAN-id TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vlan-name select`	Enable the VLAN-NAME TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-ptcl-vlanid select`	Enable the Port and Protocol VLAN id TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific ptcl-identity select`	Enable the Protocol Identity TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vid-digest select`	Enable the VID Usage Digest TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific mgmt-vid select`	Enable the Management VID TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific link-agg select`	Enable the Link Aggregation TLV to be transmitted on the port.
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific mac-phy select`	Enable the MAC/PHY Configuration/Status TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific max-mtu-size select`	Enable the Maximum Frame Size TLV to be transmitted on the port.
`(if-lldp-agent)#set lldp timer msg-fast-tx 5`	Defines the time interval during fast transmission periods.
`(if-lldp-agent)#set lldp tx-fast-init 6`	Defines the number of LLD PDUs that are transmitted during a fast transmission period.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#exit`	Exit interface mode.

Validation

1. Verify the LLDP configurations in the local switch:

```
#show #show running-config lldp
!
interface eth1
lldp-agent customer-bridge
  set lldp enable txrx
  set lldp chassis-id-tlv ip-address
  set lldp port-id-tlv mac-address
  lldp tlv basic-mgmt port-description select
  lldp tlv basic-mgmt system-name select
  lldp tlv basic-mgmt system-description select
  lldp tlv basic-mgmt system-capabilities select
  lldp tlv basic-mgmt management-address select
  lldp tlv ieee-8021-org-specific port-vlanid select
  lldp tlv ieee-8021-org-specific port-ptcl-vlanid select
  lldp tlv ieee-8021-org-specific vlan-name select
  lldp tlv ieee-8021-org-specific ptcl-identity select
  lldp tlv ieee-8021-org-specific vid-digest select
  lldp tlv ieee-8021-org-specific mgmt-vid select
```

```
  lldp tlv ieee-8021-org-specific link-agg select
  lldp tlv ieee-8023-org-specific mac-phy select
  lldp tlv ieee-8023-org-specific max-mtu-size select
  set lldp timer msg-fast-tx 5
  set lldp tx-fast-init 6
!
```

2. Verify the LLDP port statistics

```
#show lldp interface eth1 customer-bridge

Agent Mode                    : Customer-bridge
 Enable (tx/rx)               : Y/Y
 Message fast transmit time   : 5
 Message transmit interval    : 30
 Reinitialisation delay       : 2
 MED Enabled                  : N
  Device Type                 : Not Defined
 Traffic statistics           :
  Total frames transmitted    : 8
  Total entries aged          : 0
  Total frames received       : 7
  Total error frames received: 0
  Total frames discarded      : 0
  Total discarded TLVs        : 0
  Total unrecognised TLVs     : 0
```

Non-Tpmr-Bridge

The below configurations should be followed for each switch.

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Configure an IEEE VLAN-aware bridge.
`(config)#vlan database`	Enter VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1 state enable`	Configure a VLAN and add it to the bridge.
`(config-vlan)#exit`	Exit the VLAN configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Set switching characteristics on the port.
`(config-if)#bridge-group 1`	Associate the interface to the bridge.
`(config-if)#lldp-agent non-tpmr-bridge`	Enter into the Non tpmr Bridge agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#set lldp chassis-id-tlv ip-address`	Configure the subtype for chassis-id TLV
`(if-lldp-agent)#set lldp port-id-tlv mac-address`	Configure the subtype for port-id TLV
`(if-lldp-agent)#lldp tlv basic-mgmt port-description select`	Enable the port-description TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt system-name select`	Enable the system-name TLV to be transmitted on the port

`(if-lldp-agent)#lldp tlv basic-mgmt system-capabilities select`	Enable the system-capabilities TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt system-description select`	Enable the system-description TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv basic-mgmt management-address select`	Enable the management-address TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-vlanid select`	Enable the VLAN-id TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vlan-name select`	Enable the VLAN-NAME TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-ptcl-vlanid select`	Enable the Port and Protocol VLAN id TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific ptcl-identity select`	Enable the Protocol Identity TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific vid-digest select`	Enable the VID Usage Digest TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific mgmt-vid select`	Enable the Management VID TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8021-org-specific link-agg select`	Enable the Link Aggregation TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific mac-phy select`	Enable the MAC/PHY Configuration/Status TLV to be transmitted on the port
`(if-lldp-agent)#lldp tlv ieee-8023-org-specific max-mtu-size select`	Enable the Maximum Frame Size TLV to be transmitted on the port
`(if-lldp-agent)#set lldp timer msg-fast-tx 5`	Defines the time interval during fast transmission periods
`(if-lldp-agent)#set lldp tx-fast-init 6`	Defines the number of LLD PDUs that are transmitted during a fast transmission period
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#exit`	Exit interface mode.

Validation

1. Verify the LLDP configurations in the local switch:

```
#show running-config lldp
lldp-agent non-tpmr-bridge
  set lldp enable txrx
  set lldp chassis-id-tlv ip-address
  set lldp port-id-tlv mac-address
  lldp tlv basic-mgmt port-description select
  lldp tlv basic-mgmt system-name select
  lldp tlv basic-mgmt system-description select
  lldp tlv basic-mgmt system-capabilities select
  lldp tlv basic-mgmt management-address select
  lldp tlv ieee-8021-org-specific port-vlanid select
  lldp tlv ieee-8021-org-specific port-ptcl-vlanid select
  lldp tlv ieee-8021-org-specific vlan-name select
  lldp tlv ieee-8021-org-specific ptcl-identity select
  lldp tlv ieee-8021-org-specific vid-digest select
  lldp tlv ieee-8021-org-specific mgmt-vid select
  lldp tlv ieee-8021-org-specific link-agg select
  lldp tlv ieee-8023-org-specific mac-phy select
```

```
  lldp tlv ieee-8023-org-specific max-mtu-size select
  set lldp timer msg-fast-tx 5
  set lldp tx-fast-init 6

!
```

2. Verify the LLDP port statistics

```
#show lldp interface eth1 non-tmpr-bridge

Agent Mode                    : Non-TPMR-bridge
 Enable (tx/rx)               : Y/Y
 Message fast transmit time   : 5
 Message transmit interval    : 30
 Reinitialisation delay       : 2

  Total error frames received: 0
  Total frames discarded      : 0
  Total discarded TLVs        : 0
  Total unrecognised TLVs     : 0
```

Media Endpoint Devices TLV

Switch A

`(config)#interface eth1`	Enter interface mode.
`(config-if)#lldp-agent`	Enter the default agent.
`(if-lldp-agent)#set lldp enable txrx`	Set the admin status of the LLDP agent.
`(if-lldp-agent)#exit`	Exit agent mode.
`(config-if)#lldp-agent customer-bridge`	Enter the customer-bridge agent.
`(if-lldp-agent)#set lldp enable txrx`	Set the admin status of the LLDP agent.
`(if-lldp-agent)#exit`	Exit agent mode.
`(config-if)#lldp-agent non-tpmr-bridge`	Enter the non-tpmr-bridge agent.
`(if-lldp-agent)#set lldp enable txrx`	Set the admin status of the LLDP agent.
`(if-lldp-agent)#exit`	Exit agent mode.
`(config-if)#set lldp med-devtype net-connect`	Enter the med-devtype agent and set the device type to network connectivity.
`(config-if)#exit`	Exit agent mode.

Validation

```
#show run lldp
!
!
interface eth1
 lldp-agent
```

```
  set lldp enable txrx
 set lldp med-devtype net-connect
 lldp-agent non-tpmr-bridge

Global Mode TLV

LLDPv2 TLVs can be configured globally, making it applicable for all interfaces where LLDP is enabled.

Topology

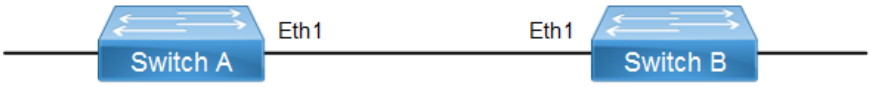

Figure 1-79: LLDP topology

SW1

`SW1#configure terminal`	Enter Configure mode
`SW1(config)#lldp tlv-select basic-mgmt port-description`	Enable LLDP port description TLV in global mode
`SW1(config)#lldp tlv-select basic-mgmt system-name`	Enable LLDP system name TLV in global mode
`SW1(config)#lldp tlv-select basic-mgmt system-capabilities`	Enable LLDP system capabilities TLV in global mode
`SW1(config)#lldp tlv-select basic-mgmt system-description`	Enable LLDP system description TLV in global mode
`SW1(config)#lldp tlv-select basic-mgmt management-address`	Enable LLDP management address TLV in global mode
`SW1(config)#interface eth1`	Enter interface mode
`SW1(config-if)#lldp-agent`	Enter LLDP interface mode
`SW1(if-lldp-agent)#set lldp enable txrx`	Enable LLDP TLV transmit and receive for the nearest bridge
`SW1(if-lldp-agent)#exit`	Exit LLDP mode
`SW1(config-if)#exit`	Exit interface mode
`SW1(config)#end`	Exit the configure mode

SW2

`SW2#configure terminal`	Enter Configure mode
`SW2(config)#lldp tlv-select basic-mgmt port-description`	Enable LLDP port description TLV in global mode
`SW2(config)#lldp tlv-select basic-mgmt system-name`	Enable LLDP system name TLV in global mode
`SW2(config)#lldp tlv-select basic-mgmt system-capabilities`	Enable LLDP system capabilities TLV in global mode
`SW2(config)#lldp tlv-select basic-mgmt system-description`	Enable LLDP system description TLV in global mode
`SW2(config)#lldp tlv-select basic-mgmt management-address`	Enable LLDP management address TLV in global mode
`SW2(config)#interface eth1`	Enter interface mode
`SW2(config-if)#lldp-agent`	Enter LLDP interface mode
`SW2(if-lldp-agent)#set lldp enable txrx`	Enable LLDP TLV transmit and receive for the nearest bridge
`SW2(if-lldp-agent)#exit`	Exit LLDP mode
`SW2(config-if)#exit`	Exit interface mode
`SW2(config)#end`	Exit the configure mode

Validation

LLDP-MED

LLDP extensions and behavior requirements are described specifically in the areas of network Configuration and policy, device location (including for Emergency Call Service / E911), Power over Ethernet management, and inventory management.

Based on the device type, different TLVs are advertised by the Station.

LLDP-MED Network Connectivity Device

LLDP-MED Network Connectivity Devices, as defined in this Standard, provide access to the IEEE 802 based LAN infrastructure for LLDP-MED Endpoint Devices. An LLDP-MED Network Connectivity Device is a LAN access device based on any of the following technologies:

- LAN Switch/Router
- IEEE 802.1 Bridge
- IEEE 802.3 Repeater (included for historical reasons)
- IEEE 802.11 Wireless Access Point
- Any device that supports the IEEE 802.1AB and MED extensions defined by this Standard and can relay IEEE 802 frames via any method.

Configuration Command

```
set lldp med-devtype net-connect
```

LLDP-MED Generic Endpoint (Class I)

The LLDP-MED Generic Endpoint (Class I) definition is applicable to all endpoint products that require the base LLDP discovery services, however do not support IP media or act as an end-user communication appliance. Such devices may include (but are not limited to) IP Communication Controllers, other communication related servers, or any device requiring basic services.

Configuration command:

```
set lldp med-devtype ep-class1
```

LLDP-MED Generic Endpoint (Class 2)

The LLDP-MED Media Endpoint (Class II) definition is applicable to all endpoint products that have IP media capabilities however may or may not be associated with a particular end user. Capabilities include all of the capabilities defined for the previous Generic Endpoint Class (Class I), and are extended to include aspects related to media streaming. Example product categories expected to adhere to this class include (but are not limited to) Voice / Media Gateways, Conference Bridges, Media Servers, and similar

Configuration command:

```
set lldp med-devtype ep-class2
```

LLDP-MED Generic Endpoint (Class 3)

The LLDP-MED Communication Endpoint (Class III) definition is applicable to all endpoint products that act as end user communication appliances supporting IP media. Capabilities include all of the capabilities defined for the previous Generic Endpoint (Class I) and Media Endpoint (Class II) classes, and are extended to include aspects related to end user devices. Example product categories expected to adhere to this class include (but are not limited to) end user communication appliances, such as IP Phones, PC-based softphones, or other communication appliances that directly support the end user.

Configuration command:

```
set lldp med-devtype ep-class3
```

Switch A

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Configure an IEEE VLAN-aware bridge.
`(config)#vlan database`	Enter VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1 state enable`	Configure a VLAN and add it to the bridge.
`(config-vlan)#exit`	Exit the VLAN configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Set switching characteristics on the port.
`(config-if)#bridge-group 1`	Associate the interface to the bridge.
`(config-if)#lldp-agent`	Enter into the default agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(if-config-if)#lldp-agent customer-bridge`	Enter into the customer-bridge agent.
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#lldp-agent non-tpmr-bridge`	Enter into the non-tpmr-bridge agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.

`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#set lldp med-devtype net-connect`	Configure the med device type
`(config-if)#exit`	Exit interface mode.

Switch B

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol ieee vlan-bridge`	Configure an IEEE VLAN-aware bridge.
`(config)#vlan database`	Enter VLAN configure mode.
`(config-vlan)#vlan 2 bridge 1 state enable`	Configure a VLAN and add it to the bridge.
`(config-vlan)#exit`	Exit the VLAN configuration mode.
`(config)#interface eth1`	Enter interface mode.
`(config-if)#switchport`	Set switching characteristics on the port.
`(config-if)#bridge-group 1`	Associate the interface to the bridge.
`(config-if)#lldp-agent`	Enter into the default agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#lldp-agent customer-bridge`	Enter into the customer-bridge agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#lldp-agent non-tpmr-bridge`	Enter into the non-tpmr-bridge agent
`(if-lldp-agent)#set lldp enable txrx`	Enable an LLDP agent on the port.
`(if-lldp-agent)#exit`	Exit the lldp agent mode
`(config-if)#set lldp med-devtype ep-class3`	Configure the med device type
`(config-if)#exit`	Exit interface mode.

Validation

1. Verify the LLDP configurations on Switch A:

```
#show running-config lldp
!
!
interface eth1
 lldp-agent
  set lldp enable txrx
 set lldp med-devtype net-connect
 lldp-agent non-tpmr-bridge
  set lldp enable txrx
 lldp-agent customer-bridge
  set lldp enable txrx
!
```

2. Verify the LLDP port statistics on Switch A:

```
#show lldp interface eth1
Agent Mode                   : Customer-bridge
 Enable (tx/rx)              : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : Y
  Device Type                : Network Connectivity
 Traffic statistics          :
  Total frames transmitted   : 11
  Total entries aged         : 0
  Total frames received      : 10
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
Agent Mode                   : Non-TPMR-bridge
 Enable (tx/rx)              : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : N
  Device Type                : Network Connectivity
 Traffic statistics          :
  Total frames transmitted   : 7
  Total entries aged         : 0
  Total frames received      : 0
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
Agent Mode                   : Nearest bridge
 Enable (tx/rx)              : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : N
  Device Type                : Network Connectivity
 Traffic statistics          :
  Total frames transmitted   : 7
  Total entries aged         : 0
  Total frames received      : 0
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0

#show lldp interface eth1 non-tpmr-bridge
Agent Mode                   : Non-TPMR-bridge
 Enable (tx/rx)              : Y/Y
 Message fast transmit time  : 5
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : N
  Device Type                : Not Defined
 Traffic statistics          :
  Total frames transmitted   : 4
```

```
  Total entries aged         : 0
  Total frames received      : 0
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
```

3. Verify the LLDP configurations for end device ep-class3 on Switch B:

```
#show running-config lldp
!
interface eth1
 set lldp med-devtype ep-class3
 lldp-agent
  set lldp enable txrx
  lldp tlv med network-policy select
lldp-agent non-TPMR-bridge
  set lldp enable txrx
  lldp tlv med network-policy select
lldp-agent customer-bridge
  set lldp enable txrx
  lldp tlv med network-policy select
!
```

4. Verify the LLDP port statistics on Switch B:

```
#show lldp interface eth1
Agent Mode                  : Customer-bridge
 Enable (tx/rx)             : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : Y
  Device Type                : End Point Class-3
 Traffic statistics          :
  Total frames transmitted   : 124
  Total entries aged         : 0
  Total frames received      : 125
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
Agent Mode                  : Non-TPMR-bridge
 Enable (tx/rx)             : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : Y
  Device Type                : End Point Class-3
 Traffic statistics          :
  Total frames transmitted   : 120
  Total entries aged         : 0
  Total frames received      : 0
  Total error frames received: 0
  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
Agent Mode                  : Nearest bridge
```

```
 Enable (tx/rx)              : Y/Y
 Message fast transmit time  : 1
 Message transmit interval   : 30
 Reinitialisation delay      : 2
 MED Enabled                 : Y
  Device Type                : End Point Class-3
 Traffic statistics          :
  Total frames transmitted   : 120
  Total entries aged         : 0
  Total frames received      : 0

  Total frames discarded     : 0
  Total discarded TLVs       : 0
  Total unrecognised TLVs    : 0
#
```

CHAPTER 2 Provider Bridging Configuration

This chapter contains sample provider bridging configurations.

A provider bridged network is a virtual bridged Local Area Network that comprises provider bridges (SVLAN bridges and provider edge bridges) and attached LANs, under the administrative control of a single service provider. Provider bridges interconnect the separate MACs of the IEEE 802 LANs that compose a provider bridged network, relaying frames to provide connectivity between all the LANs that provide customer interfaces for each service instance.

Single Provider Bridge Configuration

Topology

Figure 2-80: Single provider bridge configuration

Configuration

SW1 (PEB)

`SW1#configure terminal`	Enter configuration mode
`SW1(config)#bridge 1 protocol provider-rstp edge`	Create bridge
`SW1(config)#vlan database`	Enter VLAN configuration mode
`SW1(config-vlan)#vlan 2 type customer bridge 1 state enable`	Create customer vlan VLAN 2
`SW1(config-vlan)#vlan 200 type service point-point bridge 1 state enable`	Create service vlan VLAN200
`SW1(config-vlan)#exit`	Exit VLAN configuration mode
`SW1(config)#cvlan registration table map1 bridge 1`	Create cvlan registration table map1
`SW1(config-cvlan-registration)#cvlan 2 svlan 200`	Map cvlan2 with svlan 200
`SW1(config-cvlan-registration)#exit`	Exit registration table
`SW1(config)#interface eth1`	Enter interface configuration mode for eth1
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode customer-edge access`	Configure switchport mode customer edge
`SW1(config-if)#switchport customer-edge access vlan 2`	Associate customer vlan2 with interface

`SW1(config-if)#switchport customer-edge vlan registration map1`	Attach registration table map1 with interface
`SW1(config-if)#exit`	Exit interface mode
`SW1(config-if)#interface eth2`	Enter interface configuration mode for eth2
`SW1(config-if)#switchport`	Make interface as switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW1(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW1(config-if)#exit`	Exit interface configuration mode

SW2 (PB)

`SW2#configure terminal`	Enter configuration mode
`SW2(config)#bridge 1 protocol provider-rstp`	Create provider bridge
`SW2(config)#vlan database`	Enter VLAN configuration mode
`SW2(config-vlan)#vlan 200 type service point-point bridge 1 state enable`	Create service vlan VLAN200
`SW2(config-vlan)#exit`	Exit VLAN configuration mode
`SW2(config)#interface eth1`	Enter interface configuration mode for eth1
`SW2(config-if)#switchport`	Make interface as switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW2(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW2(config-if)#exit`	Exit interface configuration mode
`SW2(config-if)#interface eth2`	Enter interface configuration mode for eth2
`SW2(config-if)#switchport`	Make interface as switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW2(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW2(config-if)#exit`	Exit interface configuration mode

SW3 (PEB)

`SW3#configure terminal`	Enter configuration mode
`SW3(config)#bridge 1 protocol provider-rstp edge`	Create bridge
`SW3(config)#vlan database`	Enter VLAN configuration mode
`SW3(config-vlan)#vlan 2 type customer bridge 1 state enable`	Create customer vlan VLAN 2

SW3(config-vlan)#vlan 200 type service point-point bridge 1 state enable	Create service vlan VLAN200
SW3(config-vlan)#exit	Exit VLAN configuration mode
SW3(config)#cvlan registration table map1 bridge 1	Create cvlan registration table map1
SW3(config-cvlan-registration)#cvlan 2 svlan 200	Map cvlan2 with svlan 200
SW3(config-cvlan-registration)#exit	Exit registration table
SW3(config)#interface eth1	Enter interface configuration mode for eth1
SW3(config-if)#switchport	Configure switchport
SW3(config-if)#bridge-group 1	Associate interface with bridge-group 1
SW3(config-if)#switchport mode customer-edge access	Configure switchport mode customer edge
SW3(config-if)#switchport customer-edge access vlan 2	Associate customer vlan2 with interface
SW3(config-if)#switchport customer-edge vlan registration map1	Attach registration table map1 with interface
SW3(config-if)#exit	Exit interface mode
SW3(config-if)#interface eth2	Enter interface configuration mode for eth2
SW3(config-if)#switchport	Make interface as switchport
SW3(config-if)#bridge-group 1	Associate interface with bridge-group 1
SW3(config-if)#switchport mode provider-network	Configure switchport pnp port
SW3(config-if)#switchport provider-network allowed vlan all	Associate all svlan to the port
SW3(config-if)#exit	Exit interface configuration mode

Validation

```
SW3#sh br
bridge 1 is running on provider-rstp edge
Ageout time is global and if something is configured for vxlan then it will be a
ffected here also
 Bridge    CVLAN  SVLAN  BVLAN  Port         MAC Address        FWD   Time-out

Two Provider Bridge Configuration

Topology

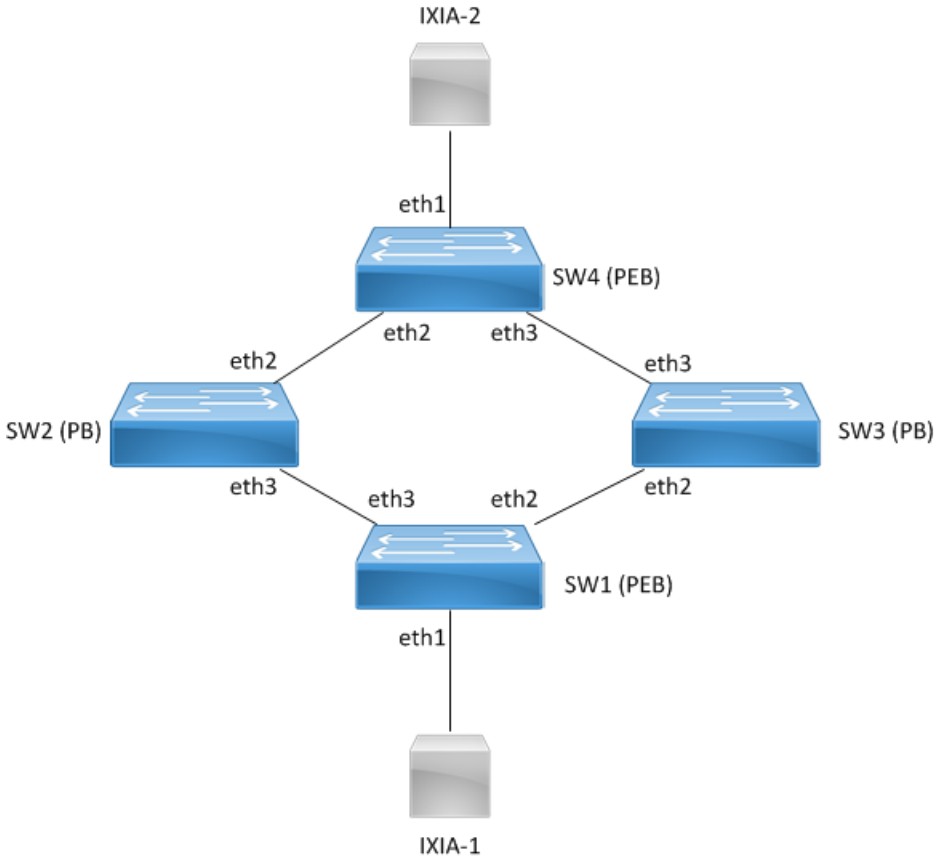

Figure 2-81: Two provider bridge configuration

Configuration

SW1 (PEB)

`SW1#configure terminal`	Enter configuration mode
`SW1(config)#bridge 1 protocol provider-rstp edge`	Create bridge
`SW1(config)#vlan database`	Enter VLAN configuration mode
`SW1(config-vlan)#vlan 2 type customer bridge 1 state enable`	Create customer vlan VLAN 2
`SW1(config-vlan)#vlan 200 type service point-point bridge 1 state enable`	Create service vlan VLAN200
`SW1(config-vlan)#exit`	Exit VLAN configuration mode
`SW1(config)#cvlan registration table map1 bridge 1`	Create cvlan registration table map1
`SW1(config-cvlan-registration)#cvlan 2 svlan 200`	Map cvlan2 with svlan 200
`SW1(config-cvlan-registration)#exit`	Exit registration table
`SW1(config)#interface eth1`	Enter interface configuration mode for eth1
`SW1(config-if)#switchport`	Configure switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode customer-edge access`	Configure switchport mode customer edge
`SW1(config-if)#switchport customer-edge access vlan 2`	Associate customer vlan2 with interface
`SW1(config-if)#switchport customer-edge vlan registration map1`	Attach registration table map1 with interface
`SW1(config-if)#exit`	Exit interface mode
`SW1(config-if)#interface eth2`	Enter interface configuration mode for eth2
`SW1(config-if)#switchport`	Make interface as switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW1(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW1(config-if)#interface eth3`	Enter interface configuration mode for eth2
`SW1(config-if)#switchport`	Make interface as switchport
`SW1(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW1(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW1(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW1(config-if)#exit`	Exit interface configuration mode

SW2 (PB)

`SW2#configure terminal`	Enter configuration mode
`SW2(config)#bridge 1 protocol provider-rstp`	Create provider bridge
`SW2(config)#vlan database`	Enter VLAN configuration mode
`SW2(config-vlan)#vlan 200 type service point-point bridge 1 state enable`	Create service vlan VLAN200
`SW2(config-vlan)#exit`	Exit VLAN configuration mode
`SW2(config)#interface eth3`	Enter interface configuration mode for eth1
`SW2(config-if)#switchport`	Make interface as switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW2(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW2(config-if)#exit`	Exit interface configuration mode
`SW2(config-if)#interface eth2`	Enter interface configuration mode for eth2
`SW2(config-if)#switchport`	Make interface as switchport
`SW2(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW2(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW2(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW2(config-if)#exit`	Exit interface configuration mode

SW3 (PB)

`SW3#configure terminal`	Enter configuration mode
`SW3(config)#bridge 1 protocol provider-rstp`	Create provider bridge
`SW3(config)#vlan database`	Enter VLAN configuration mode
`SW3(config-vlan)#vlan 200 type service point-point bridge 1 state enable`	Create service vlan VLAN200
`SW3(config-vlan)#exit`	Exit VLAN configuration mode
`SW3(config)#interface eth3`	Enter interface configuration mode for eth1
`SW3(config-if)#switchport`	Make interface as switchport
`SW3(config-if)#bridge-group 1`	Associate interface with bridge-group 1
`SW3(config-if)#switchport mode provider-network`	Configure switchport pnp port
`SW3(config-if)#switchport provider-network allowed vlan all`	Associate all svlan to the port
`SW3(config-if)#exit`	Exit interface configuration mode
`SW3(config-if)#interface eth2`	Enter interface configuration mode for eth2
`SW3(config-if)#switchport`	Make interface as switchport
`SW3(config-if)#bridge-group 1`	Associate interface with bridge-group 1

SW3(config-if)#switchport mode provider-network	Configure switchport pnp port
SW3(config-if)#switchport provider-network allowed vlan all	Associate all svlan to the port
SW3(config-if)#exit	Exit interface configuration mode

SW4 (PEB)

SW4#configure terminal	Enter configuration mode
SW4(config)#bridge 1 protocol provider-rstp edge	Create bridge
SW4(config)#vlan database	Enter VLAN configuration mode
SW4(config-vlan)#vlan 2 type customer bridge 1 state enable	Create customer vlan VLAN 2
SW4(config-vlan)#vlan 200 type service point-point bridge 1 state enable	Create service vlan VLAN200
SW4(config-vlan)#exit	Exit VLAN configuration mode
SW4(config)#cvlan registration table map1 bridge 1	Create cvlan registration table map1
SW4(config-cvlan-registration)#cvlan 2 svlan 200	Map cvlan2 with svlan 200
SW4(config-cvlan-registration)#exit	Exit registration table
SW4(config)#interface eth1	Enter interface configuration mode for eth1
SW4(config-if)#switchport	Configure switchport
SW4(config-if)#bridge-group 1	Associate interface with bridge-group 1
SW4(config-if)#switchport mode customer-edge access	Configure switchport mode customer edge
SW4(config-if)#switchport customer-edge access vlan 2	Associate customer vlan2 with interface
SW4(config-if)#switchport customer-edge vlan registration map1	Attach registration table map1 with interface
SW4(config-if)#exit	Exit interface mode
SW4(config-if)#interface eth2	Enter interface configuration mode for eth2
SW4(config-if)#switchport	Make interface as switchport
SW4(config-if)#bridge-group 1	Associate interface with bridge-group 1
SW4(config-if)#switchport mode provider-network	Configure switchport pnp port
SW4(config-if)#switchport provider-network allowed vlan all	Associate all svlan to the port
SW4(config-if)#interface eth3	Enter interface configuration mode for eth2
SW4(config-if)#switchport	Make interface as switchport
SW4(config-if)#bridge-group 1	Associate interface with bridge-group 1
SW4(config-if)#switchport mode provider-network	Configure switchport pnp port

SW4(config-if)#switchport provider-network allowed vlan all	Associate all svlan to the port
SW4(config-if)#exit	Exit interface configuration mode

Validation

```
SW4#sh br
bridge 1 is running on provider-rstp edge
Ageout time is global and if something is configured for vxlan then it will be affected here also
 Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out

```

Layer 2 Protocol Tunneling (L2PT/ L2CP Tunneling)

L2CP tunneling provides support for tunneling Control plane frames between CE nodes.

When control frames received at CEP port of PE bridge, predefined multicast address (01-00-C2-CD-CD-D0) is used for tunnelling the packets across service provider network. If control packets are customer vlan tagged or untagged, then PE bridge will append corresponding service vlan tag to the control packet as per registration table / vlan translation table mapped to the port and send it across the service provider as a data packet.

When tunnelled control packet with multicast address (01-00-C2-CD-CD-D0) received on PNP port, the multicast address is replaced with corresponding control packet multicast address and cvlan/svlan removal or updating is done as per registration table / vlan translation table.

Topology

Figure 2-82 displays a sample Provider Bridged topology with customer equipment.

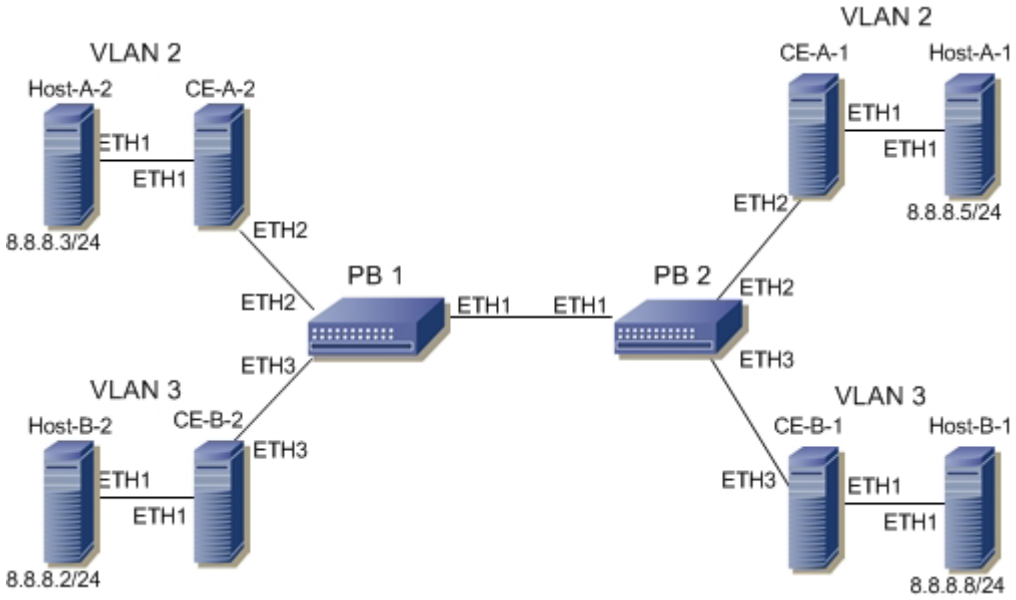

Figure 2-82: Provider Bridging with Customer Equipment Topology

Configuring the L2PT Protocol on the Interface

The following L2PT protocols are supported in OcNOS-SP version 1.0 release:

- efm Ethernet first mile (Link OAM)
- elmi Ethernet local management interface
- lacp Link Aggregation (LACP)
- lldp Link layer discovery protocol
- stp Spanning Tree Protocols
- synce Synchronous Ethernet

PB1

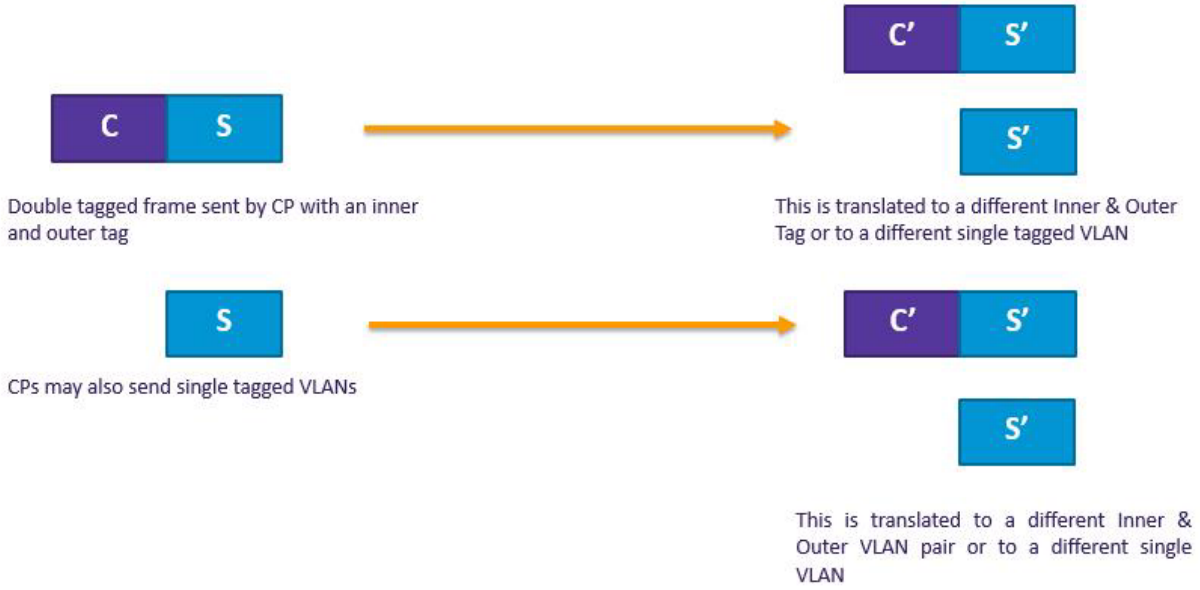
`PB1#configure terminal`	Enter Configure mode.
`PB1(config)#interface eth2`	Enter Interface mode
`PB1(config-if)#l2protocol stp peer`	Configure STP protocol as peer
`PB1(config-if)#l2protocol elmi tunnel`	Configure Elmi protocol as tunnel
`PB1(config-if)#l2protocol lldp tunnel`	Configure LLDP protocol as tunnel
`PB1(config-if)#l2protocol lacp discard`	Configure LACP protocol as discard
`PB1(config-if)#l2protocol efm discard`	Configure EFM protocol as discard
`PB1(config-if)#l2protocol synce discard`	Configure Synce protocol as discard
`PB1(config-if)#exit`	Exit of the interface

Validation

```
PB1#show l2protocol processing interface eth2
Bridge    Interface Name                 Protocol       Processing Status
======    ==============                 ========       =================
1         eth2                           stp            Peer
1         eth2                           gmrp           Peer
1         eth2                           gvrp           Peer
1         eth2                           mmrp           Peer
1         eth2                           mvrp           Peer
1         eth2                           lacp           Discard
1         eth2                           lldp           Tunnel
1         eth2                           efm            Discard
1         eth2                           elmi           Tunnel
1         eth2                            ptp           Peer
1         eth2                           synce          Discard
```

Provider Bridging with VLAN Translation

This is a sample configurations to verify functionality to support provider-bridging feature with extended SVLAN translation as below:



Topology

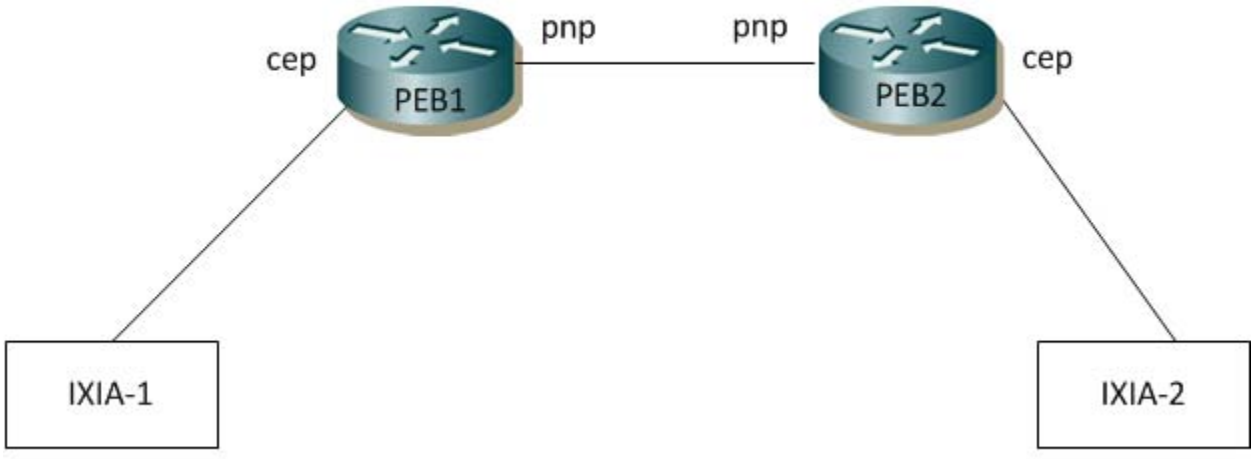


Figure 2-83: Provider Bridging with VLAN Traslation Topology

PEB1

Bridge Configuration

`#configure terminal`	Enter configure mode.
`(config)#bridge 1 protocol provider-rstp edge`	Enter Configure bridge type as provider-RSTP edge bridge
`(config)#exit`	Exit configure mode.

VLAN Configuration

`#configure terminal`	Enter configure mode.
`(config)#vlan database`	Enter VLAN database
`(config-vlan)# vlan 2-500 type customer bridge 1 state enable`	Configure customer VLANs on bridge 1
`(config-vlan)#vlan 501-1005 type service point-point bridge 1 state enable`	Configure service VLANs on bridge 1
`(config-vlan)#end`	Exit VLAN database and configure mode.

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 6`	Map CVLAN to SVLAN
`(config-cvlan-registration)#cvlan 3 svlan 7`	Map CVLAN to SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode customer-edge hybrid`	Configure port as customer-edge hybrid port
`(config-if)#switchport customer-edge hybrid allowed vlan all`	Add all VLANs configured above to this CEP port
`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode

(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode provider-network	Configure port as Provider Network Port (PNP)
(config-if)#switchport provider-network allowed vlan all	Add all VLANs configured above to this PNP port
(config-if)#end	Exit interface and configure mode.

PEB2

Bridge Configuration

#configure terminal	Enter configure mode.
(config)# bridge 1 protocol provider-rstp edge	Enter configure bridge type as provider-RSTP edge bridge
(config)#exit	Exit configure mode.

VLAN Configuration

#configure terminal	Enter configure mode.
(config)#vlan database	Enter VLAN database
(config-vlan)#vlan 2-500 type customer bridge 1 state enable	Configure customer VLANs on bridge 1
(config-vlan)#vlan 501-1005 type service point-point bridge 1 state enable	Configure service VLANs on bridge 1
(config-vlan)#end	Exit VLAN database and configure mode.

CVLAN Registration Table Configuration

#configure terminal	Enter configure mode.
(config)#cvlan registration table map1 bridge 1	Configure CVLAN registration table as map1
(config-cvlan-registration)#cvlan 2 svlan 6	Map CVLAN to SVLAN
(config-cvlan-registration)#cvlan 3 svlan 7	Map CVLAN to SVLAN
(config-cvlan-registration)#end	End the CVLAN registration mode

CEP Port Configuration

#configure terminal	Enter configure mode.
(config)#interface ge3	Enter the interface mode
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode customer-edge hybrid	Configure port as customer-edge hybrid port
(config-if)#switchport customer-edge hybrid allowed vlan all	Add all VLANs configured above to this CEP port

`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode provider-network`	Configure port as Provider Network Port (PNP)
`(config-if)#switchport provider-network allowed vlan all`	Add all VLANs configured above to this PNP port
`(config-if)#end`	Exit interface and configure mode.

Translation Cases

Case1 - (C S - C' S')

Configuration on PEB2

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#switchport provider-network vlan translation cvlan 2 svlan 6 cvlan 3 svlan 7`	Translate CVLAN and SVLAN to new CVLAN and new SVLAN on PNP port

Validation for Case 1

When tagged traffic with CVLAN 2 is sent from IXIA-1 to IXIA-2 with both CTAG and STAG entering provider network and gets translated to new CVLAN and SVLAN as per Case1.

```
PEB2#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address     FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1               1            ge27        1402.ec1c.3144    1     300
 1               6            ge9         6400.6a1e.d9a5    1     300
 1               7            ge9         0000.0500.0400    1     300
 1               7            ge9         6400.6a1e.d9a5    1     300
```

New SVLAN 7 is observed on PEB2 after translation. Also, captured packets on CEP show new CVLAN 3.

When tagged traffic for CVLAN 3 is sent from IXIA-2 to IXIA-1

```
PEB1#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1               1            ge9         74e6.e2af.598b    1     300
 1               6            ge3         0000.0500.0400    1     300
 1               6            ge9         0000.0500.0700    1     300
```

When traffic is reversed and traffic has both new CVLAN 3 and SVLAN 7 on provider network from IXIA-2, translation to old CVLAN 2 and SVLAN 6 happens. Also, captured packets have CVLAN as 2.

Case2 - (C S - S')

Configuration on PEB2

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 6`	Map CVLAN to SVLAN
`(config-cvlan-registration)#cvlan 3 svlan 7`	Map CVLAN to SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport customer-edge hybrid vlan 3`	Allow access VLAN 3 configured above to this CEP port
`(config-if)#switchport customer-edge hybrid allowed vlan add 2-3`	Allow other VLANs configured to this CEP port
`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#no switchport provider-network vlan translation cvlan 2 svlan 6`	Unconfigure Translation Case1 from PNP port
`(config-if)#switchport provider-network vlan translation cvlan 2 svlan 6 svlan 7`	Configure Translation Case2 on PNP port
`(config-if)#end`	Exit interface and configure mode.

Validation for Case 2

When tagged traffic with CVLAN 2 is sent from IXIA-1 to IXIA-2 with both CTAG and STAG entering provider network and translated to new SVLAN as per Case2.

```
PEB2#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port         MAC Address        FWD   Time-out
 ---------+------+------+------+-----------+------------------+-----+---------+
 1                 1             ge27        1402.ec1c.3144    1     300
 1                 7             ge9         0000.0500.0400    1     300
```

New SVLAN 7 is observed on PEB2 after translation. At CEP port connected to IXIA-2, untagged traffic should be received.

When tagged traffic for CVLAN 3 is sent from IXIA-2 to IXIA-1.

```
PEB1#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port         MAC Address        FWD   Time-out
 ---------+------+------+------+-----------+------------------+-----+---------+
 1               1             ge9          74e6.e2af.598b     1     300
 1               6             ge3          0000.0500.0400     1     300
 1               6             ge9          0000.0500.0700     1     300
```

When traffic is reversed and traffic has both new CVLAN 3 and SVLAN 7 from IXIA-2, translatiom to old CVLAN 2 and SVLAN 6 happens. Also, captured packets have CVLAN as 2.

Case3 - (S - S')

Configuration on PEB1

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 6`	Map CVLAN to SVLAN
`(config-cvlan-registration)#cvlan 3 svlan 7`	Map CVLAN to SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport customer-edge hybrid vlan 2`	Allow access VLAN 2 configured above to this CEP port
`(config-if)#switchport customer-edge hybrid allowed vlan add 2-3`	Allow other VLANs configured to this CEP port
`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

Configuration on PEB2

CEP Port Configuration (should be configured as PNP in this case)

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#switchport mode provider-network`	Configure port as Provider Network Port (PNP)
`(config-if)#switchport provider-network allowed vlan all`	Add all VLANs configured above to this PNP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#no switchport provider-network vlan translation cvlan 2 svlan 6`	Unconfigure Translation Case2 from PNP port
`(config-if)#switchport provider-network vlan translation svlan 6 svlan 7`	Configure Translation Case3 on PNP port
`(config-if)#end`	Exit interface and configure mode.

Validation for Case 3

When tagged traffic with CVLAN 2 is sent from IXIA-1 to IXIA-2 with only STAG entering provider network and translation happens to new SVLAN as per Case3.

```
PEB2#show bridge
 Bridge    CVLAN  SVLAN  BVLAN  Port         MAC Address        FWD   Time-out
 ---------+------+------+------+-----------+------------------+-----+---------+
 1              1             ge27         1402.ec1c.3144    1     300
 1              6             ge9          0000.0500.0400    1     300
 1              6             ge9          6400.6a1e.d9a5    1     300
```

New SVLAN 7 is observed on PEB2 At PNP port connected to IXIA-2.

When double tagged traffic of CVLAN 2 and SVLAN 7 is sent from IXIA-2 to IXIA-1:

```
PEB1#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port         MAC Address        FWD   Time-out
 ---------+------+------+------+-----------+------------------+-----+---------+
 1              1             ge9          74e6.e2af.598b    1     300
 1              7             ge3          0000.0500.0400    1     300
 1              6             ge9          0000.0500.0700    1     300
```

Here we get a tagged traffic of CVALN 2 when the captured at IXIA-1.

Case4 - (S - C' S')

Configuration on PEB1

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 6`	Map CVLAN to SVLAN
`(config-cvlan-registration)#cvlan 3 svlan 7`	Map CVLAN to SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode

`(config-if)#switchport customer-edge hybrid vlan 2`	Allow access VLAN 2 configured above to this CEP port
`(config-if)#switchport customer-edge hybrid allowed vlan add 2-3`	Allow other VLANs configured to this CEP port
`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

Configuration on PEB2

CEP Port Configuration (should be configured as PNP in this case)

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode provider-network`	Configure port as Provider Network Port (PNP)
`(config-if)#switchport provider-network allowed vlan all`	Add all VLANs configured above to this PNP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#no switchport provider-network vlan translation svlan 6`	Unconfigure Translation Case2 from PNP port
`(config-if)#switchport provider-network vlan translation svlan 6 cvlan 3 svlan 7`	Configure Translation Case3 on PNP port
`(config-if)#end`	Exit interface and configure mode.

Validation for Case 4

When tagged traffic with CVLAN 2 is sent from IXIA-1 to IXIA-2 enters provider network and translation happens to new CVLAN and new SVLAN as per Case4.

```
PEB2#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1              1             ge27        1402.ec1c.3144    1     300
 1              6             ge9         0000.0500.0400    1     300
 1              6             ge9         6400.6a1e.d9a5    1     300
```

When you observe the traffic received in IXIA-2, you can observe that new CVLAN 3 and SVLAN 7 tags can be seen. Here the VLAN 2 will be a data packet.

When tagged traffic for CVLAN 3 and SVLAN 7 is sent from IXIA-2 to IXIA-1:

```
PEB1#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
```

```
1               6               ge3          0000.0500.0400    1      300
1               7               ge9          0000.0500.0700    1      300
```

When you observe, in PEB1 the packets will be dropped at the CEP port since only a single S tagged packets is obtained in the PNP.

Case5 - (C - C' S')

Configuration on PEB1

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 cvlan3 svlan 4`	Map CVLAN to C'VLAN and SVLAN
`(config-cvlan-registration)#cvlan 5 cvlan 6 svlan 7`	Map CVLAN to C'VLAN and SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode customer-edge hybrid`	Configure port as customer-edge hybrid port
`(config-if)#switchport customer-edge hybrid allowed vlan all`	Allow other VLANs configured to this CEP port
`(config-if)#switchport customer-edge vlan registration map1`	Attach the Map1 to CEP port
`(config-if)#end`	Exit interface and configure mode.

Configuration on PEB2

CEP Port Configuration (should be configured as PNP in this case)

`#configure terminal`	Enter configure mode.
`(config)#interface ge3`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode provider-network`	Configure port as Provider Network Port (PNP)
`(config-if)#switchport provider-network allowed vlan all`	Add all VLANs configured above to this PNP port
`(config-if)#end`	Exit interface and configure mode.

PNP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface ge9`	Enter the interface mode
`(config-if)#switchport`	Configure switchport
`(config-if)#bridge-group 1`	Attach port to bridge
`(config-if)#switchport mode provider-network`	Configure port as Provider Network Port (PNP)
`(config-if)#switchport provider-network allowed vlan all`	Add all VLANs configured above to this PNP port
`(config-if)#end`	Exit interface and configure mode.

Validation for Case 5

When tagged traffic with CVLAN 2 is sent from IXIA-1 to IXIA-2 with both CTAG and STAG entering provider network and gets translated to new CVLAN and SVLAN as per Case1.

```
PEB2#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1               1             ge27        1402.ec1c.3144    1     300
 1               6             ge9         0000.0500.0400    1     300
 1               6             ge9         6400.6a1e.d9a5    1     300
```

When the packet is captured at PNP port of PEB2 CVLAN of 3 and SVLAN of 4 is seen.

When tagged traffic for CVLAN 6 and SVLAN 7 is sent from IXIA-2 to IXIA-1:

```
PEB1#show bridge
Bridge    CVLAN  SVLAN  BVLAN  Port        MAC Address       FWD   Time-out
 ---------+------+------+------+-----------+-----------------+-----+---------+
 1               1             ge9         74e6.e2af.598b    1     300
 1               4             ge3         0000.0500.0400    1     300
 1               7             ge9         0000.0500.0700    1     300
```

When traffic is reversed and traffic has both new CVLAN 6 and SVLAN 7 on provider network from IXIA-2, translation to CVLAN 5 and SVLAN 7 happens. Also, captured packets have CVLAN as 2 based on the entry in the cvlan registration table.

Switchport ethertype

Bridge Configuration (for 0x88a8)

Configuration on PEB1

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 4`	Map CVLAN to SVLAN

(config-cvlan-registration)#cvlan 3 svlan 6	Map CVLAN to SVLAN
(config-cvlan-registration)#end	End the CVLAN registration mode

Configuration on PEB2

CEP Port Configuration (should be configured as PNP in this case)

CEP Port Configuration

#configure terminal	Enter configure mode.
(config)#interface ge3	Enter the interface mode
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode provider-network	Configure port as Provider Network Port (PNP)
(config-if)#switchport provider-network allowed vlan all	Add all VLANs configured above to this PNP port
(config-if)#end	Exit interface and configure mode.

PNP Port Configuration

#configure terminal	Enter configure mode.
(config)#interface ge9	Enter the interface mode
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode provider-network	Configure port as Provider Network Port (PNP)
(config-if)#switchport provider-network vlan allowed vlan all	Add all VLANs configured above to this PNP port
(config-if)#switchport dot1q ethertype 0x88a8	Change the TPID of the SVLAN to 0x88a8
(config-if)#end	Exit interface and configure mode.

Validation for Switchport ethertype

To validate, send tagged traffic of VLAN 2 from IXIA-1.

Now at eth9 of PB2, capture the packets through IXIA-2 and verify that the traffic is received with double tag.

If the 2 tags CVLAN tag 2 will have the TPID of 0x8100 and SVLAN tag 4 will have a TPID of 0x88a8.

Provider Bridging QoS Configuration

This chapter contains sample provider bridging configurations for QoS.

Scenario: 1 Traffic flow from CEP to PNP

Topology

Figure 2-84: Provider Bridging with QoS Topology

Bridge Configuration

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol provider-rstp edge`	Enter configure bridge type as provider-RSTP edge bridge
`(config)#exit`	Exit configure mode.

VLAN Configuration

`#configure terminal`	Enter configure mode.
`(config)#vlan database`	Enter VLAN database
`(config-vlan)#vlan 2-500 type customer bridge 1 state enable`	Configure customer VLANs on bridge 1
`(config-vlan)#vlan 501-1005 type service point-point bridge 1 state enable`	Configure service VLANs on bridge 1
`(config-vlan)#end`	Exit VLAN database and configure mode.

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#cvlan 2 svlan 501`	Map CVLAN to SVLAN
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface xe2`	Enter the interface mode

(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode customer-edge hybrid	Configure port as customer-edge hybrid port
(config-if)#switchport customer-edge hybrid allowed vlan all	Add all VLANs configured above to this CEP port
(config-if)#switchport customer-edge vlan registration map1	Attach the Map1 to CEP port
(config-if)#end	Exit interface and configure mode.

PNP Port Configuration

#configure terminal	Enter configure mode.
(config)#interface xe3	Enter the interface mode
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode provider-network	Configure port as Provider Network Port (PNP)
(config-if)#switchport provider-network allowed vlan add 501	Add all VLANs configured above to this PNP port
(config-if)#end	Exit interface and configure mode.

QoS Configurations

#configure terminal	Enter configure mode.
(config)#hardware-profile filter qos-ext enable	Enabling Ingress extended QoS group for QoS support with statistics
(config-if)#qos enable	Enabling QoS
(config-if)#qos statistics	Enabling QoS statistics
(config-if)#qos profile cos-to-queue cosq-cust1	Configure QoS map profile
config-ingress-cos-map)#cos 0 queue 1	Configuring the cos value to be mapped to queue
(config-ingress-cos-map)#exit	Exit configure mode.
(config)#qos profile queue-color-to-cos cosq-service1	Configuring profile for queue color to cos map
(config-egress-cos-map)#queue 1 cos 3	Configuring the queue value to be cos remarked.
(config-egress-cos-map)#exit	Exit configure mode
(config)#cvlan registration table map1 bridge 1	Enter CVLAN registration mode
(config-cvlan-registration)#cvlan 2 svlan 501 cos-to-queue cosq-cust1	Map CVLAN to SVLAN with QoS map profile. Eg: when vlan 2 customer traffic with cos 0 value is received, queue will be assigned to 1 based on mapping.
(config-cvlan-registration)#end	End the CVLAN registration mode
(config)#interface xe3	Enter the interface mode
(config-if)#qos map-profile queue-color-to-cos cosq-service1	Map the profile to the PNP port. Eg: when traffic goes out of queue 1, cos value on service vlan header will be modified to 3 as remarking is enabled on the interface.

(config-if)#qos remark cos enable	Enabling Cos Remark on the Network Interface.
(config-if)#end	Exit interface and configure mode.

Scenario: 2 Traffic flow from PNP to CEP

Topology

Figure 2-85: Provider Bridging with QoS Topology

Bridge Configuration

`#configure terminal`	Enter configure mode.
`(config)# bridge 1 protocol provider-rstp edge`	Enter configure bridge type as provider-RSTP edge bridge
`(config)#exit`	Exit configure mode.

VLAN Configuration

`#configure terminal`	Enter configure mode.
`(config)#vlan database`	Enter VLAN database
`(config-vlan)#vlan 2-500 type customer bridge 1 state enable`	Configure customer VLANs on bridge 1
`(config-vlan)#vlan 501-1005 type service point-point bridge 1 state enable`	Configure service VLANs on bridge 1
`(config-vlan)#end`	Exit VLAN database and configure mode.

CVLAN Registration Table Configuration

`#configure terminal`	Enter configure mode.
`(config)#cvlan registration table map1 bridge 1`	Configure CVLAN registration table as map1
`(config-cvlan-registration)#end`	End the CVLAN registration mode

CEP Port Configuration

`#configure terminal`	Enter configure mode.
`(config)#interface xe2`	Enter the interface mode

(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode customer-edge hybrid	Configure port as customer-edge hybrid port
(config-if)#switchport customer-edge hybrid allowed vlan all	Add all VLANs configured above to this CEP port
(config-if)#switchport customer-edge vlan registration map1	Attach the Map1 to CEP port
(config-if)#end	Exit interface and configure mode.

PNP Port Configuration

#configure terminal	Enter configure mode.
(config)#interface xe3	Enter the interface mode
(config-if)#switchport	Configure switchport
(config-if)#bridge-group 1	Attach port to bridge
(config-if)#switchport mode provider-network	Configure port as Provider Network Port (PNP)
(config-if)#switchport provider-network allowed vlan add 501	Add all VLANs configured above to this PNP port
(config-if)#end	Exit interface and configure mode.

QoS Configurations

#configure terminal	Enter configure mode.
(config)#hardware-profile filter qos-ext enable	Enabling Ingress extended QoS group for QoS support with statistics
(config-if)#qos enable	Enabling QoS
(config-if)#qos statistics	Enabling QoS statistics
(config-if)#qos profile cos-to-queue cosq-cust1	Configure QoS map profile
config-ingress-cos-map)#cos 2 queue 5	Configuring the cos value to be mapped to queue. Eg: when double tagged traffic with cos 2 for outer vlan is received, queue will be assigned to 5 based on mapping.
(config-ingress-cos-map)#exit	Exit configure mode.
(config)#cvlan registration table map1 bridge 1	Enter CVLAN registration mode
(config-cvlan-registration)#cvlan 2 svlan 501 remark-cos	Map CVLAN to SVLAN with remark cos enabled. Eg: when double tagged traffic with cos 2 for outer vlan is received, queue will be assigned to 5 based on mapping and cos value will be changed to 5 when it goes out of cep port since remark cos is enabled.
(config-cvlan-registration)#cvlan 3 svlan 501 remark-cos	Map CVLAN to SVLAN without remark cos. Eg: when double tagged traffic with cos 2 for outer vlan is received, and cos value will be forwarded as it is when it goes out of cep port since remark cos is not enabled for customer2.
(config-cvlan-registration)#end	End the CVLAN registration mode
(config)#configure terminal	Enter configure mode

(config)#interface xe3	Enter the interface mode
(config-if)#qos map-profile cos-to-queue cosq-service	Map the profile to the PNP port
(config-if)#end	Exit interface and configure mode

Validation for Scenario 2

CHAPTER 3 Ethernet CFM Configurations

This chapter contains examples of Ethernet Operations and Management (OAM) configurations using the Connectivity Fault Management (CFM) protocol.

Connectivity Fault Management detects, verifies, isolates and notifies connectivity failures on a Virtual Bridged LAN (B-VLAN) based on the protocol standard specified in IEEE 802.1ag 2007. It provides discovery and verification of paths through 802.1 bridges and LANs and is part of the Operation, Administration and Management (OAM) module. CFM is transparent to customer data being transported by a network and is capable of providing maximum fault management.

Continuity Check Message(CCM)

Topology

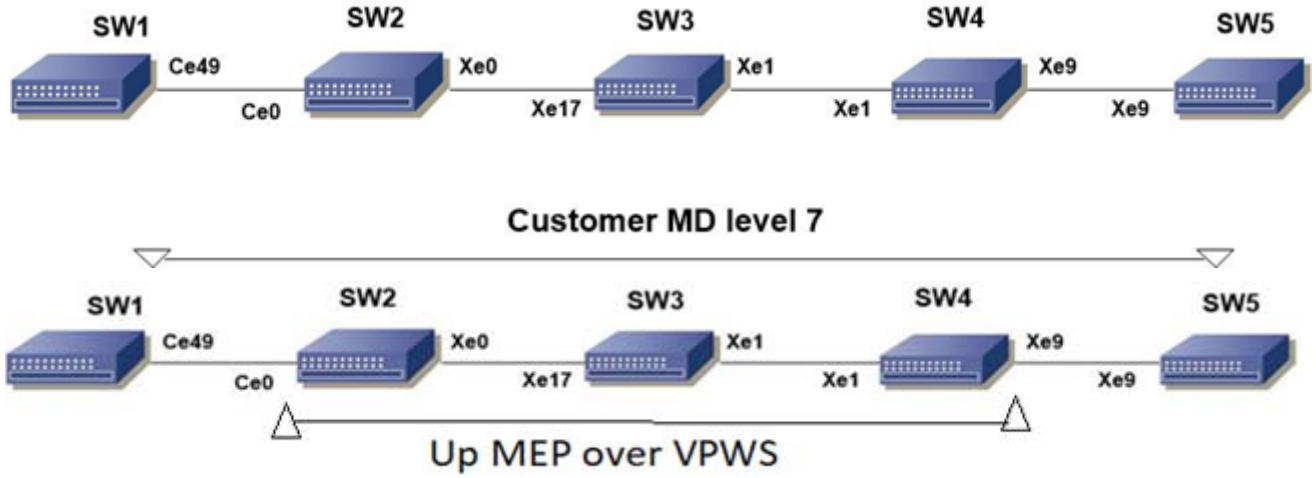

Figure 3-86: CFM Y.1731Topology

Prerequisite

Configure below hardware-profile commands related to CFM in configuration mode and reboot the nodes.

```
hardware-profile filter cfm-domain-name-str enable
hardware-profile statistics cfm-ccm enable
```

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering vlan database
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.

SW1(config-vlan)#exit	Exit vlan database
SW1(config)#int ce49	Configure interface ce49.
SW1(config-if)#switchport	Configure the interface as switch port.
SW1(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW1(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW1(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface ce49.
SW1(config-if)#exit	Exit config mode.
SW1(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1	Create cfm domain with type as character string and set mip creation criteria to default.
SW1(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default	Create ma type as string and set mip creation criteria to default.
SW1(config-ether-cfm-ma)#ethernet cfm mep down mpid 2 active true local-vid 512 ce49	Create down mep for local-vid on ce49.
SW1(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet cfm ma-mep mode.
SW1(config-ether-cfm-ma)#mep crosscheck mpid 1	Configure crosscheck to remote MEP in VLAN 512.
SW1(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW1(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW1(config-ether-cfm)#exit	Exit ethernet CFM mode.

SW2

SW2#configure terminal	Enter configure mode.
SW2(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW2(config)#vlan database	Entering vlan database
SW2(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW2(config-vlan)#exit	Exit vlan database
SW2(config)#int ce0	Configure interface ce0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface ce0.
SW2(config-if)#exit	Exit config mode.
SW2(config)#int xe0	Configure interface xe0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.

SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW2(config-if)#exit	Exit config mode.

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW3(config)#vlan database	Entering vlan database
SW3(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW3(config-vlan)#exit	Exit vlan database
SW3(config)#int xe17	Configure interface xe17
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe17.
SW3(config-if)#exit	Exit config mode.
SW3(config)#int xe1	Configure interface xe1.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW3(config-if)#exit	Exit config mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW4(config)#vlan database	Entering vlan database
SW4(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW4(config-vlan)#exit	Exit vlan database
SW4(config)#int xe1	Configure interface xe1.
SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW4(config-if)#exit	Exit config mode.
SW4(config)#int xe9	Configure interface xe9.

SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW4(config-if)#exit	Exit config mode.

SW5

SW5#configure terminal	Enter configure mode.
SW5(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW5(config)#vlan database	Entering vlan database
SW5(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW5(config-vlan)#exit	Exit vlan database
SW5(config)#int xe9	Configure interface xe9.
SW5(config-if)#switchport	Configure the interface as switch port.
SW5(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW5(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW5(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW5(config-if)#exit	Exit config mode.
SW5(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1	Create cfm domain with type as character string and set mip creation criteria to default.
SW5(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default	Create ma type as string and set mip creation criteria to default.
SW5(config-ether-cfm-ma)#ethernet cfm mep down mpid 1 active true local-vid 512 xe9	Create down mep for local-vid on xe9.
SW5(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet ma-mep mode.
SW5(config-ether-cfm-ma)#mep crosscheck mpid 2	Configure crosscheck to remote MEP in VLAN 512.
SW5(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW5(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW5(config-ether-cfm)#exit	Exit ethernet CFM mode.

Validation

CHAPTER 4 Y.1731 Performance Monitoring Configurations

ITU-T Y.1731 supports Performance Monitoring feature for Ethernet. Loss and Delay measurement can be achieved which can be significantly used to identify network problems before they impact. SLM is used to calculate the frame loss between endpoints using synthetic frames. Transmit and received counters at endpoints for received vs dropped are used to measure frame loss. CCM and LMM are used to calculate the frame loss of data traffic between endpoints. On CCM, loss measurement is encapsulated as part of CFM packets and it's dual ended. For LMM, separate loss measurement message and reply is shared on configured interval between endpoints to calculate the data frame loss. CCM and LMM service frames will have the counters which maintain a count of transmitted and received data frames between a pair of MEPs.Ethernet frame delay measurement provides fine control to operators for triggering delay measurement on a given service and can be used to monitor SLAs. Ethernet frame delay measure-ment also collects other useful information, such as worst and best case delays, average delay, and aver-age delay variation.

Synthetic Loss Measurement (SLM)

Topology

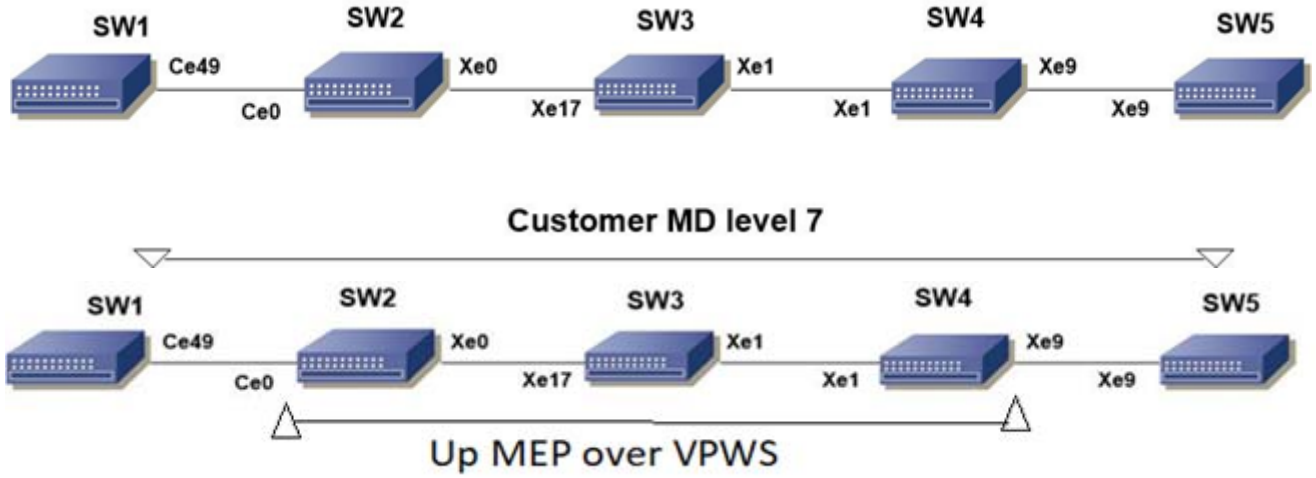

Figure 4-87: CFM Y.1731Topology

Prerequisite

Configure below hardware-profile commands related to CFM in configuration mode and reboot the nodes.

```
hardware-profile filter cfm-domain-name-str enable
hardware-profile statistics cfm-ccm enable
```

Synthetic Loss Measurement (SLM)

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering VLAN database.
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit config mode.
`SW1(config)#int ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.
`SW1(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1`	Create cfm domain with type as character string and set mip creation criteria to default.
`SW1(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default`	Create ma type as string and set mip creation criteria to default.
`SW1(config-ether-cfm-ma)#ethernet cfm mep down mpid 2 active true local-vid 512 ce49`	Create down mep for local-vid on ce49.
`SW1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast.
`SW1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode.
`SW1(config-ether-cfm-ma)#mep crosscheck mpid 1`	Configure crosscheck to remote MEP in VLAN 512.
`SW1(config-ether-cfm-ma)#cc interval 2`	Enable cc interval for 10 millisecond.
`SW1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit ethernet ma mode.
`SW1(config-ether-cfm)#exit`	Exit ethernet CFM mode.
`SW1(config)#ethernet cfm loss-measurement profile-name SLM`	Creating loss-measurement profile for SLM
`SW1(config-cfm-lm)#measurement-interval 1`	Specify the measurement-interval in minutes
`SW1(config)#intervals-stored 3`	Specify the number of history interval to be stored
`SW1(config)# message-period 1`	Specify message period interval time

SW2

`SW2#configure terminal`	Enter configure mode.
`SW2(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW2(config)#vlan database`	Entering VLAN database.

SW2(config-vlan)#vlan 512 type customer bridge 1 state enable	Create VLAN 512 for customer bridge.
SW2(config-vlan)#exit	Exit config mode.
SW2(config)#int ce0	Configure interface ce0.
SW2(config-if)#switchport	Configure interface as a switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all customer VLANs on interface ce0.
SW2(config-if)#exit	Exit interface mode.
SW2(config)#int xe0	Configure interface xe0
SW2(config-if)#switchport	Configure interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1
SW2(config-if)#exit	Exit config mode.

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW3(config)#vlan database	Entering VLAN database.
SW3(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW3(config-vlan)#exit	Exit config mode.
SW3(config)#int xe17	Configure interface xe17.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe17.
SW3(config-if)#exit	Exit config mode.
SW3(config)#int xe1	Configure interface xe1.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW3(config-if)#exit	Exit config mode.

SW4

`SW4#configure terminal`	Enter configure mode.
`SW4(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW4(config)#vlan database`	Entering VLAN database.
`SW4(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW4(config-vlan)#exit`	Exit config mode.
`SW4(config)#int xe1`	Configure interface xe1.
`SW4(config-if)#switchport`	Configure the interface as switch port.
`SW4(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW4(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW4(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface xe1.
`SW4(config-if)#exit`	Exit config mode.
`SW4(config)#int xe9`	Configure interface xe9.
`SW4(config-if)#switchport`	Configure the interface as switch port.
`SW4(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW4(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW4(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface xe9.
`SW4(config-if)#exit`	Exit config mode.

SW5

`SW5#configure terminal`	Enter configure mode.
`SW5(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW5(config)#vlan database`	Entering VLAN database.
`SW5(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW5(config-vlan)#exit`	Exit config mode.
`SW5(config)#int xe9`	Configure interface xe9.
`SW5(config-if)#switchport`	Configure the interface as switch port.
`SW5(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW5(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW5(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface xe9.
`SW5(config-if)#exit`	Exit config mode.
`SW5(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1`	Create cfm domain with type as character string and set mip creation criteria to default.
`SW5(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default`	Create ma type as string and set mip creation criteria to default.

SW5(config-ether-cfm-ma)#ethernet cfm mep down mpid 1 active true local-vid 512 xe9	Create down mep for local-vid on xe9
SW5(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW5(config-ether-cfm-ma-mep)#ethernet cfm loss-measurement reply slm	Generate and send SLR responses tacked
SW5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet cfm ma-mep mode.
SW5(config-ether-cfm-ma)#mep crosscheck mpid 2	Configure crosscheck to remote MEP in VLAN 512.
SW5(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW5(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW5(config-ether-cfm)#exit	Exit ethernet CFM mode.

Commands to initiate/abort loss measurement

```
SW1#loss-measurement type proactive profile-name <WORD> rmep mac-address
<HHHH.HHHH.HHHH>mep <MEPID> domain < DOMAIN_NAME> vlan <VLANID>bridge <1-32>

SW1#abort loss-measurement mep <MEPID> domain <DOMAIN_NAME> vlan <VLANID> bridge <1-32>
```

Validation

```
SW1#ping ethernet mac 3c2c.9926.e683 unicast source 2 domain mdnam vlan 512 bridge 1
success rate is     100 (5/5)

Synthetic Loss Measurement (SLM) Over VPWS

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering VLAN database.
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit config mode.
`SW1(config)#interface ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.

SW2

`SW2#configure terminal`	Enter configure mode.
`SW2(config)#interface ce0`	Configure interface ce0.
`SW2(config-if)#switchport`	Configure interface as a switch port.
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#interface xe0`	Configure interface xe1.
`SW2(config-if)#no switchport`	Configure interface as router port.
`SW2(config-if)#ip address 10.0.0.1/24`	Assign IP address to router port xe0
`SW2(config-if)#no shutdown`	Making the interface up
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#interface lo`	Configure interface lo
`SW2(config-if)#ip address 1.1.1.1/32 secondary`	Configure secondary IP address to loopback interface .
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#router ospf 100`	Configure ospf
`SW2(config-router)#network 10.0.0.0/24 area 0`	Advertising 10 network
`SW2(config-router)#network 1.1.1.1/32 area 0`	Advertising loopback IP
`SW2(config-router)#exit`	Exit router mode.
`SW2(config)#router rsvp`	Configuring rsvp
`SW2(config-router)#hello-receipt`	Configuring hello reception
`SW2(config-router)#no-php`	Configuring device as not a PHP
`SW2(config-router)#revert-timer 10`	Configuring reversion time of RSVP

SW2(config-router)#exit	Exit router mode.
SW2(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path
SW2(config-trunk)#to 2.2.2.2	Configuring first hop
SW2(config-trunk)#to 3.3.3.3	Configuring second hop
SW2(config-trunk)#exit	Exit trunk mode.
SW2(config)#interface xe0	Configuring interface
SW2(config-if)#enable-rsvp	Enabling RSVP in interface
SW2(config-if)#label-switching	Enabling MPLS labeling
SW2(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW2(config-if)#exit	Exit interface mode.
SW2(config)#router ldp	Configuring LDP
SW2(config-router)#targeted-peer ipv4 3.3.3.3	Configuring LDP target peer for PW
SW2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit target peer mode
SW2(config-router)#no multicast-hellos	Disabling LDP multicast
SW2(config-router)#exit	Exit router mode.
SW2(config)#mpls l2-circuit ETH-2001 1 3.3.3.3	Creating VPWS PW
SW2(config)#service-template ETH-2001	Configuring service template profile for PW
SW2(config-svc)#match outer-vlan 10	Configuring match condition
SW2(config-svc)# rewrite ingress push 2000	Configuring action for match
SW2(config-svc)#exit	Exit service template mode
SW2(config)#interface ce0	Configuring interface
SW2(config-if)#mpls-l2-circuit ETH-2001 service-template ETH-2001	Mapping VPWS in AC
SW2(config-if)#exit	Exit interface mode.
SW2(config)#hardware-profile filter cfm-domain-name-str enable	Enabling HW filter for character string domain name
SW2(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none vpws	Configuring CFM domain over VPWS
SW2(config-ether-cfm-mpls-md)#service ma-type string ma-name 43981 mip-creation none	Creating MA for domain
SW2(config-ether-cfm-mpls-md-ma)#cc interval 3	Configuring CFM interval

SW2(config-ether-cfm-mpls-md-ma)#ethernet cfm mep up mpid 4001 active true vpws ETH-2001	Configuring local mep and mapping the same with vpws service
SW2(config-ether-cfm-mpls-ma-mep)#cc multicast state enable	Enabling the CFM multicast
SW2(config-ether-cfm-mpls-ma-mep)#end	Exit config mode
SW2#conf t	Config mode

SW2(config)#ethernet cfm loss-measurement profile-name slm	Configuring LM profile
SW2(config-cfm-lm)#measurement-type slm	Configuring measurement type as SLM
SW2(config-cfm-lm)#message-period 3	Configuring message period
SW2(config-cfm-lm)#measurement-interval 1	Configuring measurement interval
SW2(config-cfm-lm)#intervals-stored 3	Configuring number of interval to be stored
SW2(config-cfm-lm)#end	Exit config mode

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#interface xe17	Configure interface
SW3(config-if)#no switchport	Configure interface as router port.
SW3(config-if)#ip address 20.0.0.1/24	Assign IP address to router port
SW3(config-if)#no shutdown	Making the interface up
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface xe1	Configure interface
SW3(config-if)#no switchport	Configure interface as router port.
SW3(config-if)#ip address 10.0.0.2/24	Assign IP address to router port
SW3(config-if)#no shutdown	Making the interface up
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface lo	Configure interface lo
SW3(config-if)#ip address 2.2.2.2/32 secondary	Configure secondary IP address to loopback interface .
SW3(config-if)#exit	Exit interface mode.
SW3(config)#router ospf 100	Configure ospf
SW3(config-router)#network 10.0.0.0/24 area 0	Advertising 10 network
SW3(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network
SW3(config-router)#network 2.2.2.2/32 area 0	Advertising loopback IP
SW3(config-router)#exit	Exit router mode.
SW3(config)#router rsvp	Configuring rsvp
SW3(config-router)#hello-receipt	Configuring hello reception
SW3(config-router)#no-php	Configuring device as not a PHP
SW3(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW3(config-router)#exit	Exit router mode.
SW3(config)#interface xe1	Configuring interface
SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface xe17	Configuring interface

SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#interface xe9	Configure interface
SW4(config-if)#switchport	Configure interface as switch port.
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface xe1	Configure interface
SW4(config-if)#no switchport	Configure interface as router port.
SW4(config-if)#ip address 20.0.0.2/24	Assign IP address to router port
SW4(config-if)#no shutdown	Making the interface up
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface lo	Configure interface lo
SW4(config-if)#ip address 3.3.3.3/32 secondary	Configure secondary IP address to loopback interface .
SW4(config-if)#exit	Exit interface mode.
SW4(config)#router ospf 100	Configure ospf
SW4(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network
SW4(config-router)#network 3.3.3.3/32 area 0	Advertising loopback IP
SW4(config-router)#exit	Exit router mode.
SW4(config)#router rsvp	Configuring rsvp
SW4(config-router)#hello-receipt	Configuring hello reception
SW4(config-router)#no-php	Configuring device as not a PHP
SW4(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW4(config-router)#exit	Exit router mode.
SW4(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path
SW4(config-trunk)#to 2.2.2.2	Configuring first hop
SW4(config-trunk)#to 1.1.1.1	Configuring second hop
SW4(config-trunk)#exit	Exit trunk mode.
SW4(config)#interface xe1	Configuring interface
SW4(config-if)#enable-rsvp	Enabling RSVP in interface
SW4(config-if)#label-switching	Enabling MPLS labeling
SW4(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW4(config-if)#exit	Exit interface mode.
SW4(config)#router ldp	Configuring LDP
SW4(config-router)#targeted-peer ipv4 1.1.1.1	Configuring LDP target peer for PW

SW4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit target peer mode
SW4(config-router)#no multicast-hellos	Disabling LDP multicast
SW4(config-router)#exit	Exit router mode.
SW4(config)#mpls l2-circuit ETH-2001 1 1.1.1.1	Creating VPWS PW
SW4(config)#service-template ETH-2001	Configuring service template profile for PW
SW4(config-svc)# match outer-vlan 200	Configuring match condition
SW4(config-svc)# rewrite ingress push 2000	Configuring action for match
SW4(config-svc)#exit	Exit service template mode
SW4(config)#interface xe9	Configuring interface
SW4(config-if)#mpls-l2-circuit ETH-2001 service-template ETH-2001	Mapping VPWS in AC
SW4(config-if)#exit	Exit interface mode.

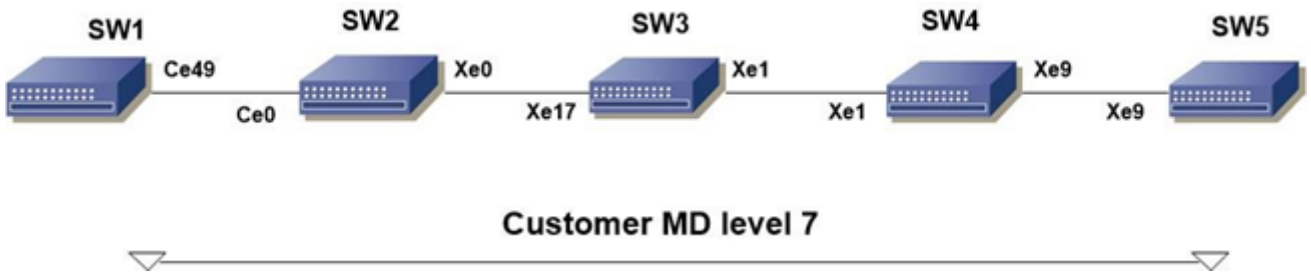
Loss Measurement Message(LMM)

Topology



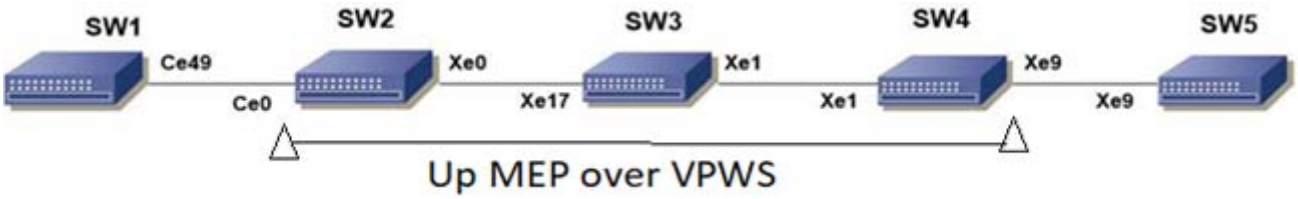


Figure 4-88: CFM Y.1731Topology

Prerequisite

Configure below hardware-profile commands related to CFM in configuration mode and reboot the nodes.

```
hardware-profile filter cfm-domain-name-str enable
hardware-profile statistics cfm-lm enable
hardware-profile statistics cfm-ccm enable
```

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering vlan database
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit vlan database
`SW1(config)#int ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.
`SW1(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1`	Create cfm domain with type as character string and set mip creation criteria to default.
`SW1(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default`	Create ma type as string and set mip creation criteria to default.
`SW1(config-ether-cfm-ma)#ethernet cfm mep down mpid 2 active true local-vid 512 ce49`	Create down mep for local-vid on ce49.
`SW1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast.
`SW1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode.
`SW1(config-ether-cfm-ma)#mep crosscheck mpid 1`	Configure crosscheck to remote MEP in VLAN 512.
`SW1(config-ether-cfm-ma)#cc interval 2`	Enable cc interval for 10 millisecond.
`SW1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit ethernet ma mode.
`SW1(config-ether-cfm)#exit`	Exit ethernet CFM mode.

SW1(config)# ethernet cfm loss-measurement profile-name LMM	Creating loss-measurement profile for LMM
SW1(config-cfm-lm)# measurement-type lmm	Specify the measurement type
SW1(config-cfm-lm)# measurement-interval 1	Specify the measurement-interval in minutes
SW1(config)# intervals-stored 3	Specify the number of history interval to be stored
SW1(config)# message-period 1	Specify message period interval time

SW2

SW2#configure terminal	Enter configure mode.
SW2(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW2(config)#vlan database	Entering vlan database
SW2(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW2(config-vlan)#exit	Exit vlan database
SW2(config)#int ce0	Configure interface ce0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface ce0.
SW2(config-if)#exit	Exit config mode.
SW2(config)#int xe0	Configure interface xe0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW2(config-if)#exit	Exit config mode.

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW3(config)#vlan database	Entering vlan database
SW3(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW3(config-vlan)#exit	Exit vlan database
SW3(config)#int xe17	Configure interface xe17.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.

SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe17.
SW3(config-if)#exit	Exit config mode.
SW3(config)#int xe1	Configure interface xe1.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW3(config-if)#exit	Exit config mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW4(config)#vlan database	Entering vlan database
SW4(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW4(config-vlan)#exit	Exit vlan database
SW4(config)#int xe1	Configure interface xe1.
SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW4(config-if)#exit	Exit config mode.
SW4(config)#int xe9	Configure interface xe9.
SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW4(config-if)#exit	Exit config mode.

SW5

SW5#configure terminal	Enter configure mode.
SW5(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW5(config)#vlan database	Entering vlan database
SW5(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW5(config-vlan)#exit	Exit vlan database
SW5(config)#int xe9	Configure interface xe9.

SW5(config-if)#switchport	Configure the interface as switch port.
SW5(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW5(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW5(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW5(config-if)#exit	Exit config mode.
SW5(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1	Create cfm domain with type as character string and set mip creation criteria to default.
SW5(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default	Create ma type as string and set mip creation criteria to default.
SW5(config-ether-cfm-ma)#ethernet cfm mep down mpid 1 active true local-vid 512 xe9	Create down mep for local-vid on xe9
SW5(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW5(config-ether-cfm-ma-mep)#ethernet cfm loss-measurement reply lmm	Generate and send LMR responses tacked
SW5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet cfm ma-mep mode.
SW5(config-ether-cfm-ma)#mep crosscheck mpid 2	Configure crosscheck to remote MEP in VLAN 512.
SW5(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW5(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW5(config-ether-cfm)#exit	Exit ethernet CFM mode.

Commands to initiate/abort loss measurement

```
loss-measurement type on-demand profile-name <WORD> rmep mac-address <HHHH.HHHH.HHHH> start-time <immediate|relative|absolute> stop-time <none|absolute|relative> repetition-period <REP-TIME> mep <MEPID> domain < DOMAIN_NAME> vlan <VLANID>bridge <1-32>

loss-measurement type proactive profile-name <WORD> rmep mac-address <HHHH.HHHH.HHHH>mep <MEPID> domain < DOMAIN_NAME> vlan <VLANID>bridge <1-32>

abort loss-measurement mep <MEPID> domain <DOMAIN_NAME> vlan <VLANID> bridge <1-32>

clear loss-measurement mep <MEPID> domain <DOMAIN_NAME> vlan <VLANID> bridge <1-32>
```

Validation

```
SW1#ping ethernet mac 3c2c.9926.e683 unicast source 2 domain mdnam vlan 512 bridge 1
 success rate is  100 (5/5)

Loss Measurement Message (LMM) Over VPWS

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering VLAN database.
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit config mode.
`SW1(config)#interface ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.

SW2

`SW2#configure terminal`	Enter configure mode.
`SW2(config)#interface ce0`	Configure interface ce0.
`SW2(config-if)#switchport`	Configure interface as a switch port.
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#interface xe0`	Configure interface xe0.
`SW2(config-if)#no switchport`	Configure interface as router port.
`SW2(config-if)#ip address 10.0.0.1/24`	Assign IP address to router port xe0
`SW2(config-if)#no shutdown`	Making the interface up
`SW2(config-if)#exit`	Exit interface mode.

SW2(config)#interface lo	Configure interface lo
SW2(config-if)#ip address 1.1.1.1/32 secondary	Configure secondary IP address to loopback interface .
SW2(config-if)#exit	Exit interface mode.
SW2(config)#router ospf 100	Configure ospf
SW2(config-router)#network 10.0.0.0/24 area 0	Advertising 10 network
SW2(config-router)#network 1.1.1.1/32 area 0	Advertising loopback IP
SW2(config-router)#exit	Exit router mode.
SW2(config)#router rsvp	Configuring rsvp
SW2(config-router)#hello-receipt	Configuring hello reception
SW2(config-router)#no-php	Configuring device as not a PHP
SW2(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW2(config-router)#exit	Exit router mode.
SW2(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path
SW2(config-trunk)#to 2.2.2.2	Configuring first hop
SW2(config-trunk)#to 3.3.3.3	Configuring second hop
SW2(config-trunk)#exit	Exit trunk mode.
SW2(config)#interface xe0	Configuring interface
SW2(config-if)#enable-rsvp	Enabling RSVP in interface
SW2(config-if)#label-switching	Enabling MPLS labeling
SW2(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW2(config-if)#exit	Exit interface mode.
SW2(config)#router ldp	Configuring LDP
SW2(config-router)#targeted-peer ipv4 3.3.3.3	Configuring LDP target peer for PW
SW2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit target peer mode
SW2(config-router)#no multicast-hellos	Disabling LDP multicast
SW2(config-router)#exit	Exit router mode.
SW2(config)#mpls l2-circuit ETH-2001 1 3.3.3.3	Creating VPWS PW
SW2(config)#service-template ETH-2001	Configuring service template profile for PW
SW2(config-svc)#match outer-vlan 200	Configuring match condition
SW2(config-svc)# rewrite ingress push 2000	Configuring action for match
SW2(config-svc)#exit	Exit service template mode
SW2(config)#interface ce0	Configuring interface
SW2(config-if)#mpls-l2-circuit ETH-2001 service-template ETH-2001	Mapping VPWS in AC
SW2(config-if)#exit	Exit interface mode.
SW2(config)#hardware-profile filter cfm-domain-name-str enable	Enabling HW filter for character string domain name

SW2(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none vpws	Configuring CFM domain over VPWS
SW2(config-ether-cfm-mpls-md)#service ma-type string ma-name 43981 mip-creation none	Creating MA for domain
SW2(config-ether-cfm-mpls-md-ma)#cc interval 3	Configuring CFM interval
SW2(config-ether-cfm-mpls-md-ma)#mep cross-check mpid 1	Configuring remote mep
SW2(config-ether-cfm-mpls-md-ma)#ethernet cfm mep up mpid 4001 active true vpws ETH-2001	Configuring local mep and mapping the same with vpws service
SW2(config-ether-cfm-mpls-ma-mep)#cc multicast state enable	Enabling the CFM multicast
SW2(config-ether-cfm-mpls-ma-mep)#end	Exit config mode
SW2#conf t	Config mode
SW2(config)#ethernet cfm loss-measurement profile-name lmm	Configuring LM profile
SW2(config-cfm-lm)#measurement-type lmm	Configuring measurement type as LMM
SW2(config-cfm-lm)#message-period 3	Configuring message period
SW2(config-cfm-lm)#measurement-interval 1	Configuring measurement interval
SW2(config-cfm-lm)#intervals-stored 3	Configuring number of interval to be stored
SW2(config-cfm-lm)#end	Exit config mode

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#interface xe17	Configure interface
SW3(config-if)#no switchport	Configure interface as router port.
SW3(config-if)#ip address 20.0.0.1/24	Assign IP address to router port
SW3(config-if)#no shutdown	Making the interface up
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface xe1	Configure interface
SW3(config-if)#no switchport	Configure interface as router port.
SW3(config-if)#ip address 10.0.0.2/24	Assign IP address to router port
SW3(config-if)#no shutdown	Making the interface up
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface lo	Configure interface lo
SW3(config-if)#ip address 2.2.2.2/32 secondary	Configure secondary IP address to loopback interface.
SW3(config-if)#exit	Exit interface mode.
SW3(config)#router ospf 100	Configure ospf
SW3(config-router)#network 10.0.0.0/24 area 0	Advertising 10 network
SW3(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network

SW3(config-router)#network 2.2.2.2/32 area 0	Advertising loopback IP
SW3(config-router)#exit	Exit router mode.
SW3(config)#router rsvp	Configuring rsvp
SW3(config-router)#hello-receipt	Configuring hello reception
SW3(config-router)#no-php	Configuring device as not a PHP
SW3(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW3(config-router)#exit	Exit router mode.
SW3(config)#interface xe1	Configuring interface
SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface xe17	Configuring interface
SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#interface xe9	Configure interface
SW4(config-if)#switchport	Configure interface as switch port.
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface xe1	Configure interface
SW4(config-if)#no switchport	Configure interface as router port.
SW4(config-if)#ip address 20.0.0.2/24	Assign IP address to router port
SW4(config-if)#no shutdown	Making the interface up
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface lo	Configure interface lo
SW4(config-if)#ip address 3.3.3.3/32 secondary	Configure secondary IP address to loopback interface .
SW4(config-if)#exit	Exit interface mode.
SW4(config)#router ospf 100	Configure ospf
SW4(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network
SW4(config-router)#network 3.3.3.3/32 area 0	Advertising loopback IP
SW4(config-router)#exit	Exit router mode.
SW4(config)#router rsvp	Configuring rsvp
SW4(config-router)#hello-receipt	Configuring hello reception
SW4(config-router)#no-php	Configuring device as not a PHP
SW4(config-router)#revert-timer 10	Configuring reversion time of RSVP

SW4(config-router)#exit	Exit router mode.
SW4(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path

Delay Measurement(DM)

Topology

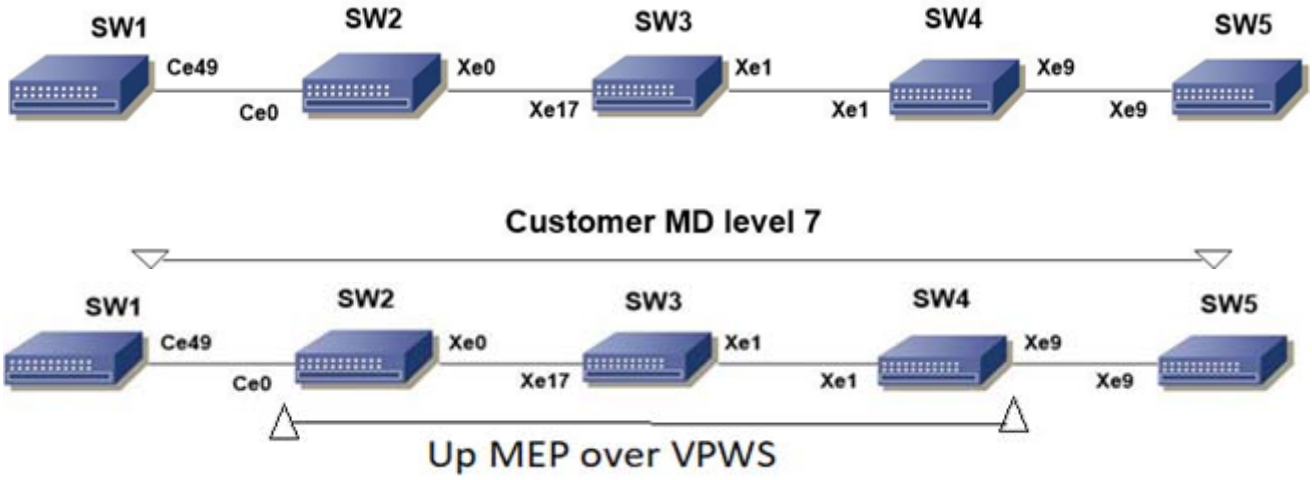

Figure 4-89: CFM Y.1731Topology

Prerequisite

Configure below hardware-profile commands related to CFM in configuration mode and reboot the nodes.

```
hardware-profile filter cfm-domain-name-str enable
hardware-profile statistics ingress-acl enable
hardware-profile statistics cfm-lm enable
hardware-profile statistics cfm-ccm enable
```

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering vlan database
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit vlan database
`SW1(config)#int ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.

SW1(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1	Create cfm domain with type as character string and set mip creation criteria to default.
SW1(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default	Create ma type as string and set mip creation criteria to default.
SW1(config-ether-cfm-ma)#ethernet cfm mep down mpid 2 active true local-vid 512 ce49	Create down mep for local-vid on ce49.
SW1(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet cfm ma-mep mode.
SW1(config-ether-cfm-ma)#mep crosscheck mpid 1	Configure crosscheck to remote MEP in VLAN 512.
SW1(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW1(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW1(config-ether-cfm)#exit	Exit ethernet CFM mode.
SW1(config)# ethernet cfm delay-measurement profile-name DM	Creating loss-measurement profile for DM
SW1(config-cfm-dm)# measurement-interval 1	Specify the measurement-interval in minutes
SW1(config-cfm-dm)# number-intervals-stored 3	Specify the number of history interval to be stored
SW1(config-cfm-dm)# message-period 1s	Specify message period interval time
SW1(config-cfm-dm)# bins-per-fd-interval 4	Specify the number of measurement bins per Measurement Interval for Frame Delay measurements.
SW1(config-cfm-dm)# bins-per-ifdv-interval 3	Specify the number of measurement bins per Measurement Interval for Inter-Frame Delay Variation measurements.

SW2

SW2#configure terminal	Enter configure mode.
SW2(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW2(config)#vlan database	Entering vlan database
SW2(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW2(config-vlan)#exit	Exit vlan database
SW2(config)#int ce0	Configure interface ce0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface ce0.
SW2(config-if)#exit	Exit config mode.
SW2(config)#int xe0	Configure interface xe0.
SW2(config-if)#switchport	Configure the interface as switch port.
SW2(config-if)#bridge-group 1	Configure interface in bridge group 1.

SW2(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW2(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW2(config-if)#exit	Exit config mode.

SW3

SW3#configure terminal	Enter configure mode.
SW3(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW3(config)#vlan database	Entering vlan database
SW3(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW3(config-vlan)#exit	Exit vlan database
SW3(config)#int xe17	Configure interface xe17.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe17.
SW3(config-if)#exit	Exit config mode.
SW3(config)#int xe1	Configure interface xe1.
SW3(config-if)#switchport	Configure the interface as switch port.
SW3(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW3(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW3(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW3(config-if)#exit	Exit config mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW4(config)#vlan database	Entering vlan database
SW4(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW4(config-vlan)#exit	Exit vlan database
SW4(config)#int xe1	Configure interface xe1.
SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe1.
SW4(config-if)#exit	Exit config mode.

SW4(config)#int xe9	Configure interface xe9.
SW4(config-if)#switchport	Configure the interface as switch port.
SW4(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW4(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW4(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW4(config-if)#exit	Exit config mode.

SW5

SW5#configure terminal	Enter configure mode.
SW5(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW5(config)#vlan database	Entering vlan database
SW5(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW5(config-vlan)#exit	Exit vlan database
SW5(config)#int xe9	Configure interface xe9.
SW5(config-if)#switchport	Configure the interface as switch port.
SW5(config-if)#bridge-group 1	Configure interface in bridge group 1.
SW5(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW5(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface xe9.
SW5(config-if)#exit	Exit config mode.
SW5(config)#ethernet cfm domain-type character-string domain-name mdnam level 7 mip-creation default bridge 1	Create cfm domain with type as character string and set mip creation criteria to default.
SW5(config-ether-cfm)#service ma-type string ma-name testtm vlan 512 mip-creation default	Create ma type as string and set mip creation criteria to default.
SW5(config-ether-cfm-ma)#ethernet cfm mep down mpid 1 active true local-vid 512 xe9	Create down mep for local-vid on xe9
SW5(config-ether-cfm-ma-mep)#cc multicast state enable	Enable cc multicast.
SW5(config-ether-cfm-ma-mep)# ethernet cfm delay-measurement reply dmm	Generate and send DMM responses tacked
SW5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit ethernet cfm ma-mep mode.
SW5(config-ether-cfm-ma)#mep crosscheck mpid 2	Configure crosscheck to remote MEP in VLAN 512.
SW5(config-ether-cfm-ma)#cc interval 2	Enable cc interval for 10 millisecond.
SW5(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ethernet ma mode.
SW5(config-ether-cfm)#exit	Exit ethernet CFM mode.

Commands to initiate/abort on-demand delay measurement

```
delay-measurement type on-demand profile-name WORD rmep (mac-address MAC|RMEPID) start-time (immediate|relative HH:MM:SS|absolute HH:MM:SS <1-31> MONTH <1993-2035>)
```

```
repetition-period <6000-4294967295> mep MEPID domain DOMAIN_NAME (vlan <2-4094>|)
bridge <1-32>

abort delay-measurement mep <MEPID> domain <DOMAIN_NAME> vlan <VLANID> bridge <1-32>
```

Validation

```

SW1# abort delay-measurement mep 2 domain mdnam vlan 512 bridge 1
```

Delay Measurement Message (LMM) Over VPWS

SW1

`SW1#configure terminal`	Enter configure mode.
`SW1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`SW1(config)#vlan database`	Entering VLAN database.
`SW1(config-vlan)#vlan 512 bridge 1 state enable`	Create VLAN 512 on bridge 1.
`SW1(config-vlan)#exit`	Exit config mode.
`SW1(config)#interface ce49`	Configure interface ce49.
`SW1(config-if)#switchport`	Configure the interface as switch port.
`SW1(config-if)#bridge-group 1`	Configure interface in bridge group 1.
`SW1(config-if)#switchport mode trunk`	Configure interface mode as trunk.
`SW1(config-if)#switchport trunk allowed vlan all`	Allow all VLANs on interface ce49.
`SW1(config-if)#exit`	Exit config mode.

SW2

`SW2#configure terminal`	Enter configure mode.
`SW2(config)#interface ce0`	Configure interface ce0.
`SW2(config-if)#switchport`	Configure interface as a switch port.
`SW2(config-if)#exit`	Exit interface mode.
`SW2(config)#interface xe0`	Configure interface xe0.
`SW2(config-if)#no switchport`	Configure interface as router port.
`SW2(config-if)#ip address 10.0.0.1/24`	Assign IP address to router port xe0
`SW2(config-if)#no shutdown`	Making the interface up

SW2(config-if)#exit	Exit interface mode.
SW2(config)#interface lo	Configure interface lo
SW2(config-if)#ip address 1.1.1.1/32 secondary	Configure secondary IP address to loopback interface.
SW2(config-if)#exit	Exit interface mode.
SW2(config)#router ospf 100	Configure ospf
SW2(config-router)#network 10.0.0.0/24 area 0	Advertising 10 network
SW2(config-router)#network 1.1.1.1/32 area 0	Advertising loopback IP
SW2(config-router)#exit	Exit router mode.
SW2(config)#router rsvp	Configuring rsvp
SW2(config-router)#hello-receipt	Configuring hello reception
SW2(config-router)#no-php	Configuring device as not a PHP
SW2(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW2(config-router)#exit	Exit router mode.
SW2(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path
SW2(config-trunk)#to 2.2.2.2	Configuring first hop
SW2(config-trunk)#to 3.3.3.3	Configuring second hop
SW2(config-trunk)#exit	Exit trunk mode.
SW2(config)#interface xe0	Configuring interface
SW2(config-if)#enable-rsvp	Enabling RSVP in interface
SW2(config-if)#label-switching	Enabling MPLS labeling
SW2(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW2(config-if)#exit	Exit interface mode.
SW2(config)#router ldp	Configuring LDP
SW2(config-router)#targeted-peer ipv4 3.3.3.3	Configuring LDP target peer for PW
SW2(config-router-targeted-peer)#exit-targeted-peer-mode	Exit target peer mode
SW2(config-router)#no multicast-hellos	Disabling LDP multicast
SW2(config-router)#exit	Exit router mode.
SW2(config)#mpls l2-circuit ETH-2001 1 3.3.3.3	Creating VPWS PW
SW2(config)#service-template ETH-2001	Configuring service template profile for PW
SW2(config-svc)#match outer-vlan 200	Configuring match condition
SW2(config-svc)# rewrite ingress push 2000	Configuring action for match
SW2(config-svc)#exit	Exit service template mode
SW2(config)#interface ce0	Configuring interface
SW2(config-if)#mpls-l2-circuit ETH-2001 service-template ETH-2001	Mapping VPWS in AC
SW2(config-if)#exit	Exit interface mode.
SW2(config)#hardware-profile filter cfm-domain-name-str enable	Enabling HW filter for character string domain name

`SW2(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none vpws`	Configuring CFM domain over VPWS
`SW2(config-ether-cfm-mpls-md)#service ma-type string ma-name 43981 mip-creation none`	Creating MA for domain
`SW2(config-ether-cfm-mpls-md-ma)#cc interval 3`	Configuring CFM interval
`SW2(config-ether-cfm-mpls-md-ma)#mep cross-check mpid 1`	Configuring remote mep
`SW2(config-ether-cfm-mpls-md-ma)#ethernet cfm mep up mpid 4001 active true vpws ETH-2001`	Configuring local mep and mapping the same with vpws service
`SW2(config-ether-cfm-mpls-ma-mep)#cc multicast state enable`	Enabling the CFM multicast
`SW2(config-ether-cfm-mpls-ma-mep)#end`	Exit config mode
`SW2#conf t`	Config mode
`SW2(config)#ethernet cfm loss-measurement profile-name DM`	Configuring DM profile
`SW2(config-cfm-dm)#measurement interval`	Configuring measurement interval
`SW2(config-cfm-dm)# number-intervals-stored 3`	Configuring the number of history interval to be stored
`SW2(config-cfm-dm)# message-period 1s`	Configuring message period interval time
`SW2(config-cfm-dm)# bins-per-fd-interval 4`	Configuring the number of measurement bins per Measurement Interval for Frame Delay measurements.
`SW2(config-cfm-dm)# bins-per-ifdv-interval 3`	Configuring the number of measurement bins per Measurement Interval for Inter-Frame Delay Variation measurements.
`SW2(config-cfm-dm)#end`	Exit config mode

SW3

`SW3#configure terminal`	Enter configure mode.
`SW3(config)#interface xe17`	Configure interface
`SW3(config-if)#no switchport`	Configure interface as router port.
`SW3(config-if)#ip address 20.0.0.1/24`	Assign IP address to router port
`SW3(config-if)#no shutdown`	Making the interface up
`SW3(config-if)#exit`	Exit interface mode.
`SW3(config)#interface xe1`	Configure interface
`SW3(config-if)#no switchport`	Configure interface as router port.
`SW3(config-if)#ip address 10.0.0.2/24`	Assign IP address to router port
`SW3(config-if)#no shutdown`	Making the interface up
`SW3(config-if)#exit`	Exit interface mode.
`SW3(config)#interface lo`	Configure interface lo
`SW3(config-if)#ip address 2.2.2.2/32 secondary`	Configure secondary IP address to loopback interface .
`SW3(config-if)#exit`	Exit interface mode.

SW3(config)#router ospf 100	Configure ospf
SW3(config-router)#network 10.0.0.0/24 area 0	Advertising 10 network
SW3(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network
SW3(config-router)#network 2.2.2.2/32 area 0	Advertising loopback IP
SW3(config-router)#exit	Exit router mode.
SW3(config)#router rsvp	Configuring rsvp
SW3(config-router)#hello-receipt	Configuring hello reception
SW3(config-router)#no-php	Configuring device as not a PHP
SW3(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW3(config-router)#exit	Exit router mode.
SW3(config)#interface xe1	Configuring interface
SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.
SW3(config)#interface xe17	Configuring interface
SW3(config-if)#enable-rsvp	Enabling RSVP in interface
SW3(config-if)#label-switching	Enabling MPLS labeling
SW3(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW3(config-if)#exit	Exit interface mode.

SW4

SW4#configure terminal	Enter configure mode.
SW4(config)#interface xe9	Configure interface
SW4(config-if)#switchport	Configure interface as switch port.
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface xe1	Configure interface
SW4(config-if)#no switchport	Configure interface as router port.
SW4(config-if)#ip address 20.0.0.2/24	Assign IP address to router port
SW4(config-if)#no shutdown	Making the interface up
SW4(config-if)#exit	Exit interface mode.
SW4(config)#interface lo	Configure interface lo
SW4(config-if)#ip address 3.3.3.3/32 secondary	Configure secondary IP address to loopback interface .
SW4(config-if)#exit	Exit interface mode.
SW4(config)#router ospf 100	Configure ospf
SW4(config-router)#network 20.0.0.0/24 area 0	Advertising 10 network
SW4(config-router)#network 3.3.3.3/32 area 0	Advertising loopback IP
SW4(config-router)#exit	Exit router mode.

SW4(config)#router rsvp	Configuring rsvp
SW4(config-router)#hello-receipt	Configuring hello reception
SW4(config-router)#no-php	Configuring device as not a PHP
SW4(config-router)#revert-timer 10	Configuring reversion time of RSVP
SW4(config-router)#exit	Exit router mode.
SW4(config)#rsvp-trunk to-1 ipv4	Configuring RSVP path
SW4(config-trunk)#to 2.2.2.2	Configuring first hop
SW4(config-trunk)#to 1.1.1.1	Configuring second hop
SW4(config-trunk)#exit	Exit trunk mode.
SW4(config)#interface xe1	Configuring interface
SW4(config-if)#enable-rsvp	Enabling RSVP in interface
SW4(config-if)#label-switching	Enabling MPLS labeling
SW4(config-if)#enable-ldp ipv4	Enabling ldp on interface
SW4(config-if)#exit	Exit interface mode.
SW4(config)#router ldp	Configuring LDP
SW4(config-router)#targeted-peer ipv4 1.1.1.1	Configuring LDP target peer for PW
SW4(config-router-targeted-peer)#exit-targeted-peer-mode	Exit target peer mode
SW4(config-router)#no multicast-hellos	Disabling LDP multicast
SW4(config-router)#exit	Exit router mode.
SW4(config)#mpls l2-circuit ETH-2001 1 1.1.1.1	Creating VPWS PW
SW4(config)#service-template ETH-2001	Configuring service template profile for PW
SW4(config-svc)# match outer-vlan 200	Configuring match condition
SW4(config-svc)# rewrite ingress push 2000	Configuring action for match
SW4(config-svc)#exit	Exit service template mode
SW4(config)#interface xe9	Configuring interface
SW4(config-if)#mpls-l2-circuit ETH-2001 service-template ETH-2001	Mapping VPWS in AC
SW4(config-if)#exit	Exit interface mode.
SW4(config)#hardware-profile filter cfm-domain-name-str enable	Enabling HW filter for character string domain name
SW4(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none vpws	Configuring CFM domain over VPWS
SW4(config-ether-cfm-mpls-md)#service ma-type string ma-name 43981 mip-creation none	Creating MA for domain
SW4(config-ether-cfm-mpls-md-ma)#cc interval 3	Configuring CFM interval
SW4(config-ether-cfm-mpls-md-ma)#mep cross-check mpid 4001	Configuring remote mep
SW4(config-ether-cfm-mpls-md-ma)#ethernet cfm mep up mpid 1 active true vpws ETH-2001	Configuring local mep and mapping the same with vpws service

SW4(config-ether-cfm-mpls-ma-mep)#cc multicast state enable	Enabling the CFM multicast
SW4(config-ether-cfm-mpls-ma-mep)#ethernet cfm loss-measurement reply dmm	Configuring DMR
SW4(config-ether-cfm-mpls-ma-mep)#end	Exit config mode

SW5

SW5#configure terminal	Enter configure mode.
SW5(config)#bridge 1 protocol rstp vlan-bridge	Create bridge 1 as an RSTP VLAN-aware bridge.
SW5(config)#vlan database	Entering VLAN database.
SW5(config-vlan)#vlan 512 bridge 1 state enable	Create VLAN 512 on bridge 1.
SW5(config-vlan)#exit	Exit config mode.
SW5(config)#interface xe9	Configure interface ce49.
SW5(config-if)#switchport	Configure the interface as switch port.
SW5(config-if)#bridge-group 1	Configure interface in bridge group 1
SW5(config-if)#switchport mode trunk	Configure interface mode as trunk.
SW5(config-if)#switchport trunk allowed vlan all	Allow all VLANs on interface ce49.
SW5(config-if)#exit	Exit config mode.

Commands to initiate/abort delay measurement

```
delay-measurement type proactive profile-name WORD rmep (mac-address MAC|mep-id MEPID) mep MEPID domain DOMAIN_NAME (((vlan <2-4094>|) bridge <1-32>) | (vpws VCNAME))

abort delay-measurement mep MEPID domain DOMAIN_NAME (((vlan <2-4094>|) bridge <1-32>) | (vpws VCNAME)
```

CHAPTER 5 G.8032 ERPS Version 2

G.8032 is an International Telecommunication Union (ITU) standard for ERPS. It prevents loops on a per-VLAN basis with networks that are wired in a simple ring topology. The loops are prevented by blocking traffic on either a predetermined link or a failed link.

G.8032 Version 2 provides enhancements in support of multiple ring and ladder topologies. G.8032 offers a rapid detection and recovery time if a link or node.

This guide contains topologies and examples on how to configure g8032 ERPS configuration.

Topology

Figure 5-90 displays a sample Ring Protection topology on which protection switching is configured with four bridges. The Ring Protection Link (RPL) owner is the link between Bridge 3 and Bridge 4 (xe16), on which one side of the link is defined explicitly as RPL owner (Bridge 4) and RPL neighbor (Bridge 3). The rest of the bridges are explicitly configured RPL non owner to enable ERPS in the ring.

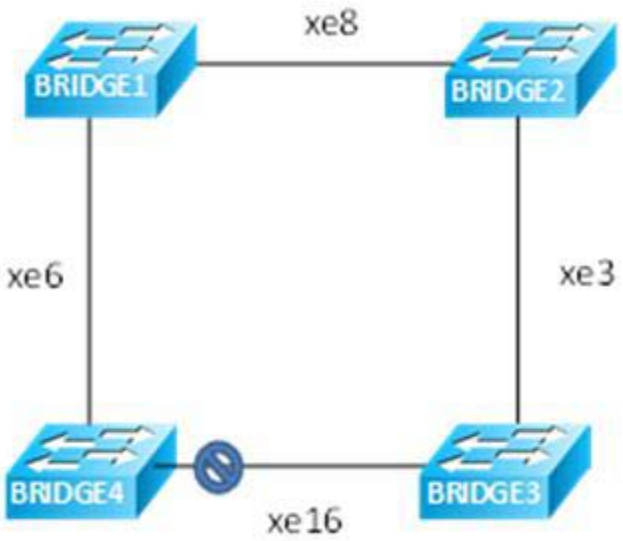

Figure 5-90: Major Ring Topology

Bridge 1

`Bridge1#configure terminal`	Enter configure mode
`Bridge1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge1(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge1(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1

`Bridge1(config-vlan)#interface xe6`	Configure interface xe6
`Bridge1(config-if)#switchport`	Configure xe6 as a layer 2 port
`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe6 interface
`Bridge1(config-if)#interface xe8`	Configure interface xe8
`Bridge1(config-if)#switchport`	Configure xe8 as a layer 2 port
`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe8 interface
`Bridge1(config-if)#ethernet cfm domain-type character-string domain-name nod12 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod12 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 12 active true local-vid 200 xe8`	Create down mep 12 with local vid 200 for xe8 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 21`	Configure crosscheck to remote MEP with value 21
`Bridge1(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod41 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod41 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 14 active true local-vid 200 xe6`	Create down mep 14 with local vid 200 for xe6 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode

`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 41`	Configure crosscheck to remote MEP with value 41
`Bridge1(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#g8032 physical-ring RING1 bridge 1`	Create g8032 physical ring with name RING1 on bridge 1
`Bridge1(g8032-ring-config)#east-interface xe6`	Associate xe6 interface as east-interface
`Bridge1(g8032-ring-config)#west-interface xe8`	Associate xe8 interface as west-interface
`Bridge1(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge1(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge1(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge1(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge1(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge1(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge1(g8032-config-switch)#physical-ring RING1`	Associate Physical ring RING1 to erp1 instance
`Bridge1(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge1(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge1(g8032-config-switch)#level 7`	Configure level as 7
`Bridge1(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge1(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge1(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge1(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 2

`Bridge2#config terminal`	Enter configure mode
`Bridge2(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge2(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge2(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1

`Bridge2(config-vlan)#interface xe3`	Configure interface xe3
`Bridge2(config-if)#switchport`	Configure xe3 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe3 interface
`Bridge2(config-if)#interface xe8`	Configure interface xe8
`Bridge2(config-if)#switchport`	Configure xe8 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe8 interface
`Bridge2(config-if)#ethernet cfm domain-type character-string domain-name nod23 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod23 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 23 active true local-vid 200 xe3`	Create down mep 23 with local vid 200 for xe3 interface
`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 32`	Configure crosscheck to remote MEP with value 32
`Bridge2(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod12 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod12 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 21 active true local-vid 200 xe8`	Create down mep 21 with local vid 200 for xe8 interface
`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode

`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 12`	Configure crosscheck to remote MEP with value 12
`Bridge2(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#g8032 physical-ring RING1 bridge 1`	Create g8032 physical ring with name RING1 on bridge 1
`Bridge2(g8032-ring-config)#east-interface xe8`	Associate xe8 interface as east-interface
`Bridge2(g8032-ring-config)#west-interface xe3`	Associate xe3 interface as west-interface
`Bridge2(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge2(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge2(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge2(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge2(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge2(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge2(g8032-config-switch)#physical-ring RING1`	Associate Physical ring RING1 to erp1 instance
`Bridge2(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge2(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge2(g8032-config-switch)#level 7`	Configure level as 7
`Bridge2(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge2(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge2(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge2(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 3

`Bridge3#config terminal`	Enter configure mode
`Bridge3(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge3(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge3(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge3(config-vlan)#interface xe3`	Configure interface xe3

`Bridge3(config-if)#switchport`	Configure xe3 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe3 interface
`Bridge3(config-if)#interface xe16`	Configure interface xe16
`Bridge3(config-if)#switchport`	Configure xe16 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe16 interface
`Bridge3(config-if)#ethernet cfm domain-type character-string domain-name nod23 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod23 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 32 active true local-vid 200 xe3`	Create down mep 32 with local vid 200 for xe3 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 23`	Configure crosscheck to remote MEP with value 23
`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod34 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod34 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 34 active true local-vid 200 xe16`	Create down mep 34 with local vid 200 for xe16 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 43`	Configure crosscheck to remote MEP with value 43
`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1

`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#g8032 physical-ring RING1 bridge 1`	Create g8032 physical ring with name RING1 on bridge 1
`Bridge3(g8032-ring-config)#east-interface xe3`	Associate xe3 interface as east-interface
`Bridge3(g8032-ring-config)#west-interface xe16`	Associate xe16 interface as west-interface
`Bridge3(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge3(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge3(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge3(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge3(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge3(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge3(g8032-config-switch)#physical-ring RING1`	Associate Physical ring RING1 to erp1 instance
`Bridge3(g8032-config-switch)#rpl role neighbor west-interface`	Configure RPL node as neighbor node on west-interface
`Bridge3(g8032-config-switch)#profile profile1`	Associate profile profile1 to erp1 instance
`Bridge3(g8032-config-switch)#level 7`	Configure level as 7
`Bridge3(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge3(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge3(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge3(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 4

`Bridge4#config term`	Enter configure mode
`Bridge4(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge4(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge4(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge4(config-vlan)#interface xe6`	Configure interface xe6
`Bridge4(config-if)#switchport`	Configure xe6 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1

`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe6 interface
`Bridge4(config-if)#interface xe16`	Configure interface xe16
`Bridge4(config-if)#switchport`	Configure xe16 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe16 interface
`Bridge4(config-if)#ethernet cfm domain-type character-string domain-name nod34 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod34 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 43 active true local-vid 200 xe16`	Create down mep 43 with local vid 200 for xe16 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 34`	Configure crosscheck to remote MEP with value 34
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod41 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod41 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200.
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 41 active true local-vid 200 xe6`	Create down mep 41 with local vid 200 for xe6 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 14`	Configure crosscheck to remote MEP with value 14
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode

`Bridge4(config-ether-cfm)#g8032 physical-ring RING1 bridge 1`	Create g8032 physical ring with name RING1 on bridge 1
`Bridge4(g8032-ring-config)#east-interface xe16`	Associate xe16 interface as east-interface
`Bridge4(g8032-ring-config)#west-interface xe6`	Associate xe6 interface as west-interface
`Bridge4(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge4(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge4(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge4(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge4(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge4(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge4(g8032-config-switch)#physical-ring RING1`	Associate Physical ring RING1 to erp1 instance
`Bridge4(g8032-config-switch)#rpl role owner east-interface`	Configure the node as owner node on east-interface
`Bridge4(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge4(g8032-config-switch)#level 7`	Configure level as 7
`Bridge4(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge4(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge4(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge4(g8032-config-switch)#end`	Exit g8032 erp instance mode

Sub-ring with Virtual Channel

An ethernet ring that is connected to a Major Ring at the Interconnection Nodes. By itself, the Sub-Ring does not constitute a closed ring. A Sub-Ring is connected to the Interconnection nodes on only one port which is configured as east-interface.

Topology

Figure 5-91 displays a sample Ring Protection topology on which protection switching is configured with six bridges. This constitutes of one major ring (Bridge2, Bridge3, Bridge4 and Bridge 5) and one sub-ring (Bridge2, Bridge1, Bridge6 and Bridge5).

Major ring's RPL in enabled between Bridge 3(owner node) and Bridge 4(neighbor node) on xe4 and other devices are non-owner nodes for that ring. Sub-ring's RPL is enabled between bridge 1(owner node) and bridge 2 (neighbor node) on link xe2 and other devices on the non-owner nodes. Bridge 2 and Bridge 5 are called interconnected nodes since they are common node between major ring and subring. Virtual channel is enabled for this Subring on interconnected nodes on vlan 100 and tcn propagation is enabled.

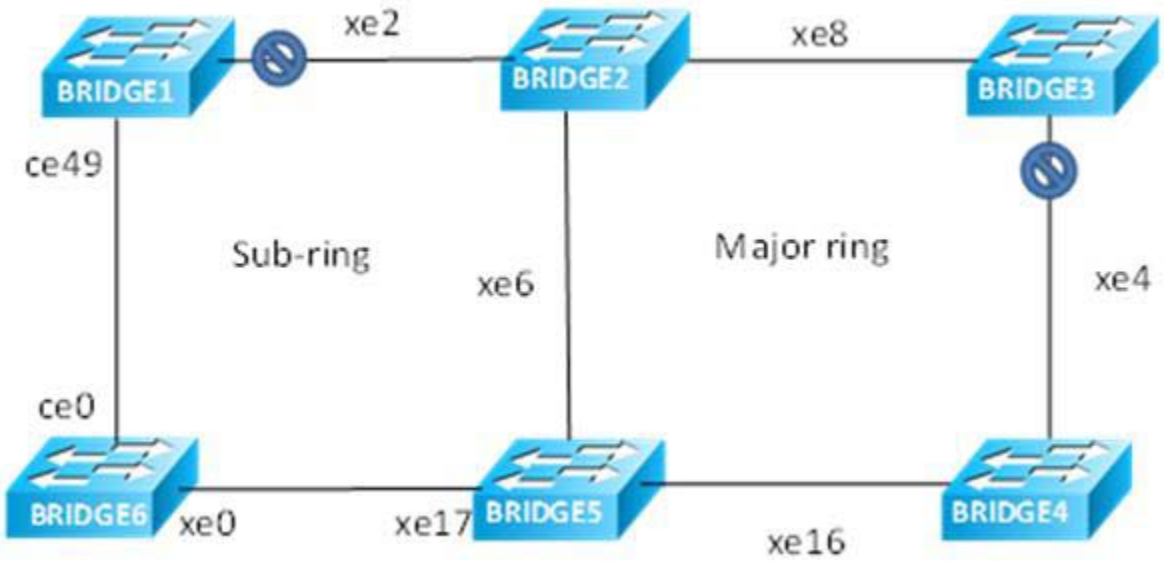

Figure 5-91: Major ring and Sub-ring with Virtual Channel Topology

Bridge 1

`Bridge1#config term`	Enter configure mode
`Bridge1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge1(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge1(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge1(config)#interface ce49`	Configure interface ce49
`Bridge1(config-if)#switchport`	Configure ce49 as a layer 2 port

`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on ce49 interface
`Bridge1(config-if)#interface xe2`	Configure interface xe2
`Bridge1(config-if)#switchport`	Configure xe2 as a layer 2 port
`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe2 interface
`Bridge1(config-if)#ethernet cfm domain-type character-string domain-name 00061 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00061 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201.
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 16 active true local-vid 201 ce49`	Create down mep 16 with local vid 201 for ce49 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 61`	Configure crosscheck to remote MEP with value 61
`Bridge1(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00012 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00012 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 12 active true local-vid 201 xe2`	Create down mep 12 with local vid 201 for xe2 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 21`	Configure crosscheck to remote MEP with value 21
`Bridge1(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1

`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#g8032 physical-ring subring bridge 1`	Create g8032 physical ring with name subring on bridge 1
`Bridge1(g8032-ring-config)#east-interface ce49`	Associate ce49 interface as east-interface
`Bridge1(g8032-ring-config)#west-interface xe2`	Associate xe2 interface as west-interface
`Bridge1(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge1(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge1(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge1(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge1(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge1(g8032-profile-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge1(g8032-config-switch)#ring-type sub-ring`	Configure ring type as subring
`Bridge1(g8032-config-switch)#physical-ring subring`	Associate Physical ring subring to erp2 instance
`Bridge1(g8032-config-switch)#rpl role owner west-interface`	Configure the node as owner node on west-interface
`Bridge1(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge1(g8032-config-switch)#level 7`	Configure level as 7
`Bridge1(g8032-config-switch)#raps-channel-vlan 201`	Configure RAPS channel vlan as 201
`Bridge1(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge1(g8032-config-switch)#ring-id 1`	Configure ring-id as 1

Bridge 2

`Bridge2#config term`	Enter configure mode
`Bridge2(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge2(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100 on bridge 1
`Bridge2(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge2(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge2(config)#interface xe2`	Configure interface xe2
`Bridge2(config-if)#switchport`	Configure xe2 as a layer 2 port

`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe2 interface
`Bridge2(config-if)#interface xe6`	Configure interface xe6
`Bridge2(config-if)#switchport`	Configure xe6 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe6 interface
`Bridge2(config-if)#interface xe8`	Configure interface xe8
`Bridge2(config-if)#switchport`	Configure xe8 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe8 interface
`Bridge2(config-if)#ethernet cfm domain-type character-string domain-name 00012 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00012 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 21 active true local-vid 201 xe2`	Create down mep 21 with local vid 201 for xe2 interface
`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 12`	Configure crosscheck to remote MEP with value 12
`Bridge2(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00052 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00052 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 25 active true local-vid 200 xe6`	Create down mep 25 with local vid 200 for xe6 interface

`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 52`	Configure crosscheck to remote MEP with value 52
`Bridge2(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00023 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00023 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 23 active true local-vid 200 xe8`	Create down mep 23 with local vid 200 for xe8 interface
`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 32`	Configure crosscheck to remote MEP with value 32
`Bridge2(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#g8032 physical-ring ring bridge 1`	Create g8032 physical ring with name ring on bridge 1
`Bridge2(g8032-ring-config)#east-interface xe6`	Associate xe6 interface as east-interface
`Bridge2(g8032-ring-config)#west-interface xe8`	Associate xe8 interface as west-interface
`Bridge2(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge2(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge2(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge2(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge2(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge2(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge2(g8032-config-switch)#physical-ring ring`	Associate Physical ring RING1 to erp1 instance
`Bridge2(g8032-config-switch)#ring-type major-ring`	Configure ring-type as major ring

`Bridge2(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge2(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge2(g8032-config-switch)#level 7`	Configure level as 7
`Bridge2(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge2(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge2(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge2(g8032-config-switch)#g8032 physical-ring subring bridge 1`	Create g8032 physical ring with name subring on bridge 1
`Bridge2(g8032-ring-config)#east-interface xe2`	Associate xe2 interface as east-interface
`Bridge2(g8032-ring-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge2(g8032-config-switch)#ring-type sub-ring`	Configure ring-type as sub-ring
`Bridge2(g8032-config-switch)#physical-ring subring`	Associate Physical ring RING1 to erp2 instance
`Bridge2(g8032-config-switch)#rpl role neighbor east-interface`	Configure the node as neighbor node on east interface
`Bridge2(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge2(g8032-config-switch)#level 7`	Configure level as 7
`Bridge2(g8032-config-switch)#raps-channel-vlan 201`	Configure RAPS channel vlan as 201
`Bridge2(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge2(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge2(g8032-config-switch)#virtual-channel 100 attached-to-instance erp1`	Configure virtual channel with vlan 100 and attach erp2 to erp1
`Bridge2(g8032-config-switch)#tcn-propogation enable`	Enable tcn propogation
`Bridge2(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 3

`Bridge3#config term`	Enter configure mode
`Bridge3(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge3(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100 on bridge 1
`Bridge3(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge3(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string

`Bridge3(config)#interface xe8`	Configure interface xe8
`Bridge3(config-if)#switchport`	Configure xe8 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe8 interface
`Bridge3(config-if)#interface xe4`	Configure interface xe4
`Bridge3(config-if)#switchport`	Configure xe4 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe4 interface
`Bridge3(config-if)#ethernet cfm domain-type character-string domain-name 00023 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00023 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 32 active true local-vid 200 xe8`	Create down mep 32 with local vid 200 for xe8 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 23`	Configure crosscheck to remote MEP with value 23
`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00034 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00034 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 34 active true local-vid 200 xe4`	Create down mep 34 with local vid 200 for xe4 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 43`	Configure crosscheck to remote MEP with value 43

`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#g8032 physical-ring ring bridge 1`	Create g8032 physical ring with name ring on bridge 1
`Bridge3(g8032-ring-config)#east-interface xe8`	Associate xe8 interface as east-interface
`Bridge3(g8032-ring-config)#west-interface xe4`	Associate xe4 interface as west-interface
`Bridge3(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge3(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge3(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge3(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge3(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge3(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge3(g8032-config-switch)#physical-ring ring`	Associate Physical ring ring to erp1 instance
`Bridge3(g8032-config-switch)#ring-type major-ring`	Configure ring-type as major ring
`Bridge3(g8032-config-switch)#rpl role owner west-interface`	Configure the node as owner node on west interface
`Bridge3(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge3(g8032-config-switch)#level 7`	Configure level as 7
`Bridge3(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge3(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge3(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge3(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 4

`Bridge4#config term`	Enter configuration mode
`Bridge4(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge5(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100 on bridge 1
`Bridge4(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge4(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string

`Bridge4(config)#interface xe4`	Configure interface xe4
`Bridge4(config-if)#switchport`	Configure xe4 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe4 interface
`Bridge4(config-if)#interface xe16`	Configure interface xe16
`Bridge4(config-if)#switchport`	Configure xe4 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe16 interface
`Bridge4(config-if)#ethernet cfm domain-type character-string domain-name 00034 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00023 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 43 active true local-vid 200 xe4`	Create down mep 43 with local vid 200 for xe4 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 34`	Configure crosscheck to remote MEP with value 34
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00045 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00045 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 45 active true local-vid 200 xe16`	Create down mep 45 with local vid 200 for xe16 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 54`	Configure crosscheck to remote MEP with value 54

`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#g8032 physical-ring ring bridge 1`	Create g8032 physical ring with name ring on bridge 1
`Bridge4(g8032-ring-config)#east-interface xe4`	Associate xe4 interface as east-interface
`Bridge4(g8032-ring-config)#west-interface xe16`	Associate xe16 interface as west-interface
`Bridge4(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge4(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge4(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge4(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge4(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge4(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge4(g8032-config-switch)#ring-type major-ring`	Configure ring-type as major ring
`Bridge4(g8032-config-switch)#physical-ring ring`	Associate Physical ring ring to erp1 instance
`Bridge4(g8032-config-switch)#rpl role neighbor east-interface`	Configure the node as neighbor node on east interface
`Bridge4(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge4(g8032-config-switch)#level 7`	Configure level as 7
`Bridge4(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge4(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge4(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge4(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 5

`Bridge5#config term`	Enter configure mode
`Bridge5(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge5(config-vlan)#vlan 100 bridge 1 state enable`	Create VLAN 100 on bridge 1
`Bridge5(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge5(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string

`Bridge5(config)#interface xe16`	Configure interface xe16
`Bridge5(config-if)#switchport`	Configure xe16 as a layer 2 port
`Bridge5(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge5(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge5(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge5(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe16 interface
`Bridge5(config-if)#interface xe6`	Configure interface xe6
`Bridge5(config-if)#switchport`	Configure xe6 as a layer 2 port
`Bridge5(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge5(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge5(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge5(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe6 interface
`Bridge5(config-if)#interface xe17`	Configure interface xe17
`Bridge5(config-if)#switchport`	Configure xe17 as a layer 2 port
`Bridge5(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge5(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge5(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge5(config-if)#switchport trunk allowed vlan add 100,200-205`	Allow vlan 100,200-205 on xe17 interface
`Bridge5(config-if)#ethernet cfm domain-type character-string domain-name 00045 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00045 and set mip creation criteria to default with level 7 on bridge 1
`Bridge5(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge5(config-ether-cfm-ma)#ethernet cfm mep down mpid 54 active true local-vid 200 xe16`	Create down mep 54 with local vid 200 for xe16 interface
`Bridge5(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge5(config-ether-cfm-ma)#mep crosscheck mpid 45`	Configure crosscheck to remote MEP with value 45
`Bridge5(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge5(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge5(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00052 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00052 and set mip creation criteria to default with level 7 on bridge 1

`Bridge5(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge5(config-ether-cfm-ma)#ethernet cfm mep down mpid 52 active true local-vid 200 xe6`	Create down mep 52 with local vid 200 for xe6 interface
`Bridge5(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge5(config-ether-cfm-ma)#mep crosscheck mpid 25`	Configure crosscheck to remote MEP with value 25
`Bridge5(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge5(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge5(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00056 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00056 and set mip creation criteria to default with level 7 on bridge 1
`Bridge5(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201
`Bridge5(config-ether-cfm-ma)#ethernet cfm mep down mpid 56 active true local-vid 201 xe17`	Create down mep 56 with local vid 201 for xe17 interface
`Bridge5(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge5(config-ether-cfm-ma)#mep crosscheck mpid 65`	Configure crosscheck to remote MEP with value 65
`Bridge5(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge5(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge5(config-ether-cfm)#g8032 physical-ring ring bridge 1`	Create g8032 physical ring with name ring on bridge 1
`Bridge5(g8032-ring-config)#east-interface xe16`	Associate xe16 interface as east-interface
`Bridge5(g8032-ring-config)#west-interface xe6`	Associate xe6 interface as west-interface
`Bridge5(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge5(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge5(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge5(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge5(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode

`Bridge5(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge5(g8032-config-switch)#physical-ring ring`	Associate Physical ring ring to erp1 instance
`Bridge5(g8032-config-switch)#ring-type major-ring`	Configure ring-type as major ring
`Bridge5(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge5(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge5(g8032-config-switch)#level 7`	Configure level as 7
`Bridge5(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge5(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge5(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge5(g8032-config-switch)#g8032 physical-ring subring bridge 1`	Create g8032 physical ring with name subring on bridge 1
`Bridge5(g8032-ring-config)#east-interface xe17`	Associate xe17 interface as east-interface
`Bridge5(g8032-profile-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge5(g8032-config-switch)#ring-type sub-ring`	Configure ring-type as sub-ring
`Bridge5(g8032-config-switch)#physical-ring subring`	Associate Physical ring subring to erp2 instance
`Bridge5(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge5(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge5(g8032-config-switch)#level 7`	Configure level as 7
`Bridge5(g8032-config-switch)#raps-channel-vlan 201`	Configure RAPS channel vlan as 201
`Bridge5(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge5(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge5(g8032-config-switch)#virtual-channel 100 attached-to-instance erp1`	Configure virtual channel with vlan 100 and attach erp2 to erp1
`Bridge5(g8032-config-switch)#tcn-propogation enable`	Enable tcn propogation
`Bridge5(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 6

`Bridge6#config term`	Enter configuration mode
`Bridge6(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.

`Bridge6(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge6(config-vlan)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge6(config)#interface xe0`	Configure interface xe0
`Bridge6(config-if)#switchport`	Configure xe0 as a layer 2 port
`Bridge6(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge6(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge6(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge6(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on xe0 interface
`Bridge6(config-if)#interface ce0`	Configure interface ce0
`Bridge6(config-if)#switchport`	Configure ce0 as a layer 2 port
`Bridge6(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge6(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge6(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge6(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on ce0 interface
`Bridge6(config-if)#ethernet cfm domain-type character-string domain-name 00056 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00056 and set mip creation criteria to default with level 7 on bridge 1
`Bridge6(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201.
`Bridge6(config-ether-cfm-ma)#ethernet cfm mep down mpid 65 active true local-vid 201 xe0`	Create down mep 65 with local vid 201 for xe0 interface
`Bridge6(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge6(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge6(config-ether-cfm-ma)#mep crosscheck mpid 56`	Configure crosscheck to remote MEP with value 56
`Bridge6(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge6(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge6(config-ether-cfm)#ethernet cfm domain-type character-string domain-name 00061 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name 00061 and set mip creation criteria to default with level 7 on bridge 1
`Bridge6(config-ether-cfm)#service ma-type string ma-name 43982 vlan 201 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 201
`Bridge6(config-ether-cfm-ma)#ethernet cfm mep down mpid 61 active true local-vid 201 ce0`	Create down mep 61 with local vid 201 for ce0 interface
`Bridge6(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast

`Bridge6(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge6(config-ether-cfm-ma)#mep crosscheck mpid 16`	Configure crosscheck to remote MEP with value 16
`Bridge6(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge6(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge6(config-ether-cfm)#g8032 physical-ring subring bridge 1`	Create g8032 physical ring with name subring on bridge 1
`Bridge6(g8032-ring-config)#east-interface xe0`	Associate xe0 interface as east-interface
`Bridge6(g8032-ring-config)#west-interface ce0`	Associate ce0 interface as west-interface
`Bridge6(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge6(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge6(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge6(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge6(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge6(g8032-profile-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge6(g8032-config-switch)#ring-type sub-ring`	Configure ring type as subring
`Bridge6(g8032-config-switch)#physical-ring subring`	Associate Physical ring subring to erp2 instance
`Bridge6(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge6(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge6(g8032-config-switch)#level 7`	Configure level as 7
`Bridge6(g8032-config-switch)#raps-channel-vlan 201`	Configure RAPS channel vlan as 201
`Bridge6(g8032-config-switch)#data-traffic-vlan 202-205`	Configure traffic vlan from 202-205
`Bridge6(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge6(g8032-config-switch)#end`	Exit g8032 erp instance mode

Sub-ring without Virtual Channel on a LAG interface

Figure 3 displays a sample Ring Protection topology on which protection switching is configured with 5 bridges on lag interfaces. The topology contains one major ring and one subring with non-virtual channel. The Ring Protection Link (RPL) for major ring is the link between Bridge 4 (owner) and Bridge 3 (neighbor) on lag interface po3. The subring is configured with no virtual channel and it's RPL link is configured between bridge 1 (neighbor) and bridge 5 (owner) on lag interface po6. The rest of the bridges are explicitly configured RPL non owner to enable ERPS in the ring in both major and subring.

Topology

Figure 5-92 displays a sample Ethernet Ring Protection Switching topology.

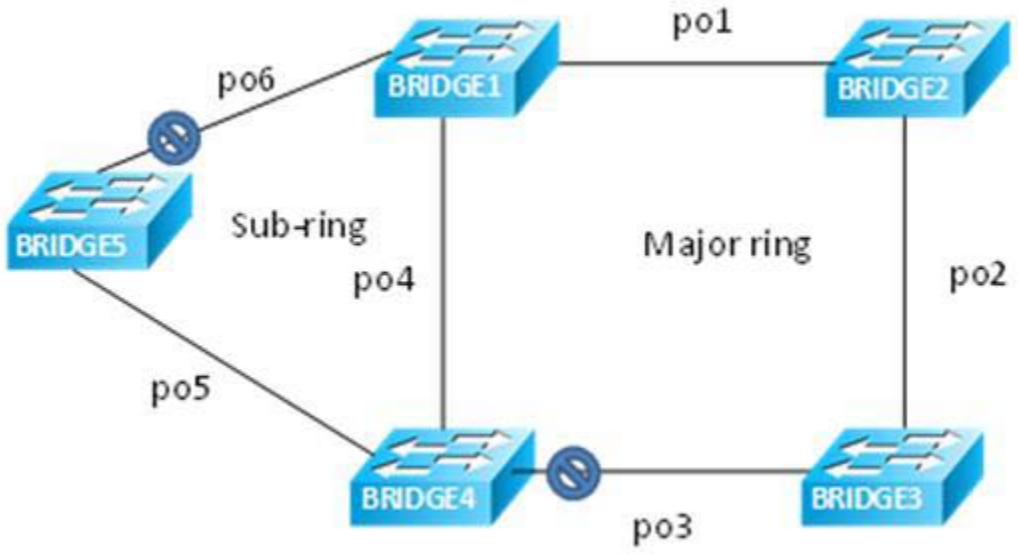

Figure 5-92: Major ring and sub-ring topology using LAG interface without a virtual channel

Bridge 1

`Bridge1#config term`	Enter configure mode
`Bridge1(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge1(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge1(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge1(config-vlan)#interface po1`	Configure lag interface po1
`Bridge1(config-if)#switchport`	Configure po1 as a layer 2 port
`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port

`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po1 interface
`Bridge1(config-if)#interface po4`	Configure lag interface po4
`Bridge1(config-if)#switchport`	Configure po4 as a layer 2 port
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Configure interface in bridge group 1
`Bridge1(config-if)#switchport mode trunk`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po4 interface
`Bridge1(config-if)#interface po6`	Configure lag interface po6
`Bridge1(config-if)#switchport`	Configure po6 as a layer 2 port
`Bridge1(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge1(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge1(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge1(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po6 interface
`Bridge1(config-if)#interface xe1`	Configure interface xe1
`Bridge1(config-if)#channel-group 6 mode active`	Configure xe1 as part of po6
`Bridge1(config-if)#interface xe2`	Configure interface xe2
`Bridge1(config-if)#channel-group 6 mode active`	Configure xe2 as part of po6
`Bridge1(config-if)#interface xe6`	Configure interface xe6
`Bridge1(config-if)#channel-group 4 mode active`	Configure xe6 as part of po4
`Bridge1(config-if)#interface xe7`	Configure interface xe7
`Bridge1(config-if)#channel-group 4 mode active`	Configure xe7 as part of po4
`Bridge1(config-if)#interface xe8`	Configure interface xe8
`Bridge1(config-if)#channel-group 1 mode active`	Configure xe8 as part of po1
`Bridge1(config-if)#interface xe9`	Configure interface xe9
`Bridge1(config-if)#channel-group 1 mode active`	Configure xe9 as part of po1
`Bridge1(config-if)#ethernet cfm domain-type character-string domain-name nod12 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod12 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 12 active true local-vid 200 po1`	Create down mep 12 with local vid 200 for po1 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode

`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 21`	Configure crosscheck to remote MEP with value 21
`Bridge1(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod41 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod41 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 14 active true local-vid 200 po4`	Create down mep 14 with local vid 200 for po4 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 41`	Configure crosscheck to remote MEP with value 41
`Bridge1(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod15 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod15 and set mip creation criteria to default with level 7 on bridge 1
`Bridge1(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge1(config-ether-cfm-ma)#ethernet cfm mep down mpid 51 active true local-vid 200 po6`	Create down mep 51 with local vid 200 for po6 interface
`Bridge1(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge1(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge1(config-ether-cfm-ma)#mep crosscheck mpid 15`	Configure crosscheck to remote MEP with value 15
`Bridge1(config-ether-cfm-ma)#cc interval 1`	Enable cc interval with 1
`Bridge1(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge1(config-ether-cfm)#g8032 physical-ring lagring bridge 1`	Create g8032 physical ring with name lagring on bridge 1
`Bridge1(g8032-ring-config)#east-interface po4`	Associate po4 interface as east-interface
`Bridge1(g8032-ring-config)#west-interface po1`	Associate po1 interface as west-interface
`Bridge1(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge1(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min

`Bridge1(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge1(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge1(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge1(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge1(g8032-config-switch)#physical-ring lagring`	Associate Physical ring lagring to erp1 instance
`Bridge1(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node
`Bridge1(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge1(g8032-config-switch)#level 7`	Configure level as 7
`Bridge1(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge1(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge1(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge1(g8032-config-switch)#g8032 physical-ring lagsubring bridge 1`	Create g8032 physical ring with name lagsubring on bridge 1
`Bridge1(g8032-ring-config)#east-interface po6`	Associate po6 interface as east-interface
`Bridge1(g8032-ring-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge1(g8032-config-switch)#ring-type sub-ring`	Configure ring-type as sub-ring
`Bridge1(g8032-config-switch)#physical-ring lagsubring`	Associate Physical ring lagsubring to erp2 instance
`Bridge1(g8032-config-switch)#rpl role neighbor east-interface`	Configure the node as neighbor node on east interface
`Bridge1(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge1(g8032-config-switch)#level 7`	Configure level as 7
`Bridge1(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge1(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge1(g8032-config-switch)#ring-id 2`	Configure ring-id as 2
`Bridge1(g8032-config-switch)# tcn-propogation enable`	Enable tcn propogation
`Bridge1(g8032-config-switch)# tcn-to-instance erp1`	Attach erp1 instance to erp2 instance to notify any changes in subring to major ring
`Bridge5(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 2

`Bridge2#config term`	Enter configure mode
`Bridge2(config)#hardware-profile filter cfm-domain-name-str enable`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge2(config)#bridge 1 protocol rstp vlan-bridge`	Enable CFM domain name as string
`Bridge2(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge2(config-vlan)#interface po1`	Configure lag interface po1
`Bridge2(config-if)#switchport`	Configure po1 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po1 interface
`Bridge2(config-if)#interface po2`	Configure lag interface po2
`Bridge2(config-if)#switchport`	Configure po2 as a layer 2 port
`Bridge2(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge2(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge2(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge2(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po2 interface
`Bridge2(config-if)#interface xe8`	Configure interface xe8
`Bridge2(config-if)#channel-group 1 mode active`	Configure xe8 as part of po1
`Bridge2(config-if)#interface xe9`	Configure interface xe9
`Bridge2(config-if)#channel-group 1 mode active`	Configure xe9 as part of po1
`Bridge2(config-if)#interface xe3`	Configure interface xe3
`Bridge2(config-if)#channel-group 2 mode active`	Configure xe3 as part of po2
`Bridge2(config-if)#interface xe4`	Configure interface xe4
`Bridge2(config-if)#channel-group 2 mode active`	Configure xe4 as part of po2
`Bridge2(config-if)#ethernet cfm domain-type character-string domain-name nod12 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod12 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 21 active true local-vid 200 po1`	Create down mep 21 with local vid 200 for po1 interface

`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 12`	Configure crosscheck to remote MEP with value 12
`Bridge2(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod23 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod23 and set mip creation criteria to default with level 7 on bridge 1
`Bridge2(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge2(config-ether-cfm-ma)#ethernet cfm mep down mpid 23 active true local-vid 200 po2`	Create down mep 23 with local vid 200 for po2 interface
`Bridge2(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge2(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge2(config-ether-cfm-ma)#mep crosscheck mpid 32`	Configure crosscheck to remote MEP with value 32
`Bridge2(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge2(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge2(config-ether-cfm)#g8032 physical-ring lagring bridge 1`	Create g8032 physical ring with name lagring on bridge 1
`Bridge2(g8032-ring-config)#east-interface po1`	Associate po1 interface as east-interface
`Bridge2(g8032-ring-config)#west-interface po2`	Associate po2 interface as west-interface
`Bridge2(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge2(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge2(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge2(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge2(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge2(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge2(g8032-config-switch)#physical-ring lagring`	Associate Physical ring lagring to erp1 instance
`Bridge2(g8032-config-switch)#rpl role non-owner`	Configure the node as non-owner node

`Bridge2(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge2(g8032-config-switch)#level 7`	Configure level as 7
`Bridge2(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge2(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge2(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge2(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 3

`Bridge3#config term`	Enter configuration mode
`Bridge3(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge3(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge3(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge3(config-vlan)#interface po2`	Configure lag interface po2
`Bridge3(config-if)#switchport`	Configure po2 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po2 interface
`Bridge3(config-if)#interface po3`	Configure lag interface po3
`Bridge3(config-if)#switchport`	Configure po3 as a layer 2 port
`Bridge3(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge3(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge3(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge3(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po3 interface
`Bridge3(config-if)#interface xe3`	Configure interface xe3
`Bridge3(config-if)#channel-group 2 mode active`	Configure xe3 as part of po2
`Bridge3(config-if)#interface xe4`	Configure interface xe4
`Bridge3(config-if)#channel-group 2 mode active`	Configure xe4 as part of po2
`Bridge3(config-if)#interface xe15`	Configure interface xe3
`Bridge3(config-if)#channel-group 3 mode active`	Configure xe3 as part of po3
`Bridge3(config-if)#interface xe16`	Configure interface xe16

`Bridge3(config-if)#channel-group 3 mode active`	Configure xe16 as part of po3
`Bridge3(config-if)#ethernet cfm domain-type character-string domain-name nod23 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod23 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 32 active true local-vid 200 po2`	Create down mep 32 with local vid 200 for po2 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 23`	Configure crosscheck to remote MEP with value 23
`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod34 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod34 and set mip creation criteria to default with level 7 on bridge 1
`Bridge3(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge3(config-ether-cfm-ma)#ethernet cfm mep down mpid 34 active true local-vid 200 po3`	Create down mep 34 with local vid 200 for po3 interface
`Bridge3(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge3(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge3(config-ether-cfm-ma)#mep crosscheck mpid 43`	Configure crosscheck to remote MEP with value 43
`Bridge3(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge3(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge3(config-ether-cfm)#g8032 physical-ring lagring bridge 1`	Create g8032 physical ring with name lagring on bridge 1
`Bridge3(g8032-ring-config)#east-interface po2`	Associate po2 interface as east-interface
`Bridge3(g8032-ring-config)#west-interface po3`	Associate po3 interface as west-interface
`Bridge3(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge3(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge3(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0

`Bridge3(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge3(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge3(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge3(g8032-config-switch)#physical-ring lagring`	Associate Physical ring lagring to erp1 instance
`Bridge3(g8032-config-switch)#rpl role neighbor west-interface`	Configure the node as neighbor node on west interface
`Bridge3(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge3(g8032-config-switch)#level 7`	Configure level as 7
`Bridge3(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge3(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge3(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge3(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 4

`Bridge4#config term`	Enter configure mode
`Bridge4(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge4(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge4(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge4(config-vlan)#interface po3`	Configure lag interface po3
`Bridge4(config-if)#switchport`	Configure po3 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po3 interface
`Bridge4(config-if)#interface po4`	Configure lag interface po4
`Bridge4(config-if)#switchport`	Configure po4 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po4 interface
`Bridge4(config-if)#interface po5`	Configure lag interface po5

`Bridge4(config-if)#switchport`	Configure po5 as a layer 2 port
`Bridge4(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge4(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge4(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge4(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po5 interface
`Bridge4(config-if)#interface xe6`	Configure interface xe6
`Bridge4(config-if)#channel-group 4 mode active`	Configure xe6 as part of po4
`Bridge4(config-if)#interface xe7`	Configure interface xe7
`Bridge4(config-if)#channel-group 4 mode active`	Configure xe7 as part of po4
`Bridge4(config-if)#interface xe10`	Configure interface xe10
`Bridge4(config-if)#channel-group 5 mode active`	Configure xe10 as part of po5
`Bridge4(config-if)#interface xe11`	Configure interface xe11
`Bridge4(config-if)#channel-group 5 mode active`	Configure xe11 as part of po5
`Bridge4(config-if)#interface xe15`	Configure interface xe15
`Bridge4(config-if)#channel-group 3 mode active`	Configure xe15 as part of po3
`Bridge4(config-if)#interface xe16`	Configure interface xe16
`Bridge4(config-if)#channel-group 3 mode active`	Configure xe16 as part of po3
`Bridge4(config-if)#ethernet cfm domain-type character-string domain-name nod34 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod34 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 43 active true local-vid 200 po3`	Create down mep 43 with local vid 200 for po3 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 34`	Configure crosscheck to remote MEP with value 34
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod41 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod41 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200

`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 41 active true local-vid 200 po4`	Create down mep 41 with local vid 200 for po4 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 14`	Configure crosscheck to remote MEP with value 14
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod45 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod45 and set mip creation criteria to default with level 7 on bridge 1
`Bridge4(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge4(config-ether-cfm-ma)#ethernet cfm mep down mpid 54 active true local-vid 200 po5`	Create down mep 54 with local vid 200 for po5 interface
`Bridge4(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge4(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge4(config-ether-cfm-ma)#mep crosscheck mpid 45`	Configure crosscheck to remote MEP with value 45
`Bridge4(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge4(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge4(config-ether-cfm)#g8032 physical-ring lagring bridge 1`	Create g8032 physical ring with name lagring on bridge 1
`Bridge4(g8032-ring-config)#east-interface po3`	Associate po3 interface as east-interface
`Bridge4(g8032-ring-config)#west-interface po4`	Associate po4 interface as west-interface
`Bridge4(g8032-ring-config)#g8032 physical-ring lagsubring bridge 1`	Create g8032 physical ring with name lagsubring on bridge 1
`Bridge4(g8032-ring-config)#east-interface po5`	Associate po5 interface as east-interface
`Bridge4(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge4(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge4(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge4(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge4(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode

`Bridge4(g8032-profile-config)#g8032 erp-instance erp1 bridge 1`	Create g8032 erp instance erp1 on bridge 1
`Bridge4(g8032-config-switch)#physical-ring lagring`	Associate Physical ring lagring to erp1 instance
`Bridge4(g8032-config-switch)#rpl role owner east-interface`	Configure the node as owner node on east interface
`Bridge4(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp1 instance
`Bridge4(g8032-config-switch)#level 7`	Configure level as 7
`Bridge4(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge4(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge4(g8032-config-switch)#ring-id 1`	Configure ring-id as 1
`Bridge4(g8032-config-switch)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge4(g8032-config-switch)#ring-type sub-ring`	Configure ring-type as sub-ring
`Bridge4(g8032-config-switch)#physical-ring lagsubring`	Associate Physical ring lagsubring to erp2 instance
`Bridge4(g8032-config-switch)#rpl role non-owner`	Configure the node as neighbor node on east interface
`Bridge4(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge4(g8032-config-switch)#level 7`	Configure level as 7
`Bridge4(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge4(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge4(g8032-config-switch)#ring-id 2`	Configure ring-id as 2
`Bridge4(g8032-config-switch)# tcn-propogation enable`	Enable tcn propogation
`Bridge4(g8032-config-switch)# tcn-to-instance erp1`	Attach erp1 instance to erp2 instance to notify any changes in subring to major ring
`Bridge4(g8032-config-switch)#end`	Exit g8032 erp instance mode

Bridge 5

`Bridge5#config term`	Enter config mode
`Bridge5(config)#bridge 1 protocol rstp vlan-bridge`	Create bridge 1 as an RSTP VLAN-aware bridge.
`Bridge5(config)#hardware-profile filter cfm-domain-name-str enable`	Enable CFM domain name as string
`Bridge5(config-vlan)#vlan 200-205 bridge 1 state enable`	Create VLAN 200-205 on bridge 1
`Bridge5(config-vlan)#interface po5`	Configure lag interface po5
`Bridge5(config-if)#switchport`	Configure po5 as a layer 2 port

`Bridge5(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge5(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge5(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge5(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po3 interface
`Bridge5(config-if)#interface po6`	Configure lag interface po3
`Bridge5(config-if)#switchport`	Configure po3 as a layer 2 port
`Bridge5(config-if)#bridge-group 1`	Configure interface in bridge group 1
`Bridge5(config-if)#bridge-group 1 spanning-tree disable`	Disable spanning tree for bridge group 1 on that interface
`Bridge5(config-if)#switchport mode trunk`	Configure port as trunk port
`Bridge5(config-if)#switchport trunk allowed vlan add 200-205`	Allow vlan 200-205 on po3 interface
`Bridge5(config-if)#interface xe1`	Configure interface xe1
`Bridge5(config-if)#channel-group 6 mode active`	Configure xe1 as part of po6
`Bridge5(config-if)#interface xe2`	Configure interface xe2
`Bridge5(config-if)#channel-group 6 mode active`	Configure xe2 as part of po6
`Bridge5(config-if)#interface xe10`	Configure interface xe10
`Bridge5(config-if)#channel-group 5 mode active`	Configure xe10 as part of po5
`Bridge5(config-if)#interface xe11`	Configure interface xe11
`Bridge5(config-if)#channel-group 5 mode active`	Configure xe11 as part of po5
`Bridge5(config-if)#ethernet cfm domain-type character-string domain-name nod15 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod15 and set mip creation criteria to default with level 7 on bridge 1
`Bridge5(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge5(config-ether-cfm-ma)#ethernet cfm mep down mpid 15 active true local-vid 200 po6`	Create down mep 15 with local vid 200 for po6 interface
`Bridge5(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge5(config-ether-cfm-ma)#mep crosscheck mpid 51`	Configure crosscheck to remote MEP with value 51
`Bridge5(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge5(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge5(config-ether-cfm)#ethernet cfm domain-type character-string domain-name nod45 level 7 mip-creation none bridge 1`	Create cfm domain with type as character string with name nod45 and set mip creation criteria to default with level 7 on bridge 1

`Bridge5(config-ether-cfm)#service ma-type string ma-name 43982 vlan 200 mip-creation none`	Create ma type as string with name 43982 and set mip creation criteria to default on vlan 200
`Bridge5(config-ether-cfm-ma)#ethernet cfm mep down mpid 45 active true local-vid 200 po5`	Create down mep 45 with local vid 200 for po5 interface
`Bridge5(config-ether-cfm-ma-mep)#cc multicast state enable`	Enable cc multicast
`Bridge5(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode`	Exit ethernet cfm ma-mep mode
`Bridge5(config-ether-cfm-ma)#mep crosscheck mpid 54`	Configure crosscheck to remote MEP with value 54
`Bridge5(config-ether-cfm-ma)#cc  interval 1`	Enable cc interval with 1
`Bridge5(config-ether-cfm-ma)#exit-ether-ma-mode`	Exit Ethernet ma mode
`Bridge5(config-ether-cfm)#g8032 physical-ring lagsubring bridge 1`	Create g8032 physical ring with name lagsubring on bridge 1
`Bridge5(g8032-ring-config)#east-interface po5`	Associate po5 interface as east-interface
`Bridge5(g8032-ring-config)#west-interface po6`	Associate po6 interface as west-interface
`Bridge5(g8032-ring-config)#g8032 profile profile1 bridge 1`	Create g8032 profile with profile name profile1 on bridge 1
`Bridge5(g8032-profile-config)#timer wait-to-restore 1`	Configure wait to restore time as 1 min
`Bridge5(g8032-profile-config)#timer hold-off 0`	Configure hold-off timer value as 0
`Bridge5(g8032-profile-config)#timer guard-timer 10`	Configure guard-timer value as 10ms
`Bridge5(g8032-profile-config)#switching-mode revertive`	Configure Switching mode as revertive Switching mode
`Bridge5(g8032-profile-config)#g8032 erp-instance erp2 bridge 1`	Create g8032 erp instance erp2 on bridge 1
`Bridge5(g8032-config-switch)#physical-ring lagsubring`	Associate Physical ring lagsubring to erp2 instance
`Bridge5(g8032-config-switch)#ring-type sub-ring`	Configure ring-type as subring
`Bridge5(g8032-config-switch)#rpl role owner west-interface`	Configure the node as owner node on west interface
`Bridge5(g8032-config-switch)#profile profile1`	Associate Profile profile1 to erp2 instance
`Bridge5(g8032-config-switch)#level 7`	Configure level as 7
`Bridge5(g8032-config-switch)#raps-channel-vlan 200`	Configure RAPS channel vlan as 200
`Bridge5(g8032-config-switch)#data-traffic-vlan 201-205`	Configure traffic vlan from 201-205
`Bridge5(g8032-config-switch)#ring-id 2`	Configure ring-id as 2
`Bridge5(g8032-config-switch)#end`	Exit g8032 erp instance mode

CHAPTER 6 Ethernet Test Signal Lock Configuration

ETH-TST (Ethernet Test Signal) and ETH-LCK (Ethernet Lock Signal) protocols are defined in Y.1731. ETH-TST is used to perform one-way on-demand in-service or out-of-service diagnostics tests. This includes verifying bandwidth throughput, frame loss, bit errors, etc.

ETH-LCK is used to communicate the administrative locking of a MEP and consequential interruption of data traffic forwarding towards the MEP expecting this traffic. It allows a MEP receiving frames with ETH-LCK information to differentiate between a defect condition and an administrative locking action at lower level MEP.

Topology

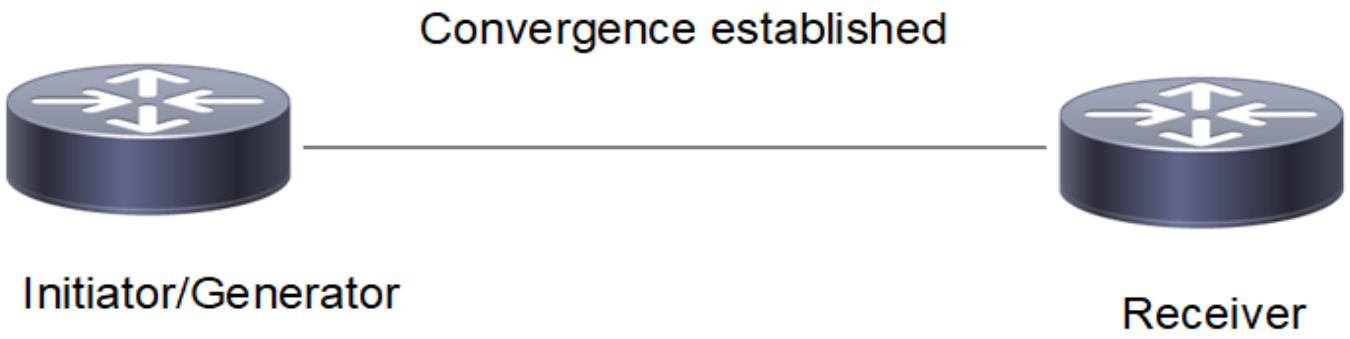

Figure 6-93: ETH Test Signal Topology

ETH-TST Configuration

Initiator/generator

`#configure terminal`	Enter configure mode.
`(config)#hardware-profile filter cfm-domain-name-str enable`	Configure Hardware profile filter.
`(config)#hardware-profile statistics ingress-acl enable`	Configure hardware profile statistics ingress-acl.
`(config)#vlan database`	Enter Vlan config mode.
`(config-vlan)#vlan 2-100 bridge 1 state enable`	Configure Vlans.
`(config-vlan)#exit`	Exit Vlan config mode.
`(config)#interface xe15`	Enter Interface config mode.
`(config-if)#switchport`	Configure Interface as switchport.
`(config-if)#bridge-group 1`	Configure bridge-group.
`(config-if)#switchport mode trunk`	Configure switchport mode as trunk.
`(config-if)#switchport trunk allowed vlan all`	Configure all vlans as part of switchport trunk.
`(config-if)#no shutdown`	Bring the interface into operation.

(config-if)#exit	Exit interface mode.
(config)#ethernet cfm domain-type character-string domain-name test1 level 7 mip-creation none bridge 1	Enter ethernet cfm mode by specifying domain name and bridge.
(config-ether-cfm)#service ma-type string ma-name test1 vlan 10 mip-creation none	Configure service ma.
(config-ether-cfm-ma)#ethernet cfm mep down mpid 200 active true local-vid 10 xe15	Configure ethernet cfm mep.
(config-ether-cfm-ma-mep)#cc multicast state enable	Enable multicast state.
(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit Ethernet ma mep mode.
(config-ether-cfm-ma)#mep crosscheck mpid 100	Configure RMEP.
(config-ether-cfm-ma)#cc interval 5	Configure interval in ma mode.
(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ma mode.
(config-ether-cfm)#exit	Exit Ethernet cfm mode.
(config)#ethernet cfm test-signal profile-name test	Configure Ethernet cfm test-signal profile.
(config-cfm-tst)#test-signal mode both	Configure test-signal mode as both(generator and receiver).
(config-cfm-tst)#test-signal frame-size 1500	Configure test-signal frame-size.
(config-cfm-tst)#exit	Exit Ethernet cfm test-signal mode.

Receiver

#configure terminal	Enter configure mode.
(config)#hardware-profile filter cfm-domain-name-str enable	Configure Hardware profile filter.
(config)#hardware-profile statistics ingress-acl enable	Configure hardware profile statistics ingress-acl.
(config)#vlan database	Enter Vlan config mode.
(config-vlan)#vlan 2-100 bridge 1 state enable	Configure Vlans.
(config-vlan)#exit	Exit Vlan config mode.
(config)#interface xe15	Enter Interface config mode.
(config-if)#switchport	Configure Interface as switchport.
(config-if)#bridge-group 1	Configure bridge-group.
(config-if)#switchport mode trunk	Configure switchport mode as trunk.
(config-if)#switchport trunk allowed vlan all	Configure all vlans as part of switchport trunk.
(config-if)#no shutdown	Bring the interface into operation.
(config-if)#exit	Exit interface mode.
(config)#ethernet cfm domain-type character-string domain-name test1 level 7 mip-creation none bridge 1	Enter ethernet cfm mode by specifying domain name and bridge.
(config-ether-cfm)#service ma-type string ma-name test1 vlan 10 mip-creation none	Configure service ma.

(config-ether-cfm-ma)#ethernet cfm mep down mpid 100 active true local-vid 10 xe15	Configure ethernet cfm mep.
(config-ether-cfm-ma-mep)#cc multicast state enable	Enable multicast state.
(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode	Exit Ethernet ma mep mode.
(config-ether-cfm-ma)#mep crosscheck mpid 200	Configure RMEP.
(config-ether-cfm-ma)#cc interval 5	Configure interval in ma mode.
(config-ether-cfm-ma)#exit-ether-ma-mode	Exit ma mode.
(config-ether-cfm)#exit	Exit Ethernet cfm mode.
(config)#ethernet cfm test-signal profile-name sample_tst	Configure Ethernet cfm test-signal profile.
(config-cfm-tst)#test-signal mode receiver	Configure test-signal mode as receiver.
(config-cfm-tst)#exit	Exit Ethernet cfm test-signal mode.

Validation

Before the ETH-TST signal is started, convergence needs to be established. Convergence is checked as mentioned below :

```
CE1#sh ethernet cfm errors domain test1 bridge 1
Domain Name         Level     Vlan     MEPID     Defects
-----------------------------------------------------------
test1               7         10       200       .....
1. defRDICCM    2. defMACstatus  3. defRemoteCCM
4. defErrorCCM  5. defXconCCM
```

After the above convergence is established with the receiver node, ETH-TST signal is started from the exec mode as mentioned below :

Generator node :

```
#test-signal start-time relative 0 stop-time relative 4 tst-profile-name test domain
test1 ma test1 mep 200 target mac-address 0018.236c.5cca  bridge 1
```

Receiver node :

```
#test-signal start-time relative 0 stop-time relative 4 tst-profile-name sample_tst
domain test1 ma test1 mep 100 target mac-address e8c5.7a78.712d  bridge 1
```

ETH-TST Signal initiated is checked as mentioned below :

Generator node :

```
#show ethernet cfm test-signal sessions
MEP-Id  Status    StartTime             Tst-Profile       Peer MAC-Address
-------------------------------------------------------------------------------
200     Active    2019/02/15 16:32:59     test            0018.236c.5cca

#show ethernet cfm test-signal domain test1 ma test1 mep 200 bridge 1 stats gtf
 TST Session status          : In-Progress
 Elapsed Time(sec)           : 77
 MD                        : test1
```

```
 MA                          : test1
 MEP                         : 200
 Peer MAC Address            : 0018.236c.5cca
 RMEP ID                     : 100
 Start Time                    : 2019 Feb 15 16:32:59
 Transmitted Packet Count     : 509767
```

Receiver Node :

```
#show ethernet cfm test-signal domain test1 ma test1 mep 100 bridge 1 stats ctf
 TST Session status          : In-Progress
 Elapsed Time(sec)           : 83
 MD                          : test1
 MA                          : test1
 MEP                         : 100
 Peer MAC Address            : e8c5.7a78.712d
 RMEP ID                     : 200
 Start Time                    : 2020 Dec 16 16:34:21
 Received Packet Count        : 545827
 Out-of-Order Packet Count     : 0
 Error Packet Count            : 0
 Last Packet Sequence Number : 664967
```

ETH-LCK Configuration

Eth-Lck configuration is performed at the MEP Level as shown below :

`#configure terminal`	Enter configure mode
`(config)# ethernet cfm domain-type character-string domain-name test1 level 7 mip-creation none bridge 1`	Enter ethernet cfm mode by specifying domain name and bridge.
`(config-ether-cfm)#service ma-type string ma-name test1 vlan 10 mip-creation none`	Configure service ma
`(config-ether-cfm-ma)#ethernet cfm mep down mpid 200 active true local-vid 10 xe15`	Configure ethernet cfm mep
`(config-ether-cfm-ma-mep)#`	Eth Lck configuration is performed in MEP Mode

Validation

Default state of the Ethernet cfm Lck details is as mentioned below :

```
#show ethernet cfm lck details domain test1 ma test1 mep 200 bridge 1

Maintenance Domain             : test1
Maintenance Association          : test1
MEP ID                         : 200
LCK PDU state                   : Unlocked
LCK Message Level              : 0
LCK PDU Interval                : 1 sec
LCK PDU Priority                : 3
```

```
(config-ether-cfm-ma-mep)#eth-lck state ?
  lock    Enable adminstrative locking state
  unlock  Disable adminstrative locking state

(config-ether-cfm-ma-mep)#eth-lck state lock
#show ethernet cfm lck details domain test1 ma test1 mep 200 bridge 1

Maintenance Domain              : test1
Maintenance Association           : test1
MEP ID                          : 200
LCK PDU state                 : Locked
LCK Message Level               : 0
LCK PDU Interval                 : 1 sec
LCK PDU Priority                 : 3

(config-ether-cfm-ma-mep)#eth-lck message level ?
  <0-7>  Enter the level for LCK transmission

(config-ether-cfm-ma-mep)#eth-lck message level 3
#show ethernet cfm lck details domain test1 ma test1 mep 200 bridge 1
Maintenance Domain              : test1
Maintenance Association           : test1
MEP ID                          : 200
LCK PDU state                    : Locked
LCK Message Level             : 3
LCK PDU Interval                  : 1 sec
LCK PDU Priority                  : 3

(config-ether-cfm-ma-mep)#eth-lck interval ?
one-minute  TX interval one minute
one-second  TX interval one second

(config-ether-cfm-ma-mep)#eth-lck interval one-minute
#show ethernet cfm lck details domain test1 ma test1 mep 200 bridge 1
Maintenance Domain              : test1
Maintenance Association           : test1
MEP ID                          : 200
LCK PDU state                    : Locked
LCK Message Level               : 3
LCK PDU Interval               : 1 min
LCK PDU Priority                  : 3

(config-ether-cfm-ma-mep)#eth-lck frame priority ?
<0-7>  Enter the priority for LCK transmission PDU

(config-ether-cfm-ma-mep)#eth-lck frame priority 7
#show ethernet cfm lck details domain test1 ma test1 mep 200 bridge 1
Maintenance Domain              : test1
Maintenance Association         : test1
```

```
MEP ID                          : 200
LCK PDU state                   : Locked
LCK Message Level               : 3
LCK PDU Interval                : 1 min
LCK PDU Priority                : 7
```

Carrier Ethernet Command Reference

Contents

This document contains these chapters and appendices:

CHAPTER 1 Link Layer Discovery Protocol v2 Commands

The commands in this chapter support:

- Link Layer Discovery Protocol (LLDP) version 2 as described in IEEE 802.1AB 2009
- LLDP-MED protocol extension as per ANSI/TIA-1057 April 2006.

Note: To enable LLDPv2, LLDP (previous version) should be disabled or vice versa.

clear lldp counters

Use this command to clear the LLDP statistics on all the interfaces.

Command Syntax

```
clear lldp counters
```

Parameters

`counters`	Reset the LLDP traffic counters to zero.

Command Mode

Exec Mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#clear lldp counters
```

lldp-agent

Use this command to create an LLDP agent mode.

Note: This command is not supported in SVLAN, VLAN, and loopback interfaces.

Use the no parameter to revert to default settings.

Command Syntax

```
lldp-agent (non-tpmr-bridge |customer-bridge| )
no lldp-agent (non-tpmr-bridge |customer-bridge| )
```

Parameters

`non-tpmr-bridge`
non-tpmr-bridge

`customer-bridge`
customer-bridge

Default

By default LLDP agent is disabled.

Command Mode

Interface Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent customer-bridge
(if-lldp-agent)#

(if-lldp-agent)#no lldp-agent customer-bridge
(if-lldp-agent)#exit
(config-if)#
```

debug lldp

Use this command to set the debugging functions for LLDP.

Use the no form of this command to turn off LLDP debugging functions

Command Syntax

```
debug lldp (event|ha|rx|tx|message)
no debug lldp (event|ha|rx|tx|message)
```

Parameters

`event`	Enable or disable event debugging
`ha`	Enable or disable high availability debugging
`rx`	Enable or disable RX debugging
`tx`	Enable or disable TX debugging
`message`	Enable or disable NSM message debugging

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug lldp event
#debug lldp message
```

lldp run

Use this command to start the Link Layer Discovery Protocol (LLDP)

Use the no form of this command to stop LLDP

Command Syntax

```
lldp run
no lldp run
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#lldp run

(config)#no lldp run
```

lldp tlv basic-mgmt

Use this command to select and unselect basic management TLVs in LLDP frames at the interface agent level. This command has precedence over the global configurations for inclusion of TLVs in LLDP frames.

Use the no parameter to remove the basic management TLV select/unselect configuration from the interface agent level.

Command Syntax

```
lldp tlv basic-mgmt (management-address|port-description|system-
  capabilities|system-description|system-name) (select|unselect)
no lldp tlv basic-mgmt (management-address|port-description|system-
  capabilities|system-description|system-name)
```

Parameters

`management-address`	Management address TLV
`port-description`	Port description TLV
`system-capabilities`	System capabilities TLV
`system-description`	System Description TLV
`system-name`	System name TLV
`select`	Select the LLDP TLV to send
`unselect`	Unselect the LLDP TLV to send

Default Value

None

Command Mode

LLDP agent mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)lldp-agent
(if-lldp-agent)#lldp tlv basic-mgmt system-name select
(if-lldp-agent)#exit
```

lldp tlv med

Use this command to select and unselect Media Endpoint Devices (MED) TLVs in LLDP frames at the interface agent level. This command has precedence over the global configurations for inclusion of TLVs in LLDP frames.

LLDP MED TLVs determine the capabilities the connected device supports and the capabilities the device has enabled.

Use the no parameter to remove the MED TLV select/unselect configuration from the interface agent level.

Command Syntax

```
lldp tlv med (network-policy|location|inventory|media-capabilities|extended-power-via-mdi) (select|unselect)
no lldp tlv med (network-policy|location|inventory|media-capabilities|extended-power-via-mdi)
```

Parameters

`network-policy`	Network-policy TLV
`location`	Location TLV
`inventory`	Inventory TLV
`media-capabilities`	Media-capabilities TLV
`extended-power-via-mdi`	Extended-power-via-mdi TLV (when PoE is available)
`select`	Select the LLDP TLV to send
`unselect`	Unselect the LLDP TLV to send

Default Value

None

Command Mode

LLDP agent mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)lldp-agent
(if-lldp-agent)#lldp tlv med network-policy select
(if-lldp-agent)#exit
```

lldp tlv ieee-8021-org-specific

Use this command to select and unselect ieee-8021-org-specific TLVs in LLDP frames at the interface agent level. This command has precedence over the global configurations for inclusion of TLVs in LLDP frames.

Use the no parameter to remove the ieee-8021-org-specific TLV select/unselect configuration from the interface agent level.

Command Syntax

```
lldp tlv ieee-8021-org-specific (link-agg|mgmt-vid|port-ptcl-vlanid|port-
  vlanid|ptcl-identity|vid-digest|vlan-name) (select|unselect)
no lldp tlv ieee-8021-org-specific {port-vlanid| port-ptcl-vlanid| vlan-name|ptcl-
  identity|vid-digest|mgmt-vid|link-agg}
```

Parameters

`link-agg`	Link-aggregation TLV
`mgmt-vid`	Management VLAN identifier TLV
`port-ptcl-vlanid`	Port protocol VLAN identifier TLV
`port-vlanid`	Port VLAN identifier TLV
`ptcl-identity`	Protocol-identifier TLV
`vid-digest`	VLAN identifier digest TLV
`vlan-name`	VLAN name TLV
`select`	Select the LLDP TLV to send
`unselect`	Unselect the LLDP TLV to send

Default Value

None

Command Mode

LLDP agent mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)lldp-agent
(if-lldp-agent)#lldp tlv ieee-8021-org-specific port-vlanid select
(if-lldp-agent)#exit
```

lldp tlv ieee-8023-org-specific

Use this command to select and unselect ieee-8023-org-specific TLVs in LLDP frames at the interface agent level. This command has precedence over the global configurations for inclusion of TLVs in LLDP frames.

Use the no parameter to remove the ieee-8023-org-specific TLV select/unselect configuration from the interface agent level.

Command Syntax

```
lldp tlv ieee-8023-org-specific (mac-phy| power-via-mdi| max-mtu-size)
  (select|unselect)
no lldp tlv ieee-8023-org-specific (mac-phy| power-via-mdi| max-mtu-size)
```

Parameters

`mac-phy`	Provider edge port VLAN ID TLV
`power-via-mdi`	Power-via-MDI TLV (when PoE is available)
`max-mtu-size`	Maximum MTU size TLV
`select`	Select the LLDP TLV to send
`unselect`	Unselect the LLDP TLV to send

Default Value

None

Command Mode

LLDP agent mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)lldp-agent
(if-lldp-agent)#lldp tlv ieee-8023-org-specific mac-phy select
(if-lldp-agent)#exit
```

lldp tlv-select basic-mgmt

Use this command to select basic management TLVs to be include in the LLDP frames.

Use the no parameter to disable basic management TLVs.

Command Syntax

```
lldp tlv-select basic-mgmt (management-address|port-description|system-
  capabilities|system-description|system-name)
no lldp tlv-select basic-mgmt (management-address|port-description|system-
  capabilities|system-description|system-name)
```

Parameters

`management-address`
: Management address specific TLV

`port-description`
: Port description specific TLV

`system-capabilities`
: System capabilities specific TLV

`system-description`
: System Description specific TLV

`system-name`
: System name specific TLV

Default Value

None

Command Mode

Configuration mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#lldp tlv-select basic-mgmt system-name
```

lldp tlv-select ieee-8021-org-specific

Use this command to select ieee-8021-org-specific TLVs to include in the LLDP frames.

Use the no parameter to disable ieee-8021-org-specific TLVs.

Command Syntax

```
lldp tlv-select ieee-8021-org-specific (link-agg|mgmt-vid|port-ptcl-vlanid|port-vlanid|ptcl-identity|vid-digest|vlan-name)
no lldp tlv-select ieee-8021-org-specific {port-vlanid| port-ptcl-vlanid| vlan-name|ptcl-identity| vid-digest|mgmt-vid|link-agg}
```

Parameters

`link-agg`	Link-aggregation TLV
`mgmt-vid`	Management VLAN identifier TLV
`port-ptcl-vlanid`	Port protocol VLAN identifier TLV
`port-vlanid`	Port VLAN identifier TLV
`ptcl-identity`	Protocol-identifier TLV
`vid-digest`	VLAN identifier digest TLV
`vlan-name`	VLAN name TLV

Default Value

None

Command Mode

Configuration mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#lldp tlv-select ieee-8021-org-specific port-vlanid
```

lldp tlv-select ieee-8023-org-specific

Use this command to select ieee-8023-org-specific TLVs to be include in LLDP frames.

Use the no parameter to disable ieee-8023-org-specific TLVs.

Command Syntax

```
lldp tlv-select ieee-8023-org-specific (mac-phy| power-via-mdi| max-mtu-size)
no lldp tlv-select ieee-8023-org-specific (mac-phy| power-via-mdi| max-mtu-size)
```

Parameters

`mac-phy`	VLAN ID Of the provider edge port <2-4094>.
`power-via-mdi`	Power-via-MDI (only when PoE feature is available)
`max-mtu-size`	Maximum MTU size TLV

Default Value

None

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 3.0.

Examples

```
#configure terminal
(config)#lldp tlv-select ieee-8023-org-specific mac-phy
```

set lldp agt-circuit-id

Use this command to configure LLDP agt-circuit-id.

Command Syntax

```
set lldp agt-circuit-id  VALUE
```

Parameters

VALUE	Specify LLDP global agt-circuit ID.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth0
(config-if)#set lldp agt-circuit-id sample
```

set lldp chassis-id-tlv

Use this command to set the chassis ID subtype for the LLDP agent on a port.

Use no form of this command to unset the chassis ID subtype.

Command Syntax

```
set lldp chassis-id-tlv (if-alias | ip-address | mac-address | if-name | locally-
  assigned)
no set lldp chassis-id-tlv
```

Parameters

`mac-address`	Use the MAC address as the chassis ID
`ip-address`	Use the management IP address as the chassis ID
`if-alias`	Use the IP address as the chassis ID
`if-name`	Use the interface name as the chassis ID
`locally-assigned`	Use the locally assigned value as the chassis ID

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp chassis-id-tlv ip-address
(if-lldp-agent)#no set lldp chassis-id-tlv
```

set lldp chassis locally-assigned

Use this command to set the locally assigned chassis name for the LLDP interface.

Command Syntax

```
set lldp chassis locally-assigned NAME
```

Parameters

NAME	Name assigned to the chassis.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#set lldp chassis locally-assigned box1
```

set lldp disable

Use this command to disable the admin status of a LLDP agent on a port.

Command Syntax

```
set lldp disable
```

Parameters

None

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp disable
(if-lldp-agent)#exit
```

set lldp enable

Use this command to set the admin status of a LLDP agent on a port.

Command Syntax

```
set lldp enable (txonly|txrx|rxonly)
```

Parameters

`rxonly`	Receive-only
`txonly`	Transmit-only
`txrx`	Transmit and receive

Default

By default, no LLDP agent is enabled for a port.

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp enable txrx
(if-lldp-agent)#exit
```

set lldp locally-assigned

Use this command to set the locally assigned name for LLDP interface.

Use no form of this command to remove the locally assigned name for LLDP interface.

Command Syntax

```
set lldp locally-assigned NAME
no set lldp locally-assigned NAME
```

Parameters

NAME	Name assigned to the port.

Command Mode

Interface Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#set lldp locally-assigned port1
(config-if)#no set lldp locally-assigned
```

set lldp management-address-tlv

Use this command to set the sub type of the Management Address TLV.

Use no form of this command to unset the sub type of the Management Address TLV.

Command Syntax

```
set lldp management-address-tlv (mac-address | ip-address)
no set lldp management-address-tlv
```

Parameters

mac-address	Use the MAC address as the Management Address.
ip-address	Use the management IP address as the Management Address.

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp management-address-tlv ip-address
(if-lldp-agent)#no set lldp management-address-tlv
```

set lldp med-devtype

Use this command to configure the LLDP device type as Network-Connectivity/ End-Point Class1/ End-Point Class2/ End-Point Class3 device.

Use the no parameter to un set the configured LLDP device type.

Command Syntax

```
set lldp med-devtype (net-connect| ep-class1| ep-class2| ep-class3)
no lldp med-devtype (net-connect| ep-class1| ep-class2| ep-class3)
```

Parameters

`net-connect`	Set device type as Network-Connectivity
`ep-class1`	Set device type as End-Point Class1
`ep-class2`	Set device type as End-Point Class2
`ep-class3`	Set device type as End-Point Class3

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#set lldp med-devtype ep-class1
(config-if)#exit

#configure terminal
(config)#interface eth0
(config-if)#no set lldp med-devtype
(config-if)#exit
```

set lldp msg-tx-hold

Use this command to set the `msg-tx-hold` parameter that determines the Time To Live (TTL) value for LLDPDUs to be transmitted by the port. The value set with this command is multiplied by the `lldp timer` `msg-tx-interval` value, which determines the final TTL value.

Use `no` form of this command to set the default value of message transmit hold.

Command Syntax

```
set lldp msg-tx-hold <1-100>
no set lldp msg-tx-hold
```

Parameters

`<1-100>`	Time in seconds to set message transmit hold.

Default

The default value of message transmit hold is 4 seconds.

Command Mode

LLDP agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp msg-tx-hold 3
(if-lldp-agent)#no set lldp msg-tx-hold
```

set lldp port-id-tlv

Use this command to set the sub type of the Port ID.

Use no form of this command to unset the sub type of the Port ID.

Command Syntax

```
set lldp port-id-tlv (if-alias | ip-address | mac-address | if-name | agt-circuit-
  id | locally-assigned)
no set lldp port-id-tlv
```

Parameters

`mac-address`	Use the MAC address as the port-id-tlv.
`ip-address`	Use the management IP address as the port-id-tlv
`if-alias`	Use the IP alias as the port-id-tlv
`if-name`	Use the interface name as the port-id-tlv
`agt-circuit-id`	Use the agt-circuit-id name as the port-id-tlv
`locally-assigned`	Use the locally assigned value as the port-id-tlv

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp port-id-tlv ip-address
(if-lldp-agent)#no set lldp port-id-tlv
```

set lldp timer

Use this command to set the interval at which LLDP frames are transmitted.

Use no form of this command to set the default value for timer.

Command Syntax

```
set lldp timer msg-fast-tx <1-3600>
set lldp timer msg-tx-interval <5-3600>
set lldp timer reinit-delay <1-10>
no set lldp timer msg-fast-tx
no set lldp timer msg-tx-interval
no set lldp timer reinit-Delay
```

Parameters

`msg-fast-tx`	Set the value in range <1-3600>
`msg-tx-interval`	Set the value in range <5-3600>
`reinit-delay`	Set the value in range <1-10>

Default Values

The default value for `msg-fast-tx` is 1 second.

The default value for `msg-tx-interval` is 30 seconds.

The default value for `reinit-delay` is 2 seconds.

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp timer msg-fast-tx 40
(if-lldp-agent)#no set lldp timer msg-fast-tx
(if-lldp-agent)#exit

#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp timer msg-tx-interval 40
(if-lldp-agent)#no set lldp timer msg-tx-interval
(if-lldp-agent)#exit
```

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp timer reinitDelay 3
(if-lldp-agent)#no set lldp timer reinitDelay
(if-lldp-agent)#exit
```

set lldp too-many-neighbors

Use this command to set the action to take when the remote table is full.

Use no form of this command to unset too many neighbors parameters.

Command Syntax

```
set lldp too-many-neighbors limit <1-65535> discard received-info timer <1-65535>
set lldp too-many-neighbors limit <1-65535> discard existing-info MAC timer <1-
  65535>
no set lldp too-many-neighbors limit
```

Parameters

`limit`	The limit on the number of LLDP neighbors.
`<1-65535>`	Upper limit for the number of Remote LLDP Information.
`received-info`	The information received for this neighbor.
`timer`	The period after which received information is discarded.
`<1-65535>`	The period in seconds after which received information is discarded.
`existing-info`	The information for this neighbor.
`MAC`	Identifies the remote LLDP Agent for which information is discarded.
`timer`	The period in seconds after which existing information is discarded.
`<1-65535>`	The period in seconds after which existing information is discarded.

Default Value

No upper limit is enforced for the number of remote LLDP agents.

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#lldp-agent
(if-lldp-agent)#set lldp too-many-neighbors limit 20 disc existing-info
1001.1001.1001 timer 1

(config)#interface eth1
(config-if)#lldp-agent
(if-lldp-agent)#set lldp too-many-neighbors limit 1 discard received-info
timer 1
```

set lldp tx-fast-init

Use this command to determine the maximum value of LLDP frames that are transmitted during a fast transmission period.

Use no form of this command to set fast transmission period to default value.

Command Syntax

```
set lldp tx-fast-init <1-8>
no set lldp tx-fast-init
```

Parameters

tx-fast-init	Set the message transmit interval value <1-8>.

Default Value

Default value is 4.

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#lldp-agent
(if-lldp-agent)#set lldp tx-fast-init 4
(if-lldp-agent)#no set lldp tx-fast-init
(if-lldp-agent)#exit
```

set lldp tx-max-credit

Use this command to set the maximum value of transmission credit, which signifies the number of consecutive LLDP frames transmitted.

Use no form of this command to set the maximum value of transmission credit to default value.

Command Syntax

```
set lldp tx-max-credit <1-10>
no set lldp tx-max-credit
```

Parameters

tx-max-credit	The maximum value of transmission credit.

Default Value

Default value is 5

Command Mode

LLDP Agent mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)lldp-agent
(if-lldp-agent)#set lldp tx-max-credit <1-10>
(if-lldp-agent)#no set lldp tx-max-credit
(if-lldp-agent)#exit
```

show debugging lldp

Use this command to display LLDP debugging information.

Command Syntax

```
show debugging lldp
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following sample output displays information about an LLDP debugging.

```
#show debugging lldp
LLDP debugging status:
 LLDP message debugging is on
```

show lldp neighbors

Use this command to display LLDP neighbors information.

Command Syntax

```
show lldp (nearest-bridge| non-tpmr-bridge| customer-bridge|) neighbors
  (brief|details)
```

Parameters

nearest-bridge	Display LLDP nearest bridge information
non-tpmr-bridge	Display LLDP non-TPMR-bridge information
customer-bridge	Display LLDP customer-bridge information
neighbor	Neighbor
brief	Brief
details	Details

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3 and changed in OcNOS version 1.3.1.

Example

The following sample output displays information about an LLDP neighbors

```
#sh lldp nearest-bridgr neighbors brief
Loc PortID  Rem Host Name   Rem Chassis Id  Rem Port Id   Agent Mode

-------------------------------------------------------------------------------
xe3/1        OcNOS       ecf4.bbfe.2864  ecf4.bbb2.4c65 Nearest bridge

#show lldp neighbors detail

-------------------------------------------------------------------------------
Nearest bridge Neighbors
 Interface Name : xe11
 Mandatory TLVs
 Chassis id type : MAC address [8cea.1b67.236c]
 Port id type : MAC address [8cea.1b28.4f6d]
 Time to live : 121
 Basic Management TLVs

AutoNego Status : Disabled
AutoNego Capability : 16
Operational MAU Type : 54 [Four-pair Category 6A or better, full duplex mode only]
Max Frame Size : 1518
```

Table 1-51 Shows the output details.

Table 1-50: show lldp neighbor output details

Entry	Description
Loc Port ID	Local interface SNMP index (appears when the interface option is used).
Rem Host Name	Name of the remote host.
Rem Chassis Id	Remote chassis identifier of the chassis type listed.
Rem Port Id	Remote port identifier of the port type listed.
Agent Mode	Agent mode enabled to the nearest bridge.
Time to live	Number of seconds for which this information is valid.
Interface Name	Name of the interface.
Chassis id type	Chassis identifier of the chassis type listed.
Port id type	Type of port identifier supplied, such as Locally assigned.
System Name	Name supplied by the system on the interface.
System Description	Description supplied by the system on the interface.
Port Description	The port description field uses the configured port description, the port name or the SNMP if Index (appears when the interface option is used).
Remote System Capabilities	Remote system capabilities (such as Bridge, Bridge Router, and Bridge Telephone) that are supported.

Table 1-50: show lldp neighbor output details

Entry	Description
Capabilities Enabled	Enabled by the system on the interface (appears when the interface option is used).
Management Address	Details of management address (such as 10.204.35.34).
Interface Number subtype	Interfaces subtype for which neighbor information is available.
Interface Number	Interfaces for which neighbor information is available.
OID Number	Number of identifier.
Port VLAN ID	Details of the port VLAN identifier.
Protocol VLAN ID	Details of the protocol VLAN identifier.
Remote Configured VLANs	Details of the remote configured VLAN.
Remote Protocols Advertised	Details of the remote protocols.
Remote VID usage Digest	Details of the VID usage.
Remote Management VLAN	Details of the management VLAN.
Link Aggregation Capability	Capabilities that supported by the link aggregation on the interface.
Link Aggregation Status	Status of the link aggregation.
Link Aggregation Port ID	Details of the link aggregation port identifier.
Auto Nego Support	Support of the auto nego on the interface.
Auto Nego Status	Status of the auto nego.
Auto Nego Capability	Capabilities that supported by the auto nego on the interface.
Operational MAU Type	Type of operational MAU on the interface.
Max Frame Size	Maximum frame size on the transit.

show lldp interface

Use this command to display LLDP interface information.

Command Syntax

```
show lldp interface IFNAME (nearest-bridge| non-tpmr-bridge| customer-bridge | )
  (neighbor| )
```

Parameters

`IFNAME`

Display LLDP interface information for all agent

`nearest-bridge`

Display LLDP nearest bridge information

`non-TPMR-bridge`

Display LLDP non-TPMR-bridge information

`customer-bridge`

Display LLDP customer-bridge information

`neighbor`

Display LLDP neighbor details.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show lldp interface eth0
Agent Mode : Customer-bridge
Enable (tx/rx): N/N
MED Enabled :N
Device Type: NOT_DEFINED
LLDP Agent traffic statistics:
Total frames transmitted: 0
Total entries aged: 0
Total frames recieved: 0
Total frames received in error: 0
Total frames discarded: 0
Total discarded TLVs: 0
Total unrecognised TLVs: 0

Agent Mode : Non-TPMR-bridge
Enable (tx/rx): N/N
MED Enabled :N
Device Type: NOT_DEFINED
LLDP Agent traffic statistics:
Total frames transmitted: 0
```

```
Total entries aged: 0
Total frames recieved: 0
Total frames received in error: 0
Total frames discarded: 0
Total discarded TLVs: 0
Total unrecognised TLVs: 0

Agent Mode : Nearest bridge
Enable (tx/rx): Y/Y
MED Enabled :N
Device Type: NOT_DEFINED
LLDP Agent traffic statistics:
Total frames transmitted: 2495
Total entries aged: 0
Total frames recieved: 0
Total frames received in error: 0
Total frames discarded: 0
Total discarded TLVs: 0
Total unrecognised TLVs: 0
```

Table 1-51 Shows the output details.

Table 1-51: show lldp interface output details

Entry	Description
Agent Mode	Agent mode enabled to the customer-bridge, Non-TPMR-bridge, and nearest bridge.
Enable (tx/rx)	Enables the transmit and receive on the interface.
Device Type	Type of device in the networks.
LLDP Agent traffic statistics	Statistics on exchanged LLDP frames between a device and neighbors.
Total frames transmitted	Number of frames transmitted in network.
Total entries aged	Number of aged entries in a networks.
Total frames received	Number of frames received from the neighbor network.
Total frames received in error	Number of frames not received from the neighbor network.
Total discarded TLVs	Number of TLVs discarded in transit.
Total unrecognised TLVs	Number of unrecognised TLVs in transit.

snmp restart lldp

Use this command to restart SNMP in Link Layer Discovery Protocol (LLDP)

Command Syntax

```
snmp restart lldp
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#snmp restart lldp
```

CHAPTER 2 Provider Bridging Commands

This chapter describes the Provider Bridging (PB) commands.

IEEE 802.1ad standardizes the architecture and bridged protocols to allow Ethernet frames with multiple VLAN tags. Packets through a provider network are doubly tagged with both an:

- Inner (C-VLAN) tag which is the customer network VLAN identifier
- Outer (S-VLAN) tag which is the service provider network VLAN identifier

bridge protocol provider-rstp

Use this command to add an IEEE 802.1D-2004 Rapid Spanning Tree Protocol (RSTP) bridge.

After creating a bridge instance, add interfaces to the bridge using the `bridge-group` command. Bring the bridge instance into operation with the `no shutdown` command in interface mode.

Command Syntax

```
bridge <1-32> protocol provider-rstp (edge|)
```

Parameters

`<1-32>`	Bridge identifier.
`edge`	Configure as an edge bridge.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bridge 2 protocol provider-rstp edge
```

clear l2protocol interface counters

This command allows you to clear the counters for numbers of packets peered, discarded and tunneled.

Command Syntax

```
clear l2protocol interface (IFNAME|) counters (peer|discard|tunnel|tunnel-discard|)
```

Parameters

`peer`	Clear stats for Peer protocol packets.
`discard`	Clear stats for Tunnel protocol packets.
`tunnel`	Clear stats for Tunnel protocol packets.
`tunnel-discard`	Clear stats for Tunnel discard protocol packets.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
# clear l2protocol interface xe1 counters peer
```

cvlan registration table

Use this command to create a customer VLAN (CVLAN) registration table that maps between CVLANs and service provider VLANs (SVLANs).

Use the no parameter with this command to delete the CVLAN registration table.

Command Syntax

```
cvlan registration table WORD bridge <1-32>
no cvlan registration table WORD bridge <1-32>
```

Parameters

WORD	Name of the CVLAN registration table.
<1-32>	Specify a bridge ID.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#cvlan registration table customer1
(config-cvlan-registration)#
```

cvlan svlan

Use this command to map one or more customer VLANs (CVLANs) to a service provider VLAN (SVLAN).

To update the optional QoS parameters cos-to-queue and remark-cos, execute the complete command along with the optional parameters. To remove these options, execute the same command by removing the optional parameters.

Refer qos profile commands from configuration guide for more details about qos profiles.

Use the no forms of this command to delete a mapping.

Command Syntax

```
cvlan VLAN_RANGE2 (cvlan VLAN_ID|) svlan VLAN_ID ({cos-to-queue NAME | remark-
  cos}|)
no cvlan VLAN_RANGE2
no svlan VLAN_ID
```

Parameters

`cvlan`	CVLAN
`VLAN_RANGE2`	VLAN identifier <1-4094> or range such as 2-5,10 or 2-5,7-19
`cvlan`	Translation of CVID
`VLAN_ID`	Translated CVID <1-4095>
`svlan`	SVLAN corresponding to the C-VLAN
`VLAN_ID`	VLAN identifier 1-4094>
`cos-to-queue`	Configure cos-to-queue map for cvlan
`NAME`	Ingress profile to modify queue/color on basis of c-cos
`remark-cos`	Remark Egress COS

Command Mode

CVLAN Registration mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#cvlan registration table customer1 (config-cvlan-registration)#cvlan
2 svlan 3
(config-cvlan-registration)#cvlan 3 svlan 3 cos-to-queue c1 remark-cos
(config-cvlan-registration)#cvlan 100 cvlan 101 svlan 200 cos-to-queue p1
remark-cos
(config-cvlan-registration)#cvlan 3 svlan 3 remark-cos
(config-cvlan-registration)#no cvlan 3
```

l2protocol

This command allows you to change the process of protocol to peer/discard/tunnel.

Command Syntax

```
l2protocol (stp|lacp|efm|elmi|lldp|synce)(peer|discard|tunnel)
```

Parameters

`stp`	Spanning Tree Protocols.
`lacp`	Link Aggregation (LACP).
`efm`	Ethernet first mile (Link OAM).
`elmi`	Ethernet local management interface.
`lldp`	Link layer discovery protocol.
`synce`	Link layer discovery protocol.
`peer`	Act as peer to the customer Device instance of the protocol.
`discard`	Discard the protocol data unit.
`tunnel`	Tunnel the Protocol data unit into the SVLAN.

Default

Default process value is peer.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#switchport mode customer-edge access
(config-if)#l2protocol stp tunnel
(config-if)#l2protocol stp peer
(config-if)#l2protocol stp discard
```

l2protocol encapsulation dest-mac

Use this command to change destination mac of tunneled l2 protocol packet. Allowed mac are 0100.C2CD.CDD0 or 0104.DFCD.CDD0.

Use the no parameter with this command to set default mac 0100.C2CD.CDD0.

Command Syntax

```
bridge <1-32> l2protocol encapsulation dest-mac XXXX.XXXX.XXXX
no bridge <1-32> l2protocol encapsulation dest-mac
```

Parameters

bridge	Bridge group for bridging.
<1-32>	<1-32>
l2protocol	Configure Layer2 Protocol Tunneling.
encapsulation	Encapsulation of L2PT packet.
dest-mac	Encapsulation with destination mac.
XXXX.XXXX.XXXX	Destination Mac-address of L2PT tunneling (0100.C2CD.CDD0 or 0104.DFCD.CDD0).

Command Mode

Configuration mode

Applicability

This command is introduced in OcNOS-SP version 1.0.

Examples

```
(config)#bridge 1 l2protocol encapsulation dest-mac ?
XXXX.XXXX.XXXX Destination Mac-address of L2PT tunneling (0100.C2CD.CDD0 or
0104.DFCD.CDD0)
(config)#bridge 1 l2protocol encapsulation dest-mac 0104.DFCD.CDD1
L2PT destination mac should be 0100.C2CD.CDD0 or 0104.DFCD.CDD0
(config)#bridge 1 l2protocol encapsulation dest-mac 0104.DFCD.CDD0
(config)#bridge 1 l2protocol encapsulation dest-mac 0100.C2CD.CDD0
(config)#bridge 1 l2protocol encapsulation dest-mac 0100.C2CD.CDD1
L2PT destination mac should be 0100.C2CD.CDD0 or 0104.DFCD.CDD0
(config)#

(config)#no bridge 1 l2protocol encapsulation dest-mac
(config)#show running-config | in bridge
bridge 1 protocol provider-rstp edge
vlan 2-10 type customer bridge 1 state enable
vlan 11-12 type service point-point bridge 1 state enable
cvlan registration table map1 bridge 1
bridge-group 1
bridge-group 1
(config)#
```

show cvlan registration table

Use this command to display the CVLAN registration table.

Command Syntax

```
show cvlan registration table (WORD|bridge <1-32>|WORD bridge <1-32>|)
```

Parameters

WORD	CVLAN registration table name.
<1-32>	Bridge identifier

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#sh cvlan registration table bridge 1
Bridge          Table Name       Port List
======          ==========       =========
  1               map              xe17

CVLAN ID      T-CVLAN ID     SVLAN ID     Profile Name    Egress remark-Cos
 ========    ==========     ========    ============    =================
 100             101            200          p1              Yes
```

Table 2-52 explains the output fields.

Table 2-52: show cvlan registration table output

Entry	Description
Bridge	ID number of the bridge associated with the Customer VLAN (CVLAN).
Table Name	ID of the CVLAN registration table.
Port List	List of ports used by this CVLAN (including Link aggregators).
CVLAN ID	ID number of the CVLAN.
T-CVLAN ID	Translation CVLAN ID.
SVLAN ID	ID number of the Service VLAN (SVLAN) associated with the CVLAN.
Profile Name	cos-to-queue profile name.
Egress remark-Cos	Remark Egress Cos

show l2protocol interface counters

This command allows you to display the counters for numbers of packets peered, discarded and tunneled.

Command Syntax

```
show l2protocol interface (IFNAME|) counters (peer|discard|tunnel|tunnel-discard|)
```

Parameters

`peer`	Display stats for Peer protocol packets.
`discard`	Display stats for Tunnel protocol packets.
`tunnel`	Display stats for Tunnel protocol packets.
`tunnel-discard`	Display stats for Tunnel discard protocol packets.

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
# show l2protocol interface xe1 counters peer
Interface xe1
Peer:     stp:    1

# show l2protocol interface xe1 counters
Interface xe1
Peer:     stp:    1
Discard:  stp:    10
Tunnel:   stp:    5
```

show l2protocol processing interface

This command allows you to display the processing information on Layer 2 protocol interface.

Command Syntax

```
show l2protocol processing interface IFNAME
```

Parameters

IFNAME	Interface name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command is introduced was before OcNOS-SP version 1.0.

Examples

```
#show l2protocol processing interface xe1/1
Bridge    Interface Name                Protocol       Processing Status
======    ==============                ========       =================
1         xe1/1                          stp            Tunnel
1         xe1/1                          gmrp           Peer
1         xe1/1                          gvrp           Peer
1         xe1/1                          mmrp           Peer
1         xe1/1                          mvrp           Peer
1         xe1/1                          lacp           Peer
1         xe1/1                          lldp           Peer
1         xe1/1                          efm            Peer
1         xe1/1                          elmi           Peer
1         xe1/1                          ptp            Peer
1         xe1/1                          synce          Peer
```

switchport customer-edge

Use this command to set the switching characteristics of the layer 2 interface and the default customer VLAN.

Use the no form of this command to remove a customer VLAN.

Command Syntax

```
switchport customer-edge (access|hybrid) vlan <2-4094>
no switchport customer-edge (access|hybrid) vlan
```

Parameters

`access`	Set the layer 2 interface as access.
`hybrid`	Set the layer 2 interface as hybrid.
`<2-4094>`	Set the default VID for the interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth0
(config-if)#switchport customer-edge access vlan 3

(config)#interface eth0
(config-if)#no switchport customer-edge access vlan
```

switchport customer-edge hybrid

Use this command to set the switching characteristics of the Layer 2 customer-facing interface to hybrid. Both tagged and untagged frames will be classified over hybrid interfaces.

Command Syntax

```
switchport customer-edge hybrid allowed vlan add VLAN_ID
switchport customer-edge hybrid allowed vlan remove VLAN_ID
switchport customer-edge hybrid allowed vlan all
switchport customer-edge hybrid allowed vlan none
```

Parameters

`add`	Add a VLAN to transmit and receive through the Layer 2 interface.
`VLAN_ID`	ID of the VLAN <2-4094>.
`remove`	Remove a VLAN from the member set.
`VLAN_ID`	ID of the VLAN <2-4094>.
`all`	Allow all VLANs to transmit and receive through the Layer 2 interface.
`none`	Allow no VLANs to transmit and receive through the Layer 2 interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)#interface eth0
(config-if)#switchport customer-edge hybrid allowed vlan add 2
```

switchport customer-edge trunk

Use this command to set the Layer2 interface as trunk.

Command Syntax

```
switchport customer-edge trunk allowed vlan add VLAN_ID
switchport customer-edge trunk allowed vlan remove VLAN_ID
switchport customer-edge trunk allowed vlan all
switchport customer-edge trunk allowed vlan none
```

Parameters

`add`	Add a VLAN to the member set.
`VLAN_ID`	Specify a VLAN ID <2-4094>
`remove`	Remove a VLAN from the member set.
`all`	Allow all VLANs to transmit and receive through the Layer 2 interface.
`none`	Allow no VLANs to transmit and receive through the Layer 2 interface.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#interface eth1
(config-if)#switchport customer-edge trunk allowed vlan add 12
```

switchport customer-edge vlan registration

Use this command to configure the VLAN registration parameters.

Use the no parameter with this command to delete the mapping from the interface.

Command Syntax

```
switchport customer-edge vlan registration WORD
no switchport customer-edge vlan registration
```

Parameters

WORD	Name of the CVLAN registration table.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#switchport customer-edge vlan registration customer1
```

switchport dot1q

This command allows you to change the TPID for a port.

Use the no form of this command to unset the TPID to default value.

Command Syntax

```
switchport dot1q ethertype ETHERTYPE
no switchport dot1q ethertype
```

Parameters

dot1q	Set the switching characteristics of the Layer2 dot1q header.
ETHERTYPE	Ethertype value for outer tag (Allowed ethertype values are 0x8100 (default) or 0x88a8 0r 0x9100 or 0x9200)

Default

The default TPID value is 8100.

Command Mode

Interface Mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#interface xe1
(config-if)# switchport dot1q ethertype 0x88a8
(config-if)# no switchport dot1q ethertype
```

switchport mode

Use this command to set the switching characteristics of the Layer 2 interface.

Command Syntax

```
switchport mode (provider-network|customer-edge)
```

Parameters

`provider-network` Provider network.

`customer-edge` Customer edge.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode provider-network
```

switchport mode customer-edge

Use this command to set the switching characteristics of the Layer 2 customer facing interface and classify only untagged frames. Received frames are classified based on the VLAN characteristics, then accepted or discarded based on the specified filtering criteria.

Command Syntax

```
switchport mode customer-edge (access|hybrid|trunk)
```

```
switchport mode customer-edge (access|hybrid|trunk)
```

Parameters

`access`	Set the layer 2 interface as access.
`hybrid`	Set the layer 2 interface as hybrid.
`trunk`	Set the layer 2 interface as trunk.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth0
(config-if)#switchport mode customer-edge access
```

switchport provider-network isolated-vlan

Use this command to attach a VLAN as an isolated VLAN for a provider network port.

Using an isolated VLAN for PNP ports on a switch can forward all frames received from the PNP port to all other PNP ports. However, if VLANs are configured to be isolated, they can traverse PNP port without sharing any of their frames.

Use the no form of this command to remove an isolated VLAN for a provider network port.

Command Syntax

```
switchport provider-network isolated-vlan VLAN_RANGE
no switchport provider-network isolated-vlan VLAN_RANGE
```

Parameters

VLAN_RANGE	VLAN identifier <2-4094> or range such as 2-5,10 or 2-5,7-19

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#bridge 1 protocol provider-rstp
(config)#vlan database
(config-vlan)#vlan 2-10 type service point-point bridge 1 state enable
(config-vlan)#exit
(config)#interface xe0
(config-if)#switchport
(config-if)#bridge-group 1
(config-if)#switchport provider-network allowed vlan all
(config-if)#switchport provider-network isolated-vlan 2-10
```

vlan type customer

Use this command to configure VLANs of type customer, to enable or disable the state of the VLANs, and to configure the name for VLANs.

Use the no form of this command to remove the VLAN type.

Command Syntax

```
vlan <2-4094> type customer bridge <1-32>
vlan <2-4094> type customer bridge <1-32> state (enable|disable)
vlan <2-4094> type customer bridge <1-32> name WORD
no vlan <2-4094> type customer bridge <1-32>
```

Parameters

<2-4094>	The VID of the VLAN that will be enabled or disabled on the bridge <2-4094>.
type	Identifies the VLAN as a customer, service, or VLAN.
customer	Identifies the Customer VLAN
bridge	Indicates a Service VLAN <1-32>.
name	The ASCII name of the VLAN. Maximum length allowed is 16 characters.
state	Indicates the operational state of the VLAN.
enable	Sets VLAN into an enable state.
disable	Sets VLAN into a disable state.
WORD	ASCII name of the VLAN.

Command Mode

VLAN Configuration mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#vlan database
(config-vlan)#vlan 12 type customer bridge 1 name new state enable
```

vlan type

This command allows you to create a single/range of VLAN's on provide/edge bridge.

Use the no form of this command to delete the VLAN.

Command Syntax

```
vlan VLAN_RANGE type customer bridge <1-32>
vlan VLAN_RANGE type customer bridge <1-32> name WORD
vlan VLAN_RANGE type customer bridge <1-32> state (enable | disable)
vlan VLAN_RANGE type service point-point bridge <1-32>
vlan VLAN_RANGE type service point-point bridge <1-32> name WORD
vlan VLAN_RANGE type service point-point bridge <1-32> state (enable | disable)

no vlan VLAN_RANGE type customer bridge <1-32>
no vlan VLAN_RANGE type service bridge <1-32>
```

Parameters

VLAN_RANGE	VLAN identifier <2-4094> or range such as 2-5,10 or 2-5,7-19
customer	Identifies the Customer VLAN
bridge	Specify the bridge group ID in the range <1-32>.
name	The ASCII name of the VLAN. Maximum length allowed is 16 characters.
point-point	Sets the VLAN connectivity mode to point-to-point
WORD	ASCII name of the VLAN.
state	Indicates the operational state of the VLAN.
enable	Sets VLAN into an enable state.
disable	Sets VLAN into a disable state.

Command Mode

Configuration Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
(config)vlan 2,4,5-6 customer bridge 2
(config)vlan 10-12 service type point-point bridge 3
```

CHAPTER 3 CFM and Y.1731 Commands

This chapter describes the commands used to manage the Connectivity Fault Management (CFM). CFM refers to the service OAM of Ethernet used to manage individual Layer 2 Ethernet services. The CFM protocol can discover and verify the path through 802.1 bridges and LANs. OcNOS adheres to the IEEE 802.1ag 2007 standard.

CFM includes the features required by ITU Y.1731 standard *OAM Functions and Mechanisms for Ethernet Based Networks*. This recommendation identifies the functions required to enable fault management (such as fault localization and defect detection) and performance monitoring in an Ethernet network.

- mep crosscheck
- mep lowest-priority-defect
- message-period
- number-intervals-stored
- ping ethernet mac
- rmep auto-discovery
- service ma-type
- show ethernet cfm ais reception-status
- show ethernet cfm delay-measurement mep
- show ethernet cfm delay-measurement profile
- show ethernet cfm dm sessions
- show ethernet cfm errors
- show ethernet cfm frame-lm session
- show ethernet cfm loss-measurement mep
- show ethernet cfm loss-measurement profile
- show ethernet cfm ma status
- show ethernet cfm maintenance-points local mep
- show ethernet cfm maintenance-points local mip
- show ethernet cfm maintenance-points remote
- show ethernet cfm statistics
- show running-config cfm
- traceroute ethernet
- ethernet cfm test-signal profile-name
- test-signal mode
- test-signal test-type
- test-signal frame-size
- test-signal pattern-type
- test-signal start-time
- abort test-signal domain
- show ethernet cfm test-signal profile
- show ethernet cfm test-signal domain
- eth-lck state
- eth-lck message
- eth-lck interval
- eth-lck frame priority
- show ethernet cfm lck statistics
- show ethernet cfm lck details domain

abort delay-measurement

Use this command to stop the ongoing or scheduled CFM frame delay measurement session.

Command Syntax

```
abort delay-measurement mep MEPID domain DOMAIN_NAME (vlan <2-4094>|bridge <1-
  32>|vpws)
```

Parameters

MEPID	MEP identifier <1-8191>
DOMAIN_NAME	MD name
<2-4094>	VLAN identifier
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#abort delay-measurement mep 123 domain 12345 vlan 10 bridge 1
#abort delay-measurement mep 123 domain 12345 vpws
```

abort loss-measurement

Use this command to stop the ongoing CFM frame loss measurement session.

Command Syntax

```
abort loss-measurement mep MEPID domain DOMAIN_NAME (vlan <2-4094>|bridge <1-
  32>|vpws)
```

Parameters

MEPID	MEP identifier <1-8191>
DOMAIN_NAME	MD name
<2-4094>	VLAN identifier
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#abort loss-measurement mep 201 domain 12345 vlan 10 bridge 1
#abort loss-measurement mep 201 domain 12345 vpws
```

ais interval

Use this command to set the AIS (Alarm Indication Signal) transmission interval.

Command Syntax

```
ais interval (one-second | one-minute)
```

Parameters

`one-second`	AIS transmission interval in packets per second
`one-minute`	AIS transmission interval in packets per minute

Default

`one-second`

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe2
(config-ether-cfm-ma-mep)#ais interval one-minute
```

ais status

Use this command to enable or disable AIS (Alarm Indication Signal) transmission and set the CFM MD level to transmit in AIS PDUs.

Command Syntax

```
ais status (enable|disable) level <0-7>
```

Parameters

`enable`	Enable AIS
`disable`	Disable AIS
`<0-7>`	CFM MD level

Default

`disable`

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-
creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe2
(config-ether-cfm-ma-mep)#ais status enable level 7
```

bins-per-fd-interval

Use this command to the set number of measurement bins per measurement interval for a two-way performance monitoring frame delay measurements on a specific MEP.

Use the no form to set number of measurement bins per measurement interval for a two-way performance monitoring frame delay measurements on a specific MEP to its default (3).

Command Syntax

```
bins-per-fd-interval <2-10>
no bins-per-fd-interval
```

Parameters

<2-10>	Number of frame delay bins to be created

Default

3

Command Mode

Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)# bins-per-fd-interval 4
```

bins-per-ifdv-interval

Use this command to set the number of measurement bins per measurement interval for an inter-frame delay for a two-way performance monitoring frame delay measurements on a specific MEP.

Use the no form to set the number of measurement bins per measurement interval for an inter-frmae delay for a two-way performance monitoring frame delay measurements on a specific MEP to its default (2).

Command Syntax

```
bins-per-ifdv-interval <2-10>
no bins-per-ifdv-interval
```

Parameters

<2-10>	Number of inter-frame delay bins to be created

Default

2

Command Mode

Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)# bins-per-ifdv-interval 3
```

bin-type

Use this command to set the threshold value for a particular bin for a two-way performance monitoring frame delay measurements on a specific MEP.

Use the no form to set threshold value for a particular bin for a two-way performance monitoring frame delay measurements on a specific MEP to its default.

Command Syntax

```
bin-type frame-delay bin 2 threshold 200
no bin-type frame-delay bin 2 threshold
bin-type inter-frame-delay-variation bin 2 threshold 1000
no bin-type inter-frame-delay-variation bin 2 threshold
```

Parameters

`frame-delay`	Frame delay bin type
`inter-frame-delay-variation`	Inter frame delay variation bin type
`<2-10>`	Bin number for which the threshold will be changed.
`<1- 4294967295>`	Threshold value for that bin.

Default

Incremental of 5000 microseconds from bin 2, that is bin 2's threshold will be 5000, bin 3's will be 10000, bin 4 will be 15000, so on and so forth.

Command Mode

Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)# bin-type frame-delay bin 2 threshold 200
(config-cfm-dm)# bin-type inter-frame-delay-variation bin 2 threshold 1000
```

cc interval

Use this command to set the continuity checking (CC) message interval.

Command Syntax

```
cc interval (1|2|3|4|5)
```

Parameters

1	3 milliseconds
2	10 milliseconds
3	100 milliseconds
4	1 seconds
5	10 seconds

Command Mode

Ethernet CFM MA mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#cc interval 1
```

cc multicast

Use this command to start or stop multicast continuity checking messages (CCMs) on a MEP.

Command Syntax

```
cc multicast state (enable|disable)
```

Parameters

`enable`	Start sending CCMs
`disable`	Stop sending CCMs

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe2
(config-ether-cfm-ma-mep)#cc multicast state enable
```

clear ethernet cfm dm history

Use this command to clear the CFM frame delay measurement history statistics from CFM_MEP DB.

Command Syntax

```
clear ethernet cfm dm history mep MEPID domain DOMAIN_NAME (vlan <2-4094>| bridge
  <1-32> | vpws VCNAME)
```

Parameters

MEPID	Local MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name
<2-4094>	Primary VLAN identifier of MA.
<1-32>	Bridge identifier
VCNAME	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear ethernet cfm dm history mep 123 domain no_name vlan 10 bridge 1
```

clear ethernet cfm lm history

Use this command to clear the CFM frame loss measurement history statistics.

Command Syntax

```
clear ethernet cfm lm history mep MEPID domain DOMAIN_NAME (vlan <2-4094>|bridge
  <1-32>|vpws VCNAME)
```

Parameters

MEPID	Local MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name
<2-4094>	Primary VLAN identifier of MA.
<1-32>	Bridge identifier
VCNAME	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear ethernet cfm lm history mep 201 domain 12345 vlan 10 bridge 1
#clear ethernet cfm lm history mep 201 domain 12345 vpws
```

clear ethernet cfm maintenance-point remote

Use this command to remove a dynamically learned RMEP.

The RMEP is relearned if rmep auto-discovery is enabled and a CCM (Continuity Checking Message) is received.

Command Syntax

```
clear ethernet cfm maintenance-points remote (domain <DOMAIN_NAME>|level <0-7>)
  (bridge <1-32> | vpws)
```

Parameters

DOMAIN_NAME	MD name
<0-7>	CFM level
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear ethernet cfm maintenance-point level 7 bridge 1
#clear ethernet cfm maintenance-point level 6 vpws
```

clear ethernet cfm statistics

Use this command to clear the CFM statistics.

Command Syntax

```
clear ethernet cfm statistics mep <MEPID> domain <DOMAIN_NAME> (vlan <2-4094>
  bridge <1-32>)
```

Parameters

MEPID	MEP identifier <1-8191>
DOMAIN_NAME	MD name
<2-4094>	Primary VLAN identifier
<1-32>	Bridge identifier

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear ethernet cfm statistics mep 201 domain 12345 vlan 10 bridge 1
```

clear ethernet cfm traceroute-cache

Use this command to clear the CFM traceroute cache entry.

Command Syntax

```
clear ethernet cfm traceroute-cache (bridge <1-32>|vpws)
```

Parameters

<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#clear ethernet cfm traceroute-cache bridge 1
#clear ethernet cfm traceroute-cache vpws
```

delay-measurement type on-demand

Use this command to schedule an on-demand CFM delay measurement session.

Command Syntax

```
delay-measurement type on-demand profile-name WORD rmep (mac-address MAC|RMEPID)
  start-time (immediate|relative HH:MM:SS|absolute HH:MM:SS <1-31> MONTH <1993-
  2035>) repetition-period <6000-4294967295> mep MEPID domain DOMAIN_NAME (vlan <2-
  4094>| bridge <1-32> | vpws VCNAME)
```

Parameters

`WORD`	Delay measurement profile name
`MAC`	Destination MAC address in HHHH.HHHH.HHHH format
`RMEPID`	Destination peer MEP identifier <1-8191>
`start-time`	Measurement session start time
`immediate`	Start immediately
`relative HH:MM:SS`	Relative time to start from the current system time
`absolute HH:MM:SS <1-31> MONTH <1993-2035>`	Scheduled date and time to start; for the month, specify the first three letters
`stop-time`	Measurement session stop time
`none`	Never stop
`relative HH:MM:SS`	Relative time to stop from the current system time
`absolute HH:MM:SS <1-31> MONTH <1993-2035>`	Scheduled date and time to stop; for the month, specify the first three letters
`<6000-4294967295>`	Repetition time in centiseconds
`MEPID`	Local MEP identifier <1-8191>
`DOMAIN_NAME`	Maintenance domain name
`<2-4094>`	Primary VLAN identifier of the MA
`<1-32>`	Bridge identifier
`VCNAME`	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#delay-measurement type on-demand profile-name PROF1 rmep 101 start-time relative
00:00:03 stop-time relative 00:03:00 repetition-period 7000 mep 123 domain no_name vlan
10 bridge 1
```

delay-measurement type proactive

Use this command to configure and start a proactive CFM delay measurement session.

Command Syntax

```
delay-measurement type proactive profile-name WORD rmep (mac-address MAC|RMEPID)
  mep MEPID domain DOMAIN_NAME (vlan <2-4094>| bridge <1-32> | vpws VCNAME)
```

Parameters

WORD	Delay measurement profile name
MAC	Destination MAC address in HHHH.HHHH.HHHH format
RMEPID	Remote MEP identifier <1-8191>
MEPID	Local MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name
<2-4094>	Primary VLAN identifier of the MA
<1-32>	Bridge identifier
VCNAME	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#delay-measurement type proactive profile-name 123 rmep 101 mep 123 domain no_name vlan
10 bridge 1
#delay-measurement type proactive profile-name 123 rmep 101 mep 123 domain no_name vpws
ETH-2001
```

ethernet cfm delay-measurement profile-name

Use this command to create a CFM frame delay measurement profile and enter Ethernet CFM delay measurement mode.

Use the no form of this command to remove a CFM delay measurement profile.

Command Syntax

```
ethernet cfm delay-measurement profile-name WORD
no ethernet cfm delay-measurement profile-name WORD
```

Parameters

WORD	Profile name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)#
```

ethernet cfm delay-measurement reply

Use this command to enable transmission of DMR (Delay Measurement Reply) PDUs for received DMMs (Delay Measurement Messages).

After this command is given, a delay measurement session cannot be configured to send DMMs. In that case, the device can only generate DMRs for received DMM PDUs.

Use the no form of this command to disable sending DMR PDUs. After no command is given we can thereby configure a delay measurement session to send DMMs if we need.

Command Syntax

```
ethernet cfm delay-measurement reply dmm
```

```
no ethernet cfm delay-measurement reply dmm
```

Parameters

None

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)# ethernet cfm domain-type no-name domain-name no_name level 4 mip-creation none
bridge 1
(config-ether-cfm)# service ma-type integer ma-name 200 vlan 10 mip-creation none
(config-ether-cfm-ma)# ethernet cfm mep down mpid 123 active true local-vid 10 xe1
(config-ether-cfm-ma-mep)#ethernet cfm delay-measurement reply dmm
```

ethernet cfm domain-type

Use this command to create a CFM Maintenance Domain (MD) in a bridge and enter Ethernet CFM mode.

Use the no form of this command to remove a domain.

Note: You can create up to 15 MDs in a bridge.

Only one domain can be created without any domain name in a bridge.

A domain name of type `character-string` can only created only after the hardware-profile filter cfm-domain-name-str command is executed.

Command Syntax

```
ethernet cfm domain-type (no-name|character-string) domain-name DOMAIN_NAME level
  <0-7> mip-creation (none|default|explicit) (bridge <1-32> | vpws)
no ethernet cfm domain-name DOMAIN_NAME level <0-7> mip-creation
  (none|default|explicit) (bridge <1-32> | vpws)
```

Parameters

`domain-type`	Domain type (must match service ma-type setting)
`no-name`	No MD name. The `ma-type` must be `integer` or `itu-t` carrier code (ICC) format defined by Y.1731.
`character-string`	Character string name. The `ma-type` must be string.
`DOMAIN_NAME`	Domain name (name must be a 5-character string)
`<0-7>`	MD level
`mip-creation`	Maintenance Intermediate Point (MIP) creation permission for this domain
`none`	No MIP can be created for this VLAN identifier
`default`	MIP can be created if no lower active level or MEP at next lower active level
`explicit`	Maintenance End Point (MEP) is needed at the next lower active level
`<1-32>`	Bridge identifier
`vpws`	VPWS instance

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe7
```

```
(config-ether-cfm-ma-mep)#
```

ethernet cfm loss-measurement profile-name

Use this command to create a CFM frame loss measurement profile and enter Ethernet CFM loss measurement mode.

Use the no form of this command to remove a CFM loss measurement profile.

Command Syntax

```
ethernet cfm loss-measurement profile-name WORD
no ethernet cfm loss-measurement profile-name WORD
```

Parameters

WORD	Profile name

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm loss-measurement profile-name PROF1
(config-cfm-lm)#
```

ethernet cfm loss-measurement reply

Use this command to enable transmission of SLR (Synthetic Loss Reply) PDUs for received SLMs (Synthetic Loss Messages) and to enable transmission of LMR (Loss Measurement Reply) PDUs for received LMMs (Loss Measurement Messages).

After this command is given, a loss measurement session cannot be configured to send SLMs. In that case, the device can only generate SLRs for received SLM PDUs. The same is true for LMM/LMR also.

Use the no form of this command to disable sending SLR/LMR PDUs.

Command Syntax

```
ethernet cfm loss-measurement reply (slm | lmm)
no ethernet cfm loss-measurement reply (slm | lmm)
```

Parameters

slm	Synthetic Loss Messages
lmm	Loss Measurement Messages

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe2
(config-ether-cfm-ma-mep)#ethernet cfm loss-measurement reply slm
```

ethernet cfm mep

Use this command to create a Maintenance End Point (MEP), make it active or inactive and enter Ethernet CFM MA MEP mode.

A MEP created with the `active false` option remains inactive and CFM functionality is suspended for such a MEP.

Note: For a VPWS instance, only an up MEP can be created; a down MEP cannot be created for VPWS.

Use the `no` form of this command to delete a MEP.

Command Syntax

```
ethernet cfm mep (up|down) mpid MEPID active (false|true) (local-vid VID|) ((uni-
  mep)|) (IFNAME | (vpws VCNAME) )
no ethernet cfm mep (up|down) mpid MEPID (local-vid VID|) (IFNAME | (vpws VCNAME) )
```

Parameters

`down`	Down MEP
`up`	Up MEP
`MEPID`	Host MEP identifier <1-8191>
`active`	Administrative state of the MEP
`true`	Make the MEP active
`false`	Make the MEP inactive
`VID`	Local VLAN identifier for the MEP, a secondary VLAN for the MA
`uni-mep`	UNI Maintenance Entity Group (MEG) MEP to intimate the UNI type
`IFNAME`	Interface name
`VCNAME`	Virtual circuit name

Command Mode

Ethernet CFM MA mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe2
(config-ether-cfm-ma-mep)#
```

ethernet cfm traceroute cache

use this command to set the cache size for traceroute output.

Use the no form of this command to set the cache size to its default (100).

Command Syntax

```
ethernet cfm traceroute cache size <1-4095> (bridge <1-32>|vpws)
no ethernet cfm traceroute cache size <1-4095> (bridge <1-32>|vpws)
```

Parameters

<1-4095>	Number of entries in cache
<1-32>	Bridge identifier
vpws	VPWS instance

Default

100 entries

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm traceroute cache size 1 bridge 1
(config)#ethernet cfm traceroute cache size 1 vpws
```

exit-ether-ma-mode

Use this command to exit Ethernet CFM MA mode and go back to Ethernet CFM mode.

Command Syntax

```
exit-ether-ma-mode
```

Parameters

None

Command Mode

Ethernet CFM MA mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#exit-ether-ma-mode
```

exit-ether-ma-mep-mode

Use this command to exit Ethernet CFM MA MEP mode and go back to Ethernet CFM MA mode.

Command Syntax

```
exit-ether-ma-mep-mode
```

Parameters

None

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe2
(config-ether-cfm-ma-mep)#exit-ether-ma-mep-mode
```

hardware-profile filter cfm-domain-name-str

Use this command to enable or disable setting the CFM domain name as a character string.

Command Syntax

```
hardware-profile filter cfm-domain-name-str (enable|disable)
```

Parameters

`enable`	Enable CFM domain name as a character string
`disable`	Disable CFM domain name as a character string

Default

Disabled

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#hardware-profile filter cfm-domain-name-str enable
```

intervals-stored

Use this command to set the number of frame loss measurement intervals to store in the history table.

Use the no form to set the number of measurement intervals to its default (32).

Command Syntax

```
intervals-stored <2-1000>
no intervals-stored
```

Parameters

<2-1000>	Time intervals

Default

32

Command Mode

Ethernet CFM loss measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm loss-measurement profile-name PROF1
(config-cfm-lm)#intervals-stored 50
```

loss-measurement type on-demand

Use this command to schedule an on-demand CFM loss measurement session.

Command Syntax

```
loss-measurement type on-demand profile-name WORD rmep (mac-address MAC|mep-id
  MEPID) start-time (immediate|relative HH:MM:SS|absolute HH:MM:SS <1-31> MONTH
  <1993-2035>) stop-time (none|relative HH:MM:SS|absolute HH:MM:SS <1-31> MONTH
  <1993-2035>) repetition-period <6000-4294967295> mep MEPID domain DOMAIN_NAME
  (vlan <2-4094> | bridge <1-32> | vpws VCNAME)
```

Parameters

`WORD`	Loss measurement profile name
`MAC`	Destination MAC address in HHHH.HHHH.HHHH format
`MEPID`	Remote MEP identifier <1-8191> to which to send the service OAM loss measurement frame
`start-time`	Measurement session start time
`immediate`	Start immediately
`relative HH:MM:SS`	Relative time to start from the current system time
`absolute HH:MM:SS <1-31> MONTH <1993-2035>`	Scheduled date and time to start; for the month, specify the first three letters
`stop-time`	Measurement session stop time
`none`	Never stop
`relative HH:MM:SS`	Relative time to stop from the current system time
`absolute HH:MM:SS <1-31> MONTH <1993-2035>`	Scheduled date and time to stop; for the month, specify the first three letters
`repetition-period`	Repetition time between measurement intervals
`<0-4294967295>`	Repetition time in seconds
`MEPID`	Remote MEP identifier <1-8191> to which to send the service OAM loss measurement frame
`DOMAIN_NAME`	Maintenance domain name
`<2-4094>`	Primary VLAN identifier of the MA
`<1-32>`	Bridge identifier
`VCNAME`	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#loss-measurement type on-demand profile-name slm rmep mac-address 0018.2323.1234
start-time immediate stop-time none repetition-period 9000 mep 201 domain 12345 vlan 10
bridge 1
#loss-measurement type on-demand profile-name slm rmep mac-address 0018.2323.1234
start-time immediate stop-time none repetition-period 9000 mep 201 domain 12345 vpws
ETH-2001
```

loss-measurement type proactive

Use this command to configure and start a proactive CFM loss measurement session.

Command Syntax

```
loss-measurement type proactive profile-name WORD rmep (mac-address MAC) mep MEPID
  domain DOMAIN_NAME (vlan <2-4094> | bridge <1-32> |vpws VCNAME)
```

Parameters

WORD	Loss measurement profile name
rmep	Remote MEP
MAC	Destination MAC address in HHHH.HHHH.HHHH format
MEPID	Remote MEP identifier <1-8191> to which to send the service OAM loss measurement frame
mep	MEP
MEPID	MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name
<2-4094>	Primary VLAN identifier of the MA
<1-32>	Bridge identifier
VCNAME	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#loss-measurement type proactive profile-name slm rmep mac-address
0018.2323.1234 mep 201 domain 12345 vlan 10 bridge 1
#loss-measurement type proactive profile-name slm rmep mac-address
0018.2323.1234 mep 201 domain 12345 vpws ETH-2001
```

measurement-interval

Use this command to set the measurement interval for frame loss or delay measurement session.

Use the no form of this command to set the measurement interval to its default value (15 minutes).

Command Syntax

Loss measurement:

```
measurement-interval <1-525600>
no measurement-interval
```

Delay measurement:

```
measurement-interval <1-1440>
no measurement-interval
```

Parameters

For frame loss measurement:

<1-525600>	Measurement interval in minutes

For frame delay measurement:

<1-1440>	Measurement interval in minutes

Default

15 minutes

Command Mode

Ethernet CFM loss measurement mode and Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

Loss measurement:

```
#configure terminal
(config)#ethernet cfm loss-measurement profile-name PROF1
(config-cfm-lm)#measurement-interval 500
```

Delay measurement:

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)# measurement-interval 1
```

measurement-type slm

Use this command to generate Frame Loss Message (SLM/LMM) service OAM PDUs and track replies (SLR/LMR).

The measurement-type CCM is a dual-ended frame loss method in which generated CCM PDUs carry frame loss measurement information (TxFCf, RxFCb and TxFCb).

Use the no form of this command to set the measurement type to its default value (slm).

SLM and LMM cannot be enabled at the same time. All MEPs can use either LMM or SLM for frame loss measurement.

Command Syntax

```
measurement-type (slm | lmm | ccm)
no measurement-type
```

Parameters

`slm`	SLM service PDUs are generated and SLRs is tracked for frame loss measurement.
`lmm`	LMM service PDUs are generated and LMRs is tracked for frame loss measurement.
`ccm`	CCM PDUs are used for frame loss measurement which carries frame loss measurement information.

Command Mode

Ethernet CFM loss measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm loss-measurement profile-name PROF1
(config-cfm-lm)#measurement-type slm
```

mep crosscheck

Use this command to configure a remote MEP crosscheck.

Use the no form of this command to delete a crosscheck MEP.

Command Syntax

```
mep crosscheck mpid MEPID (mac MAC|)
no mep crosscheck mpid MEPID (mac MAC|)
```

Parameters

MEPID	Remote host MEP identifier <1-8191>
MAC	MAC address in HHHH.HHHH.HHHH format. This parameter is mandatory to send unicast Continuity Check Messages (CCMs). Otherwise, multicast CCMs are sent by default.

Command Mode

Ethernet CFM MA mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#mep crosscheck mpid 51
```

mep lowest-priority-defect

Use this command to set the lowest-priority defect that can generate a fault alarm.

Use the no form of this command to set the lowest-priority defect to its default (`defMACstatus`).

Command Syntax

```
mep lowest-priority-defect
  (defRDICCM|defMACstatus|defRemoteCCM|defErrorCCM|defXconCCM)
no mep lowest-priority-defect
```

Parameters

`defRDICCM`	1 (lowest): At least one of the Remote MEP state machines is receiving valid CCMs from its remote MEP that has the Remote Defect Indication (RDI) bit set.
`defMACstatus`	2: One or more of the remote MEPs is reporting a failure in its Port Status Type-Length-Value (TLV) or Interface Status TLV: MEP Down.
`defRemoteCCM`	3: At least one of the remote MEP state machines is not receiving valid CCMs from its remote MEP.
`defErrorCCM`	4: One or more invalid CCMs has been received, and 3.5 times the CCMs' transmission interval has not yet expired.
`defXconCCM`	5: (highest): One or more cross-connect continuity check messages (CCMs) has been received, and 3.5 times at least one of those CCMs' transmission interval has not yet expired.

Default Value

defMACstatus

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-
creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe7
(config-ether-cfm-ma-mep)#mep lowest-priority-defect defRemoteCCM
```

message-period

Use this command to set the interval between loss or delay measurement OAM message transmission.

Use the no form of this command to set the interval between loss or delay measurement messages to its default value (1 second).

Command Syntax

Loss measurement:

```
message-period (1|2|3|4|5)
no message-period
```

Delay measurement:

```
message-period (1s|10s)
no message-period
```

Parameters

Loss measurement:

1	3 milliseconds
2	10 milliseconds
3	100 milliseconds
4	1 second
5	10 seconds

Delay measurement:

1s	1 second
10s	10 seconds

Default Value

1 second

Command Mode

Ethernet CFM loss measurement mode

Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

Loss measurement:

```
#configure terminal
(config)#ethernet cfm loss-measurement profile-name PROF1
(config-cfm-lm)#message-period 3
```

Delay measurement:

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)#message-period 10s
```

number-intervals-stored

Use this command to set the number of completed measurement intervals to store in the history statistic table for a two-way performance monitoring frame delay measurements on a specific MEP.

Use the no form to set the number of completed measurement intervals to store in the history statistic table for a two-way performance monitoring frame delay measurements on a specific MEP to its default (32).

Command Syntax

```
number-intervals-stored <2-1000>
no number-intervals-stored
```

Parameters

<2-1000>	Number of records to store in history

Default

32

Command Mode

Ethernet CFM delay measurement mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm delay-measurement profile-name PROF1
(config-cfm-dm)# number-intervals-stored 4
```

ping ethernet mac

Use this command to send a loopback message for a MAC address to a remote MEP for fault verification. Use either the `domain` or the `level` parameter with the `vlan` or `bridge` parameter to target a specific device.

Command Syntax

```
ping ethernet mac MACADDRESS unicast source MEPID (domain DOMAIN_NAME | level <0-
  7>) (vlan VLAN_ID | bridge <1-32> | vpws VCNAME)
```

Parameters

`MACADDRESS`	Destination MAC address in HHHH.HHHH.HHHH format
`MEPID`	Source host MEP ID <1-8191>
`DOMAIN_NAME`	Maintenance domain name of MEP
`<0-7>`	Level associated with the domain
`VLAN_ID`	Primary VLAN identifier <2-4094> of the MA
`<1-32>`	Bridge identifier
`VCNAME`	Virtual circuit name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#ping ethernet mac 0018.236e.5eb5 unicast source 201 domain 12345 vlan 10 bridge 1
success rate is  100 (5/5)

#ping ethernet mac 0018.236e.5eb5 unicast source 201 domain 12345 vpws ETH-2001
success rate is  100 (5/5)
```

rmep auto-discovery

Use this command to enable or disable whether MEPs are discovered automatically based on received CCMs (Continuity Checking Messages).

On disabling RMEP auto-discovery, a previously learned RMEP is removed.

Command Syntax

```
rmep auto-discovery enable|disable
```

Parameters

`enable`	Enable automatic RMEP discovery
`disable`	Disable automatic RMEP discovery

Default

disable

Command Mode

Ethernet CFM MA mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Examples

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#rmep auto-discovery enable
```

service ma-type

Use this command to create a service Maintenance Association (MA), with or without a VLAN, and enter Ethernet CFM MA mode

This command allows creation of a maintenance association for link-level MEPs (level 0) which do not listen on a VLAN.

A VID can be associated with an MA only at the time of MA creation. If an MA is created without a VID, a VID cannot be added to it during runtime because an MA without a VID is a link-level MA.

Use the no form of this command to remove an MA.

Command Syntax

```
service ma-type (string|integer|itu-t) ma-name MA_NAME (vlan VLAN_ID mip-creation
  (none|default|explicit|defer)
no service ma-name MA_NAME (vlan VLAN_ID mip-creation (none|default|explicit|defer)
```

Parameters

`ma-type`	Type of MA name (must match ethernet cfm domain-type `md-type` setting)
`string`	Character MA name. The `md-type` must be `character-string`.
`integer`	Integer MA name. The `md-type` must be `no-name`.
`itu-t`	ITU-T carrier code (ICC) format name defined by Y.1731.The `md-type` must be `integer`.
`MA_NAME`	MA name
`VLAN_ID`	Primary VLAN identifier <2-4094>
`mip-creation`	Maintenance domain Intermediate Point (MIP) creation permission for this domain
`none`	No MIP can be created for this VLAN identifier
`default`	MIP can be created if no lower active level or MEP at next lower active level
`explicit`	MEP is needed at the next lower active level
`defer`	Use the MIP creation permissions of the MD to which this MA belongs

Command Mode

Ethernet CFM mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7 mip-
creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10 xe7
(config-ether-cfm-ma-mep)#
```

show ethernet cfm ais reception-status

Use this command to display information about the AIS (Alarm Indication Signal) frames received on a MEP.

Command Syntax

```
show ethernet cfm ais reception-status mep MEPID domain DOMAIN_NAME (vlan VLAN_ID|)
  (bridge <1-32>|)
```

Parameters

MEPID	Source host MEP ID <1-8191>
DOMAIN_NAME	Maintenance domain name of MEP
VLAN_ID	Primary VLAN identifier <2-4094> of the MA
<1-32>	Bridge identifier

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm ais reception-status mep 100 domain 12345 vlan 10 bridge 1
AIS frame is currently being received by MEP id 100

#show ethernet cfm ais reception-status mep 100 domain 12345 vlan 10 bridge 1
No AIS frame is being received by MEP 100
```

show ethernet cfm delay-measurement mep

Use this command to display delay measurement statistics for a MEP both for current and history or individually.

Command Syntax

```
show ethernet cfm delay-measurement mep MEPID domain DOMAIN_NAME (vlan <2-4094> |
  bridge <1-32> | vpws VCNAME) ((current-stats|history-stats)
```

Parameters

MEPID	Local MEP identifier<1-8191>
DOMAIN_NAME	Maintenance domain name of MEP
<2-4094>	VLAN identifier <2-4094>
<1-32>	Bridge identifier
VCNAME	Virtual circuit name
current-stats	Current session DB statistics.
history-stats	History DB statistics.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm delay-measurement mep  123 domain no_name vlan 10 bridge 1
 MEP                    : 123
 MA                     : 200

Table 3-53 explains the output fields.

Table 3-53: show ethernet cfm dm sessions

Field	Description
MEP	Local Maintenance End Point identifier
MA	Maintenance Association name

Table 3-53: show ethernet cfm dm sessions

Field	Description
Vlan Id	Primary vlan identifier of MA
DM-Profile	delay measurement profile name
Peer MAC Address	Peer's MAC address
Measurement ID	Id of the current or history session for that particular measurement interval
Measurement Type	One way or two way DM
Elapsed time	Time still left to complete the measurement interval
Start time	Time when DM session started
Min frame delay	Minimum delay recorded
Max frame delay	Max delay recorded
Avg frame delay	Average delay calculated
Min Inter FD Variation	Minimum inter frame delay variation calculated
Max Inter FD Variation	Maximum inter frame delay variation calculated
Avg Inter FD Variation	Average inter frame delay variation calculated
FRAME DELAY BINS	Frame delay bin configuration
INTER-FRAME DELAY BINS	Inter frame delay bin configuration
Bin Number	Bin number for which the threshold and counter is configured
Bin Threshold	A bin's configured threshold value
Bin counter	The number of delays recorded in this range
RMEP Id	Peer's MEP Id
End time	The time when the Measurement Interval was completed.
MD	Maintenance domain name

show ethernet cfm delay-measurement profile

Use this command to display information about a specified delay measurement profile or all configured delay measurement profiles.

Command Syntax

```
show ethernet cfm delay-measurement profile (WORD|)
```

Parameters

WORD	Profile name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#sh ethernet cfm delay-measurement profile dmm
Profile Name: dmm
 Measurement-type     -  DMM
 Measurement-interval -  1
 Message-period       -  10s
 Number of intervals stored -  4
 Bins per FD Interval       -  4
 Bins per IFDV Interval     -  3

       Frame Delay Bins
 Bin Number       Bin Threshold
  1               0
  2               1
  3               4

    Inter-Frame Delay Bins
 Bin Number       Bin Threshold
  1               0
  2               5000
```

Table 3-54 explains the output fields.

Table 3-54: show ethernet cfm delay-measurement profile

Field	Description
Profile Name	Loss measurement profile name
Measurement-type	DM session is one way or two way

Table 3-54: show ethernet cfm delay-measurement profile

Field	Description
Measurement-interval	See measurement-interval
message-period	See message-period
Number of intervals stored	See number-intervals-stored
Bins per FD Interval	See bins-per-fd-interval
Bins per IFDV Interval	See bins-per-ifdv-interval
Frame Delay Bins	Number of Frame Delay bins configured
Inter-Frame Delay Bins	Number of Inter-Frame Delay bins configured
Bin number	See bin-type
Bin threshold	See bin-type

show ethernet cfm dm sessions

Use this command to display information about the delay measurement session.

Command Syntax

```
show ethernet cfm dm sessions
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm dm sessions
MEP-Id  Status  StartTime           DM-Profile   Mac-address    Repetition Period(sec)
------------------------------------------------------------------------------------
123    Active  2019/06/01 13:14:46  123        0018.236e.5eb5     60
```

Table 3-55 explains the output fields.

Table 3-55: show ethernet cfm dm sessions

Field	Description
MEP-Id	Local Maintenance End Point identifier
Status	Inactive: if delay measurement session is not started Active: if delay measurement session is started
StartTime	Time when delay measurement session is started
DM-Profile	delay measurement profile name
Mac-address	MAC address
Repetition Period	Repetition time between measurement intervals in seconds

show ethernet cfm errors

Use this command to verify the defects present in a MEP.

Command Syntax

```
show ethernet cfm errors domain DOMAIN_NAME (bridge <1-32>|vpws)
```

Parameters

DOMAIN_NAME	Maintenance domain name
<1-32>	Bridge identifier
vpws	VPWS instance.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm errors domain 12345 bridge 1
Domain Name      Level     Vlan      MEPID      Defects
-------------------------------------------------------
12345             7        10        100        .....

#show ethernet cfm errors level 7 bridge 1
Domain Name      Level     Vlan      MEPID      Defects
-------------------------------------------------------
12345             7        10        100        .....

#show ethernet cfm errors level 7 vpws
Domain Name         Level         MEPID     Defects
-----------------------------------------------
12345               7         200       .....
```

Table 3-56 explains the output fields

Table 3-56: show ethernet cfm errors

Field	Description
Domain Name	Maintenance Domain name
Level	MD Level
Vlan	Vlan identifier
MEPID	Maintenance End Point identifier
Defects	Defects in current MEP

show ethernet cfm frame-lm session

Use this command to display information about the frame loss measurement session.

Command Syntax

```
show ethernet cfm frame-lm session
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm frame-lm session
MEPID  Status  StartTime           Lm-profile   Mac-address    Repetition Period(sec)
--------------------------------------------------------------------------------
201    Active  2018/10/01 00:18:46  slm        0018.236e.5eb5     60
```

Table 3-57 explains the output fields.

Table 3-57: show ethernet cfm frame-lm session

Field	Description
MEPID	Maintenance End Point identifier
Status	Inactive: if loss measurement is not in progress Active: otherwise
StartTime	When loss measurement started
Lm-profile	Loss measurement profile name
Mac-address	MAC address
Repetition Period	Repetition time between measurement intervals in seconds

show ethernet cfm loss-measurement mep

Use this command to display frame loss measurement statistics for a MEP.

Command Syntax

```
show ethernet cfm loss-measurement mep MEPID domain DOMAIN_NAME (vlan <2-4094> |
  bridge <1-32> | vpws VCNAME)
```

Parameters

MEPID	Host MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name of MEP
<2-4094>	VLAN identifier <2-4094>1
<1-32>	Bridge identifier.
VCNAME	Virtual circuit name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm loss-measurement mep 201 domain 12345 vlan 10 bridge 1
MEP: 201 MA: 43982
CURRENT:
 Measurement ID : 3
  Measurement Type           : slm
  Elapsed time(sec)          : 51
  Start Time                 : 2018 Nov 19 22:37:31
  Near End loss              : 0
  Far End loss               : 0
  Near End accumulated loss  : 0
  Far End accumulated loss   : 0

HISTORY:

 Measurement ID : 1
  Measurement Type           : slm
  Elapsed time(sec)          : 60
  End Time                   : 2018 Nov 19 22:36:31
  Near End loss              : 0
  Far End loss               : 0
  Near End accumulated loss  : 0
  Far End accumulated loss   : 0

 Measurement ID : 2
  Measurement Type           : slm
```

```
Elapsed time(sec)          : 60
End Time                   : 2018 Nov 19 22:37:31
Near End loss              : 0
Far End loss               : 0
Near End accumulated loss  : 0
Far End accumulated loss   : 0
```

Table 3-58 explains the output fields.

Table 3-58: show ethernet cfm loss-measurement mep

Field	Description
MEP	Maintenance End Point identifier
MA	Maintenance Association name
CURRENT:	Current loss measurement statistics
HISTORY:	Historic loss measurement statistics
Measurement ID	Sequence number
Measurement Type	See measurement-type slm
Elapsed time	Elapsed time in seconds
Start Time	Start time
End Time	End time
Near End loss	Near end loss
Far End loss	Far end loss
Near End accumulated loss	Near end accumulated loss
Far End accumulated loss	Far end accumulated loss

show ethernet cfm loss-measurement profile

Use this command to display information about a given loss measurement profile or all loss measurement profiles.

Command Syntax

```
show ethernet cfm loss-measurement profile WORD
```

Parameters

WORD	Profile name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm loss-measurement profile slm
Profile Name:slm
 measurement-type     -  slm
 measurement-interval -  1
 intervals-stored     -  3
 message-period       -  1
```

Table 3-59 explains the output fields.

Table 3-59: show ethernet cfm loss-measurement profile

Field	Description
Profile Name	Loss measurement profile name
measurement-type	See measurement-type slm
measurement-interval	See measurement-interval
intervals-stored	See intervals-stored
message-period	See message-period

show ethernet cfm ma status

Use this command to display the connectivity status of Maintenance Associations (MAs) in a domain.

Command Syntax

```
show ethernet cfm ma status domain DOMAIN_NAME (vlan <2-4094>|)
  (mep <1-8191>| mep all|) ((bridge <1-32>|vpws))
```

Parameters

DOMAIN_NAME	Maintenance domain name
<2-4094>	VLAN identifier
mep	Host MEP
<1-8191>	Host MEP identifier
all	All host MEPs
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm ma status domain 12345 vlan 10 bridge 1
MA NAME        VLAN                  STATUS
-----------------------------------------
  43982          10                  Active

#show ethernet cfm ma status domain 12345 vpws

MA NAME                   STATUS
------------------------------
  43981                   Active
```

Table 3-60 explains the output fields.

Table 3-60: show ethernet cfm ma status

Field	Description
MA NAME	Maintenance Association name

Table 3-60: show ethernet cfm ma status (Continued)

Field	Description
VLAN	VLAN identifier
STATUS	Active: All connected MEPs in MA are receiving the CCM with no defect or alarm present Partially Active: One or more connected MEPs in MA is not receiving CCM or it is receiving CCM with defect or alarm present Not Active: None of the connected MEPS in MA are receiving CCM or it is receiving CCM with defect or alarm present

show ethernet cfm maintenance-points local mep

Use this command to display information about the Maintenance End Points (MEPs) on a local interface.

Command Syntax

```
show ethernet cfm maintenance-points local mep (interface IFNAME|domain
  DOMAIN_NAME|level <0-7>) ((bridge <1-32>|vpws)|)
```

Parameters

IFNAME	Interface name
DOMAIN_NAME	Maintenance domain name
<0-7>	Maintenance level
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm maintenance-point local mep level 7 bridge 1
MPID  Dir Lvl  VLAN  CC-Stat  HW-Status  CC-Intvl  MAC-Address    Def  Port  MD Name
------------------------------------------------------------------------------
100   Dn   7    10    Enable   Installed  100 ms   3c2c.99f0.b0c1  F    xe2   12345

#show ethernet cfm maintenance-points local mep domain 12345 bridge 1
MPID  Dir Lvl  VLAN  CC-Stat  HW-Status  CC-Intvl  MAC-Address    Def  Port  MD Name
------------------------------------------------------------------------------
100   Dn   7    10    Enable   Installed  100 ms   3c2c.99f0.b0c1  F    xe2   12345

#show ethernet cfm maintenance-points local mep level 7 vpws

MPID Dir Lvl CC-Stat HW-Status  CC-Intvl MAC-Address    Def Port  MD Name
------------------------------------------------------------------------
200  Up  7   Enable  Installed  3 ms     0018.23c8.f822 F   xe15  12345
```

Table 3-61 explains the output fields.

Table 3-61: show ethernet cfm maintenance-points local mep

Field	Description
MPID	MEP identifier
Dir	Up MEP or Down MEP

Table 3-61: show ethernet cfm maintenance-points local mep

Field	Description
Lvl	MD level
Vlan	VLAN identifier
CC-Stat	Whether continuity checking (CC) is enabled or disabled
HW-Status	Installed or pending to install in hardware
CC-Intvl	CCM Interval
MAC-Address	MAC address
Def	Defect present
Port	CFM interface
MD Name	MD name

show ethernet cfm maintenance-points local mip

Use this command to display information about the Maintenance Intermediate Points (MIPs) on a local interface.

Command Syntax

```
show ethernet cfm maintenance-points local mip (interface IFNAME|level <0-7>)
  (bridge <1-32>|)
```

Parameters

IFNAME	Interface name.
<0-7>	Maintenance level.
<1-32>	Bridge identifier.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm maintenance-points local mip level 7 bridge 1
Level  VID   Type  Port   MAC-Address
------------------------------------------------------
7      10    MIP   xe3   0018.23ea.da36
7      10    MIP   xe5   0018.23ea.da38
```

Table 3-62 explains the output fields.

Table 3-62: show ethernet cfm maintenance-points local mip

Field	Description
Level	MD level
VID	VLAN identifier
Type	MIP
Port	Interface name
MAC-Address	MAC address

show ethernet cfm maintenance-points remote

Use this command to display information about a remote MEP.

Command Syntax

```
show ethernet cfm maintenance-points remote (mpid MEP_ID|) (domain
  DOMAIN_NAME|level LEVEL_ID) (vlan VLAN_ID|) ((bridge <1-32>|vpws)|)
```

Parameters

MEP_ID	Remote MEP identifier <1-8191>
DOMAIN_NAME	Maintenance domain name
LEVEL_ID	Maintenance level <0-7>
VLAN_ID	VLAN identifier <2-4094>
<1-32>	Bridge identifier
vpws	VPWS instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm maintenance-points remote level 7 bridge 1
MEPID   RMEPID   LEVEL   VLAN    Rx CCM    RDI     PEER-MAC         TYPE
------------------------------------------------------------------------------
100     200        7      10       Yes    False   a82b.b579.fd2a   Configured

#show ethernet cfm maintenance-points remote domain 12345 bridge 1
MEPID   RMEPID   LEVEL   VLAN    Rx CCM    RDI     PEER-MAC         TYPE
------------------------------------------------------------------------------
100     200         7       10        Yes      False    a82b.b579.fd2a    Configured

#show ethernet cfm maintenance-points remote level 7 vpws
 MEPID     RMEPID     LEVEL     Rx CCM    RDI    PEER-MAC        TYPE
------------------------------------------------------------------------
 200       100        7         Yes       False  0018.236e.5ec2 Configured
```

Table 3-63 explains the output fields.

Table 3-63: show ethernet cfm maintenance-points remote

Field	Description
MEPID	MEP identifier
RMEPID	Remote MEP identifier
LEVEL	MD level

Table 3-63: show ethernet cfm maintenance-points remote

Field	Description
VLAN	VLAN identifier
Rx CCM	Yes if CCM receives, no if CCM doesn't receive.
RDI	Whether Remote Defect Indication (RDI) is on or off
PEER-MAC	Remote MEP mac address
TYPE	Configured or auto learned

show ethernet cfm statistics

Use this command to display CFM statistics: CCM sent and received, LBM sent and LBR received, LTM sent and LTR received.

Command Syntax

```
show ethernet cfm statistics mep MEPID domain DOMAIN_NAME vid VLANID
```

Parameters

MEPID	Host MEP identifier <1-8191>
DOMAIN_NAME	MD name
VLANID	Primary VLAN identifier

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show ethernet cfm statistics
Continuity Check Messages
   CCM Sent                : 168164
   CCM Received            : 165460

Loop Back Messages
   LBM Sent                : 5
   LBR Received(Valid)     : 5
   LBR Received(Bad msdu)  : 0
   LBR Received(Out-of-Seq): 0

Link Trace Messages
   LTM Sent                : 1
   LTR Sent                : 0
   LTR Received(Valid)     : 3
   LTR Received(unexpected): 0
```

Table 3-64 explains the output fields.

Table 3-64: show ethernet cfm statistics

Field	Description
Continuity Check Messages	
CCM Sent	Number of continuity check messsages (CCMs) sent
CCM Received	Number of CCMs received

Table 3-64: show ethernet cfm statistics

Field	Description
Loop Back Messages	
LBM Sent	Number of loopback messages (LBMs) sent
LBR Received(Valid)	Number of valid LBRs received
LBR Received(Bad msdu)	Number of LBRs received with bad MAC service data unit
LBR Received(Out-of-Seq)	Number of out-of-sequence LBRs received
Link Trace Messages	
LTM Sent	Number of link trace messages (LTMs) sent
LTR Received(Valid)	Number of link trace replies (LTRs) received
LTR Received(unexpected)	Number of unexpected LTRs received

show running-config cfm

Use this command to display CFM running configuration alone.

Command Syntax

```
show running-config cfm
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#show running-config cfm
ethernet cfm domain-type character-string domain-name 12345 level 7 mip-
creation none bridge 1
 service ma-type string ma-name 43982 vlan 10 mip-creation none
   ethernet cfm mep down mpid 201 active true local-vid 10 xe2
     cc multicast state enable
     exit-ether-ma-mep-mode
   mep crosscheck mpid 18
   cc  interval 1
   exit-ether-ma-mode
!
```

traceroute ethernet

Use this command to start traceroute messages on a remote MEP.

Command Syntax

```
traceroute ethernet MAC mepid MEPID (domain DOMAIN | level <0-7>) (vlan VLANID |
  bridge <1-32> | vpws VCNAME)
```

Parameters

MAC	MAC address of the remote MEP or MIP in HHHH.HHHH.HHHH format.
MEPID	Host MEP identifier <1-8191>.
DOMAIN	MD name of the destination MEP or MIP.
<0-7>	Maintenance level to which remote MEP or MIP belongs.
VLANID	Primary VLAN identifier to which the destination MEP or MIP is associated.<2-4096>.
<1-32>	Bridge identifier.
VCNAME	Virtual circuit name.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#traceroute ethernet 0018.236e.5eb8 mepid 201 domain 12345 vlan 10 bridge 1
MP Mac         Hops  Relay-action          Ingress/Egress  Ingress/Egress
action
0018.23ea.da36   1     RlyFDB                Ingress         IngOK
0018.23ea.da38   2     RlyFDB                Egress          EgrOK
0018.236e.5eb8   3     RlyHit                Ingress         IngOK

#traceroute ethernet 0018.236e.5eb8 mepid 201 domain 12345 vpws ETH-2001
MP Mac         Hops  Relay-action          Ingress/Egress  Ingress/Egress
action
0018.23ea.da36   1     RlyFDB                Ingress         IngOK
0018.23ea.da38   2     RlyFDB                Egress          EgrOK
0018.236e.5eb8   3     RlyHit                Ingress         IngOK
```

ethernet cfm test-signal profile-name

Use this command to create a test signal configuration profile associated with a specific MEP.

Use no form of this command to delete a test signal configuration profile.

Command Syntax

```
ethernet cfm test-signal profile-name WORD
no ethernet cfm test-signal profile-name WORD
```

Parameters

`profile-name`	Specify a profile-name
`WORD`	Specify the test signal profile name with max length of 64 characters

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm test-signal profile-name 123
(config-cfm-eth-tst)#

(config)#no ethernet cfm test-signal profile-name 123
```

test-signal mode

Use this command to enable an ETH test signal mode as generator or receiver or both.

Command Syntax

```
test-signal mode (generator|receiver|both)
```

Parameters

`generator`	The node will act as a ETH-TST frame generator
`receiver`	The node will act as a ETH-TST frame receiver
`both`	The node will act as both ETH-TST frame generator and receiver

Command Mode

Configure CFM ETH test mode

Default

The default test signal mode is receiver.

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm test-signal profile-name 123
(config-cfm-eth-tst)#test-signal mode generator
```

test-signal test-type

Use this command to configure an ETH test signal test type is service interrupting or not.

Use no form of this command to delete the configured ETH test signal test type.

Command Syntax

```
test-signal test-type (in-service|out-of-service)
no test-signal test-type
```

Parameters

`in-service`	This indicates the ETH-Test is in-service and normal client service traffic is not interrupted
`out-of-service`	This indicates the ETH-Test is out-of-service and normal client service traffic is not disrupted

Command Mode

Configure CFM ETH test mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm test-signal profile-name 123
(config-cfm-eth-tst)#test-signal test-type in-service

(config-cfm-eth-tst)#no test-signal test-type
```

test-signal frame-size

Use this command to configure an ETH test signal frame size which is applicable only for generator test signal mode.

Use no form of this command to delete the configured ETH test signal frame size.

Command Syntax

```
test-signal frame-size <68-9600>
no test-signal frame-size
```

Parameters

<68-9600>	Specify the frame size within the range

Command Mode

Configure CFM ETH test mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm test-signal profile-name 123
(config-cfm-eth-tst)#test-signal frame-size 124

(config-cfm-eth-tst)#no test-signal frame-size
```

test-signal pattern-type

Use this command to configure the TLV type to be encoded in ETH-Test PDU.

Use no form of this command to reset the TLV pattern type to default.

Command Syntax

```
test-signal pattern-type (null-sig|null-sig-crc32|prbs|prbs-crc32)
no test-signal pattern-type
```

Parameters

`null-sig`	Specify test pattern as a Null signal without CRC-32
`null-sig-crc32`	Specify test pattern as a Null signal with CRC-32
`prbs`	Specify test pattern as a PRBS 2^31-1 without CRC-32
`prbs-crc32`	Specify test pattern as a PRBS 2^31-1 with CRC-32

Command Mode

Configure CFM ETH test mode

Default

Default TLV pattern type is Null signal.

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm test-signal profile-name 123
(config-cfm-eth-tst)#test-signal pattern-type null-signal

(config-cfm-eth-tst)#no test-signal pattern-type
```

test-signal start-time

Use this command to start the ETH-Test session.

Command Syntax

```
test-signal start-time (relative START-TIME  | absolute START-TIME ) stop-time
  (relative STOP-TIME | absolute STOP-TIME) tst-profile-name WORD domain
  DOMAIN_NAME ma MA_NAME mep MEPID target (mac-address MAC|RMEPID) bridge <1-32>
```

Parameters

`start-time`	Specify Test session start time
`relative`	Specify Test session start time as relative
`absolute`	Specify Test session start time as absolute
`START-TIME`	Test session start time in minutes
`stop-time`	Specify Test session stop time
`STOP-TIME`	Test session stop time in minutes
`tst-profile-name`	
	Test session profile name
`WORD`	Specify test session profile name
`domain`	Specify domain
`DOMAIN_NAME`	The ID of maintenance domain of the MEP
`ma`	Specify ma
`MA_NAME`	The name of maintenance association name the MEP
`mep`	Specify mep
`MEPID`	Enter the MEPID ranging from <1-8191>
`target`	
`mac-address`	
`MAC`	
`RMEPID`	
`bridge <1-32>`	Specify the bridge ID

Command Mode

Exec mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#test-signal start-time relative 0 stop-time relative 30 tst-profile-name 123
domain 12345 ma 43982 mep 21 target mac-address 6cb9.c557.42d0 bridge 1
```

abort test-signal domain

Use this command to abort pre-configured test session.

Command Syntax

```
abort test-signal domain DOMAIN_NAME ma MA_NAME mep MEPID bridge <1-32>
```

Parameters

`domain`	Specify domain
`DOMAIN_NAME`	The ID of maintenance domain of the MEP
`ma`	Specify ma
`MA_NAME`	The name of maintenance association name the MEP
`mep`	Specify mep
`MEPID`	Enter the MEPID ranging from <1-8191>
`bridge <1-32>`	Specify the bridge ID

Command Mode

Exec mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#abort test-signal domain 12345 ma 43982 mep 21 bridge 1
```

show ethernet cfm test-signal profile

Use this command to display ETH-Test signal profile configuration.

Command Syntax

```
show ethernet cfm test-signal profile (WORD|)
```

Parameters

WORD	Specify the test signal profile name with max length of 64 characters

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ethernet cfm test-signal profile 123
  Profile Name      : 123
  Is Receiver       : False
  Is Generator      : True
  Test-Signal Type  : In-Service
  Frame Size(bytes) : 124
  Test Pattern Type : Null-Signal-Without-CRC-32
```

show ethernet cfm test-signal domain

Use this command to display ETH-Test receiver or generator statistics.

Command Syntax

```
show ethernet cfm test-signal domain DOMAIN_NAME ma MA_NAME mep MEPID bridge <1-32>
  stats (ctf|gtf)
```

Parameters

DOMAIN_NAME	The ID of maintenance domain of the MEP
ma	Specify ma
MA_NAME	The name of maintenance association name the MEP
mep	Specify mep
MEPID	Enter the MEPID ranging from <1-8191>
bridge 1	Bridge group name for bridging
stats	Display the statistics
ctf	Display ETH Test Frame Collector statistics
gtf	Display ETH Test Frame Generator statistics

Command Mode

Exec mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ethernet cfm test-signal domain 12345 ma 43982 mep 21 bridge 1 stats gtf
 TST Session status          : In-Progress
 Elapsed Time(sec)           : 36
 MD                          : 12345
 MA                          : 43982
 MEP                         : 21
 Peer MAC Address            : 6cb9.c557.42d0
 RMEP ID                     : 12
 Start Time                  : 2019 Mar 01 10:23:11
 Transmitted Packet Count    : 2854713
```

eth-lck state

Use this command to enable or disable ETH-Lock PDU transmission.

Command Syntax

```
eth-lck state (unlock|lock)
```

Parameters

`unlock`	Display ethernet lock PDU transmission
`lock`	Enable ethernet lock PDU transmission

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe2
(config-ether-cfm-ma-mep)#eth-lck state lock
```

eth-lck message

Use this command to set the PDU MD level.

Command Syntax

```
eth-lck message level <0-7>
no eth-lck message level
```

Parameters

<0-7>	Set the level of the MD PDU.

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe2
(config-ether-cfm-ma-mep)#eth-lck message level 2
```

eth-lck interval

Use this command to set/reset the PDU interval.

Command Syntax

```
eth-lck interval (1s|1m)
no eth-lck interval
```

Parameters

1s	Set the PDU interval in seconds.
1m	Set the PDU interval in minutes.

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe2
(config-ether-cfm-ma-mep)#eth-lck interval 1s
```

eth-lck frame priority

Use this command to set/reset the PDU frame priority.

Command Syntax

```
eth-lck frame priority <0-7>
no eth-lck frame priority
```

Parameters

<0-7>	Set the PDU priority range.

Command Mode

Ethernet CFM MA MEP mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#configure terminal
(config)#ethernet cfm domain-type character-string domain-name 12345 level 7
mip-creation none bridge 1
(config-ether-cfm)#service ma-type string ma-name 43982 vlan 10 mip-creation
none
(config-ether-cfm-ma)#ethernet cfm mep down mpid 201 active true local-vid 10
xe2
(config-ether-cfm-ma-mep)#eth-lck frame priority 3
```

show ethernet cfm lck statistics

Use this command to display a CFM lock statistics for a MEP.

Command Syntax

```
show ethernet cfm lck statistics mep MEPID domain DOMAIN_NAME (bridge <1-32>)
```

Parameters

`domain`	Specify domain
`DOMAIN_NAME`	The ID of maintenance domain of the MEP
`mep`	Specify mep
`MEPID`	Enter the MEPID ranging from <1-8191>
`bridge <1-32>`	Specify the bridge ID

Command Mode

Exec mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ethernet cfm lck statistics mep 151 domain 12345 bridge 1
MPID MD Name MA Name Lck State Rx Status Tx Rx
-----------------------------------------------
151  12345   200     True      False     7  0
```

show ethernet cfm lck details domain

Use this command to display a CFM lock user configuration.

Command Syntax

```
show ethernet cfm lck details domain DOMAIN_NAME ma MA_NAME mep MEPID (bridge <1-
  32>)
```

Parameters

`domain`	Specify domain
`DOMAIN_NAME`	The ID of maintenance domain of the MEP
`ma`	Specify ma
`MA_NAME`	The name of maintenance association name the MEP
`mep`	Specify mep
`MEPID`	Enter the MEPID ranging from <1-8191>
`bridge <1-32>`	Specify the bridge ID

Command Mode

Exec mode

Default

None

Applicability

This command was introduced in OcNOS-SP version 4.0.

Example

```
#show ethernet cfm lck details domain 12345 ma 200 mep 151 bridge 1

Maintenance Domain              : 12345
Maintenance Association         : 200
MEP ID                          : 151
LCK PDU state                   : Locked
LCK Message Level               : 7
LCK PDU Interval                : 1 min
LCK PDU Priority                : 3
```

CHAPTER 4 G.8032 ERPS Version 2 Commands

This chapter contains the G.8032 (2012) Ethernet Ring Protection Switching (ERPS) version 2 commands.

bridge g8032 physical-ring

Use this command to create a physical ring and associate east and west interfaces with it. All ERP instances on this ring have the same east and west interfaces,

Use the no form of this command to delete a physical ring.

Command Syntax

```
bridge (<1-32> | backbone) g8032 physical-ring RINGNAME east-interface IFNAME
  west-interface IFNAME
no bridge (<1-32> | backbone) g8032 physical-ring RINGNAME
```

Parameters

bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.
physical-ring	Physical ring.
RINGNAME	Physical ring name (maximum 37 characters).
east-interface	East interface.
IFNAME	East interface name.
west-interface	West interface.
IFNAME	West interface name.

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#bridge 1 g8032 physical-ring ring1 east-interface eth1 west-interface
eth2
(config)#no bridge 1 g8032 physical-ring ring1 disable
```

enable revertive

Use this command to set the revertive behavior of the ring node.

Command Syntax

```
enable (revertive | non-revertive)
```

Parameters

`revertive`	Revertive behavior.
`non-revertive`	Non-revertive behavior.

Command Mode

G.8032 profile configure mode

Examples

```
(g8032-profile-config)#enable revertive
```

force-switch|manual-switch

Use this command to configure administrative commands.

Command Syntax

```
(((force-switch|manual-switch)(east-interface|west-interface))|clear)
```

Parameters

`force-switch`	Forcefully block a ring port.
`manual-switch`	Manually block a ring port.
`east-interface`	Apply command to east interface.
`west-interface`	Apply command to west interface.
`clear`	Cancel a command.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#force-switch east-interface
```

g8032 erp-instance

Use this command to create an ERP instance and change to G.8032 configure switch mode.

Use the no form of this command to delete an ERP instance.

Command Syntax

```
g8032 erp-instance INSTANCENAME bridge (<1-32> | backbone)
no g8032 erp-instance INSTANCENAME bridge (<1-32> | backbone)
```

Parameters

INSTANCENAME	Instance name (maximum 32 characters).
bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#g8032 erp-instance instance1 bridge 1
(g8032-config-switch)#
```

g8032 profile

Use this command to create a profile on a bridge and switch to G.8032 profile configure mode.

Use the no form of this command delete a profile on a bridge.

Command Syntax

```
g8032 profile PROFILENAME bridge (<1-32> | backbone)
no g8032 profile PROFILENAME bridge (<1-32> | backbone)
```

Parameters

PROFILENAME	Profile name (maximum 32 characters).
bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.

Command Mode

Configure mode

Examples

```
#configure terminal
(config)#g8032 profile profile123 bridge 1
(g8032-profile-config)#
```

level

Use this command to set the maintenance entity group (MEG) level (MEL) to carry in R-APS messages.

Command Syntax

```
level <0-7>
```

Parameters

<0-7>	Level.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#level 2
```

non-virtual-channel

Use this command to make a sub-ring function without a virtual channel.

Use the no form of this command to delete a non-virtual channel.

Command Syntax

```
non-virtual-channel
no non-virtual-channel
```

Parameters

None

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#non-virtual-channel
```

physical-ring

Use this command to associate the ERP instance to a physical ring.

Command Syntax

```
physical-ring RINGNAME
```

Parameters

RINGNAME	Physical ring name.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#physical-ring ring1
```

profile name

Use this command to associate the ERP instance to a profile.

Command Syntax

```
profile name PROFILENAME
```

Parameters

PROFILENAME	Profile name.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#profile prof_1
```

ring-id

Use this command to set the ring identifier.

Command Syntax

```
ring-id <1-255>
```

Parameters

<1-255>	Ring identifier.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#ring-id 1
```

rpl role

Use this command to set the RPL (Ring Protection Link) role of the ring node.

Command Syntax

```
rpl role ((owner | neighbor | next-neighbor)(east-interface | west-interface) |
  non-owner )
```

Parameters

`owner`	Ring node is the RPL owner.
`neighbor`	Ring node is neighbor to the RPL owner.
`next-neighbor`	Ring node is neighbor to the neighbor of the RPL owner.
`east-interface`	Role assigned to east interface.
`west-interface`	Role assigned to west interface.
`non-owner`	Ring node does not own the RPL.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#rpl role owner east-interface
```

show g8032 erp-instance

Use this command to display details about an ERP instance.

Command Syntax

```
show g8032 erp-instance INSTANCENAME bridge (<1-32>|backbone)
```

Parameters

INSTANCENAME	Instance name.
bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.

Command Mode

Configure mode

Example

```
(config)#show g8032 erp-instance instance1 bridge 1
Inst Name  : instance1
State      : G8032_ST_INIT
Phy Ring   : -
Role       : -
East Link  : -
West Link  : -
Attached   : -
Attached To: -
Virt Chan  : -
-------------------------------------------------------------

     Channel        |    Interface           |  Profile
 (LEVL, VID, RID)   | (east,ver), (west,ver) |
=========================================================
 (7, 4065, 135)     | (eth11,1),  (eth2,2)   | PROF1
=========================================================
Data Traffic: 1,2,3,10,12...
```

show g8032 physical-ring

Use this command to display details about a physical ring.

Command Syntax

```
show g8032 physical-ring RINGNAME bridge (<1-32>|backbone)
```

Parameters

RINGNAME	Ring name.
bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.

Command Mode

Configure mode

Examples

```
(config)#show g8032 physical-ring ring1 bridge1
Ring     : ring1
==========
Bridge   : 1
East     : eth1
West     : eth2
ERP Inst : inst1, inst2, inst3
```

show g8032 profile

Use this command to display details about a profile.

Command Syntax

```
show g8032 profile PROFILENAME bridge (<1-32>|backbone)
```

Parameters

PROFILENAME	Profile name.
bridge	Bridge.
<1-32>	Bridge identifier.
backbone	Backbone bridge.

Command Mode

Configure mode

Examples

```
(config)#show g8032 profile profile1 bridge 1
Profile : profile1
=========
 Wait-To-Restore : 5 mins
 Hold Off Timer  : 0 secs
 Guard Timer     : 500 ms
 Wait-To-Block   : 5500 ms
 Protection Type : Revertive
```

sub-ring

Use this command to make the ERP instance a sub-ring. You should only give this command on interconnection nodes.

Use the no form of this command to make the ERP instance a major ring.

Command Syntax

```
sub-ring block (east-interface|west-interface)
no sub-ring
```

Parameters

`east-interface`
: Block east interface.

`west-interface`
: Block west interface.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#sub-ring block east-interface
```

tcn-propogation

Use this command to enable or disable TCN (topology change notification) propagation for an interconnected ring.

Command Syntax

```
tcn-propogation (enable|disable)
```

Parameters

`enable`	Enable TCN propagation.
`disable`	Disable TCN propagation.

Command Mode

Configure mode

Examples

```
(config)#tcn-propogation enable
```

timer

Use this command to set timers.

Command Syntax

```
timer (wait-to-restore (<1-12>|default) | hold-off (<0-100>|default) | guard-timer
  (<1-200>|default))
```

Parameters

`wait-to-restore`	Wait-to-restore timer used to verify that a signal failure is not intermittent.
`<1-12>`	Timer value in minutes.
`default`	Default value of timer <5>.
`hold-off`	Hold-off timer used to filter intermittent link faults.
`<0-100>`	Timer value in a multiple of 100 milliseconds.
`default`	Default value of timer <0>.
`guard-timer`	Guard timer that blocks latent outdated messages from causing unnecessary state changes.
`<1-200>`	Timer value in a multiple of 10 milliseconds.
`default`	Default value of timer <50>.

Command Mode

G.8032 profile configure mode

Examples

```
(g8032-profile-config)#timer wait-to-restore 7
(g8032-profile-config)#timer hold-off 50
(g8032-profile-config)#timer guard-timer 30
```

version

Use this command to set the version to carry in R-APS messages for an interface.

Command Syntax

```
version <0-1> (east-interface | west-interface)
```

Parameters

`<0-1>`	Version:
`0`	ITU-T Recommendation G.8032/Y.1344 2008
`1`	ITU-T Recommendation G.8032/Y.1344 2012
`east-interface`	Assigned to east interface.
`west-interface`	Assigned to west interface.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#version 1 east-interface
```

virtual-channel

Use this command on a sub-ring to attach it to a major instance.

Use the no form of this command to delete a virtual channel.

Command Syntax

```
virtual-channel (<2-4094>|) attached-to-instance INSTANCENAME
no virtual-channel
```

Parameters

`<2-4094>`	VLAN identifier.
`INSTANCENAME`	Major instance name.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#virtual-channel 3 attached-to-instance inst1
```

vlan

Use this command to add a VLAN to the ERP instance and set its type.

Use the no forms of this command to disassociate a VLAN from the ERP instance.

Command Syntax

```
vlan <2-4094> (raps-channel | data-traffic)
no raps-channel
no data-traffic <2-4094>
```

Parameters

`<2-4094>`	VLAN identifier.
`raps-channel`	Direct R-APS traffic on this VLAN.
`data-traffic`	Direct data traffic on this VLAN.

Command Mode

G.8032 configure switch mode

Examples

```
(g8032-config-switch)#vlan 3 raps-channel
```

SECTION 9

Trigger Fail-Over

Trigger Failover Configuration Guide

Contents

This document contains this chapter:

CHAPTER 1 Trigger Failover Configuration

This chapter contains Trigger Failover (TFO) configuration examples.

This example shows the complete configuration to enable TFO in a simple network topology. TFO complements NIC teaming functionality supported on blade servers. TFO allows a switch module to monitor specific uplink ports to detect link failures. When the switch module detects a link failure, it disables the corresponding downlink ports automatically.

TFO uses these components:

- A Fail Over Group (FOG) contains a Monitor Port Group (MPG) and a Control Port Group (CPG).
- An MPG contains only uplink ports.
- A CPG contains only downlink ports.

Note:

- TFO is supported in STP or RSTP bridge mode.
- TFO can be configured on a LAG interface.

Basic Configuration

Figure 1-94: Basic topology

Switch

`#configure terminal`	Enter configure mode.
`(config)#tfo enable`	Enable TFO globally.
`(config)#fog 1 enable`	Create a Fail over group (FOG) and enable it.
`(config)#interface xe35`	Enter interface mode
`(config-if)#link-type uplink`	Specify the link-type as Uplink.
`(config-if)#fog 1 type mpg`	Specify the MPG member for FOG 1.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe34`	Enter interface mode
`(config-if)#link-type downlink`	Specify the link-type as Downlink.
`(config-if)#fog 1 type cpg`	Specify the CPG member for FOG 1.
`(config-if)#end`	Exit interface and configure mode

Validation

```
#show tfo

TFO : Enable

Failover Group 1 : Enable
```

```
No. of links to trigger failover : 0
MPG Port : xe35
CPG Port : xe34
No. of times MPG link failure : 1
No. of times MPG link recovered : 0
No. of times CPG got auto disabled : 1
No. of times CPG got auto enable : 0
#
```

Port-Channel Configuration

Topology

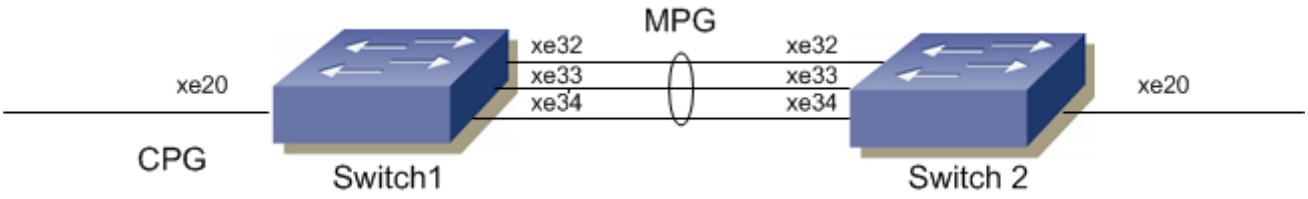

Figure 1-95: TFO with port-channel

Switch 1

`#configure terminal`	Enter configure mode.
`(config)#tfo enable`	Enable TFO globally.
`(config)#fog 1 enable`	Create a Fail over group (FOG) and enable it.
`(config)#interface po1`	Enter interface mode
`(config-if)#switchport`	Make the interface Layer2.
`(config-if)#exit`	Exit interface mode
`(config)#interface xe32`	Enter interface mode
`(config-if)#switchport`	Make the interface Layer2.
`(config-if)#link-type uplink`	Specify the link-type as Uplink.
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe33`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2.
`(config-if)#link-type uplink`	Specify the link-type as Uplink.
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode
`(config)#interface xe34`	Enter interface mode
`(config-if)#switchport`	Make the interface as Layer2.
`(config-if)#link-type uplink`	Specify the link-type as Uplink.
`(config-if)#channel-group 1 mode active`	Specify the channel group in interface
`(config-if)#exit`	Exit interface mode

(config)#interface xe20	Enter interface mode
(config-if)#link-type downlink	Specify the link-type as Downlink.
(config-if)#fog 1 type cpg	Specify the CPG member for FOG 1
(config-if)#exit	Exit interface mode
(config)#interface po1	Enter port-channel mode
(config-if)#link-type uplink	Specify the link-type as Uplink.
(config-if)#fog 1 type mpg	Specify the MPG member for FOG 1.
(config-if)#end	Exit interface and configure mode

Switch 2

#configure terminal	Enter configure mode.
(config)#interface po1	Enter interface mode
(config-if)#switchport	Make the interface as Layer2.
(config-if)#exit	Exit interface mode
(config)#interface xe32	Enter interface mode
(config-if)#switchport	Make the interface as Layer2.
(config-if)#channel-group 1 mode active	Specify the channel group in interface
(config-if)#exit	Exit interface mode
(config)#interface xe33	Enter interface mode
(config-if)#switchport	Make the interface as Layer2.
(config-if)#channel-group 1 mode active	Specify the channel group in interface
(config-if)#exit	Exit interface mode
(config)#interface xe34	Enter interface mode
(config-if)#switchport	Make the interface as Layer2
(config-if)#channel-group 1 mode active	Specify the channel group in interface
(config-if)#exit	Exit interface mode

Validation

```
#show interface brief | include up
xe20        ETH   --    --                up      none    10g   --
xe32        ETH   --    --                up      none    10g   --

    No. of times CPG got auto enable : 0
```

Trigger Failover Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Trigger Failover Commands

This chapter describes the trigger failover (TFO) commands.

clear tfo counter

Use this command to clear the TFO counters. If you do not specify a parameter, this command clears counters for all FOG indexes.

Command Syntax

```
clear tfo counter
clear tfo counter fog <1-64>
```

Parameters

<1-64>	Clear counters for this Failover Group Index

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#clear tfo counter
```

fog

Use this command to:

- Create or delete a failover group (FOG)
- Enable or disable an exisitng FOG

Even if FOG index do not exit, FOG can be created as enabled with “enable” option in CLI.

If the FOG index already exists:

- When the FOG status is disabled and Control Port Group (CPG) links are previously disabled (because of TFO), then the links are enabled. If a particular CPG member belongs to multiple CPGs, then this CPG member is enabled only if all corresponding Monitor Port Groups (MPG) are enabled.
- When the FOG status is enabled and MPG is down, then the corresponding CPG links are disabled.

Use the `no` form of this command to delete a FOG.

Command Syntax

```
fog <1-64> (enable|disable)
no fog <1-64>
```

Parameters

`<1-64>`	Failover Group Index
`enable`	Enable Failover Group
`disable`	Disable Failover Group

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#fog 5 enable
```

fog tfc

Use this command to set the number of links to trigger failover for a Monitor Port Groups (MPG).

Command Syntax

```
fog <1-64> tfc <0-63>
```

Parameters

<1-64>	Failover Group index
<0-63>	Trigger failover count

Default

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#fog 5 tfc 7
```

fog type

Use this command to map upstream/downstream links in a FOG as a Monitor Port Group (MPG) or Control Port Group (CPG).

Use the no form of this command to unmap upstream/downstream links.

Command Syntax

```
fog <1-64> type (mpg|cpg)
no fog <1-64> type (mpg|cpg)
```

Parameters

<1-64>	Failover Group Index
mpg	Map the interface to an MPG
cpg	Map the interface to a CPG

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#interface eth1
(config-if)#fog 5 type mpg
```

link-type

Use this command to make a port an uplink or downlink.

Use the no form of this command to remove the configuration.

Command Syntax

```
link-type (uplink|downlink)
no link-type
```

Parameters

`uplink`	Make the port an uplink
`downlink`	Make the port a downlink

Default

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
#interface eth1
(config-if)#link-type downlink
```

show tfo

Use this command to display FOG configuration and statistics.

Command Syntax

```
show tfo
```

Parameters

None

Default

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show tfo

TFO : Enable

Failover Group 1 : Enable
No. of links to trigger failover : 0
MPG Port : xe1
CPG Port : xe18
No. of times MPG link failure : 0
No. of times MPG link recovered : 0
No. of times CPG got auto disabled : 0
No. of times CPG got auto enable : 0
```

Table 1-65 Explains the show command output fields.

Table 1-65: show tfo output fields

Field	Description
Failover Group	Enable the failover group.
No. of links to trigger failover	Number of links to trigger the failover group.
MPG Port	Details of the monitor port group.
CPG Port	Details of the control port group.

tfo

Use this command to enable or disable trigger failover (TFO). TFO can be enabled only if the bridge mode is STP or RSTP.

Command Syntax

```
tfo (enable|disable)
```

Parameters

`enable`	Enables Trigger failover
`disable`	Disables Trigger failover

Default

By default, TFO is disabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#tfo enable
```

SECTION 10 Virtual Router Redundancy Protocol

Virtual Router Redundancy Protocol Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 VRRP Configuration

This chapter provides an overview of Virtual Router Redundancy Protocol (VRRP) and its implementation with OcNOS. VRRP eliminates the risk of a single point of failure inherent in a static default routing environment. It specifies an election protocol that dynamically assigns responsibility for a virtual router to one of the VRRP routers on a LAN. One of the major advantages of VRRP is that it makes default path available without requiring configuration of dynamic routing on every end-host.

OcNOS only supports VRRP protocol version 3.

Terminology

Terms related to VRRP configuration are defined in the table below.

Backup Router	The VRRP router that is backing up an IP address. It assumes forwarding responsibility for the virtual IP address if the Master fails.
Critical IP	The IP address that a VRRP router sends/receives messages on for a particular session.
IP Address Owner	The VRRP Router that has the virtual router's IP address(es) as real interface address(es). This is the router that, when up, will respond to packets addressed to one of these IP addresses for ICMP pings, TCP connections, and so on
Master Router	The VRRP router that owns the IP address (i.e., is being backed up), and which is the default router for forwarding for that IP address.
Virtual IP	The IP address that is being backed up by a VRRP session.
Virtual Router	A router managed by VRRP that acts as a default router for hosts on a shared LAN. It consists of a Virtual Router Identifier and a set of associated IP addresses across a common LAN. A VRRP Router might backup one or more virtual routers.
VRRPv2 Router	A router running the Virtual Router Redundancy Protocol version 2. It might participate in one or more virtual routers.
VRRPv3 Router	A router running the Virtual Router Redundancy Protocol version 3. It might participate in one or more virtual routers.

VRRP Process

Typically, end hosts are connected to the enterprise network through a single router (first-hop router) that is in the same Local Area Network (LAN) segment. The most popular method of configuration is for the end hosts to configure statically this router as their default gateway. This minimizes configuration and processing overhead. As shown in Figure 1-96, the problem with this configuration is that it produces a single point of failure if this first-hop router fails.

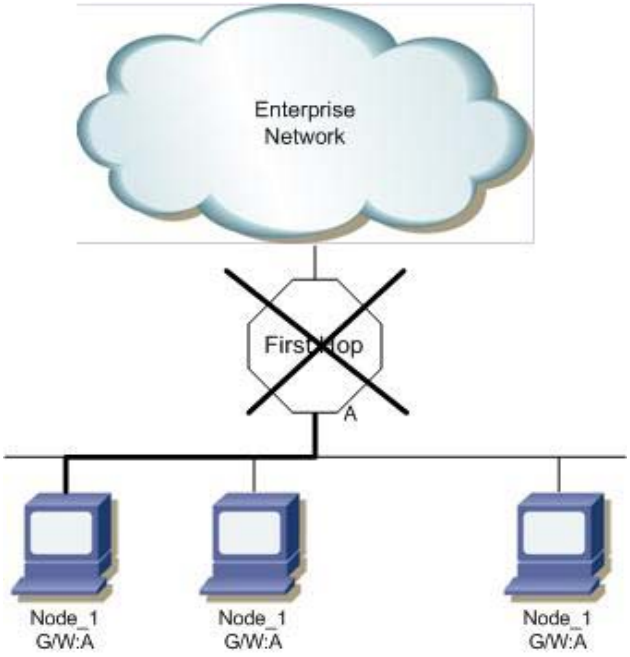

Figure 1-96: VRRP Process - First-Hop Not Reachable

The Virtual Router Redundancy Protocol attempts to solve this problem by introducing the concept of a virtual router, composed of two or more VRRP routers on the same subnet as shown in Figure 1-97. The concept of a virtual IP address is also introduced, which is the address that end hosts configure as their default gateway. One of the routers called the “Master” forwards packets on behalf of this IP address.

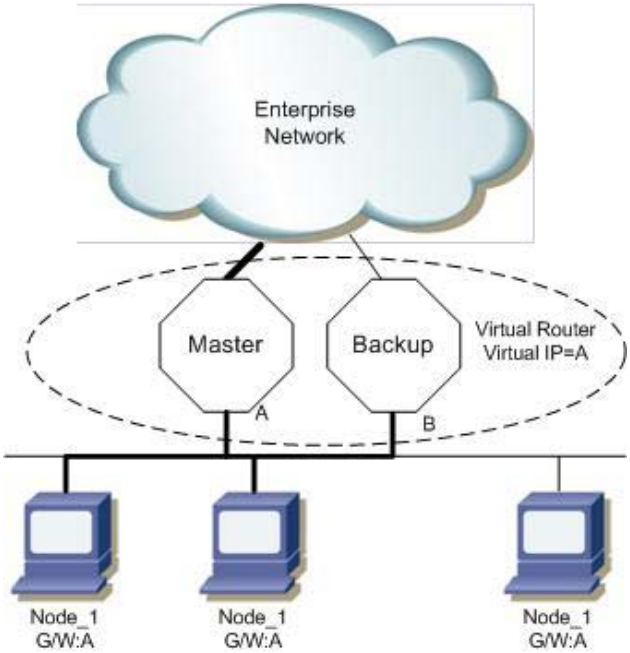

Figure 1-97: VRRP Process - Master and Backup VR

As shown in Figure 1-98, if the Master router fails, one of the other routers (Backup) assumes forwarding responsibility for it.

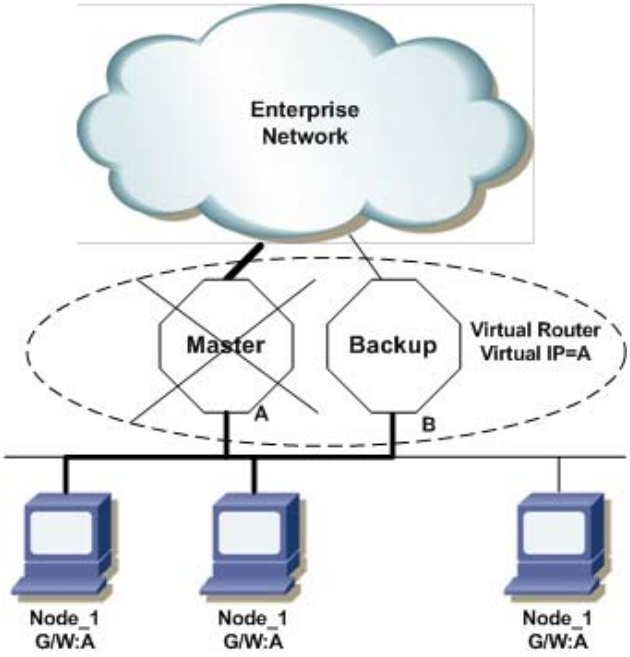

Figure 1-98: VRRP Process - Master Down and Backup Takeover

At first glance, the configuration in might not seem very useful, as it doubles the cost, and leaves one router idle at all times. This, however, can be avoided by creating two virtual routers and splitting the traffic between them.

Note: Adding a default route in the kernel on the interface that is used for VRRP might cause loss of network connectivity. According to the VRRP guidelines, when the VRRP session changes, the MAC address for the machine that attains the master state also changes. The change causes the default route from the kernel to disappear and leads to loss of connectivity. To avoid this situation, add the default route in the NSM and not in the kernel. This ensures that the default route remains on the machine across changes in the VRRP state.

To add default route through NSM, run the following command in NSM:

```
ip route 0.0.0.0/0 <IPADDRESS>
```

where `<IPADDRESS>` is the IP address of the default gateway.

One Virtual Router

In this configuration, the end-hosts install a default route to the IP address of virtual router 1(VRID = 1), and both routers R1 and R2 run VRRP. R1 is configured to be the Owner for virtual router 1 (VRID = 1) and R2 as a Backup for virtual router 1. If R1 fails, R2 will take over virtual router 1 and its IP addresses, and provide uninterrupted service for the hosts. Configuring only one virtual router doubles the cost, and leaves R2 idle at all times.

Topology

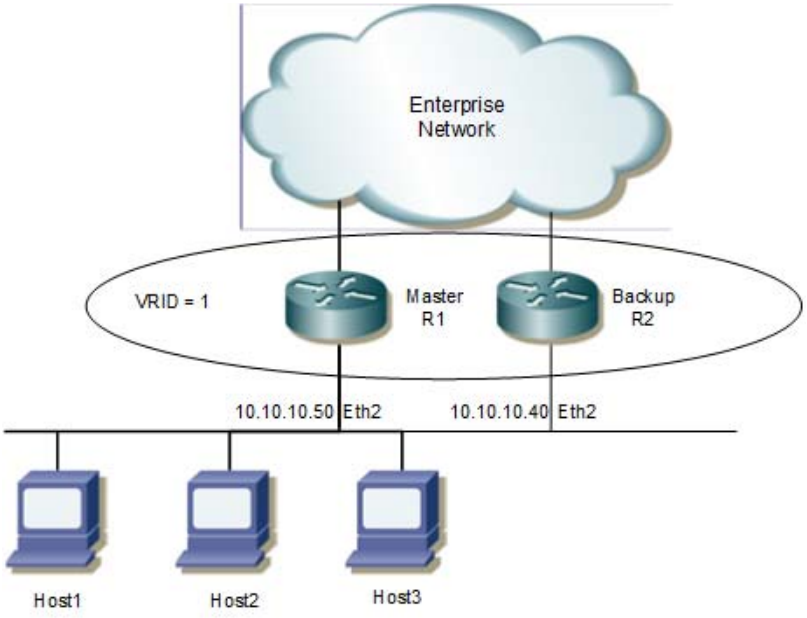

Figure 1-99: VRRP with One Virtual Router

R1

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.50 owner`	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP router within the virtual router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)#enable`	Enable the VRRP session on the router.

R2

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.50`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 200`	Configure the priority to 200 (less than 255), because R2 is the Backup router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)#enable`	Enable the VRRP session on the router.

Validation

R1

```
R1#sh vrrp

```

Two Virtual Routers

In the previous, one virtual router example, R2 is not backed up by R1. This example illustrates how to back up R2 by configuring a second virtual router. In this configuration, R1 and R2 are two virtual routers, and the hosts split their traffic between R1 and R2. R1and R2 functions as backups for each other.

Topology

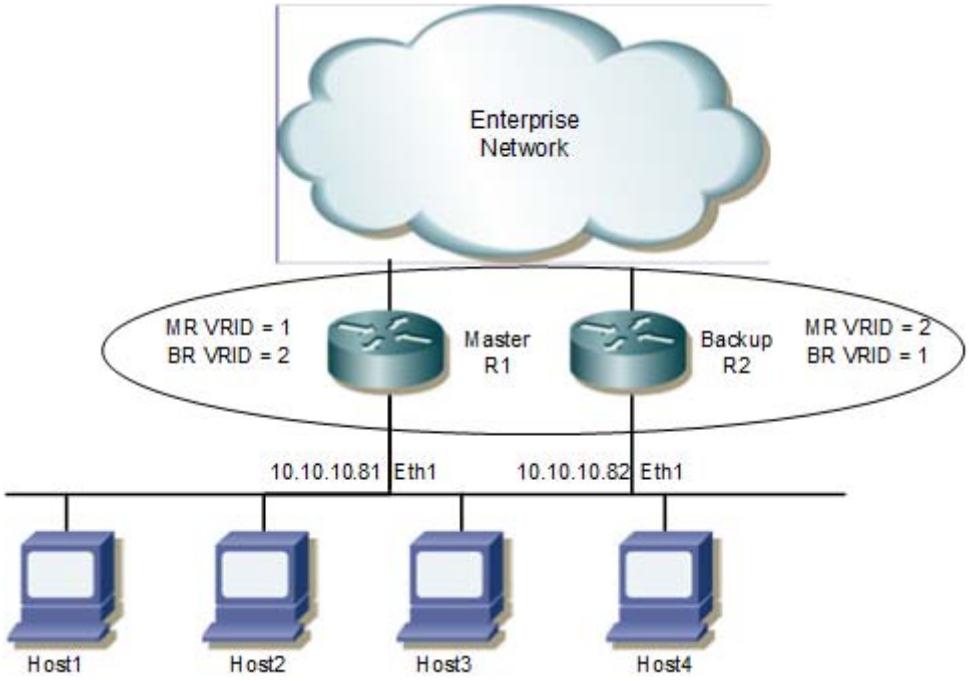

Figure 1-100: Configuring VRRP with Two Virtual Routers

R1

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth1`	Create a VRRP instance for interface eth1.
`(config-router)#virtual-ip 10.10.10.81 owner`	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP router within the virtual router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)#enable`	Enable the VRRP session 1 on the router.
`(config-router)#exit`	Exit `Router` mode and enter the `Configure` mode.

(config)#router vrrp 2 eth1	Create a VRRP instance for interface eth1.
(config-router)#virtual-ip 10.10.10.82	Set the virtual IP address for the VRRP session.
(config-router)#priority 200	Configure the priority to 200 (less than 255), because R2 is the Backup router.
(config-router)#preempt-mode true	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
(config-router)#advertisement-interval 100	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
(config-router)#enable	Enable the VRRP session two on the router.

R2

#configure terminal	Enter the Configure mode.
(config)#router vrrp 1 eth1	Create a VRRP instance for interface eth1.
(config-router)#virtual-ip 10.10.10.81	Set the virtual IP address for the VRRP session.
(config-router)#priority 200	Configure the priority to 200 (less than 255), because R2 is the Backup router.
(config-router)#preempt-mode true	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
(config-router)#advertisement-interval 100	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
(config-router)#enable	Enable the VRRP session 1 on the router.
(config-router)#exit	Exit the Router mode and enter the Configure mode.
(config)#router vrrp 2 eth1	Create a VRRP instance for interface eth1
(config-router)#virtual-ip 10.10.10.82 owner	Set the virtual IP address for the VRRP session. Define the default state (owner) of the VRRP router within the virtual router.
(config-router)#preempt-mode true	Set the preempt mode to specify that the highest priority will function as a backup to master when master is unavailable.
(config-router)#advertisement-interval 100	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
(config-router)#enable	Enable the VRRP session two on the router.

Validation

The following outputs on R1and R2 display the complete configuration for each session on R1 and R2. In session one, R1 is the master router, and in session two R2 is the master router.

R1

```

```

Two Backup Routers

In this configuration, Host B could be a gateway router. As such, interface eth1 on Routers R1, R2, and R3, and the gateway router, would run the IGP protocol.

Topology

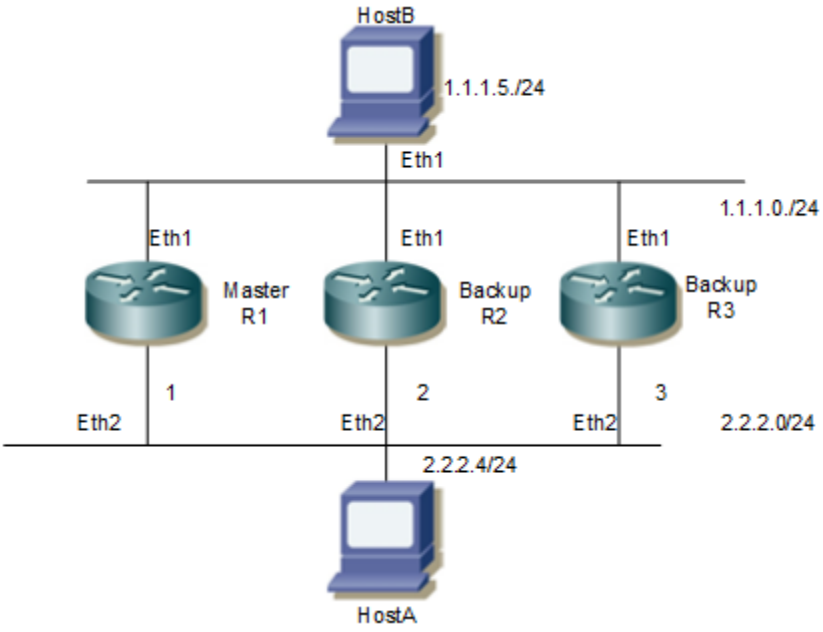

Figure 1-101: Configuring VRRP with Two Backup Routers

R1

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth2`	Enter interface mode for eth2.
`(config-if)#ip address 2.2.2.1/24`	Configure the IP address for interface eth2 to be in network 0.
`(config-if)#exit`	Exit interface mode.
`(config)#interface eth1`	Enter interface mode for eth1.
`(config-if)#ip address 1.1.1.1/24`	Configure the IP address for interface eth1 to be in network 1.
`(config-if)#exit`	Exit interface mode.
`(config)#router vrrp 1 eth2`	Create a VRRP instance for interface eth2.
`(config-router)#virtual-ip 2.2.2.1 owner`	Configure R1 as the owner.
`(config-router)#advertisement-interval 100`	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
`(config-router)#preempt-mode true`	Set `true` as the default value for the field.
`(config-router)#enable`	Enable the VRRP session on the router.
`(config-router)#exit`	Exit Router mode.

R2

`#configure terminal`	Enter the Configure mode.
`(config)#interface eth2`	Enter interface mode for eth2.

(config-if)#ip address 2.2.2.2/24	Configure the IP address for interface eth2 to be in network 0.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ip address 1.1.1.2/24	Configure the IP address for interface eth1 to be in network 1.
(config-if)#exit	Exit interface mode.
(config)#router vrrp 1 eth2	Create a VRRP instance for interface eth2.
(config-router)#virtual-ip 2.2.2.1	Configure R2 as the backup.
(config-router)#advertisement-interval 100	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
(config-router)#priority 100	Set the default value for the backup router.
(config-router)#preempt-mode true	Set true as the default value for the field.
(config-router)#enable	Enable the VRRP session on the router.
(config-router)#exit	Exit Router mode.

R3

#configure terminal	Enter the Configure mode.
(config)#interface eth2	Enter interface mode for eth2.
(config-if)#ip address 2.2.2.3/24	Configure the IP address for interface eth2 to be in network 0.
(config-if)#exit	Exit interface mode.
(config)#interface eth1	Enter interface mode for eth1.
(config-if)#ip address 1.1.1.3/24	Configure the IP address for interface eth1 to be in network 1.
(config-if)#exit	Exit interface mode.
(config)#router vrrp 1 eth2	Create a VRRP instance for interface eth2.
(config-router)#virtual-ip 2.2.2.1	Configure R3 as the backup.
(config-router)#advertisement-interval 100	Configure the default value for the advertisement interval. The configurable range is 5 to 4095 centi seconds (value must be a multiple of 5).
(config-router)#priority 254	Configure the priority for R3. The configurable range is 1-255.
(config-router)#preempt-mode true	Set true as the default value for the field.
(config-router)#enable	Enable the VRRP session on the router.
(config-router)#exit	Exit Router mode.

Validation

Router 1

```
R1#show vrrp
VRRP Version: 3
VMAC enabled
```

```
Backward Compatibility disabled

Address family IPv4
VRRP Id: 1 on interface: eth2

```

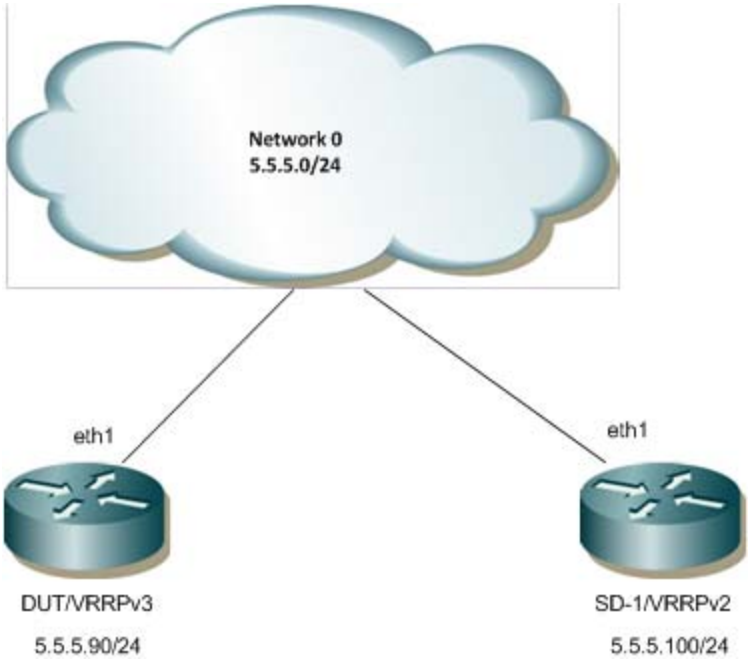
VRRP-Backward Compatibility

This section contains VRRP Backward Compatibility configuration examples.

The backward compatibility feature which implements version 3 of VRRP protocol recognizes the presence of VRRP version 2 compatible routers in the network and performs all operations normally. This support is intended for upgrade scenarios and is not recommended for permanent deployments. This should only occur when a router is transitioning from VRRPv2 to VRRPv3.

VRRP Backward Compatibility is applicable only for VRRP IPv4.

Topology



DUT

`#configure terminal`	Enter the Configure mode.
`(config)# interface eth1`	Enter Interface configuration mode.
`(config-if)# ip address 5.5.5.90/24`	Configure IP address on the interface.
`(config-if)#end`	Exit from configuration mode.
`#configure terminal`	Enter Configuration mode.
`(config)# router vrrp 1 eth1`	Configure VRRP on DUT with Virtual router Identifier as 1 on the interface eth1.
`(config-router)#virtual-ip 5.5.5.190`	Configure Virtual-IP address as the interface IP address of Owner which is not actually present in the LAN.
`(config-router)#enable`	Enable VRRP session on DUT.
`(config-router)#end`	Exit router VRRP mode.
`#configure terminal`	Enter Configuration mode.
`(config)#vrrp compatible-v2 enable`	Enable VRRP-Backward compatibility feature on a VRRPv3 running router.

SD-1

`#configure terminal`	Enter the Configure mode.
`(config)# interface eth1`	Enter Interface configuration mode.
`(config-if)# ip address 5.5.5.100/24`	Configure IP address on the interface.
`(config-if)#end`	Exit from configuration mode.
`#configure terminal`	Enter Configuration mode.

(config)#router vrrp 1 eth1	Configure VRRP on DUT with Virtual router Identifier as 1 on the interface eth1.
(config-router)#virtual-ip 5.5.5.190	Configure Virtual-IP address as the interface IP address of Owner which is not actually present in the LAN.
(config-router)#enable	Enable VRRP session on DUT.
(config-router)#end	Exit router VRRP mode.

Redundancy Using VRRP and OSPF: Two Virtual Routers

This example illustrates a configuration of two routers between two end-hosts. R1 and R2 are two virtual routers functioning as backups for each other, with VRRP running on the 10.10.12.0/24 network (LAN), and OSPF running on the 10.10.10.0/24 network (ISP).

Topology

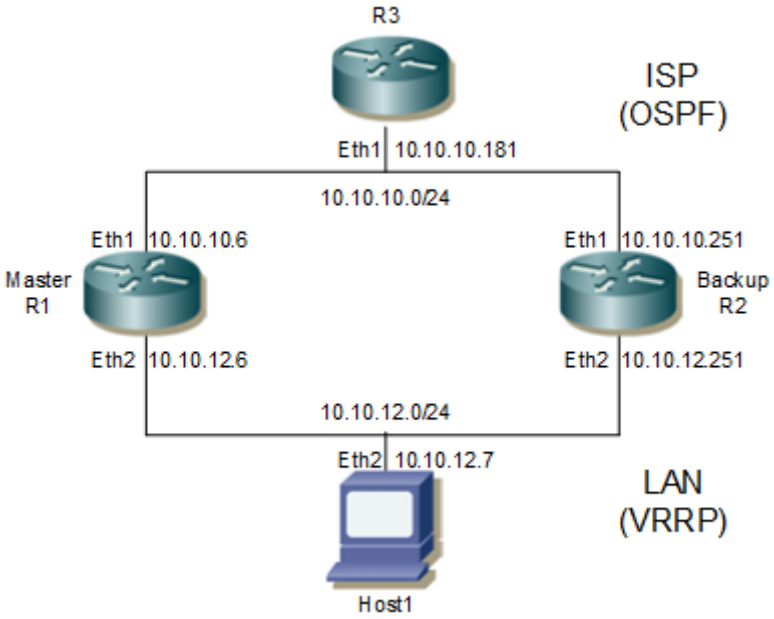

Figure 1-102: Redundancy Using VRRP and OSPF

In Figure 1-102:

- R3 is an OSPF router representing an OSPF network to an ISP.
- R1 is the VRRP Master/OSPF router.
- R2 is the VRRP Backup/OSPF router.
- Host 1 is an end-host.

VRRP handles any failure of the Master's link to the LAN. Failures in the OSPF network that could cause the Master to lose routing information would cause packets from Host 1 that are targeted for R3 to be dropped. Running VRRP on the OSPF network to create redundancy is undesirable, because doing so would cause erroneous VRRP packets to be sent to the ISP.

An alternative method to achieve redundancy is to run OSPF on the LAN side. By running OSPF on the LAN, any routing information lost by the Master would be regained from the Backup on the LAN interface, resulting in ICMP redirects to R2 for traffic received from Host 1. To reduce OSPF control traffic, R1 and R2 are configured as Area Border Routers (ABR), and the LAN is configured as a stub network to reduce LSA advertisement traffic on the LAN. Before enabling OSPF on the LAN, verify that VRRP is running with R1 as the Master and R2 as the Backup.

```
R1#show vrrp
 VrId <1>
```

```
 State is Master
 Virtual IP is 10.10.12.6 (IP owner)
 Interface is eth1
 Priority is 255
 Advertisement interval: 5 centi sec
 Preempt mode is TRUE
R2#show vrrp
 VrId <1>
  State is Backup
  Virtual IP is 10.10.12.6 (Not IP owner)
  Interface is eth1
  Priority is 100
  Advertisement interval: 5 centi sec
  Preempt mode is TRUE
```

Steps to configure OSPF on the LAN are given below.

R3

`#configure terminal`	Enter the Configure mode.
`(config)#router ospf 1`	Configure the routing process and specify the process ID (1). The process ID should be a unique integer.
`(config-router)#ospf router-id 10.10.10.181`	Specify the OSPF router ID.
`(config-router)#timers spf exp 0 0`	Set `timers` to minimum time for quick convergence.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (0).

R1

`#configure terminal`	Enter the Configure mode.
`(config)#router ospf 1`	Configure the routing process and specify the process ID (1). The process ID should be a unique integer.
`(config-router)#ospf router-id 10.10.12.6`	Specify the OSPF router ID.
`(config-router)#area 1 stub`	Define area 1 as a stub network.
`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (0).
`(config-router)#network 10.10.12.0/24 area 1`	Define the other interface (`10.10.12.0/24`) on which OSPF runs and associate the area ID (1)

R2

`#configure terminal`	Enter the Configure mode.
`(config)#router ospf 1`	Configure the routing process, and specify the process ID (1). The process ID should be a unique integer
`(config-router)#ospf router-id 10.10.12.251`	Specify the OSPF router ID.
`(config-router)#area 1 stub`	Define area 1 as a stub network.

`(config-router)#network 10.10.10.0/24 area 0`	Define one interface (`10.10.10.0/24`) on which OSPF runs and associate the area ID (`0`).
`(config-router)#network 10.10.12.0/24 area 1`	Define the other interface (`10.12.10.0/24`) on which OSPF runs and associate the area ID (`1`)

Verification

1. Set gateway on the end-host (statically):

```
(root@host1)#route add -net 10.10.10.0 netmask 255.255.255.0 gw 10.10.12.6
```

2. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.835 ms 0.350 ms 0.341 ms
2 10.10.10.181 (10.10.10.181) 9.557 ms 0.572 ms 0.545 ms
```

3. Bring down eth2 of R1:

```
[root@r1 sbin]#ifconfig eth2 down
```

4. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.461 ms 0.352 ms 0.334 ms
2 10.10.12.251 (10.10.12.251) 0.425 ms 0.432 ms 0.410 ms
3 10.10.10.181 (10.10.10.181) 0.691 ms 0.639 ms 0.607 ms
```

5. Bring up eth2 of R1:

```
[root@r1 sbin]#ifconfig eth2 up
```

6. Verify end-host reachability via traceroute:

```
(root@host1)#traceroute 10.10.10.181
traceroute to 10.10.10.181 (10.10.10.181), 30 hops max, 38 byte packets
1 10.10.12.6 (10.10.12.6) 0.457 ms 0.356 ms 0.443 ms
2 10.10.10.181 (10.10.10.181) 0.698 ms 0.642 ms 0.618 ms
```

VRRP Over MLAG

This section contains VRRP over MLAG configuration examples.

In this configuration TOR1 and TOR2 forms the VRRP master/backup relationship over MLAG interface.

Topology

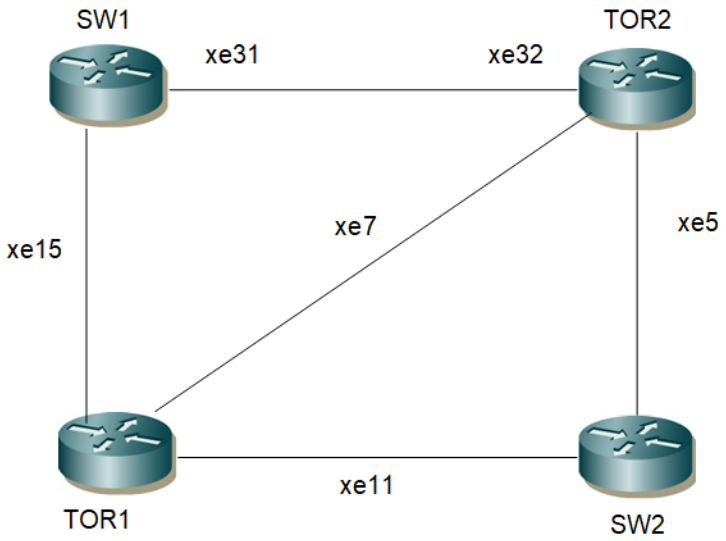

Figure 1-103: VRRP over MLAG

SW1

`#config terminal`	Enter the Configure mode.
`(config)#hostname SW1`	Assign the hostname for the router.
`SW1(config)# bridge 1 protocol rstp vlan-bridge`	Create bridge
`SW1(config)#vlan database`	Enter to VLAN database
`SW1(config-vlan)#vlan 2-1002 bridge 1 state enable`	Create VLANs
`SW1(config-vlan)#exit`	Exit the VLAN database mode
`SW1(config)# int po1`	Enter the interface mode
`SW1(config-if)#switchport`	Configure the interface as Layer 2
`SW1(config-if)# bridge-group 1`	Assign the bridge to the interface.
`SW1(config-if)#switchport mode trunk`	Configure the interface as trunk mode
`SW1(config-if)#switchport trunk allowed vlan all`	Configure the interface to allow all VLAN IDs
`SW1(config-if)#exit`	Exit the interface mode
`SW1(config)# int xe15`	Enter the interface mode
`SW1(config-if)# channel-group 1 mode active`	Add the interface as member of LAG interface

SW1(config-if)# int xe31	Enter the interface mode
SW1(config-if)# channel-group 1 mode active	Add the interface as member of LAG interface
SW1(config-if)# int xe36	Enter the interface mode
SW1(config-if)#switchport	Configure the interface as Layer 2
SW1(config-if)# bridge-group 1	Assign the bridge to the interface.
SW1(config-if)#switchport mode trunk	Configure the interface as trunk mode
SW1(config-if)#switchport trunk allowed vlan all	Configure the interface to allow all VLAN IDs
SW1(config-if)#exit	Exit the interface mode

TOR1

#config terminal	Enter the Config terminal
(config)#hostname TOR1	Assign the hostname to the router
TOR1(config)# bridge 1 protocol rstp vlan-bridge	Configure the bridge
TOR1(config)#vlan database	Enter the VLAN database
TOR1(config-vlan)#vlan 2-1002 bridge 1 state enable	Configure VLANs
TOR1(config-vlan)#exit	Exit the VLAN database
TOR1(config)# int po1	Enter the interface mode
TOR1(config-if)#switchport	Configure the interface as L2
TOR1(config-if)# bridge-group 1	Assign the bridge to the interface
TOR1(config-if)#switchport mode trunk	Configure the interface as trunk mode
TOR1(config-if)#switchport trunk allowed vlan all	Configure to allow all the VLANs
TOR1(config-if)#exit	Exit the interface mode
TOR1(config)# int xe15	Enter the interface mode
TOR1(config-if)# channel-group 1 mode active	Assign the interface as member of LAG interface
TOR1(config-if)#exit	Exit the interface mode
TOR1(config)#mcec domain configuration	Enter the MCEC mode
TOR1(config-mcec-domain)#domain-system-number 1	Assign the domain system number for MLAG interface.
TOR1(config-mcec-domain)#domain-address 1111.2222.3333	Assign the domain address
TOR1(config-mcec-domain)#domain-hello-timeout short	Assign the domain hello timeout
TOR1(config-mcec-domain)#intra-domain-link xe7	Assign the interface as IDL
TOR1(config-mcec-domain)#exit	Exit the MCEC domain
TOR1(config)#interface lo	Enter the interface mode
TOR1(config-if)#ip add 1.1.1.1/32 secondary	Create the MLAG interface.
TOR1(config-if)#int xe11	Exit the interface mode
TOR1(config-if)#ip add 20.20.20.1/24	Enter the interface mode

TOR1(config-if)#exit	Assign IP address to the interface
TOR1(config)#router ospf 100	Enter the interface mode
TOR1(config-router)#network 20.20.20.1/24 area 0	Assign IP address to the interface
TOR1(config-router)#network 1.1.1.1/32 area 0	Exit the interface mode
TOR1(config-router)#redistribute connected	Enter the OSPF router mode
TOR1(config-router)#exit	Add the network to the OSPF process
TOR1(config)#int po1	Add the network to the OSPF process
TOR1(config-if)#mlag 1	Redistribute the connected routes
TOR1(config-if)#exit	Exit the OSPF process
TOR1(config)#int vlan1.2	Enter interface mode
TOR1(config-if)#ip address 10.10.10.1/24	Assign IP address
TOR1(config-if)#exit	Exit the interface mode
TOR1(config)#router vrrp 1 vlan1.2	Create the VRRP process
TOR1(config-router)# virtual-ip 10.10.10.1 owner	Assign the virtual IP address to VRRP
TOR1(config-router)#enable	Enable the VRRP process
TOR1(config-router)#exit	Exit the VRRP mode
TOR1(config)#end	End the config terminal

TOR2

#config terminal	Enter the Config terminal
(config)#hostname TOR2	Assign the hostname to the router
TOR2(config)# bridge 1 protocol rstp vlan-bridge	Configure the bridge
TOR2(config)#vlan database	Enter the VLAN database
TOR2(config-vlan)#vlan 2-1002 bridge 1 state enable	Configure VLANs
TOR2(config-vlan)#exit	Exit the VLAN database
TOR2(config)# int po1	Enter the interface mode
TOR2(config-if)#switchport	Configure the interface as L2
TOR2(config-if)# bridge-group 1	Assign the bridge to the interface
TOR2(config-if)#switchport mode trunk	Configure the interface as trunk mode
TOR2(config-if)#switchport trunk allowed vlan add 2	Configure to add the VLAN 2 to the receiving packet.
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)# int xe32	Enter the interface mode
TOR2(config-if)# channel-group 1 mode active	Assign the interface as member of LAG interface
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#mcec domain configuration	Enter the MCEC mode
TOR2(config-mcec-domain)#domain-system-number 2	Assign the domain system number for MLAG interface.

TOR2(config-mcec-domain)#domain-address 1111.2222.3333	Assign the domain address
TOR2(config-mcec-domain)#domain-hello-timeout short	Assign the domain hello timeout
TOR2(config-mcec-domain)#intra-domain-link xe7	Assign the interface as IDL
TOR2(config-mcec-domain)#exit	Exit the MCEC domain
TOR2(config)# int po1	Enter the interface mode
TOR2(config-if)# mlag 1	Create the MLAG interface.
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#interface lo	Enter the interface mode
TOR2(config-if)#ip add 2.2.2.2/32 secondary	Assign IP address to the interface
TOR2(config-if)#int xe5	Enter the interface mode
TOR2(config-if)#ip add 30.30.30.1/24	Assign IP address to the interface
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#router ospf 100	Enter the OSPF router mode
TOR2(config-router)#network 30.30.30.1/24 area 0	Add the network to the OSPF process
TOR2(config-router)#network 2.2.2.2/32 area 0	Add the network to the OSPF process
TOR2(config-router)#redistribute connected	Redistribute the connected routes
TOR2(config-router)#exit	Exit the OSPF process
TOR2(config)#int vlan1.2	Enter interface mode
TOR2(config-if)#ip address 10.10.10.2/24	Assign IP address
TOR2(config-if)#exit	Exit the interface mode
TOR2(config)#router vrrp 1 vlan1.2	Create the VRRP process
TOR2(config-router)# virtual-ip 10.10.10.1	Assign the virtual IP address to VRRP
TOR2(config-router)#enable	Enable the VRRP process
TOR2(config-router)#exit	Exit the VRRP mode
TOR2(config)#end	End the config terminal

SW2

#config terminal	Enter the Config terminal
(config)#hostname SW2	Assign the hostname to the router
SW2(config)# bridge 1 protocol rstp vlan-bridge	Configure the bridge
SW2(config)#vlan database	Enter the VLAN database
SW2(config-vlan)#vlan 2-1002 bridge 1 state enable	Configure VLANs
SW2(config-vlan)#exit	Exit the VLAN database
SW2(config)# int xe11	Enter the interface mode
SW2(config-if)#ip address 20.20.20.2/24	Assign IP address to the interface
SW2(config-if)# int xe5	Enter the interface mode

SW2(config-if)#ip address 30.30.30.2/24	Assign IP address to the interface
SW2(config-if)# int xe46	Enter the interface mode
SW2(config-if)#ip address 40.40.40.1/24	Assign IP address to the interface
SW2(config-if)#int lo	Enter the interface mode
SW2(config-if)#ip add 3.3.3.3/32 secondary	Assign IP address to the interface
SW2(config-if)#int xe32	Enter the interface mode
SW2(config-if)#ip add 50.50.50.2/24	Assign IP address to the interface
SW2(config-if)#exit	Exit interface mode
SW2(config)# router ospf 100	Enter OSPF router
SW2(config-router)# network 3.3.3.3/32 area 0	Add the IP address to the OSPF process
SW2(config-router)# network 20.20.20.0/24 area 0	Add the IP address to the OSPF process
SW2(config-router)# network 30.30.30.0/24 area 0	Add the IP address to the OSPF process
SW2(config-router)#network 50.50.50.2/24 area 0	Add the IP address to the OSPF process
SW2(config-router)#exit	Exit the OSPF mode
SW2(config)#end	End the config mode.

CHAPTER 2 Interface Tracking

The need for VRRP Interface Tracking arose because VRRPv2 was unable to track the gateway interface status. The VRRP Interface Tracking feature provides dynamic failover of an entire circuit, in the event that one member of the group fails. It introduces the concept of a circuit, where two or more Virtual Routers on a single system can be grouped. In the event that a failure occurs, and one of the Virtual Routers performs the Master to Backup transition, the other Virtual Routers in the group are notified, and are forced into the Master to Backup transition, so that both incoming and outgoing packets are routed through the same gateway router, eliminating the problem for Firewall/NAT environments.

Note: Only 5 interfaces are supported in interface tracking for a VRRP session.

To configure VRRP Interface Tracking, each circuit is configured to have a corresponding priority-delta value, which is passed to VRRP when a failure occurs. The priority of each Virtual Router on the circuit is decremented by the priority-delta value, causing the VR Master to VR Backup transition.

In this example, two routers, R1 and R2, are configured as backup routers with different priorities. The priority-delta value is configured to be greater than the difference of both the priorities. R1 is configured to have a priority of 100, and R2 has a priority of 90. R1, with a greater priority, is the Virtual Router Master. The priority-delta value is 20, greater than 10 (100 minus 90). On R1, when the external interface `eth1` fails, the priority of R1 becomes 80 (100 minus 20). Since R2 has a greater priority (90) than R1, R2 becomes the VR Master, and routing of packages continues without interruption. When this VR Backup (R1) is up again, it regains its original priority (100), and becomes the VR Master again.

Topology

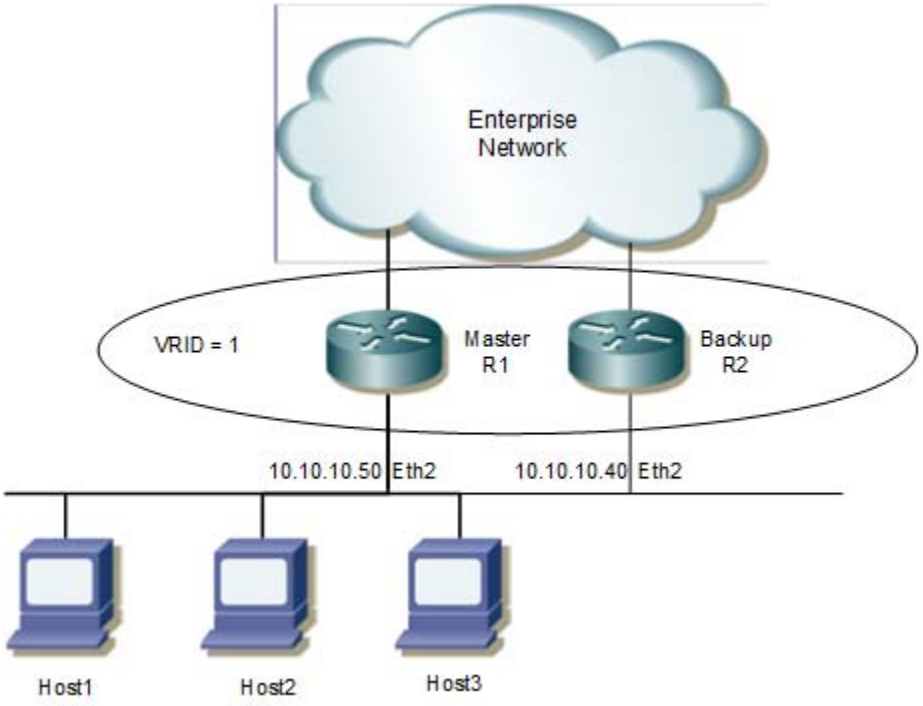

Figure 2-104: VRRP Interface Tracking

R1

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a new VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.1`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 100`	Configure the priority to 100.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will own the external ip address when there is a failure.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)#circuit-failover eth1 20`	Configure the priority-delta value to be 20. In case of failover, this priority-delta value is subtracted from the current VR Master.
`(config-router)#enable`	Enable the VRRP session on the router.

R2

`#configure terminal`	Enter the `Configure` mode.
`(config)#router vrrp 1 eth2`	Create a new VRRP instance for interface eth2.
`(config-router)#virtual-ip 10.10.10.1`	Set the virtual IP address for the VRRP session.
`(config-router)#priority 90`	Configure the priority to 90 (less than 100), because R2 is the VR Backup router.
`(config-router)#preempt-mode true`	Set the preempt mode to specify that the highest priority will function as a primary backup router in case of failure.
`(config-router)#advertisement-interval 100`	Configure the advertisement interval to 100 centi seconds (value must be a multiple of 5).
`(config-router)#enable`	Enable the VRRP session on the router.

show vrrp

Virtual Router Redundancy Protocol Command Reference

Contents

This document contains these chapters:

CHAPTER 1 VRRP Commands

This chapter describes the commands for VRRP.

accept-mode

Use this command to enable/disable accept mode for the session.

Controls whether a VRRP master node will accept/respond to packets addressed to the Virtual-IP address as its own address if it is not the Virtual-IP Owner.

Command Syntax

```
accept-mode true
accept-mode false
```

Parameter

`true`	The accept-mode for the session is enabled.
`false`	The accept-mode for the session is disabled.

Default

By default, accept-mode for the session is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to set and unset the accept-mode.

```
#configure terminal
(config)#router vrrp 2 eth2
(config-router)#accept-mode false

# configure terminal
(config)#router vrrp 2 eth2
(config-router)#accept-mode True
```

advertisement-interval

Use this command to configure the advertisement interval of a virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s). The master virtual router sends VRRP advertisements to other VRRP routers in the same group. The advertisements communicate the priority and state of the master virtual router. The VRRP advertisements are encapsulated in IP packets and sent to the multicast address assigned to the VRRP group (224.0.0.18). Advertisements are sent every second by default.

Note: Higher-priority master routers with slower transmission rates than their backup routers are unstable. This is because low-priority nodes configured to faster rates could come online and decide they should be masters before they have heard anything from the higher-priority master with a slower rate. When this happens, it is temporary: once the lower-priority node does hear from the higher-priority Mmaster, it will relinquish mastership.

Use the no parameter with this command to restore the default setting.

Command Syntax

```
advertisement-interval <5-4095>
no advertisement-interval
```

Parameter

<5-4095>	Specify the advertisement interval in centi-seconds (in multiples of 5) when VRRPv3 is enabled

Default

By default, advertisements are sent every second

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure an advertisement interval of 50 centi-seconds for the virtual router with VR ID 2 on interface eth0.

```
#configure terminal
(config)#router ip vrrp 2 eth0
(config-router)#advertisement-interval 50
```

circuit-failover

Use this command to enable the VRRP circuit failover feature.

Use the no parameter with this command to disable this feature.

Command Syntax

```
circuit-failover [IFNAME] |<1-253>
no circuit-failover [IFNAME] |<1-253>
```

Parameters

IFNAME	Specify an interface of the router that is monitored by the virtual router. This is usually an upstream interface. Should the interface go down, another router, configured as backup within the VRRP group, may take over as a master.
<1-253>	Specify the delta value. The value by which the virtual router decrements its priority value during a circuit failover event. Configure this value to be greater than the difference of priorities between the master and backup routers.

Default

By default, circuit failover feature is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to configure circuit failover for the VRRP session with VR ID 1. Interface eth1 is considered the monitored interface.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#circuit-failover eth1 30
```

debug vrrp

Use this command to specify debugging options for VRRP.

Use the no parameter with this command to disable debugging.

Command Syntax

```
debug vrrp (all|event|packet [send|recv|])
no debug vrrp (all|event|packet [send|recv|])
```

Parameters

all	Specify debugging options for all VRRP events.
event	Specify debugging options for VRRP event troubleshooting.
packet	Specify debugging options for VRRP packets
send	Specify the debug option set for sent packets.
recv	Specify the debug option set for received packets.

Command Mode

Configure mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to enable all VRRP debug options.

```
#configure terminal
(config)#debug vrrp all
```

The example below shows how to enable debugging options for VRRP events.

```
#configure terminal
(config)#debug vrrp events
```

The example below shows how to enable debug options for VRRP packets sent.

```
#configure terminal
(config)#debug vrrp packet send
```

The example below shows how to enable debug options for VRRP packets received.

```
#configure terminal
(config)#debug vrrp packet recv
```

disable

Use this command to disable a VRRP session on the router (to stop the router from participating in virtual routing). When this command is configured, a backup Router assumes the Role of Master depending on its priority.

Command Syntax

```
disable
```

Parameters

None

Default

By default, VRRP session on the router is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to disable a VRRP session.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#disable
```

enable

Use this command to enable a VRRP session on the router (to make it participate in virtual routing). To make any changes to the VRRP configuration, first disable the router from participating in virtual routing using the `disable` command.

Note: Configure the virtual IP address and define an interface for the VRRP session (using the `virtual-ip` and `interface` commands) before using this command.

Command Syntax

```
enable
```

Parameters

None

Default

By default, VRRP session on the router is disabled

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to enable a VRRP session with VR ID 1 on interface eth0.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#enable
```

ipv4-exclude-pseudo-header

Use this command to exclude the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP group in router mode to support IPv4 VRRPv3 interoperability.

Note: Use this command when checksum errors are observed with other vendors for VRRPv3.

Use the no form of this command to delete the VRRP IPv4 checksum pseudo-header exclude configuration from the VRRP group on the router.

Command Syntax

```
ipv4-exclude-pseudo-header
```

Parameter

None

Default

Disabled

Command Mode

Router mode

Applicability

This command was introduced in OcNOS-SP version 2.4.

Examples

```
#configure terminal
(config)#router vrrp 2 eth2
(config-router)#ipv4-exclude-pseudo-header

#configure terminal
(config)#router vrrp 2 eth2
(config-router)#no ipv4-exclude-pseudo-header
```

ip pim redundancy

Use this command to set the priority for which a router is elected as the designated router (DR).

Note: This command should be applied to the all related VRRP routers with identical priority values.

Command Syntax

```
ip pim redundancy <1-255> vrrp dr-priority <0-4294967294>
```

Parameter

`<1-255>`	VRRP virtual router identifier
`<0-4294967294>`	DR priority

Command Mode

Interface mode

Applicability

This command was introduced in OcNOS-SP version 4.0.

Examples

```
OcNOS(config-if)#ip pim redundancy 1 vrrp dr-priority 900
OcNOS(config-if)#
```

operational-ip

Use this command to set the primary IPv4 address.

Use the no parameter with this command to remove a primary IPv4 address.

Command Syntax

```
operational-ip A.B.C.D
no operational-ip
```

Parameters

A.B.C.D	IPv4 address.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#operational-ip 1.2.3.4
```

preempt-mode

Use this command to configure preempt mode. If set to `true`, the highest priority backup is always the master when the default master is unavailable. If set to `false`, a higher priority backup does not preempt a lower priority backup which is acting as master.

When the master router fails, the backup routers come online in priority order — highest to lowest. Preempt mode set to `true` allows a higher priority backup router to relieve a lower priority backup.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over for the backup virtual router that was elected to become master virtual router. This preemptive scheme can be disabled using the `preempt-mode false` command. If preemption is disabled, the backup virtual router that is currently elected as Master does not transition to backup again when the alternate backup router with higher priority becomes available.

Command Syntax

```
preempt-mode (true|false)
```

Parameters

`true`	Specify that preemption is enabled.
`false`	Specify that preemption is disabled.

Default

By default, preempt mode is true

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to enable the preempt mode.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#preempt-mode false

#configure terminal
(config)#router vrrp 1 eth0
(config-router)#preempt-mode true
```

router vrrp

Use this command to enable a VRRP routing process.

Use the no form of this command to disable a VRRP routing process.

Command Syntax

```
router vrrp <1-255> IFNAME
no router vrrp <1-255> IFNAME
```

Parameters

<1-255>	Virtual router identifier
IFNAME	Interface name

Default

No default value is specified

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router vrrp 1 eth0
```

show debugging vrrp

Use this command to display the set VRRP debugging option.

Command Syntax

```
show debugging vrrp
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show debugging vrrp
VVRRP debugging status:
VRRP event debugging is on
VRRP packet debugging is on
```

show running-config vrrpv6

Use this command to show the running configuration for VRRPv6.

Command Syntax

```
show running-config router vrrpv6
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS-SP version 1.0.

Example

```
#show running-config vrrpv6
!
vrrp vmac disable
!
!
router ipv6 vrrp 1 eth1
virtual-ipv6 fe80::c0
enable
!
```

show running-config router vrrp

Use this command to show the running configuration for VRRP.

Command Syntax

```
show running-config router vrrp
```

Parameters

None

Command Mode

Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows the running configuration of VRRP. Virtual Router is configured as Master and Owner of IP address.

```
#show running-config router vrrp
!
router vrrp 1 eth0
 virtual-ip 39.0.0.24 owner
 advertisement-interval 5
 preempt-mode false
 enable
!
```

show vrrp

Use this command to display a list of virtual router identifiers that are configured on the router.

Command Syntax

```
show vrrp
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show vrrp

R1#show vrrp
VrId <1>
State is Master
Virtual IP is 10.10.12.6 (IP owner)
Interface is eth0
Priority is 255
Advertisement interval: 5 centi sec
Preempt mode is TRUE

R2#show vrrp
VrId <1>
State is Backup
Virtual IP is 10.10.12.6 (Not IP owner)
Interface is eth0
Priority is 100
Advertisement interval: 5 centi sec
Preempt mode is TRUE
```

Table 1-66 Explains the show command output fields.

Table 1-66: show vrrp output fields

Field	Description
VrID	Type of vr identifier by the system on the interface.
State	VRRP State: Master — The interface is acting as the master router interface. Backup —The interface is acting as the backup router interface.
Virtual IP	List of virtual IP addresses configured on the interface.
Interface	Name of the logical interface.

Field	Description
Priority	Configured VRRP priority for the interface.
Advertisement interval	Configured VRRP advertisement interval.
Preempt mode	Whether preemption is allowed on the interface.

show vrrp <1-255>

Use this command to display VRRP information for a virtual router.

Command Syntax

```
show vrrp <1-255> IFNAME
```

Parameters

<1-255>	Virtual router identifier
IFNAME	Interface name

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show vrrp 7 eth0
```

show vrrp (global | ipv4) statistics

Use this command to display VRRP global or ipv4 router statistics.

Command Syntax

```
show vrrp (global | ipv4 ) statistics
```

Parameters

`global`	Global (VRRP Router)
`ipv4`	VRRP IPv4 router

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.8.

Example

```
#show vrrp global statistics
VRRP Global Statistics
Checksum Errors  : 0
Version Errors   : 0
VRid Errors      : 0
Discontinuity Time: 00 hour, 00 min, 00 sec

#show vrrp ipv4 statistics
Address family IPv4
VRRP Id: 1 on interface: xe1
Master Transitions: 0
Advertisements Rcvd: 0
Pkts Rcvd with IP TTL Errors: 0
Pkts Rcvd with Zero Priority: 0
Pkts Sent with Zero Priority: 0
Pkts Rcvd with Invalid TYPE: 0
Pkts Rcvd with Packet Length Errors: 0
Pkts Rcvd with IP Count Mismatch: 0
Discontinuity Time: 00 hour, 00 min, 00 sec
Refresh Rate: 1000 ms
```

snmp restart vrrp

Use this command to restart SNMP in Virtual Routing Redundancy Protocol (VRRP).

Command Syntax

```
snmp restart vrrp
```

Parameters

None

Default

By default, SNMP restart is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#snmp restart vrrp
```

switch-back-delay

Use this command to set a switch-back delay timer for the master VRRP router. This feature prevents the original master VRRP router from transitioning back to the master state after coming back online until the configured delay timer has expired.

Command Syntax

```
switch-back-delay <1-500000>
no switch-back-delay
```

Parameters

<1-500000>	Specify a switch-back delay in milliseconds.

Command Mode

Router mode

Default

By default, the switch-back delay is set to 0

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The example below shows how to set a switch-back delay timer of 7000 milliseconds.

```
#configure terminal
(config)#router vrrp 5 eth1
(config-router)#switch-back-delay 7000
```

undebug vrrp

Use this command to disable debugging options for VRRP.

Command Syntax

```
undebug vrrp (all|event|packet [send|recv|])
no undebug vrrp (all|event|packet [send|recv|])
```

Parameters

`all`	Specify debugging options for all VRRP events.
`event`	Specify debugging options for VRRP event troubleshooting.
`packet`	Specify debugging options for VRRP packets
`send`	Specify the debug option set for sent packets.
`recv`	Specify the debug option set for received packets.

Command Mode

Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#undebug vrrp all
```

The example below shows how to disable debug options for VRRP events.

```
#undebug vrrp events
```

The example below shows how to disable debug options for VRRP packets sent.

```
#undebug vrrp packet send
```

The example below shows how to disable debug options for VRRP packets received.

```
#undebug vrrp packet recv
```

virtual-ip

Use this command to set the virtual IP address for the VRRP virtual router as VRRP Owner. This is the IP address used by end hosts to address their default gateway.

The VRRP Owner of the Virtual IP address only responds to packets destined to the Virtual IP address (for example, ICMP packets destined to the Virtual IP address).

Use the `no` parameter with this command to remove a virtual IP address assignment.

Syntax Description

```
virtual-ip A.B.C.D (owner|)
no virtual-ip
```

Parameters

`A.B.C.D`	Specify the virtual IP address of the interface that participates in virtual routing.
`owner`	Specify the IP address as the owner.

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to configure the router as VRRP owner.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#virtual-ip 10.10.20.30 owner
```

The example below removes the virtual IP address assignment.

```
#configure terminal
(config)#router vrrp 1 eth0
(config-router)#no virtual-ip
```

vrrp compatible-v2

Use this command to enable the backward-compatibility feature. When enabled, both VRRPv3 and VRRPv2 inter-operation are supported.

Command Syntax

```
vrrp compatible-v2 (enable| disable)
```

Parameters

`enable`	Enable VRRPv2 inter-operation
`disable`	Disable VRRPv2 inter-operation

Default

By default, vrrp compatible-v2 is enabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#vrrp compatible-v2 enable
```

vrrp ipv4-exclude-pseudo-header

Use this command to excludes the pseudo-header in IPv4 VRRPv3 checksum calculation on the VRRP groups in configuration mode to support IPv4 VRRPv3 interoperability.

Note: Use this command when checksum errors are observed with other vendors for VRRPv3.

Command Syntax

```
vrrp ipv4-exclude-pseudo-header (enable| disable)
```

Parameters

`enable`	Enable ipv4-exclude-pseudo-header
`disable`	Disable ipv4-exclude-pseudo-header

Default

By default, VRRP includes the pseudo header in checksum calculation.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 2.4.

Examples

```
#configure terminal
(config)#vrrp ipv4-exclude-pseudo-header enable

#configure terminal
(config)#vrrp ipv4-exclude-pseudo-header disable
```

vrrp vmac

Use this command to enable or disable Virtual MAC (VMAC).

This command affects all VRRP groups in a router. On a single network segment, multiple VRRP groups can be configured, each using a different VMAC. The use of VMAC addressing allows for faster switchover when a backup router assumes the master role. When this command is used to enable a VMAC, the virtual router forwards packets with a special-purpose multicast VMAC address (0:0:5e:0:01:<VR ID>). Otherwise, it forwards with is interface's physical address.

The VMAC address is assigned to a router interface at the time the VRRP group is enabled in the router.

Command Syntax

```
vrrp vmac (enable|disable)
```

Parameters

`enable`	Enable virtual MAC addressing.
`disable`	Disable virtual MAC addressing and use physical MAC addressing.

Default

By default, VMAC is disabled

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below shows how to enable a virtual MAC address on the router.

```
#configure terminal
(config)#vrrp vmac enable
```

The example below shows how to disable a virtual MAC address on the router.

```
#configure terminal
(config)#vrrp vmac disable
```

Bidirectional Forwarding Detection Configuration Guide

Contents

This document contains these chapters and appendices:

CHAPTER 1 Base BFD Configuration

This chapter provides the steps for configuring the base Bidirectional Forwarding Detection (BFD) setup.

Overview

This section provides an overview of Bidirectional Forwarding Detection (BFD). BFD is a detection protocol designed to provide fast forwarding path failure detection times for all media types, encapsulations, topologies, and routing protocols like BGP, EIGRP, IS-IS, and OSPF. In addition to fast forwarding path failure detection, BFD provides a consistent failure detection method for network administrators.The configuration and command reference for BFD is given in the following chapters in this section.

Topology

Figure 1-105: Basic Topology of Three Routers

BFD Echo Function

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 10.1.1.2`	Configure BFD session on interface.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#bfd echo`	Enable BFD echo mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#bfd session 10.1.1.2 10.1.1.1`	Configure BFD session on interface.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#bfd echo`	Enable BFD echo mode.

Validation

R1

```
#sh bfd session detail

BFD Slow Timer

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 10.1.1.2`	Configure BFD session on interface.
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#bfd slow-timer 1000`	Configure BFD `slow-timer` in milliseconds.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#bfd session 10.1.1.2 10.1.1.1`	Configure BFD session on interface.
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#bfd slow-timer 1000`	Configure BFD `slow-timer` in milliseconds.

BFD Multihop Peer Timer

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-router)#redistribute connected`	
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 20.1.1.3 interval 100 minrx 100 multiplier 3`	Configure BFD `multihop-peer` timer and reception intervals in milliseconds and the Hello multiplier.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface eth2`	Enter interface Mode.
`R2(config-if)#ip address 20.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#router ospf 1`	Enter router OSPF mode
`R2(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#redistribute connected`	
`R2(config-router)#exit`	Exit router OSPF mode

R3

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth2`	Enter interface Mode.
`R1(config-if)#ip address 20.1.1.3/24`	Assign IP address for interface
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-router)#redistribute connected`	
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 10.1.1.1 interval 100 minrx 100 multiplier 3`	Configure BFD `multihop-peer` timer and reception intervals in milliseconds and the Hello multiplier.

Validation:

BFD Single-hop Session Timer

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 10.1.1.2`	Configure BFD session on interface.
`R1(config-if)#bfd interval 100 minrx 100 multiplier 4`	Configure BFD single-hop sessions timer and reception interval in millisecond and the Hello multiplier.
`R1(config-if)#exit`	Exit from interface mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#bfd session 10.1.1.2 10.1.1.1`	Configure BFD session on interface.
`R2(config-if)#bfd interval 100 minrx 100 multiplier 4`	Configure BFD single-hop sessions timer and reception interval in millisecond and the Hello multiplier.
`R2(config-if)#exit`	Exit from interface mode.

CHAPTER 2 BFD Protocol Configurations

This chapter describes the BFD protocol configurations.

OSPF—BFD Single-Hop Session

This section provides the steps for configuring BFD for Single-Hop OSPF.

Topology

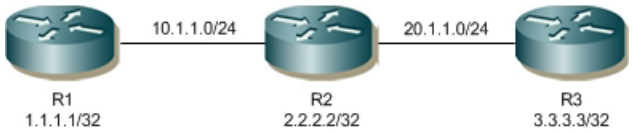

Figure 2-106: Single-Hop OSPF Topology

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Interface configuration mode for lo
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP Address
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#router ospf 100`	Enter the Router mode for OSPF.
`R1(config-router)#network 10.1.1.0/24 area 1`	Advertise network `10.1.1.0/24` in OSPF `area 1`.
`R1(config-router)#network 1.1.1.1/32 area 1`	Advertise loopback network `1.1.1.1/32` in OSPF `area 1`.
`R1(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.
`R1(config-router)#exit`	Exit the router mode

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#router ospf 100`	Enter the Router mode for OSPF.
`R2(config-router)#network 10.1.1.0/24 area 1`	Advertise network `10.1.1.0/24` in OSPF `area 1`.

R2(config-router)#network 20.1.1.0/24 area 1	Advertise network 20.1.1.0/24 in OSPF area 1.
R2(config-router)#network 2.2.2.2/32 area 1	Advertise loopback network 2.2.2.2/32 in OSPF area 1.
R2(config-router)#bfd all-interfaces	Enable BFD for all neighbors.
R2(config)#interface lo	Enter the Interface configuration mode for lo
R2(config-if)#ip address 2.2.2.2/32 secondary	Assign IP Address
R2(config-router)#exit	Exit the router mode.

R3

R3#configure terminal	Enter the Configure mode.
R3(config)#interface lo	Enter the Interface configuration mode for lo
R3(config-if)#ip address 3.3.3.3/32 secondary	Assign IP Address
R3(config)#interface eth2	Enter the Interface configuration mode for eth2.
R3(config-if)#ip address 20.1.1.2/24	Assign IP Address.
R3(config-if)#exit	Exit the Interface configuration mode.
R3(config)#router ospf 100	Enter the Router mode for OSPF.
R3(config-router)#network 20.1.1.0/24 area 1	Advertise network 20.1.1.0/24 in OSPF area 1.
R3(config-router)#network 3.3.3.3/32 area 1	Advertise loopback network 3.3.3.3/32 in OSPF area 1.
R3(config-router)#bfd all-interfaces	Enable BFD for all neighbors
R3(config-router)#exit	Exit the router mode.

OSPF—BFD Multi-Hop Session

This section provides the steps for configuring BFD for OSPF multi-hop sessions.

Topology

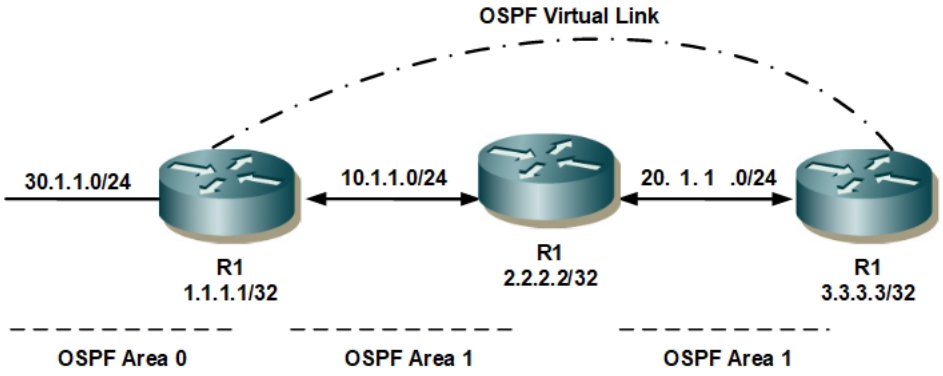

Figure 2-107: Multi-hop OSPFv2 Topology

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Interface configuration mode for lo
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP Address
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#interface eth2`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 30.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)#router ospf 100`	Enter the Router mode for OSPF.
`R1(config-router)#ospf router-id 1.1.1.1`	OSPF router ID in IPv4 format
`R1(config-router)#network 10.1.1.0/24 area 1`	Advertise network `20.1.1.0/24` in OSPF `area 1`.
`R1(config-router)#network 1.1.1.1/32 area 1`	Advertise loopback network `1.1.1.1/32` in OSPF `area 1.`
`R1(config-router)#network 30.1.1.0/24 area 0`	Advertise network `30.1.1.0/24` in OSPF `area 0`.
`R1(config-router)#area 1 virtual-link 3.3.3.3 fall-over bfd`	Create a virtual link to R3 with BFD.

R2

`R2#configure terminal`	Enter the Configure mode
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.

`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#interface lo`	Enter the Interface configuration mode for lo
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode
`R2(config)#router ospf 100`	Enter the Router mode for OSPF.
`R2(config-router)#ospf router-id 2.2.2.2`	OSPF router ID in IPv4 format
`R2(config-router)#network 10.1.1.0/24 area 1`	Advertise network `10.1.1.0/24` in OSPF `area 1`.
`R2(config-router)#network 20.1.1.0/24 area 1`	Advertise network `20.1.1.0/24` in OSPF `area 1`.
`R2(config-router)#network 2.2.2.2/32 area 1`	Advertise loopback network `2.2.2.2/32` in OSPF `area 1`.
`R2(config-router)#exit`	Exit the router mode.

R3

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#interface lo`	Enter the Interface configuration mode for lo
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assign IP Address
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP Address.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#router ospf 100`	Enter the Router mode for OSPF.
`R3(config-router)#ospf router-id 3.3.3.3`	OSPF router ID in IPv4 format
`R3(config-router)#network 20.1.1.0/24 area 1`	Advertise network `20.1.1.0/24` in OSPF `area 1`.
`R3(config-router)#network 3.3.3.3/32 area 1`	Advertise loopback network `3.3.3.3/32` in OSPF `area 1`.
`R3(config-router)#area 1 virtual-link 1.1.1.1 fall-over bfd`	Create a virtual link to R1 with BFD.

BFD Configuration in IS-IS

This section provides the steps for configuring BFD for the IS-IS protocol.

Topology

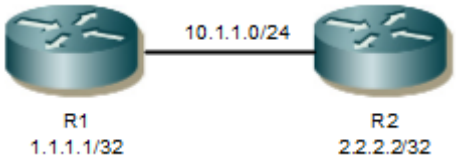

Figure 2-108: Basic Topology for BFD-ISIS

R1

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface eth1`	Enter interface mode.
`R1(config-if)#ip address 10.1.1.1/24`	Configure IP address.
`R2(config-if)#ip router isis 1`	Configure ISIS router
`R1(config-if)#exit`	Exit interface mode.
`R1(config)#router isis 1`	Enter the Router mode for IS-IS.
`R1(config-router)#net 10.0000.0000.0001.00`	Advertise network `10.0000.0000.0001.00` in IS-IS.
`R1(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface eth1`	Enter interface mode.
`R2(config-if)#ip address 10.1.1.2/24`	Configure IP address.
`R2(config-if)#ip router isis 1`	Configure ISIS router
`R2(config-if)#exit`	Exit interface mode.
`R2(config)#router isis 1`	Enter the Router mode for IS-IS.
`R2(config-router)#net 10.0000.0000.0002.00`	Advertise network `10.0000.0000.0002.00` in IS-IS.
`R2(config-router)#bfd all-interfaces`	Enable BFD for all neighbors.

BFD Configuration in BGP

This section provides the steps for configuring BFD for the BGP protocol.

Topology

Figure 2-109: Basic Topology for BFD in BGP

R1

`R1#configure terminal`	Enter configure mode
`R1(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP Address
`R1(config-if)#exit`	Exit the Interface configuration mode.
`R1(config)# interface lo`	Enter interface mode
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Configure the IP address on loopback interface.
`R1(config-if)#bfd session 1.1.1.1 3.3.3.3 multihop`	Enable BFD multihop session
`R1(config)#router ospf 100`	Enter Router mode for OSPF
`R1(config-router)# ospf router-id 1.1.1.1`	Configure router-id in OSPF
`R1(config-router)# network 1.1.1.1/32 area 0.0.0.1`	Advertise network 1.1.1.1/32 in OSPF area 1.
`R1(config-router)# network 10.1.1.0/24 area 0.0.0.1`	Advertise network 10.1.1.0/24 in OSPF area 1.
`R1(config)#router bgp 100`	Enter Router mode for BGP
`R1(config-router)# neighbor 3.3.3.3 remote-as 100`	Add the neighbor 3.3.3.3 to remote-as 100.
`R1(config-router)# neighbor 3.3.3.3 fall-over bfd`	Enable BFD option for neighbor `multihop`
`R1(config-router)#neighbor 3.3.3.3 update-source lo`	Add neighbor 3.3.3.3 to update-source lo.
`R1(config-router)#neighbor 10.1.1.2 remote-as 100`	Add neighbor 10.1.1.2 to remote-as 100.
`R1(config-router)# neighbor 10.1.1.2 fall-over bfd`	Enable BFD option for neighbor
`R1(config-router)#end`	Exit from Router BGP mode

R2

`R2#configure terminal`	Enter configure mode
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP Address
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP Address

R2(config-if)#exit	Exit the Interface configuration mode
R2(config)# interface lo	Enter interface mode
R2(config-if)#ip address 2.2.2.2/32 secondary	Configure the IP address on loopback interface.
R2(config-if)#exit	Exit the Interface configuration mode
R2(config)#router ospf 100	Enter Router mode for OSPF
R2(config-router)#ospf router-id 2.2.2.2	Configure router-id in OSPF
R2(config-router)# network 2.2.2.2/32 area 0.0.0.1	Advertise network 1.1.1.1/32 in OSPF area 1.
R2(config-router)#network 10.1.1.0/24 area 0.0.0.1	Advertise network 10.1.1.0/24 in OSPF area 1.
R2(config-router)# network 20.1.1.0/24 area 0.0.0.1	Advertise network 20.1.1.0/24 in OSPF area 1.
R3(config-router)#exit	Exit from Router OSPF mode
R2(config)#router bgp 100	Enter Router mode for BGP
R2(config-router)# neighbor 10.1.1.1 remote-as 100	Add neighbor 10.1.1.1 to remote-as 100.
R2(config-router)#neighbor 10.1.1.1 fall-over bfd	Enable BFD option for neighbor
R2(config-router)# neighbor 20.1.1.2 remote-as 100	Add neighbor 20.1.1.2 to remote-as 100.
R2(config-router)# neighbor 20.1.1.2 fall-over bfd	Enable BFD option for neighbor
R2(config-router)#end	Exit from Router BGP mode

R3

R3#configure terminal	Enter configure mode
R3(config)#interface eth2	Enter the Interface configuration mode for eth2.
R3(config-if)#ip address 20.1.1.2/24	Assign IP Address.
R3(config-if)#exit	Exit the Interface configuration mode.
R3(config)# interface lo	Enter interface mode
R3(config-if)#ip address 3.3.3.3/32 secondary	Configure IP address on loopback interface.
R1(config-if)#bfd session 3.3.3.3 1.1.1.1 multihop	Enable BFD multihop session
R2(config-if)#exit	Exit the Interface configuration mode
R3(config)#router ospf 100	Enter Router mode for OSPF
R3(config-router)#ospf router-id 3.3.3.3	Configure router-id in OSPF
R3(config-router)# network 3.3.3.3/32 area 0.0.0.1	Advertise network 3.3.3.3/32 in OSPF area 1.
R3(config-router)# network 20.1.1.0/24 area 0.0.0.1	Advertise network 20.1.1.0/24 in OSPF area 1.
R3(config-router)#exit	Exit from Router OSPF mode
R3(config)#router bgp 100	Enter Router mode for BGP

R3(config-router)# neighbor 1.1.1.1 remote-as 100	Add neighbor 1.1.1.1 to remote-as 100.
R3(config-router)# neighbor 1.1.1.1 fall-over bfd multihop	Enable BFD option for neighbor
R3(config-router)#neighbor 1.1.1.1 update-source lo	Add neighbor 1.1.1.1 to update-source lo.
R3(config-router)# neighbor 20.1.1.1 remote-as 100	Add neighbor 20.1.1.1 to remote-as 100.
R3(config-router)#neighbor 20.1.1.1 fall-over bfd	Enable BFD option for neighbor
R3(config-router)#end	Exit from Router BGP mode

CHAPTER 3 BFD Static Route Configuration

This chapter describes the configurations for BFD static routes.

In order to establish alternate paths to destinations that have the least possible delay it is important to quickly detect any changes to static route validity. BFD detects the liveliness of a static route's nexthop and then uses the nexthop's reachability information to determine whether routes are valid. Using BFD to reach a static route's nexthop also ensures that a static route is inserted in the forwarding database only when the nexthop neighbor is reachable.

Topology

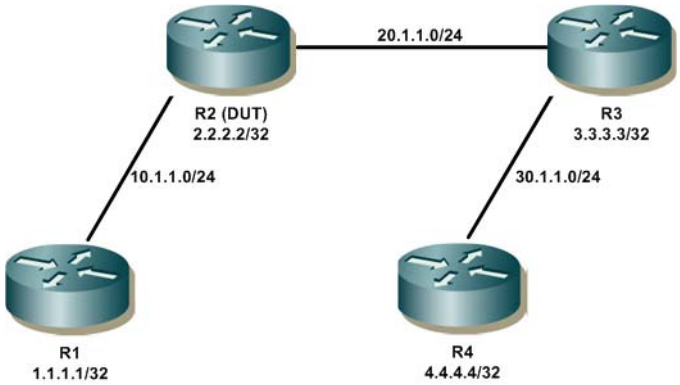

Figure 3-110: BFD Static Route Basic Topology

R1

`R1(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address on interface.
`R1(config-if)#exit`	Exit the Interface configuration mode.

R2

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#ip route 30.1.1.0/24 20.1.1.3`	Configure static route.
`R2(config)#ip bfd static all-interfaces`	Enable BFD for all static routes.
`R2(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R2(config-if)#ip static bfd`	Enable static BFD on the interface.
`R2(config-if)#ip address 20.1.1.2/24`	Assign IP address on interface.
`R2(config-if)#exit`	Exit the Interface configuration mode.
`R2(config)#ip static 30.1.1.0/24 20.1.1.3 fall-over bfd`	Enable static BFD at static route level.
`R2(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address on interface.
`R2(config-if)#exit`	Exit the Interface configuration mode.

R3

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#ip route 10.1.1.0/24 20.1.1.2`	Configure static route.
`R3(config)#ip bfd static all-interfaces`	Enable BFD for all static routes.
`R3(config)#interface eth1`	Enter the Interface configuration mode for `eth1`.
`R3(config-if)#ip address 20.1.1.3/24`	Assign IP address on interface.
`R3(config-if)#ip static bfd`	Enable static BFD at interface level.
`R3(config-if)#exit`	Exit the Interface configuration mode.
`R3(config)#ip static 10.1.1.0/24 20.1.1.2 fall-over bfd`	Enable static BFD at static route level.
`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 30.1.1.2/24`	Assign IP address on interface.
`R3(config-if)#exit`	Exit the Interface configuration mode.

R4

`R3(config)#interface eth2`	Enter the Interface configuration mode for `eth2`.
`R3(config-if)#ip address 30.1.1.1/24`	Assign IP address on interface.
`R3(config-if)#exit`	Exit the Interface configuration mode.

CHAPTER 4 BFD Authentication

This chapter provides BFD authentication configuration examples.

Overview

Bidirectional Forwarding Detection (BFD) is a protocol intended to detect faults in the bidirectional path between two forwarding engines, including physical interfaces, sub-interfaces, and data link. It operates independently of media, data protocols, and routing protocols. A session will be created between links. When BFD links is hacked, the link may be falsely declared to be down, or falsely declared to be up. To overcome this type of situations, need to use authentication on BFD. Using this we can mitigate threats from attackers.

OcNOS supports the following authentication types:

- Simple password
- Meticulous-Keyed-SHA1
- Keyed-SHA1

Among these types, Meticulous-Keyed-SHA1 is the strongest one.

Authentication is optionally enabled on BFD sessions. By default, it is disabled and is configurable via CLI. When authentication is enabled, BFD packets will exchange with authentication section (based on the configured auth type). Receiving system will examine the authentication section of the packet; if it is successful then it will accept. Otherwise, it will discard.

Enabling BFD Authentication for Multihop for IPv4, Using Key-ID

In this example, the BFD Multihop session is configured between R1 and R3 using single key (using key-ID). Once the BFD session is up, the authentication is enabled on both the routers, with the authentication type as Keyed-SHA1. We can enable the authentication on BFD session using any one of the above mentioned authentication type, with the Identical authentication type on both side.

Note: BFD authentication is not supported for Single hop BFD session.

Topology

Figure 4-111: Basic Topology of Three Routers

Router 1 (R1)

`R1#configure terminal`	Enter the Configure mode.
`R1(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R1(config-if)#ip address 1.1.1.1/32 secondary`	Assign IP address for interface
`R1(config-if)#exit`	Exit from interface mode.

`R1(config)#interface xe9`	Enter Interface Mode.
`R1(config-if)#ip address 10.1.1.1/24`	Assign IP address for interface
`R1(config-if)#bfd session 10.1.1.1 20.1.1.2 multihop`	Enabling BFD Multihop session
`R1(config-if)#exit`	Exit from interface mode.
`R1(config)#router ospf 1`	Enter router OSPF mode
`R1(config-router)#redistribute connected`	
`R1(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R1(config-router)#exit`	Exit router OSPF mode
`R1(config)#bfd multihop-peer 20.1.1.2 auth type keyed-sha1 key-id 2 key ocnos`	Enabling Authentication for Multihop session

Router 2 (R2)

`R2#configure terminal`	Enter the Configure mode.
`R2(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R2(config-if)#ip address 2.2.2.2/32 secondary`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface xe9`	Enter Interface Mode.
`R2(config-if)#ip address 10.1.1.2/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#interface xe2`	Enter Interface Mode.
`R2(config-if)#ip address 20.1.1.1/24`	Assign IP address for interface
`R2(config-if)#exit`	Exit from interface mode.
`R2(config)#router ospf 1`	Enter router OSPF mode
`R2(config-router)#redistribute connected`	
`R2(config-router)#network 10.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#network 20.1.1.0/24 area 0`	Advertise the network to area 0
`R2(config-router)#exit`	Exit router OSPF mode

Router 3 (R3)

`R3#configure terminal`	Enter the Configure mode.
`R3(config)#interface lo`	Enter the Loopback Interface configuration mode.
`R3(config-if)#ip address 3.3.3.3/32 secondary`	Assign IP address for interface
`R3(config-if)#exit`	Exit from interface mode.
`R3(config)#interface xe2`	Enter Interface Mode.
`R3(config-if)#ip address 20.1.1.2/24`	Assign IP address for interface
`R3(config-if)#bfd session 20.1.1.2 10.1.1.1 multihop`	Enabling BFD Multihop session

R3(config-if)#exit	Exit from interface mode.
R3(config)#router ospf 1	Enter router OSPF mode
R3(config-router)#redistribute connected	
R3(config-router)#network 20.1.1.0/24 area 0	Advertise the network to area 0
R3(config-router)#exit	Exit router OSPF mode
R3(config)#bfd multihop-peer 10.1.1.1 auth type keyed-sha1 key-id 2 key ocnos	Enabling Authentication for Multihop session

Validation

Check Multihop session is up between R1 and R3 with authentication type configured.

CHAPTER 5 BFD with VRF Configuration

This chapter shows using BFD with user defined VRF for OSPFv2 and OSPFv3.

Topology

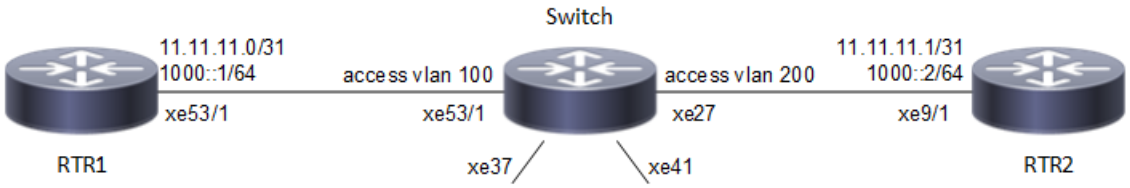

Figure 5-112: BFD user-defined VRF

RTR1

`#configure terminal`	Enter configure mode.
`(config)#ip vrf vrf10`	Create VRF instance with VRF10 and enter into VRF mode
`(config-vrf)#exit`	Exit from VRF mode
`(config)#interface xe53/1`	Enter interface mode
`(config-if)#ip vrf forwarding vrf10`	Enable VRF forwarding on interface
`(config-if)#ip address 11.11.11.0/31`	Assign IPv4 address in /31 mask.
`(config-if)#ipv6 address 1000::1/64`	Assign IPv6 address in /64 mask.
`(config-if)#ipv6 router ospf area 0 tag vrf10`	Tag OSPFv3 instance on interface with VRF10 for area 0
`(config-if)#exit`	Exit interface mode.
`(config)#router ospf 65535 vrf10`	Enter into OSPF VRF configuration mode
`(config-router)#router-id 1.1.1.1`	Assign router ID 1.1.1.1 for OSPF process 65535
`(config-router)#bfd all-interfaces`	Enable BFD for all-interface into OSPF
`(config-router)#network 11.11.11.0/31 area 0`	Enable routing for network 11.11.11.0/31 in area 0
`(config-router)#exit`	Exit from OSPF VRF configuration mode
`(config)#router ipv6 vrf ospf vrf10`	Enter into IPv6 OSPF VRF configuration mode
`(config-router)#router-id 2.2.2.2`	Assign router-id 2.2.2.2 for IPv6 OSPF process
`(config-router)#bfd all-interfaces`	Enable BFD for all-interface into OSPF
`(config-router)#exit`	Exit from IPv6 OSPF VRF configuration mode

Switch

`#configure terminal`	Enter configure mode.
`(config)#bridge 32 protocol rstp vlan-bridge`	Create a RSTP VLAN aware bridge with bridge-id 32
`(config)#vlan 100 bridge 32`	Create VLAN 100 and map it to bridge 32
`(config)#vlan 200 bridge 32`	Create VLAN 200 and map it to bridge 32
`(config)#interface xe53/1`	Enter interface mode

(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode access	Set the layer 2 interface as access interface
(config-if)#switchport access vlan 100	Map the VLAN 100 to access interface
(config-if)#exit	Exit interface mode.
(config)#interface xe27	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode access	Set the layer 2 interface as access interface
(config-if)#switchport access vlan 200	Map the VLAN 200 to access interface
(config-if)#exit	Exit interface mode.
(config)#interface xe37	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)#bridge-group 32	Configure bridge group to l2 interface
(config-if)#switchport mode access	Set the layer 2 interface as access interface
(config-if)#switchport access vlan 100	Map the vlan 100 to access interface
(config-if)#exit	Exit interface mode.
(config)#interface xe41	Enter interface mode
(config-if)#switchport	Make it port as L2 interface
(config-if)# bridge-group 32 spanning-tree disable	Configure bridge group to l2 interface with spanning-tree disable
(config-if)#switchport mode access	Set the layer 2 interface as access interface
(config-if)#switchport access vlan 200	Map the VLAN 200 to access interface
(config-if)#exit	Exit interface mode.

RTR2

#configure terminal	Enter configure mode.
(config)#ip vrf vrf10	Create VRF instance with VRF10 and enter into vrf mode
(config-vrf)#exit	Exit from VRF mode
(config)#interface xe9/1	Enter interface mode
(config-if)#ip vrf forwarding vrf10	Enable VRF forwarding on interface
(config-if)#ip address 11.11.11.1/31	Assign IPv4 address in /31 mask.
(config-if)#ipv6 address 1000::2/64	Assign IPv6 address in /64 mask.
(config-if)#ipv6 router ospf area 0 tag vrf10	Tag OSPFv3 instance on interface with VRF10 for area 0
(config-if)#exit	Exit interface mode.
(config)#router ospf 65535 vrf10	Enter into OSPF VRF configuration mode
(config-router)#router-id 3.3.3.3	Assign router ID 3.3.3.3 for OSPF process 65535
(config-router)#bfd all-interfaces	Enable BFD for all-interface into OSPF
(config-router)#network 11.11.11.0/31 area 0	Enable routing for network 11.11.11.0/31 in area 0
(config-router)#exit	Exit from OSPF VRF configuration mode

(config)#router ipv6 vrf ospf vrf10	Enter into IPv6 OSPF VRF configuration mode
(config-router)#router-id 4.4.4.4	Assign router-id 4.4.4.4 for IPv6 OSPF process
(config-router)#bfd all-interfaces	Enable BFD for all-interface into OSPF
(config-router)#exit	Exit from IPv6 OSPF VRF configuration mode

Validation

Bidirectional Forwarding Detection Command Reference

Contents

This document contains these chapters:

CHAPTER 1 Bidirectional Forwarding Commands

This chapter explains the commands used to configure Bidirectional Forwarding (BFD):

bfd auth type

Use this command to enable BFD authentication on an interface that has either an IPv4 or an IPv6 BFD session.

Use the no form of the command to disable BFD authentication.

Note: BFD authentication is not supported for single hop IPv4 sessions.

Command Syntax

```
bfd auth type (simple | keyed-sha1 | meticulous-keyed-sha1) (key-id <0-255> key
  LINE)
no bfd auth
```

Parameters

`simple`	Specify a simple authentication type.
`keyed-sha1`	Specify a keyed secure hashing algorithm authentication type.
`meticulous-keyed-sha1`	Specify an authentication key meticulous keyed secure hashing algorithm authentication.
`key-id`	Indicate the `key-id` keyword.
`<0-255>`	Specify the key ID value.
`key`	Indicate the `key` keyword.
`LINE`	Specify the authentication key name.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Do the following to configure a single-key support:

```
(config)#interface eth1
(config-if)#bfd auth type simple key-id 14 key myid1
```

bfd

Use this command to enable and disable all the BFD sessions on this interface.

Command Syntax

```
bfd (enable|disable)
```

Parameters

`enable`	Enable BFD
`disable`	Disable BFD

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bfd disable
```

bfd echo

Use this command to set BFD sessions to echo mode.

Use the no form of the command to return a BFD session to its default mode.

Note: BFD echo mode is supported for IPv4 BFD single hop sessions only.

Command Syntax

```
bfd echo
no bfd echo
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd echo
```

bfd echo interval

Use this command to set the BFD echo interval.

Use the no form of this command to reset the echo interval to its default value.

Command Syntax

```
bfd echo interval <50-4294967>
no bfd echo interval <50-4294967>
```

Parameter

<50-4294967>	Transmit interval in milliseconds.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The following command sets the BFD echo with no values.

```
#configure terminal
(config)#interface eth1
(config-if)#bfd echo interval 234
```

bfd-firmware

Use this command to enable multi-hop or micro-BFD processing in hardware.

Note: For LAG interfaces, you must specify `micro-bfd`. With `micro-bfd` only single hop sessions are supported.

Command Syntax

```
bfd-firmware (multi-hop|micro-bfd)
```

Parameter

`multi-hop`	Enable multihop sessions
`micro-bfd`	Enable micro-BFD sessions (default)

Default

By default, micro-BFD sessions are enabled.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd-firmware multi-hop
```

bfd interval

Use this command to configure BFD transmit and receive intervals, and the hello multiplier value.

Use the no form of the command to set the intervals and multiplier to their default values.

Command Syntax

```
bfd interval <3-999> minrx <3-999> multiplier <3-50>
no bfd interval <3-999> minrx <3-999> multiplier <3-50>
```

Parameters

<3-999>	Transmit interval in milliseconds.
minrx	Receive interval.
<3-999>	Receive interval in milliseconds.
multiplier	Hello multiplier.
<3-50>	Hello multiplier value.

Defaults

The default for the transmit and receive intervals is 250 milliseconds.

The default hello multiplier value is 3.

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#bfd interval 100 minrx 100 multiplier 5
(config-if)#
```

bfd multihop-peer

Use this command to enable authentication over either a multihop IPv4 or IPv6 session

Use the no form of the command to disable BFD authentication.

Command Syntax

```
bfd multihop-peer (A.B.C.D|X:X::X:X) auth type (simple | keyed-sha1 | meticulous-
  keyed-sha1) key-id <0-255> key LINE
no bfd multihop-peer (A.B.C.D) auth
```

Parameters

`A.B.C.D`	Specify an IPv4 address.
`auth type`	Specify an authentication type.
`simple`	Specify a simple authentication type.
`keyed-sha1`	Specify a keyed secure hashing algorithm authentication type.
`meticulous-keyed-sha1`	Specify an authentication key Meticulous Keyed Secure hashing algorithm authentication type.
`key-id`	Indicate the `key-id` keyword.
`<0-255>`	Specify the key ID value.
`key`	Indicate the `key` keyword.
`LINE`	Specify the authentication key name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

Do the following to configure a single-key support:

```
#configure terminal
(config)#bfd multihop-peer 123.12.1.2 auth-type simple key-id 14 key myid1
```

bfd multihop-peer A.B.C.D interval

Use this command to configure IPv4 BFD multihop peer timer values.

Use the no form of the command to reset the IPv4 multihop peer timer value.

Command Syntax

```
bfd multihop-peer A.B.C.D interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer A.B.C.D interval <50-999> minrx <50-999> multiplier <3-50>
```

Parameters

`interval`	Indicate the interval parameter.
`<50-999>`	Specify the actual transmit interval in milliseconds.
`minrx`	Indicate the minrx parameter.
`<50-999>`	Specify the actual reception interval in milliseconds.
`multiplier`	Indicate the multiplier parameter.
`<3-50>`	Specify the actual hello multiplier value.

Command Mode

Configure mode

Default

Multiplier value is 3

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd multihop-peer 10.1.1.67 interval 100 minrx 100 multiplier 3
(config)#
```

bfd multihop-peer X:X::X:X interval

Use this command to configure an IPv6 BFD multihop peer timer values.

Use the no form of the command to reset the IPv6 multihop peer timer values.

Command Syntax

```
bfd multihop-peer X:X::X:X interval <50-999> minrx <50-999> multiplier <3-50>
no bfd multihop-peer X:X::X:X interval <50-999> minrx <50-999> multiplier <3-50>
```

Parameters

`interval`	Indicate the interval parameter.
`<50-999>`	Specify the actual transmit interval in milliseconds.
`minrx`	Indicate the minrx parameter.
`<50-999>`	Specify the actual reception interval in milliseconds.
`multiplier`	Indicate the multiplier parameter.
`<3-50>`	Specify the actual hello multiplier value.

Command Mode

Configure mode

Default

Default multiplier value is 3

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd multihop-peer 10.1.1.1 interval 100 minrx 100 multiplier 3
```

bfd notification

Use this command to enable or disable BFD notification.

Command Syntax

```
bfd notification (enable | disable)
```

Parameters

`disable`	Disable BFD notification.
`enable`	Enable BFD notification.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#configure terminal
(config)#bfd notification enable

(config)#bfd notification disable
```

bfd slow-timer

Use this command to set a BFD slow timer interval.

Use the no form of the command to reset the timer to default values.

Command Syntax

```
bfd slow-timer <1000-30000>
no bfd slow-timer
```

Parameter

<1000-30000>	Interval for the slow-timer in milliseconds

Command Mode

Configure mode

Default

Default slow-timer value is 2000

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#bfd slow-timer 1500
(config)#
```

debug bfd

Use this command to enable debugging for BFD.

Use the no form of the command to disable all debugging for BFD.

Command Syntax

```
debug bfd (all|)
debug bfd (event|ipc-error|ipc-event|nsm|packet|session)
no debug bfd (all|)
no debug all
no debug all bfd
no debug bfd (event|ipc-error|ipc-event|nsm|packet|session)
```

Parameters

`all`	Enable all debugging.
`event`	Enable BFD event debugging.
`ipc-error`	Enable BFD IPC-error debugging
`ipc-event`	Enable BFD IPC-event debugging.
`nsm`	Enable BFD NSM debugging.
`packet`	Enable BFD packet debugging.
`session`	Enable BFD session debugging.

Command Mode

Exec, Privileged Exec and Configure Mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#debug bfd all
#no debug bfd all
#debug bfd event
#debug bfd ipc-error
#debug bfd ipc-event
#debug bfd nsm
#debug bfd packet
#debug bfd session
```

hardware-profile micro-bfd

Use this command to enable micro-BFD support on hardware.

Note: Micro-bfd support is optional when a BFD session is configured over a LAG interface between two Qumran devices. It is mandatory to enable micro-bfd when the BFD session is configured over LAG interface between different platforms. When BFD sessions are configured over LAG interfaces, both Qumran nodes should have micro-bfd enabled or disabled.

Command Syntax

```
hardware-profile micro-bfd (enable|disable)
```

Parameter

`enable`	Enable micro-bfd support on Qumran
`disable`	Disable micro-bfd support on Qumran

Default

By default, micro-bfd support is disabled on Qumran.

Command Mode

Configure mode

Applicability

This command was introduced in OcNOS-SP version 1.0.

Example

```
#configure terminal
(config)# hardware-profile micro-bfd enable
```

key

Use this command to manage, add or delete authentication keys in a key chain. This command allows you to enter the keychain-key mode to set a password for the key.

Command Syntax

```
key <0-2147483647>
no key <0-2147483647>
```

Parameters

`<0-2147483647>` Specify a key identifier.

Default

By default, BFD uses level-1-2 if there is no Level-2 instance nor a Level-1-2 instance. Otherwise, it uses level-1.

Command Mode

Keychain mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example configures a key number 1 and shows the change to keychain-key command mode.

```
#configure terminal
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#
```

key chain

Use this command to enter key chain mode to configure a key chain with a key chain name. This command allows you to enter the keychain mode to specify keys on this key chain.

Command Syntax

```
key chain WORD
no key chain WORD
```

Parameters

WORD	Specify the name of the key chain to manage.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the creation of a key chain named `mychain` and the change to keychain mode:

```
#configure terminal
(config)#key chain mychain
(config-keychain)#
```

send-lifetime

Use this command to specify the time period during which the authentication key on a key chain can be sent.

Use the `no` parameter with this command to negate this command.

Command Syntax

```
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS <1-31> MONTH <1993-2035>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> HH:MM:SS MONTH <1-31> <1993-2035>
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> infinite
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> infinite
send-lifetime HH:MM:SS <1-31> MONTH <1993-2035> duration <1-2147483646>
send-lifetime HH:MM:SS MONTH <1-31> <1993-2035> duration <1-2147483646>
no send-lifetime
```

Parameters

`HH:MM:SS`	Specify the start time of accept-lifetime in hours, minutes and seconds.
`<1-31>`	Specify the day of the month to start.
`MONTH`	Specify the month of the year to start as the first three letters of the month, for example, Jan.
`<1993-2035>`	Specify the year to start.
`HH:MM:SS`	Specify the end time of accept-lifetime in hours, minutes and seconds.
`<1-31>`	Specify the day of the month to end.
`MONTH`	Specify the month of the year to end as the first three letters of the month, for example, Jan.
`<1993-2035>`	Specify the year to end.
`duration`	Indicate the duration parameter.
`<1-2147483646>`	Specify the actual end time duration of a key in seconds.
`infinite`	Specify the end time to never expire.

Command Mode

Keychain-key mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

The following example shows the setting of `send-lifetime` for `key 1` on the key chain named `mychain`:

```
#configure terminal
```

```
(config)#key chain mychain
(config-keychain)#key 1
(config-keychain-key)#send-lifetime 03:03:01 Jan 3 2004 04:04:02 Dec 6 2006
```

show bfd

Use this command to display information about the BFD process.

Command Syntax

```
show bfd
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd
BFD ID: 00      Start Time:Fri May 1 09:55:06 2009
Number of Sessions:     1
Slow Timer: 1000        Image type: MONOLITHIC
Echo Mode: Disabled     Next Session Discriminator:    2
#
```

Table 1-67 explains the output fields.

Table 1-67: show BFD fields

Entry	Description
BFD ID	ID number of the BFD session.
Start Time	The date and time when the BFD session was started
BFD Admin State	State of the BFD session: Initializing: session is initializing Up: session is up. Down: session is down
Number of Sessions	Number of BFD sessions running on the device.
Slow Timer	Required minimum transmission time for the BFD session.
Image Type	Distributed or Monolithic.
Echo Mode	Either enabled or disabled.
Next Session Discriminator	An opaque discriminator value that identifies each session on the device that is used to demultiplex multiple BFD sessions between the same pair of devices.

show bfd interface

Use this command to display details for an interface running BFD or for all interfaces configured for BFD.

Command Syntax

```
show bfd interface (ifindex <0-4294967295>|all|)
```

Parameters

`all`	Display all interfaces.
`ifindex`	Display an interface index.
`<0-4294967295>`	Display an ID of an interface in this range.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd interface all
Interface:         lo ifindex: 1 state:   UP
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       eth0 ifindex: 2 state:   UP
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       eth1 ifindex: 3 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       sit0 ifindex: 4 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5

Interface:       gre0 ifindex: 5 state: DOWN
Interface level configuration: NO ECHO, NO SLOW TMR
Timers in Milliseconds
Min Tx: 20 Min Rx: 20 Multiplier: 5
```

Table 1-68 explains the output fields.

Table 1-68: show BFD interface fields

Entry	Description
interface	Interface on which BFD is running
ifindex	Interface index number
state	State of the BFD session for the interface: UP: session is up. DOWN: session is down
Interface level configuration	State of interface-level properties: echo on or off slow-timer (timer dampening) on or off
Min Tx	The minimum interval that the local device would like to use when transmitting BFD control packets.
Min Rx	The minimum interval between received BFD control packets that this device is capable of supporting
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving device in asynchronous mode.

show bfd session

Use this command to display BFD sessions.

Note: BFD Packet In and BFD Packet Out counters are not supported for Single Hop IPv4 BFD sessions on Qumran devices.

Command Syntax

```
show bfd session (detail|)
show bfd session vrf (WORD|all|default) (detail|)
```

Parameters

`detail`	Session details.
`WORD`	Sessions for this user-defined Virtual Routing and Forwarding instance name.
`all`	Show information for all Virtual Routing and Forwarding instances
`default`	Show information for only the default Virtual Routing and Forwarding instance

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#show bfd session detail
Session Interface Index : 3                Session Index : 1
Lower Layer : IPv4                         Version : 1

Table 1-69 explains the output fields.

Table 1-69: show bfd session detail fields

Entry	Description
Session Interface Index	ID number of the interface.
Session Index Sess-Idx	ID number of this BFD session.
Lower Layer	The lower layer protocol on which BFD is carried: IPv4 IPv6 MPLS LSP MPLS VCCV MPLS-TP
Version	Session version number; generally 1.

Table 1-69: show bfd session detail fields (Continued)

Entry	Description
Session Type Sess-Type	Single Hop Multihop Arbit Path Multihop OOB Signalled Multihop Unidirectional.
Session State Sess-State	The State of the session: Init: The session is initializing Up: The session is up. Down: The session is down AdminDown: The session has been administratively shutdown indefinitely.
Local Discriminator	A unique discriminator value generated by the transmitting device used to demultiplex multiple BFD sessions between the same pair of devices.
Local Address	Local address of the transmitting device.
Remote Discriminator Remote-Disc	The discriminator received from the corresponding remote device; zero if that value is unknown.
Remote Address Remote-Addr	Remote address of the receiving device.
Local Port	UDP port number of the transmitting device.
Remote Port	UDP port number of destination.
Options	Fate Shared Echo Enabled Demand Enabled Remote Demand Enbl Remote admin Down Poll seq Init.
Diagnostics	Performance diagnostics: None Control Detection Time Expired Echo Failed Neighbor Session Down Forwarding Plane Reset Path Down Concatenated Path Down Admin Down Reverse Concatenated Path Down
Min Tx	Minimum transmit interval.
Min Rx	Minimum receive interval.
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving system in asynchronous mode.
Neg Tx	Negotiated transmit interval.
Neg Rx	Negotiated receive interval in milliseconds.

Table 1-69: show bfd session detail fields (Continued)

Entry	Description
Neg detect mult	Negotiated detection multiplier.
Min echo Tx	Minimum echo transmit interval in milliseconds.
Min echo Rx	Minimum echo receive interval in milliseconds.
Neg echo intrvl	Negotiated echo interval.
Storage type	SNMPv2 storage type (usually be set to 2): other(1) volatile(2) non-Volatile(3) permanent(4 read-Only(5)
Sess down time	Length of time this BFD session has been down.
Bfd GTSM	Whether the BFD session has enabled or disabled the Generalized TTL Security Mechanism (GTSM), which uses the time to live (TTL) or hop count to prevent off-link attackers from spoofing packets.
Bfd Authentication Enabled	When authentication is enabled.
Authentication type	Type of authentication: simple: Simple Password keyed-md5: Keyed message digest keyed-sha1: Keyed Secure hashing algorithm meticulous-keyed-md5: Meticulous Keyed message digest meticulous-keyed-sha1: Meticulous Keyed Secure hashing algorithm
Authentication Key-id	ID number of the authentication key.
Pkt In	Number of packets that have been received during this BFD session.
Pkt Out	Number of packets that have been transmitted during this BFD session.
Echo Out	Number of Echo-packets that have been transmitted during this BFD session.
IPv6 Pkt In	Number of IPv6 packets that have been received during this BFD session.
IPv6 Pkt Out	Number of IPv6 packets that have been transmitted during this BFD session.
UP Count	Number of times the BFD session has been up.
UPTIME	Length of time this BFD session has been up.
BGP-> Client ID	Protocol and module ID number of this BFD session’s neighboring device.
Flags	Session state of the neighboring device.
Interface	The interface on which the VRF resides.
Down-Reason	The reason causing the VRF to be down.

show bfd session A.B.C.D

Use this command to display information about an IPv4 BFD session neighbor.

Command Syntax

```
show bfd session A.B.C.D A.B.C.D (detail|)
show bfd session vrf WORD A.B.C.D A.B.C.D (detail|)
show bfd session A.B.C.D A.B.C.D <0-4294967295> (detail|)
show bfd session vrf WORD A.B.C.D A.B.C.D <0-4294967295> (detail|)
```

Parameters

WORD	Name of a specific Virtual Routing and Forwarding instance
A.B.C.D	Display the local IPv4 address.
A.B.C.D	Display the neighbor IPv4 address.
<0-4294967295>	Display the interface index of the address.
detail	Display detailed information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show bfd session 10.1.1.66 10.1.1.67 3
Session Interface Index: 3     Session Index: 1
Lower Layer: IPv4     Single Hop

Table 1-70 explains the output fields.

Table 1-70: Show BFD session fields

Entry	Description
Session Interface Index	ID number of the Interface.
Session Index	ID number for this BFD session.
Lower Layer	The lower layer protocol on which BFD is carried (IPv4 or IPv6).
Session State	The state of the session: Init: session is initializing Up: session is up. Down: session is down AdminDown: session has been administratively shutdown indefinitely
Local Discriminator	A unique value generated by the transmitting device used to demultiplex multiple BFD sessions between the same pair of devices.
Remote Discriminator	The discriminator received from the corresponding remote device. This field is zero if the value is unknown.
Local Address	Local address of the transmitting device.
Remote Address	Remote address of the receiving device.
Local Port	UDP port number of the transmitting device.
Remote Port	UDP port number of the receiving device.
Min Tx	Minimum transmit interval in milliseconds.

Table 1-70: Show BFD session fields

Entry	Description
Min Rx	Minimum receive interval in milliseconds.
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving system in asynchronous mode.
UP Count	The number of times the BFD session has been in up state.
UPTIME	The length of time this BFD session has been in the up state.

show bfd session ipv6

Use this command to display information about an IPv6 BFD session neighbor.

Command Syntax

```
show bfd session ipv6 X:X::X:X X:X::X:X (detail|)
show bfd session ipv6 vrf WORD X:X::X:X X:X::X:X (detail|)
show bfd session ipv6 X:X::X:X X:X::X:X <0-4294967295> (detail|)
show bfd session ipv6 vrf WORD X:X::X:X X:X::X:X <0-4294967295> (detail|)
```

Parameters

WORD	Name of a specific Virtual Routing and Forwarding instance
X:X::X:X	Display the local IPv6 address.
X:X::X:X	Display the neighbor IPv6 address.
<0-4294967295>	Display the interface index of the address.
detail	Display detailed information.

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```

```

Table 1-71 explains the output fields.

Table 1-71: show BFD session fields

Entry	Description
Session Interface Index	ID number of the Interface.
Session Index	ID number for this BFD session.
Lower Layer	The lower layer protocol on which BFD is carried (IPv4 or IPv6).
Session State	The state of the session: Init: session is initializing Up: session is up. Down: session is down AdminDown: session has been administratively shutdown indefinitely
Session Type	Whether the session is Single Hop or Multiple Hop
Local Discriminator	A unique value generated by the transmitting device used to demultiplex multiple BFD sessions between the same pair of devices.
Remote Discriminator	The discriminator received from the corresponding remote device. This field is zero if the value is unknown.

Table 1-71: show BFD session fields

Entry	Description
Local Address	Local address of the transmitting device.
Remote Address	Remote address of the receiving device.
Local Port	UDP port number of the transmitting device.
Remote Port	UDP port number of the receiving device.
Min Tx	Minimum transmit interval in milliseconds.
Min Rx	Minimum receive interval in milliseconds.
Min echo Tx	Minimum transmit interval for echo packets
Min echo Rx	minimum receive interval for echo packets
Neg echo intrvl	The negotiated
Storage type	Indicates the storage type: 1 = other 2 = volatile 3 = nonvolatile 4 = permanent 5 = read only
Sess down time	How long the session was down
Sess Down Reason	Reason for Session being down
Bfd GTSM	Whether Generalized TTL Security Mechanism (GTSM) is enabled or disabled on the connection.
Multiplier	The negotiated transmit interval, multiplied by this value, provides the detection time for the receiving system in asynchronous mode.
UP Count	Number of times the BFD session has been in up state.
UPTIME	Length of time this BFD session has been in the up state.
Bfd Authentication	If authentication is used, if yes, the type authentication: simple password, MD5, and so on.
Pkt In	Number of Packets received on the BFD session
Pkt Out	Number of packets transmitted on the BFD session
Pkts Drop	Number of packets dropped on the session
Auth Pkts Drop	Number of Authentication packets dropped
Echo Out	Number of Transmitted BFD Echo Packets
IPv6 Echo Out	Number of transmitted BFD Ipv6 Echo packets
IPv6 Pkt In	Number of received IPv6 BFD packets
IPv6 Pkt Out	Number of transmitted IPV6 BFD packets
Protocol Client Info	Client ID and flags

show debugging bfd

Use this command to display debugging information for BFD processes.

Command Syntax

```
show debugging bfd
```

Parameters

None

Command Mode

Exec mode and Privileged Exec mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

The example below displays the command syntax and sample output from the command.

```
#show debugging bfd
BFD debugging status:
BFD events debugging is on
BFD packet debugging is on
BFD ipc-error debugging is on
BFD ipc-event debugging is on
BFD session debugging is on
BFD nsm debugging is on
#
```

snmp restart bfd

Use this command to restart SNMP in Bidirectional Forwarding (BFD)

Command Syntax

```
snmp restart bfd
```

Parameters

None

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Examples

```
#snmp restart bfd
```

CHAPTER 2 Protocol Commands for BFD

The chapter describes the commands used to manage BFD functionality for OSPF, IS-IS and BGP.

area virtual-link

Use this command to enable the BFD option for a specified virtual-link neighbor.

Use the no form of the command to disable BFD on a virtual-link neighbor.

Command Syntax

```
area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
no area (A.B.C.D|<0-4294967295>) virtual-link A.B.C.D {fall-over bfd}
```

Parameters

A.B.C.D	Indicate an area IP address
<0-429467295>	Indicate an area ID in integer format
virtual-link	Indicate a virtual link and its parameters
A.B.C.D	Indicate the IP address of the virtual link
fall-over	Indicate fall-over detection
bfd	Specify the Bidirectional Forwarding Detection (BFD)

Default

No default value is specified

Command Mode

Router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf
(config-router)#area 1 virtual-link 192.168.0.1 fall-over bfd
```

bfd all-interfaces

Use this command to enable BFD for all neighbors maintained by an OSPF process or an ISIS instance.

Use the no form of the command to disable BFD.

Note: This command does not apply BFD to virtual-link neighbors.

Command Syntax

```
bfd all-interfaces
no bfd all-interfaces
```

Parameters

None

Default

By default, bfd all interface is disabled

Command Mode

Configure router mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#router ospf
(config-router)#bfd all-interfaces

#configure terminal
(config)#router isis
(config-router)#bfd all-interfaces
```

debug bgp bfd

Use this command to debug BFD processes in BGP.

Use the no form of the command to stop debugging.

Command Syntax

```
debug bgp bfd
no debug bgp bfd
undebug bgp bfd
```

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug bgp bfd
```

debug isis bfd

Use this command to debug BFD processes in IS-IS.

Use the no form of the command to stop debugging.

Command Syntax

```
debug isis bfd
no debug isis bfd
undebug isis bfd
```

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug isis bfd
```

debug ospf bfd

Use this command to debug BFD processes in OSPF.

Use the no form of the command to stop debugging.

Command Syntax

```
debug ospf bfd
no debug ospf bfd
undebug ospf bfd
```

Parameters

None

Command Mode

Exec mode and Configure mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#debug ospf bfd
```

ip ospf bfd

Use this command to enable the BFD option for OSPF neighbors on an interface. Use the no form of the command to disable the BFD option for OSPF neighbors on an interface.

Note: When BFD monitoring is enabled for ospf session, protocol admin events like clear/ shutdown will cause BFD session to go to admin down.Due to this, neigbourship/adjacency down detection on peer will be according to the protocol configured dead interval and is not based on BFD interval.

Command Syntax

```
ip ospf bfd (disable|)
no ip ospf bfd (disable|)
```

Parameter

disable	Disable the BFD option for neighbors on an interface

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip ospf bfd
```

isis bfd

Use this command to enable the BFD option for IS-IS neighbors on an interface. Use the no form of the command to disable the BFD option for neighbors on an interface.

Note: When BFD monitoring is enabled for ISIS session, protocol admin events like clear/ shutdown will cause BFD session to go to admin down. Due to this, neigbourship/adjacency down detection on peer will be according to the protocol configured hello hold interval and is not based on BFD interval.

Command Syntax

```
isis bfd (disable|)
no isis bfd (disable|)
```

Parameter

disable	Used to disable the BFD option for neighbors on an interface

Default

No default value is specified

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#isis bfd disable
```

CHAPTER 3 BFD Static Route Commands

Bidirectional Forwarding Detection (BFD) support for static routes can be configured on a static route basis, interface basis, or on a global level:

- When BFD is configured for an IPv4 or IPv6 static route, BFD provides the next-hop reachability detection for the given static route.
- When BFD is configured for an interface, BFD provides the data plane next-hop reachability information for any IPv4 or IPv6 static route configured through the given interface.
- When BFD is configured globally, BFD is applied on all interfaces with a single command. In all these cases, the BFD session update for NSM governs the state of the static routes.

This chapter includes the following commands:

ip bfd static all-interfaces

Use this command to enable BFD support for IPv4 static routes configured on all interfaces.

Use the no option with this command to disable BFD support for IPv4 static routes configured on all interfaces.

Command Syntax

```
ip bfd static all-interfaces
ip bfd vrf NAME static all-interfaces
no ip bfd static all-interfaces
no ip bfd vrf NAME static all-interfaces
```

Parameters

NAME	Enable/disable IPv4 static BFD on all interfaces bound to this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Example

```
#configure terminal
(config)#ip bfd static all-interfaces

#configure terminal
(config)#ip  bfd  vrf vrf1 static all-interfaces
```

ip static fall-over bfd

Use this command to enable BFD support for a specific IPv4 static route.

Use the no form of the command to disable the BFD support for a specific IPv4 static route.

Command Syntax

```
ip static A.B.C.D/M A.B.C.D fall-over bfd (disable|)
ip static vrf NAME A.B.C.D/M A.B.C.D fall-over bfd (disable|)
no ip static A.B.C.D/M A.B.C.D fall-over bfd (disable|)
ip static vrf NAME A.B.C.D/M A.B.C.D fall-over bfd (disable|)
```

Parameters

A.B.C.D/M	The IPv4 destination prefix and mask length.
A.B.C.D	The IPv4 gateway address.
disable	Disable BFD.
NAME	Enable/disable BFD for the IPv4 routes for this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Example

```
#configure terminal
(config)#ip static 4.4.4.4/32 20.0.10.82 fall-over bfd

#configure terminal
(config)# ip static vrf vrf1 4.4.4.4/32 20.0.10.82 fall-over bfd
```

ip static bfd

Use this command to enable or disable BFD support for IPv4 static route(s) configured on an interface.

Use the no option with this command to reset BFD support for IPv4 static route(s) configured on an interface.

Command Syntax

```
ip static bfd (disable|)
no ip static bfd (disable|)
```

Parameters

None

Command Mode

Interface mode

Default

By default, BFD static route support is disabled at all levels.

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ip static bfd disable

(config)#interface eth1
(config-if)#ip static bfd
```

ipv6 bfd static all-interfaces

Use this command to enable BFD support for IPv6 static routes on all interfaces.

Use the no option with this command to disable BFD support for IPv6 static routes on all interfaces.

Command Syntax

```
ipv6 bfd static all-interfaces
ipv6 bfd vrf NAME static all-interfaces
no ipv6 bfd static all-interfaces
no ipv6 bfd vrf NAME static all-interfaces
```

Parameters

NAME	Enable/disable IPv6 static BFD on all interfaces bound to this user-defined Virtual Routing and Forwarding instance name.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Example

```
#configure terminal
(config)#ipv6 bfd static all-interfaces

#configure terminal
(config)#ipv6 bfd vrf vrf1 static all-interfaces
```

ipv6 static fall-over bfd

Use this command to enable BFD support for a specific IPv6 static route.

Use the no option with this command to disable BFD support for a specific IPv6 static route.

Command Syntax

```
ipv6 static X:X::X:X/M X:X::X:X fall-over bfd (disable|)
ipv6 static vrf NAME X:X::X:X/M X:X::X:X fall-over bfd (disable|)
no ipv6 static X:X::X:X/M X:X::X:X fall-over bfd (disable|)
no ipv6 static vrf NAME X:X::X:X/M X:X::X:X fall-over bfd (disable|)
```

Parameters

`X:X::X:X/M`	The IPv6 destination prefix and mask length.
`X:X::X:X`	The IPv6 gateway address.
`NAME`	Enable/disable BFD for the IPv6 routes for this user-defined Virtual Routing and Forwarding instance name.
`disable`	Disable BFD.

Command Mode

Configure mode

Applicability

This command was introduced before OcNOS version 1.3 and updated in OcNOS version 1.3.5.

Examples

```
#configure terminal
(config)#ipv6 static 2345:6::0:1/28 2345:6::0:2 fall-over bfd

#configure terminal
(config)#ipv6 static 2345:12::1/64 2345:12::2 fall-over bfd disable

#configure terminal
(config)#ipv6 static vrf vrf1 2345:6::0:1/28 2345:6::0:2 fall-over bfd
```

ipv6 static bfd

Use this command to disable BFD support for IPv6 static route(s) configured on an interface.

Use the no option with this command to reset BFD support for IPv6 static route(s) configured on an interface.

Command Syntax

```
ipv6 static bfd (disable|)
no ipv6 static bfd (disable|)
```

Parameters

None

Command Mode

Interface mode

Applicability

This command was introduced before OcNOS version 1.3.

Example

```
#configure terminal
(config)#interface eth1
(config-if)#ipv6 static bfd disable
```

SECTION 12 Precision Time Protocol

Precision Time Protocol Configuration Guide

Contents

This guide contains these chapters:

CHAPTER 1 Boundary Clock Configuration

This chapter shows how to configure a boundary clock over Ethernet, IPv4, and IPv6. You configure a boundary clock with more than one port.

Note: We can enable PTP on physical interfaces which can be L2, L3 or member port of the LAG.

Topology

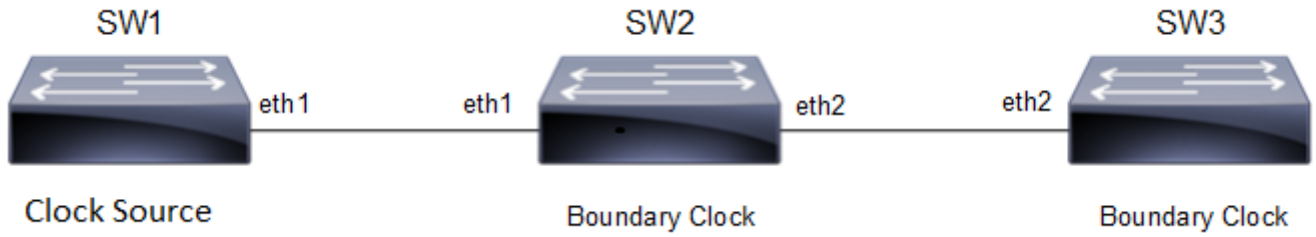

Figure 1-113: Configuration Topology

In this example, SW2 and SW3 are running PTP acting as boundary clock.

Boundary Clock Configuration

This section shows how to set up a boundary clock.

SW2 (boundary clock)

`#configure terminal`	Enter Configure mode
`(config)#bridge 1 protocol mstp`	Create bridge 1 as an MSTP bridge (this step is not mandatory, but is a good practice to avoid layer 2 loops)
`(config)#synce`	Enter configure Synchronous Ethernet mode.
`(config-synce)#synchronization option 1`	Set the synchronization network type.
`(config-synce)#exit`	Exit Synce mode
`(config)#interface eth1`	Configure interface eth1
`(config-if)#switchport`	Configure eth1 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth1 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.
`(config-if-synce)# mode synchronous`	Configure synchronous mode.
`(config-if-synce)#input-source 2`	Configure the interface as an input source with priority 2.
`(config-if-synce)#exit`	Exit Port Configure mode
`(conig-if)#exit`	Exit Interface mode
`(config)#interface eth2`	Configure interface eth2
`(config-if)#switchport`	Configure eth2 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth2 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.

(config-if-synce)#mode synchronous	Configure synchronous mode.
(config-if-synce)#output-source	Configure the interface as an output source.
(config-if-synce)#exit	Exit Port Configure mode
(config-if)#exit	Exit interface mode
(config)#ptp clock profile g8275.1	Enables G8275.1 for PTP time/phase telecom profile
(config-ptp-clk)#number-ports 2	Configure the number of PTP ports on the instance
(config-ptp-clk)#clock-port 2	Configure ptp port
(config-clk-port)#network-interface xe2	Configure underlying interface that is used by this PTP Port
(config-clk-port)#exit	Exit ptp clock port mode
(config-ptp-clk)#clock-port 1	Configure ptp port
(config-clk-port)#network-interface xe1	Configure underlying interface that is used by this PTP Port
(config-clk-port)#exit	Exit ptp clock port mode

SW3 (Boundary clock)

#configure terminal	Enter Configure mode
(config)#bridge 1 protocol mstp	Create bridge 1 as an MSTP bridge (this step is not mandatory, but is a good practice to avoid layer 2 loops)
(config)#synce	Enter configure Synchronous Ethernet mode.
(config-synce)#synchronization option 1	Set the synchronization network type.
(config-synce)#exit	Exit Synce mode
(config)#interface eth2	Configure interface eth2
(config-if)#switchport	Configure eth2 as Layer 2 port
(config-if)#bridge-group 1	Configure eth2 in bridge group 1
(config-if)#synce	Enter interface Synchronous Ethernet mode.
(config-if-synce)#mode synchronous	Configure synchronous mode.
(config-if-synce)#input-source 4	Configure the interface as an input source with priority 4.
(config-if-synce)#exit	Exit Port Configure mode
(config-if)#exit	Exit interface mode
(config)#ptp clock profile g8275.1	Enables G8275.1 for PTP time/phase telecom profile
(config-ptp-clk)#number-ports 2	Configure the number of PTP ports on the instance
(config-ptp-clk)#clock-port 2	Configure ptp port
(config-clk-port)#network-interface xe2	Configure underlying interface that is used by this PTP Port
(config-clk-port)#exit	Exit ptp clock port mode
(config-clk-clk)#clock-port 1	Configure ptp port
(config-clk-port)#network-interface xe1	Configure underlying interface that is used by this PTP Port
(config-clk-port)#exit	Exit ptp clock port mode

Validation

SW2

1. Verify the default data set on SW2.

```
#show ptp clock dataset default
Two Step Flag               : No
  Clock Identity              : B8:6A:97:FF:FE:F5:F4:C4
  Number Of Ports             : 2
  Priority1                   : 128
  Priority2                   : 128
  Slave Only                  : No
  Local Priority              : 128
  Max Steps Removed           : 255
  Domain Number               : 24
  Clock Quality               :
    Clock Class               : 248
    Clock Accuracy            : 254
    Offset ScaledLogVariance  : 65535
```

2. Verify the current data set on SW2.

```
#show ptp clock dataset current
Steps Removed               : 0
  Offset From Master          : 0 (0.000 nsec)
  Mean Path Delay             : 0
```

3. Verify the parent data set on SW2.

```
#show ptp clock dataset paren
Parent Port ID              :
    Clock Identity            : E8:C5:7A:FF:FE:2E:4B:1C
    Port Number               : 0
  Parent Stats                : No
  Observed Parent O.S.L.V     : 65535 (Offset Scaled Log Variance)
  Observed Parent P.C.R.      : 2147483647 (Phase Change Rate)
  Grandmaster Identity        : E8:C5:7A:FF:FE:2E:4B:1C
  Grandmaster Priority1       : 128
  Grandmaster Priority2       : 128
  Grandmaster Clock Quality   :
    Clock Class               : 248
    Clock Accuracy            : 38
    Offset ScaledLogVariance  : 65535
```

4. Verify the port state on SW2.

```
#show ptp port
Port 1:
  Port State                  : Slave
  Port Identity               : B8:6A:97:FF:FE:F5:F4:C4:00:01
  Log Min Delay Req Interval  : -4
  Peer Mean Path Delay        : 0
  Log Announce Interval       : -3
  Announce Receipt Timeout    : 3
  Log Sync Interval           : -4
  Delay Mechanism             : End to end
  Version Number              : 2
  Local Priority              : 128
  Master only                 : False
```

```
      Signal Fail                 : False
      Network Interface           : xe1
      Vlan Configured             :
      Description                 :

      Transmitted Packets         : 113
```

Note: Use show `ptp stats` to collect the PTP statistics and use `clear ptp stats` to clear the same.

CHAPTER 2 PTP G.8275.1 Profile Configuration

This chapter shows how to configure a PTP G.8275.1 profile over Ethernet, IPv4, and IPv6. You configure T-GM and boundary clock with more than one port.

Note: We can enable G.8275.2 on L3 interfaces, sub interfaces and member port of the LAG.

Topology

Figure 2-114: Configuration Topology

In this example, SW1, SW2 and SW3 are running PTP. SW1 acting as T-GM and SW2, SW3 acting as boundary clock.

PTP G.8275.1 Profile Configuration

This section shows how to set up G.8275.1 profile.

SW2 (boundary clock)

`#configure terminal`	Enter Configure mode
`(config)#bridge 1 protocol mstp`	Create bridge 1 as an MSTP bridge (this step is not mandatory, but is a good practice to avoid layer 2 loops)
`(config)#synce`	Enter configure Synchronous Ethernet mode.
`(config-synce)#synchronization option 1`	Set the synchronization network type.
`(config-synce)#exit`	Exit Synce mode
`(config)#interface eth1`	Configure interface eth1
`(config-if)#switchport`	Configure eth1 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth1 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.
`(config-if-synce)# mode synchronous`	Configure synchronous mode.
`(config-if-synce)#input-source 2`	Configure the interface as an input source with priority 2.
`(config-if-synce)#exit`	Exit Port Configure mode
`(conig-if)#exit`	Exit Interface mode
`(config)#interface eth2`	Configure interface eth2
`(config-if)#switchport`	Configure eth2 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth2 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.
`(config-if-synce)#mode synchronous`	Configure synchronous mode.
`(config-if-synce)#output-source`	Configure the interface as an output source.
`(config-if-synce)#exit`	Exit Port Configure mode
`(config-if)#exit`	Exit interface mode
`(config)#ptp clock profile g8275.1`	Enables G8275.1 for PTP time/phase telecom profile
`(config-ptp-clk)#number-ports 2`	Configure the number of PTP ports on the instance
`(config-ptp-clk)#clock-port 2`	Configure ptp port
`(config-clk-port)#network-interface eth2`	Configure underlying interface that is used by this PTP Port
`(config-clk-port)#exit`	Exit ptp clock port mode
`(config-ptp-clk)#clock-port 1`	Configure ptp port
`(config-clk-port)#network-interface eth1`	Configure underlying interface that is used by this PTP Port
`(config-clk-port)#exit`	Exit ptp clock port mode

SW3 (Boundary clock)

`#configure terminal`	Enter Configure mode
`(config)#bridge 1 protocol mstp`	Create bridge 1 as an MSTP bridge (this step is not mandatory, but is a good practice to avoid layer 2 loops)
`(config)#synce`	Enter configure Synchronous Ethernet mode.
`(config-synce)#synchronization option 1`	Set the synchronization network type.
`(config-synce)#exit`	Exit Synce mode
`(config)#interface eth2`	Configure interface eth2
`(config-if)#switchport`	Configure eth2 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth2 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.
`(config-if-synce)#mode synchronous`	Configure synchronous mode.
`(config-if-synce)#input-source 4`	Configure the interface as an input source with priority 4.
`(config-if-synce)#exit`	Exit Port Configure mode
`(config-if)#exit`	Exit interface mode
`(config)#ptp clock profile g8275.1`	Enables G8275.1 for PTP time/phase telecom profile
`(config-ptp-clk)#number-ports 1`	Configure the number of PTP ports on the instance
`(config-clk-clk)#clock-port 1`	Configure ptp port
`(config-clk-port)#network-interface eth2`	Configure underlying interface that is used by this PTP Port
`(config-clk-port)#exit`	Exit ptp clock port mode

SW1 (T-GM)

`#configure terminal`	Enter Configure mode
`(config)#bridge 1 protocol mstp`	Create bridge 1 as an MSTP bridge (this step is not mandatory, but is a good practice to avoid layer 2 loops)
`(config)#synce`	Enter configure Synchronous Ethernet mode.
`(config-synce)#synchronization option 1`	Set the synchronization network type.
`(config-synce)#exit`	Exit Synce mode
`(config)#synce-interface gps`	Configure synce interface gps
`(config-synce-if)# mode synchronous`	Configure synchronous mode
`(config-synce-if)# input-source 1`	Configure the interface as an input source with priority 1
`(config-synce-if)# quality-level QL_PRC`	Configure QL-value.
`(config-synce-if)# mode synchronous`	Configure synchronous mode.
`(config-synce-if)# wait-to-restore 1`	Configure Wait-to-Restore timer.
`(config-synce-if)#exit`	Exit Port Configure mode
`(config)#interface eth1`	Configure interface eth2
`(config-if)#switchport`	Configure eth2 as Layer 2 port
`(config-if)#bridge-group 1`	Configure eth2 in bridge group 1
`(config-if)#synce`	Enter interface Synchronous Ethernet mode.
`(config-if-synce)#mode synchronous`	Configure synchronous mode.
`(config-if-synce)#output-source`	Configure the interface as an output source.
`(config-if-synce)#exit`	Exit Port Configure mode
`(config-if)#exit`	Exit interface mode
`(config)#ptp clock profile g8275.1`	Enables G8275.1 for PTP time/phase telecom profile
`(config-ptp-clk)#number-ports 2`	Configure the number of PTP ports on the instance
`(config-ptp-clk)#clock-port 2`	Configure ptp port
`(config-clk-port)# master-only`	Configure the port as an master-only port
`(config-clk-port)#network-interface eth1`	Configure underlying interface that is used by this PTP Port
`(config-clk-port)#exit`	Exit ptp clock port mode
`(config-ptp-clk)#clock-port 1`	Configure ptp port
`(config-clk-port)#network-interface gps`	Configure underlying interface that is used by this PTP Port
`(config-clk-port)#exit`	Exit ptp clock port mode

Validation

SW2

1. Verify the default data set on SW2.

```
sh ptp clock dataset default
Two Step Flag               : No
```

```
  Clock Identity              : E8:C5:7A:FF:FE:23:6E:1C
  Number Of Ports             : 2
  Priority1                   : 128
  Priority2                   : 128
  Slave Only                  : No
  Local Priority              : 128
  Max Steps Removed           : 255
  Domain Number               : 24
  Clock Quality               :
    Clock Class               : 248
    Clock Accuracy            : 254
    Offset ScaledLogVariance  : 65535
```

2. Verify the current data set on SW2.

```
BC#sh ptp clock dataset current
  Steps Removed               : 1
  Offset From Master          : -25657344 (-391.500 nsec)
  Mean Path Delay             : 3449
```

3. Verify the parent data set on SW2.

```
BC# show ptp clock dataset parent
  Parent Port ID              :
    Clock Identity            : 00:00:00:00:00:00:00:01
    Port Number               : 1
  Parent Stats                : No
  Observed Parent O.S.L.V     : 0 (Offset Scaled Log Variance)
  Observed Parent P.C.R.      : 0 (Phase Change Rate)
  Grandmaster Identity        : 00:00:00:00:00:00:00:01
  Grandmaster Priority1       : 128
  Grandmaster Priority2       : 128
  Grandmaster Clock Quality   :
    Clock Class               : 6
    Clock Accuracy            : 33
    Offset ScaledLogVariance  : 65535
```

4. Verify the port state on SW2.

```
BC#sh ptp port
Port 1:
  Port State                  : Slave
  Port Identity               : E8:C5:7A:FF:FE:23:6E:1C:00:01
  Peer Mean Path Delay        : 0
  Log Announce Interval       : -3
  Log Min Delay Req Interval  : -4
  Log Sync Interval           : -4
  Announce Receipt Timeout    : 3
  Delay Mechanism             : End to end
  Version Number              : 2
  Local Priority              : 128
  Master only                 : False
  Signal Fail                 : False
  Network Interface           : eth1
```

```
  Vlan Configured             :
  Description                 :
  Configured delay asymmetry  : 0 nsec
